**About Microsemi**

Microsemi Corporation (NASDAQ: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions; security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at [www.microsemi.com](http://www.microsemi.com).

# Introduction to FlashPro Express

## About FlashPro Express

FlashPro Express is Microsemi's programming tool designed from the ground up to address secured programming assurance in production programming house environments. FlashPro Express supports PolarFire, SmartFusion2, IGLOO2, and RTG4 in the Windows and Linux OS environments.

You can install FlashPro Express two ways:

- **Integrated with Libero** - FlashPro Express is installed automatically when Libero is installed. FlashPro express is used by Libero to perform the programming tasks for PolarFire, SmartFusion2, IGLOO2, and RTG4, as part of the design flow.
- **Stand-Alone** - FlashPro Express is also available as a standalone installation. This mode is primarily used for production programming or lab programming on machines in which a full version of Libero is not required.

See [the Microsemi Website for more information on FlashPro Express](#).

## Secure Job Programming

Job programming is the concept of using a single file to program a Microsemi device or chain of Microsemi devices using encrypted bitstreams.

The single job file contains all of the information necessary to setup FlashPro Express as well as the encrypted bitstream images for the devices in the job. Once a job file is created it can be handed off securely to production programming houses or contract engineering facilities to load the Microsemi images during manufacturing. Job projects can be exported from Libero and imported into stand-alone FlashPro Express providing a clean delineation between design flow and production programming.

## Migrating FlashPro Projects to FlashPro Express

Existing FlashPro projects (\*.pro) files are now called Job Project files in FlashPro Express. These Job Projects can be opened with FlashPro Express to take advantage of Linux programming support and the simplified tool targeted for operators in a production floor environment.

FlashPro projects that were created in single mode will not be supported with this tool. Microsemi recommends that you convert these projects to chain mode projects. To convert the project to a chain project, do the following steps:

1. Open the FlashPro project (\*.pro) in FlashPro.
2. Locate the loaded STAPL file by one of two methods:

The log will print "STAPL file '<stapl\_path>' has been loaded successfully." <stapl\_path> is the location of the STAPL file loaded.

Within the Single Device Configuration Window there is a field STAPL\_FILE\_NAME, which displays the location of the STAPL file loaded.

3. Switch the project to chain mode by one of the two methods:
  - a. Press the chain button from the toolbar.
- 
  - b. From the Tools menu, select **Mode->Chain Programming**.
4. Load the STAPL file in chain mode by adding a Microsemi device in the chain.
  - a. From the File menu, select **Configuration->Add Microsemi Devices from Files**.
  - b. Browse to the location of the STAPL file and click **Open**.
5. To save the project, from the File menu, select **Save Project**.
6. You may now open the project using FlashPro Express.

When moving FlashPro project (\*.pro) files to another machine, Microsemi recommends that you archive the entire project folder, copy it to the new machine, extract it locally, then load the job project within FlashPro Express. FlashPro Express will only open a job project if a programmer is connected to the machine, at least one Microsemi device has programmed enabled, and all enabled Microsemi devices have a bitstream file loaded.

## Supported Families - FlashPro Express

The table below lists the device families and their derivatives that FlashPro Express can program directly through Libero or by exporting a FlashPro Express job:

Table 1 · Product Families and Derivatives Directly Supported by FlashPro Express

| Device Family                | Family Derivatives | Description                                                                                                                                                                 |
|------------------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PolarFire</a>    | N/A                | Lowest power, cost optimized, mid-range solution                                                                                                                            |
| <a href="#">SmartFusion2</a> | N/A                | Address fundamental requirements for advanced security, high reliability and low power in critical industrial, military, aviation, communications and medical applications. |
| <a href="#">IGLOO2</a>       | N/A                | Low-power mixed-signal programmable solution                                                                                                                                |
| <a href="#">RTG4</a>         | N/A                | Radiation-tolerant programmable solution                                                                                                                                    |

## Installing FlashPro Express Software and Hardware

See [the Microsemi Website](#) for more information about FlashPro Express.

---

# Getting Started

---

## Starting FlashPro Express

Start FlashPro Express by running the program at [installation folder] > bin > FPEXpress.

## FlashPro Express Interface

The main FlashPro Express UI consists of a list of programmers and a chain table, as shown in the figure below. This view displays the programmers connected to the machine, and the devices within the JTAG chain specified in the job project file (PRO) file, as shown in the figure below.

**Note:** For SmartFusion2 and IGLOO2 devices, you have the option to select JTAG or SPI Slave in the Select Programming Interface dialog box. See the Select Programming Interface help topic in the online help for more information.

- Hover over the programmer Info icon to display more information about a programmer.
- Click the Name field to change a programmer name.
- Click the checkbox to enable or disable a programmer.
- Right-click a programmer to Ping, Self-Test, Scan, Check Chain or Remove it from the list.
- Additional information about a device and programming file, if loaded, can be viewed by hovering over the info icon of that device.
- Devices specified as disabled in the job project (\*.pro) file are shown disabled and their HighZ value is displayed in the column header.
- Device/Programmer States:
  - **IDLE:** The devices/programmers are idle and not executing any programming action.
  - **DISABLED:** Devices that are not enabled for programming
  - **PASSED:** The last programming operation passed
  - **FAILED:** The last programming operation failed

Figure 1 · FlashPro Express Programmers and Chain Table (JTAG example)

**Note:** If you are using a FlashPro5 programmer and you select the SPI Slave programming interface in SmartFusion2 or IGLOO2, you will see information similar to the following:

Figure 2 · FlashPro Express Programmers and Chain Table (SPI Slave example)

**Note:** RTG4 and PolarFire devices do not support SPI Slave programming.

## Creating a Job Project from a FlashPro Express Job

Once you are ready to hand off your design for production you can create a job project. To do so:

1. In Libero run **Export FlashPro Express Job** to create a container that will be used to transfer programming configuration information, including programming files, to the production programming tool FlashPro Express.

Figure 3 · Export FlashPro Express Job

2. In FlashPro Express, from the **Project** menu choose **New Job Project From FlashPro Express Job**. You will be prompted to specify the Programming Job File location that you just exported from Libero and the location of where to store the FlashPro Express Job Project. The Job Project name automatically uses the programming job name and cannot be changed. Click **OK** and a new Job Project will be created and opened for production programming.

Figure 4 · New Job Project from FlashPro Express Job Dialog Box

## Load a Job Project

To get started in FlashPro Express you must load a job project (\*.pro file). To do so, from the **Project** menu choose **Open Job Project**. A job project will open if:

- At least 1 programmer is connected
- At least 1 Microsemi device is enabled for programming
- Any enabled Microsemi device for programming must have a bitstream file loaded

### *To open a project:*

1. From the **Project** menu, choose **Open Job Project**. The **Open Project** dialog box appears.
2. Find your project file or type in your project file name in the **File name** field.
3. Click **Open**.

Figure 5 · FlashPro Express Launch Screen

## Saving a Job Project

Click the **Save** button on the toolbar, or from the **Project** menu choose **Save Job Project** to save your project.

## Programming Tutorials

### Parallel Programming with FlashPro5/4/3/3X

Parallel programming enables you to program multiple Microsemi devices in parallel with multiple programmers. In parallel programming, all targeted devices are programmed with the same programming file (STAPL). The targeted device or chain configuration that is connected to each programmer must be identical.

The FlashPro Express software together with the FlashPro5/4/3/3X programmers supports parallel programming via a USB port. You can connect up to sixteen FlashPro5/4/3/3X's to a PC via a USB v1.1 or a USB v2.0 port. FlashPro5/4/3/3X requires a self-powered hub.

Connecting FlashPro5/4/3/3X (a USB v2.0 enabled programmer) to USB v1.1 port increases device programming time due to a slow data transfer rate on the USB v1.1 port in comparison to a USB v2.0 port.

The following figure illustrates how you can connect a FlashPro5/4/3/3X programmer for parallel programming.

Figure 6 · Connecting a FlashPro5/4/3/3X Programmer

An independent thread processes the STAPL file during parallel programming. In an Microsemi test, parallel programming is approximately five times faster than programming 16 devices sequentially.

**Note:** Microsemi has tested Belkin PCI-USB cards and hubs. We have found that parallel programming works best with the vendor's latest driver installed and with the matching hubs.

## Chain Programming Tutorial

This tutorial demonstrates how to use FlashPro Express to program a multi-device, multi-programmer chain. This tutorial uses the production programming flow that exports a programming job from Libero SoC, which includes chain configuration, programmer settings, and bitstream files for programming, and creates a job project from a programming job.

The figure below shows the chain used in this tutorial. M2S050T is device 1 and A3P250 is device 3. Device 1 is the first device to be programmed in the chain and device 2 is the last; device 3 is disabled and will not be programmed.

Figure 7 · Chain Programming Devices

## To program a chain:

1. From the **Project** menu, choose **New Job Project from FlashPro Express Job**.
2. Click **Browse** to load a Programming Job File, and specify your **FlashPro Express job project location**. Click **OK** to continue, as shown in the figure below.

Figure 8 · New Job Project from FlashPro Express Job

FlashPro Express displays your Job Project and programmers, as shown in the figure below. The Device/Programmer states are:

- **IDLE**: The devices/programmers are idle and not executing any programming action
- **DISABLED**: Devices that are not enabled for programming
- **PASSED**: The last programming operation passed
- **FAILED**: The last programming operation failed

Figure 9 · FlashPro Express with Loaded Job Project (JTAG example)

Figure 10 · FlashPro Express with Loaded Job Project (SPI Slave example – SmartFusion2/IGLOO2 only)

See the Export Programming Job topic for information on how to generate a Programming Job file.

3. Click the **Refresh/Rescan** button if your programmer is not listed. Hover your mouse over the **Info** icon to view device info. If a device is Disabled for programming the HighZ status appears in the GUI, as shown in the figure above.
4. Set the Programming Action in the dropdown menu to **PROGRAM**, as shown in the figure below.

Figure 11 · Programming Action Set to PROGRAM

5. Click **RUN**. Detailed individual programmer and device status information appears in the Programmer List. Your programmer status (PASSED or FAILED) appears in the Programmer Status Bar, as shown in the figure below.
  - Hover over the Programmer Status Bar to display information on the programmers.
  - Hover over the FAILED status to list all programmers that failed programming.
  - Hover over the PASSED status to list all the programmers that programmed successfully.

Figure 12 · Chain Programming Complete

View the **Log** for Messages, Errors, Warnings and Info generated during programming.

# Programmer Settings and Operations

## Introduction

The FlashPro Express software enables you to connect multiple programmers to your computer. With each programmer you select, you can connect the programmer, perform a self-test, customize, add, and remove and analyze the JTAG chain, as shown in the figure below.

Figure 13 · FlashPro Express Right-Click Menu

## Programmer Settings

In the Libero SoC Design Flow window, expand **Configure Hardware**, double-click **Configure Programmer**, or right-click **Configure Programmer** and choose **Programmer Settings** to view the Programmer Settings dialog. You can set specific voltage and force TCK frequency values for your programmer in this dialog.

Figure 14 · Programmer Settings

The Programmer Settings dialog includes setting options for FlashPro5/4/3/3X, FlashPro.

Limitation of the TCK frequency for the selected programmer:

- FlashPro5: 1, 2, 3, 4, 5, 6, 10, 15, 30 MHz
- FlashPro4: 1, 2, 3, 4, 5, 6 MHz
- FlashPro3/3X: 1, 2, 3, 4, 6 MHz
- FlashPro supports 1-4 MHz

TCK frequency limits by target device:

- Refer to target device data sheet

During execution, the frequency set by the FREQUENCY statement in the PDB/STAPL file overrides the TCK frequency setting selected by you in the Programmer Settings dialog box unless you also select the Force TCK Frequency checkbox.

## FlashPro5/4/3/3X Programmer Settings

For FlashPro5/4/3/3X, you can choose the Set Vpump setting or the Force TCK Frequency. If you choose the Force TCK Frequency, select the appropriate MHz frequency. For FlashPro4/3X settings, you can switch the TCK mode between Free running clock and Discrete clocking. Discrete clocking should be used when there is a JTAG non-compliant device in a chain with Microsemi devices. After you have made your selections(s), click **OK**.

**Alert:** Do *not* connect VPUMP to a PolarFire device.

### Default Settings

- The Vpump option is checked to instruct the FlashPro5/4/3/3X programmer(s) to supply Vpump to the device.  
NOTE: VPUMP voltage will not be checked for the SmartFusion2/IGLOO2 and newer families of devices. VPUMP does not need to be connected to the programmer for these devices.
- The Force TCK Frequency option is unchecked to instruct the FlashPro5/4/3/3X to use the TCK frequency specified by the Frequency statement in the PDB/STAPL file(s).

- FlashPro5/4/3/3X default TCK mode setting is Free running clock.

## TCK Setting (ForceTCK Frequency)

If **Force TCK Frequency** is checked (in the **Programmer Setting**), the selected TCK value is set for the programmer and the Frequency statement in the PDB/STAPL file is ignored.

## Default TCK frequency

When the IPD/STAPL file or Chain does not exist, the default TCK frequency is set to 4MHz. When more than one Microsemi flash device is targeted in the chain, the FlashPro Express software passes through all of the files and searches for the "freq" keyword and the "MAX\_FREQ" **Note** field. The FlashPro Express software uses the lesser value of all the TCK frequency settings and the "MAX\_FREQ" **Note** field values.

## FlashPro Programmer Settings

Choose your programmer settings for FlashPro (see the above figure). If you choose to add the Force TCK Frequency, select the appropriate MHz frequency. After you have made your selection(s), click **OK**.

### Default Settings

- The Vpp, Vpn, Vdd(I), and Vddp options are checked (Vddp is set to 2.5V) to instruct the FlashPro programmer(s) to supply Vpp, Vpn, Vdd(I) and Vddp.
  - The Driver TRST option is unchecked to instruct the FlashPro programmer(s) NOT to drive the TRST pin.
  - The Force TCK Frequency option is unchecked to instruct FlashPro to use the TCK frequency specified by the Frequency statement in the STAPL file(s).

## Ping Programmers

Right-click a programmer and choose Ping.

**Note:** You can click the Refresh/Rescan for Programmers button to quickly ping new programmers.

## Performing a Self-Test

Right-click the programmer you want to self-test and choose Self Test.

**Note:** You must connect the programmer to the self-test board that comes with your programmer before performing a self-test.

**Note:** Self-test is not supported with FlashPro5/4 programmers. These programmers are rigorously tested at the factory during production.

## Scanning and Checking a Chain

The scan chain operation scans and analyzes the JTAG chain connected to programmer(s) you have selected and checks that chain scanned matches the chain configured in FlashPro Express.

### **To scan a chain:**

Right-click the programmer you want to scan and choose **Scan and check chain**.

## Enabling and Disabling Programmers

After [loading a job project](#), you can enable/disable or remove a programmer and can also ping, self-test, run scan and check chain on any of the connected programmers. These actions are available in the shortcut menu (right-click) for each of the programmers listed in the programmer column.

**Click the checkbox** next to a programmer in the Programmer column to enable or disable it. The programmer is enabled when there is a tick mark in the checkbox and disabled when the checkbox is empty.

## Renaming a Programmer

Enter the new programmer name in the **Programmer** window to rename the programmer. By default, the programmer name is the same as the programmer ID.

## Removing a Programmer

Right-click the programmer and choose **Remove**.

## Selecting and Running an Action

FlashPro Express supports the following programming actions:

- DEVICE\_INFO
- ENC\_DATA\_AUTHENTICATION  
This action is only visible if every device in the chain contains encrypted bitstream files. Selecting this action causes each bitstream file to be checked for authentication.
- ERASE
- PROGRAM
- READ\_IDCODE
- VERIFY

### *To select a programming action:*

Select an action from the Programming Action dropdown menu in FlashPro Express, as shown in the figure below.

Figure 15 · FlashPro Express Programming Actions

### *To run the selected programming action:*

Click on the **RUN** button below the Programming Action drop-down menu.

# Chain Programming

## Chain Order

Chain Programming enables you to program several devices at one time. The order of devices in the chain imported from Job Project must match the physical chain to be programmed.

The TDO for the first device connects to the programmer, and the last device's TDI connects to the programmer. The devices in the chain go in order from a device's TDI into the next device's TDO, as shown in the figure below.

Figure 16 · Chain Order

## Multiple Device Chain Programming

The FlashPro Express software enables direct chain programming without generating a chain STAPL file. Each device will be programmed in sequential order starting from device 1 to device N. See example below. For more information about chain order, see the [Chain Order](#) help topic.

TDI > Device N > Device N-1 > ... > Device 2 > Device 1 > TDO

## Device Programming Compatibility

PolarFire, SmartFusion2, IGLOO2, and RTG4 devices can be programmed in the same chain.

## Programmer Support

FlashPro5/4/3/3X supports PolarFire, SmartFusion2, IGLOO2, and RTG4 devices. The Vpump on FlashPro5/4/3/3X is designed to support the programming of only one device. Please make sure that Vpump, Vcc and Vjtag are provided on board for chain programming. Connect the Vpump to the header as the Flashpro Express software will attempt to check for all external supplies, including Vpump, to ensure successful programming. There is no limitation to the chain length; however, ensure that the JTAG signal integrity and the timing are preserved.

# TCL Commands - FlashPro Express

## About TCL Commands - FlashPro Express Tcl Command Reference

Note: For details about all Tcl commands supported by FlashPro Express, see the following documents:

Note: [Tcl Command Reference Guide \(SmartFusion2, IGLOO2, RTG4\)](#)

Note: [Tcl Command Reference Guide \(PolarFire\)](#)

A Tcl (Tool Command Language) file contains scripts for simple or complex tasks. You can run scripts from the Windows command line or store and run a series of Tcl commands in a \*.tcl batch file. The Tcl commands supported by FlashPro Express are listed in the table below.

Note: Tcl commands are case sensitive. However, their arguments are not.

| Command                                 | Action                                                                                         |
|-----------------------------------------|------------------------------------------------------------------------------------------------|
| <a href="#">close_project</a>           | Closes the FlashPro project                                                                    |
| <a href="#">configure_flashpro_prq</a>  | Changes FlashPro programmer settings                                                           |
| <a href="#">configure_flashpro3_prq</a> | Changes FlashPro3 programmer settings                                                          |
| <a href="#">configure_flashpro4_prq</a> | Changes FlashPro 4 programmer settings                                                         |
| <a href="#">configure_flashpro5_prq</a> | Changes FlashPro 5 programmer settings                                                         |
| <a href="#">create_job</a>              | Create a job in FlashPro Express                                                               |
| <a href="#">dump_tcl_support</a>        | Unloads the list of supported FlashPro Tcl commands                                            |
| <a href="#">enable_serialization</a>    | Enables or disables serialization programming.                                                 |
| <a href="#">open_project</a>            | Opens a FlashPro project                                                                       |
| <a href="#">ping_prq</a>                | Pings one or more programmers                                                                  |
| <a href="#">refresh_prq_list</a>        | Refreshes the programmer list                                                                  |
| <a href="#">remove_prq</a>              | Removes the programmer from the programmer list                                                |
| <a href="#">run_selected_actions</a>    | Runs the selected action on the specified programmer and returns the exit code from the action |
| <a href="#">save_log</a>                | Saves the log file                                                                             |
| <a href="#">save_project</a>            | Saves the FlashPro project                                                                     |
| <a href="#">scan_chain_prq</a>          | Runs scan chain on a programmer                                                                |
| <a href="#">select_serial_range</a>     | Selects the range of indexes to program.                                                       |
| <a href="#">self_test_prq</a>           | Runs Self-Test on a programmer                                                                 |
| <a href="#">set_prq_name</a>            | Changes the user name of a programmer                                                          |

| Command                                    | Action                                                |
|--------------------------------------------|-------------------------------------------------------|
| <a href="#">set_programming_action</a>     | Selects the action for a device                       |
| <a href="#">set_serialization_log_file</a> | Sets the path and name of the serialization log file. |

## Running Tcl Scripts from within FlashPro Express

Instead of running scripts from the command line, you can use FlashPro Express's Execute Script dialog box to run a script.

*To execute a Tcl script file within FlashPro Express:*

1. From the **File** menu, choose **Execute Script** to display the **Run Script** dialog box.

Figure 17 · Run Script Dialog Box

2. Click the **Browse** button to display the **Open** dialog box, in which you can navigate to the folder containing the script file to open. When you click **Open**, FlashPro Express enters the full path and script filename into the Run Script dialog box for you.
3. In the Arguments box, enter the arguments to pass to your Tcl script. Separate each argument by a space character. For information about accessing arguments passed to a Tcl script, see [Running Tcl Scripts From the Command Line](#).
4. Click **Run**.

## Running Tcl Scripts from the Command Line

You can run Tcl scripts from your Windows or Linux command line.

*To execute a Tcl script file in the FlashPro Express software from a shell command line:*

1. At the prompt, type the path to the Microsemi software followed by the word "SCRIPT" and a colon, and then the name of the script file as follows:

```
<location of Microsemi software>/bin/FPExpress.exe SCRIPT:<filename>
```

The example below executes in batch mode the script *foo.tcl*:

```
<location of Microsemi software>/bin/FPExpress.exe script:foo.tcl
```

The example below executes in batch mode the script *foo.tcl* and exports the log in the file *foo.txt*:

```
<location of Microsemi software>/bin/FPExpress.exe script:foo.tcl logfile:foo.txt
```

The example below executes in batch mode the script *foo.tcl*, creates a console where the log is displayed briefly, and exports the log in the file *foo.txt*:

```
<location of Microsemi software>/bin/FPExpress.exe script:foo.tcl console_mode:brief
logfile:foo.txt
```

If you leave `console_mode` unspecified or set it to 'hide' FlashPro Express executes without a console window. If you want to leave the console window open you can run the script with the `console_mode` parameter set to 'show', as in the following example:

```
<location of Microsemi software>/bin/FPExpress.exe script:foo.tcl console_mode:show
logfile:foo.txt
```

2. If you want to pass arguments to the Tcl script from the command line, then use the "SCRIPT\_ARGS" variable as follows:

```
<location of Microsemi software>/bin/FPExpress.exe SCRIPT:<filename> SCRIPT_ARGS:"param1
param2 param3"
```

Arguments passed to a Tcl script can be accessed through the Tcl variables `argc` and `argv`. The example below demonstrates how a Tcl script accesses these arguments:

```
puts "Script name: $argv0"
puts "Number of arguments: $argc"
set i 0
foreach arg $argv {
    puts "Arg $i : $arg"
    incr i
}
```

**Note:** Script names can contain spaces if the script name is protected with double quotes:

```
FPExpress script:"FPExpress tcl/foo 1.tcl"
```

## Exporting Tcl Scripts from within FlashPro Express

*To export a set of Tcl commands from the FlashPro Express history:*

1. From the **File** menu, choose **Export Script File**.
2. Enter the filename and click **Save**. The Export Script Options dialog appears (as shown in the figure below).

Figure 18 · Script Export Options Dialog Box

Check the **Include commands from current project only** to export commands of the current project only. You can specify the filename formatting by selecting **Relative filenames** (relative to the current directory) or **Qualified filenames** (absolute path, including the directory name).

4. Click **OK**.

# Troubleshooting

## Exit Codes (PolarFire)

| Error Code                           | Exit Message                                                                                              | Exit Code | Possible Cause                                                                                                                                      | Possible Solution                                                                                                                                                                                                                                                                                                                                                            |

# SmartDebug

---

Microsemi's SmartDebug tool complements design simulation by allowing verification and troubleshooting at the hardware level.

For detailed information about SmartDebug for SmartFusion2, IGLOO2, and RTG4, refer to the [SmartDebug User Guide](#).

For detailed information about SmartDebug for PolarFire, refer to the [SmartDebug User Guide](#).

# Electrical Parameters

## DC Characteristics for FlashPro5/4/3/3X

**Note:** The target board must provide the VCC, VCCI, VPUMP, and VJTAG during programming.

**Note:** The VJTAG signal is driven from the target/DUT board. The VJTAG pin is sensed by the FP4 to configure the internal input and output buffers to the same IO Voltage levels. The VJTAG pin is only an input pin to the programmer.

Table 2 · DC Characteristic for FlashPro5/4/3/3X

| Description                                    | Symbol   | Min        | Max        | Unit |
|------------------------------------------------|----------|------------|------------|------|
| Input low voltage, TDO                         | VIL      | -0.5       | 0.35*VJTAG | V    |
| Input high voltage, TDO                        | VIH      | 0.65*VJTAG | 3.6        | V    |
| Input current, TDO                             | IIL, IIH | -20        | +20        | mA   |
| Input capacitance, TDO                         |          |            | 40         | pF   |
| Output voltage, VPUMP, operating               | VPP      | +3.0       | +3.6       | V    |
| Output current, VPUMP                          | IPP      |            | 250        | mA   |
| VJTAG = 1.5V                                   |          |            |            |      |
| Output low voltage, TCK, TMS, TDI, 100μA load  | VOL      | 0.0        | 0.2        | V    |
| Output low voltage, TCK, TMS, TDI, 4mA load    | VOL      | 0.0        | 0.30*VJTAG | V    |
| Output high voltage, TCK, TMS, TDI, 100μA load | V        | VJTAG-0.2  | VJTAG      | V    |

| Output current, IPN                             | IPN      | -270           | +270 <sup>1</sup> | mA   |
| Output low voltage, TCK, TMS, TDI, OUT0, nTRST  | VOL      | 0.0            | 0.4               | V    |
| Output high voltage, TCK, TMS, TDI, OUT0, nTRST | VOH      | 0.85 *<br>VDDP | + 0.3<br>VDDP     | V    |
| Output current, TCK, TMS, TDI, OUT0, nTRST      | IOL, IOH | -12            | +12               | mA   |

**Note:** Note (1): When power supply mode is set to ABI\_GROUND.

**Note:** \* - If you want to power-up the device from the board power supply, clear the checkboxes for VDDL and VDDP. VPP and VPN are required during programming only and are supplied by the FlashPro programmer.

**Note:** (2) Microsemi does not have operating temperature information for the FlashPro programmer. FlashPro is intended to be used as lab or production equipment and not tested at extreme temperatures. All devices in the unit are commercial temp. FlashPro4 went through a burn-in cycle operating at 100C for 250 hours during quality testing. This involved repeatedly powering the programmers and then programming after the burn in; they are not actively programming during the burn in.

# Electrical Specifications

## FlashPro5

The FlashPro5 is a JTAG and a SPI based programmer for flash based Microsemi devices.

The FlashPro5 output is supplied via a connector to which a detachable 10-pin cable is fitted. The connector on the FlashPro5 unit is a 2x5, RA male Header connector, which is manufactured by AMP and has a manufacturer's part number of 103310-1. This is a standard 2x5, 0.1 pitch connector which is keyed. Use the 10 pin right-angle header, AMP P/N 103310-1 (DigiKey P/N A26285-ND) for FlashPro4 and use the 10 pin straight header, AMP P/N 103308-1 (DigiKey P/N A26267-ND) for the straight version.

The signals on the pins of the FlashPro5 10-pin connector are shown in the figure below.

Figure 19 · FlashPro5 10-Pin Connector

**Note:** All ground pins must be connected. The rectangular shape shows connections on the programmer itself. Arrows show current flow towards or from the rectangular programmer.

The table below shows a description of the signals.

Table 4 · FlashPro5 Signal Description

| Signal    | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| VPUMP     | 3.3V Programming voltage                                                      |
| GND       | Signal reference                                                              |
| TCK/SCK   | JTAG clock; SPI clock                                                         |
| TDI/SDI   | JTAG data input to device; SPI MOSI                                           |
| TDO/SDO   | JTAG data output from device; SPI MISO                                        |
| TMS/SS#   | JTAG mode select; SPI Chip Select                                             |
| nTRST     | Programmable output pin may be set to off, toggle, low, or high level         |
| VJTAG     | Reference voltage from the target board                                       |
| PROG_MODE | IGLOO v2 family - Used for switching from VCC 1.2V to 1.5V during programming |

Some designers of high-integrity boards (military and avionic) may arrange their boards so that TRST is tied to ground via a weak pull-down resistor. The purpose of this is to hold the JTAG state-machine in a reset state by

default, so that even with TCK oscillating, some sudden ion bombardment or other electrical even will not suddenly throw the JTAG state-machine into an unknown state. If your design also uses a weak pull-down resistor on TRST on your board, then enabling the “Drive TRST” flag will be required to force the JTAG state-machine out of reset to permit programming to take place. With most boards, there is no need to select this flag.

## FlashPro4

The FlashPro4 output is supplied via a connector to which a detachable 10-pin cable is fitted. The connector on the FlashPro4 unit is a 2x5, RA male Header connector, which is manufactured by AMP and has a manufacturer's part number of 103310-1. This is a standard 2x5, 0.1 pitch connector which is keyed. Use the 10 pin right-angle header, AMP P/N 103310-1 (DigiKey P/N A26285-ND) for FlashPro4 and use the 10 pin straight header, AMP P/N 103308-1 (DigiKey P/N A26267-ND) for the straight version.

The signals on the pins of the FlashPro4 10-pin connector are shown in the figure below (extracted from FlashPro4 product specification):

Figure 20 · FlashPro4 10-Pin Connector

**Note:** All ground pins must be connected. The rectangular shape shows connections on the programmer itself. Arrows show current flow towards or from the rectangular programmer.

The table below shows a description of the signals.

Table 5 · FlashPro4 Signal Description

| Signal    | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| VPUMP     | 3.3V Programming voltage                                                      |
| GND       | Signal reference                                                              |
| TCK       | JTAG clock                                                                    |
| TDI       | JTAG data input to device                                                     |
| TDO       | JTAG data output from device                                                  |
| TMS       | JTAG mode select                                                              |
| nTRST     | Programmable output pin may be set to off, toggle, low, or high level         |
| VJTAG     | Reference voltage from the target board                                       |
| PROG_MODE | IGLOO v2 family - Used for switching from VCC 1.2V to 1.5V during programming |

Some designers of high-integrity boards (military and avionic) may arrange their boards so that TRST is tied to ground via a weak pull-down resistor. The purpose of this is to hold the JTAG state-machine in a reset state by default, so that even with TCK oscillating, some sudden ion bombardment or other electrical even will not suddenly throw the JTAG state-machine into an unknown state. If your design also uses a weak pull-down

resistor on TRST on your board, then enabling the “Drive TRST” flag will be required to force the JTAG state-machine out of reset to permit programming to take place. With most boards, there is no need to select this flag.

## FlashPro3

**Note:** FlashPro3 is not supported on Windows 8.1.

The FlashPro3 output is supplied via a connector to which a detachable 10-pin cable is fitted. The connector on the FlashPro3 unit is a 2x5, RA male Header connector, which is manufactured by AMP and has a manufacturer’s part number of 103310-1. This is a standard 2x5, 0.1 pitch connector which is keyed. Use the 10 pin right-angle header, AMP P/N 103310-1 (DigiKey P/N A26285-ND) for FlashPro5/4/3/3X and use the 10 pin straight header, AMP P/N 103308-1 (DigiKey P/N A26267-ND) for the straight version.

The signals on the pins of the FlashPro3 10-pin connector are shown in the figure below (extracted from FlashPro3 product specification):

Figure 21 · FlashPro3 10-Pin Connector

**Note:** All ground pins must be connected. The rectangular shape shows connections on the programmer itself. Arrows show current flow towards or from the rectangular programmer.

The table below shows a description of the signals.

Table 6 · FlashPro3 Signal Description

| Signal | Description                                                           |
|--------|-----------------------------------------------------------------------|
| VPUMP  | 3.3V Programming voltage                                              |
| GND    | Signal reference                                                      |
| TCK    | JTAG clock                                                            |
| TDI    | JTAG data input to device                                             |
| TDO    | JTAG data output from device                                          |
| TMS    | JTAG mode select                                                      |
| nTRST  | Programmable output pin may be set to off, toggle, low, or high level |
| VJTAG  | Reference voltage from the target board                               |
| N/C    | Programmer does not connect to this pin                               |

Some designers of high-integrity boards (military and avionic) may arrange their boards so that TRST is tied to ground via a weak pull-down resistor. The purpose of this is to hold the JTAG state-machine in a reset state by default, so that even with TCK oscillating, some sudden ion bombardment or other electrical even will not suddenly throw the JTAG state-machine into an unknown state. If your design also uses a weak pull-down

resistor on TRST on your board, then enabling the “Drive TRST” flag will be required to force the JTAG state-machine out of reset to permit programming to take place. With most boards, there is no need to select this flag.

## FlashPro

FlashPro uses a 26-pin target cable. The connections are shown in the figure below.

Figure 22 · 26-pin connections for FlashPro

**Note:** All ground pins must be connected. The rectangular shape shows connections on the programmer itself. Arrows show current flow towards or from the rectangular programmer.

The table below shows the signal pin descriptions for FlashPro.

Table 7 · FlashPro Signal Description

| Signal               | Description                                                            |
|----------------------|------------------------------------------------------------------------|
| VDDP                 | VDD supply for logic I/O pads                                          |
| VDDL                 | VDD supply for core                                                    |
| VPP                  | Positive programming supply (+16.5 V)                                  |
| VPN                  | Negative programming supply (-13.8 V)                                  |
| GND                  | Signal reference                                                       |
| SENSE                | Input from target board to programmer to indicate connection to ground |
| TCK                  | JTAG clock                                                             |
| TDI                  | JTAG data input to device                                              |
| TDO                  | JTAG data output from device                                           |
| TMS                  | JTAG mode select                                                       |
| nTRST                | Programmable output pin may be set to off, toggle, low, or high level  |
| RCK/OUT0             | Programmable output pin may be set to off, toggle, low, or high level  |
| 2.5V, 2.5V/3.3V, N/C | Programmer does not connect to these pins                              |

Some designers of high-integrity boards (military and avionic) may arrange their boards so that TRST is tied to ground via a weak pull-down resistor. The purpose of this is to hold the JTAG state-machine in a reset state by default, so that even with TCK oscillating, some sudden ion bombardment or other electrical even will not suddenly throw the JTAG state-machine into an unknown state. If your design also uses a weak pull-down resistor on TRST on your board, then enabling the "Drive TRST" flag will be required to force the JTAG state-machine out of reset to permit programming to take place. With most boards, there is no need to select this flag.

## JTAG Switching Characteristics

### FlashPro 5/4/3/3X Characteristics

Table 8 · JTAG Switching Characteristics for FlashPro5/4/3/3X

| Description                                 | Symbol  | Min  | Max   | Unit |
|---------------------------------------------|---------|------|-------|------|
| Output delay from TCK to TDI, TMS           | TTCKTDI | -2   | 2     | ns   |
| TDO setup time before TCK rising, VJTAG=3.3 | TTDOTCK | 12   |       | ns   |
| TDO setup time before TCK rising, VJTAG=1.5 | TTDOTCK | 14.5 |       | ns   |
| TDO hold time after TCK rising              | TTCKTDO | 0    |       | ns   |
| TCK period                                  | TTCK    | 41.7 | 10667 | ns   |

### FlashPro Characteristics

The table below shows the JTAG switching characteristics for FlashPro measured at the programmer end of the JTAG cable.

Table 9 · JTAG Switching Characteristics for FlashPro

| Description                               | Symbol  | Min | Max   | Unit |
|-------------------------------------------|---------|-----|-------|------|
| Output delay from TCK falling to TDI, TMS | TTCKTDI | -2  | 2     | ns   |
| TDO setup time before TCK rising          | TTDOTCK | 5.0 |       | ns   |
| TDO hold time after TCK rising            | TTCKTDO | 0   |       | ns   |
| TCK period                                | TTCK    | 40  | 10240 | ns   |

### Illustration of the JTAG Switching Characteristics

The figure below is an illustration of the JTAG switching characteristics.

# FlashPro Express Reference

---

## FlashPro Express Start Page

The FlashPro Express Start Page is the first page to show when the tool starts up. This page provides the interface for loading a project into the tool by either navigating to the project location, or clicking on one of the recently opened projects.

## FlashPro Express Project Menu

| Command                                 | Function                                                                                    |
|-----------------------------------------|---------------------------------------------------------------------------------------------|
| Create Job Project from Programming Job | New job project folder with programming job name will be created at the specified location. |
| Open Job Project                        | Loads a job project into the tool by reading the information in user specified .pro file.   |
| Close Job Project                       | Closes the current job project                                                              |
| Save Job Project                        | Saves the current job project                                                               |
| Set Log File                            | Sets the location of the Log file to your specified location.                               |
| Export Log File                         | Exports the Log file to your specified location.                                            |
| Execute Script                          | Runs your specified Tcl script.                                                             |
| Export Script File                      | Exports all commands run in this session to your specified path as a Tcl script             |
| Exit                                    | Exits FlashPro Express                                                                      |

## FlashPro Express Edit Menu

| Command          | Function              |
|------------------|-----------------------|
| Clear Log Window | Clears the Log window |

## FlashPro Express View Menu

The View menu shows or hides the FlashPro Express GUI elements.

| Command    | Function                   |
|------------|----------------------------|
| Log Window | Shows/hides the Log window |

## FlashPro Express Tools Menu

| Command             | Function                                                                                                              |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| Programmer Settings | Opens the Programmer Settings dialog box; enables you to set options for all types of supported Microsemi programmers |
| Run                 | Runs the current <a href="#">Programming Action</a> .                                                                 |

## FlashPro Express Help Menu

| Command                     | Function                                                                      |
|-----------------------------|-------------------------------------------------------------------------------|
| Help Topics                 | Opens the help                                                                |
| Microsemi Technical Support | Opens the Microsemi technical support site.                                   |
| Microsemi Web Site          | Opens the <a href="#">Microsemi website</a> in your default browser           |
| User Guide                  | Opens the FlashPro Express User Guide.                                        |
| Check for Software Updates  | Checks for software updates (works only if you are connected to the internet) |
| About FlashPro Express      | Lists the FlashPro Express release information                                |

## FlashPro Express Log Window and Status Bar

### FlashPro Express Log Window

The FlashPro Express log window shows status messages for user activity. Click on the appropriate tab (Messages, Errors, Warning, Info) to filter messages by type.

- Use the right-click menu to copy text, clear the log, and scroll the log.
- Use the def variable LOG\_WINDOW\_BUFFER\_SIZE to set the buffer size.
- Use the View menu to show or hide the Log window.

### FlashPro Express Status Bar

The Status Bar at the bottom displays the status of the load project action.

---

## Contacting Microsemi

---

### Microsemi SoC Products Group Headquarters

Microsemi Corporation is a supplier of innovative programmable logic solutions, including field-programmable gate arrays (FPGAs) based on antifuse and flash technologies, high-performance intellectual property (IP) cores, software development tools, and design services targeted for the high-speed communications, application-specific integrated circuit (ASIC) replacement, and radiation-tolerant markets.
