0	Reset after Read mode is disabled.
1	Reset after Read mode is enabled.

Bits 5:4 – BAYSEL[1:0] Bayer Color Component Selection

Value	Name	Description
0	GRGR	Starting row configuration is G R G R (red row)
1	RGRG	Starting row configuration is R G R G (red row)
2	GBGB	Starting row configuration is G B G B (blue row)
3	BGBG	Starting row configuration is B G B G (blue row)

Bits 2:0 – MODE[2:0] Histogram Operating Mode

Value	Name	Description
0	GR	Gr sampling
1	R	R sampling
2	GB	Gb sampling
3	B	B sampling
4	Y	Luminance-only mode
5	RAW	Raw sampling
6	YCCIR656	Luminance only with CCIR656 10-bit or 8-bit mode

52.7.70. ISC DMA Configuration Register

Name: ISC_DCFG
Offset: 0x51C
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	AWQOS[3:0]				ARQOS[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
						CMBSIZE[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
		YMBSIZE[2:0]				IMODE[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0

Bits 23:20 – AWQOS[3:0] Write QoS Value
If AWQOS is set to 0, the QoS value depends on the output FIFO level (dynamic configuration). Otherwise the value is defined in the register.

Bits 19:16 – ARQOS[3:0] Read QoS Value
Returns the QoS bus value when a descriptor is retrieved from the memory.

Bits 10:8 – CMBSIZE[2:0] DMA Memory Burst Size C channel

Value	Name	Description
0	SINGLE	DMA single access
1	BEATS4	4-beat burst access
2	BEATS8	8-beat burst access
3	BEATS16	16-beat burst access
4	BEATS32	32-beat burst access

Bits 6:4 – YMBSIZE[2:0] DMA Memory Burst Size Y channel

Value	Name	Description
0	SINGLE	DMA single access
1	BEATS4	4-beat burst access
2	BEATS8	8-beat burst access
3	BEATS16	16-beat burst access
4	BEATS32	32-beat burst access

Audio Subsystem

53. Overview

53.1. Components

The audio subsystem is made of the following components. Unless otherwise specified, all except the CLASSD controller are designed to handle audio sample rates up to 192 kHz.

- 1x Synchronous Serial Controller (SSC)
  - The maximum bit clock (TK or RK) speed is 25 MHz in Host or Client mode on both the receiver and the transmitter.
  - As an example, in TDM mode, this corresponds to up to 4x 32-bit channels at 192 kHz, or up to 8x 32-bit channels at 96 kHz.
- 1x Inter-IC Sound Multi Channel Controller (I2SMCC)
  - The maximum bit clock (I2SMCC_SCK) speed is 25 MHz in both Host and Client modes.
  - In TDM256 mode, this corresponds to 8x 32-bit channels at 96 kHz.
- 1x Low-jitter audio PLL with one dedicated AUDIOCLK output pin
- 1x Stereo Class D Controller (CLASSD)
  - Fixed PWM frequency operation in the 750 to 800 kHz range
  - Targeted to low-end audio applications
  - Embedded interpolation filters to accommodate standard audio sampling rates

53.2. Product Dependencies

53.2.1. Clocks

To generate audio frequencies with high accuracy, the device embeds a fractional audio PLL that can serve both the internal (GCLK generation used for CLASSD) and external needs (MCK generation on external audio components).

53.2.2. Interrupts

Refer to the table Peripheral Identifiers.

53.2.3. Reset

Audio peripherals are connected to the processor and peripherals reset line.

53.2.4. I/Os

Audio I/Os are multiplexed on GPIOs with various power supplies. For the applicable I/O type and power supply, refer to the table Pin Description.

53.3. Special Functions in SFR

None.

© 2026 Microchip Technology Inc. and its subsidiaries

54. Audio Class D Amplifier (CLASSD)

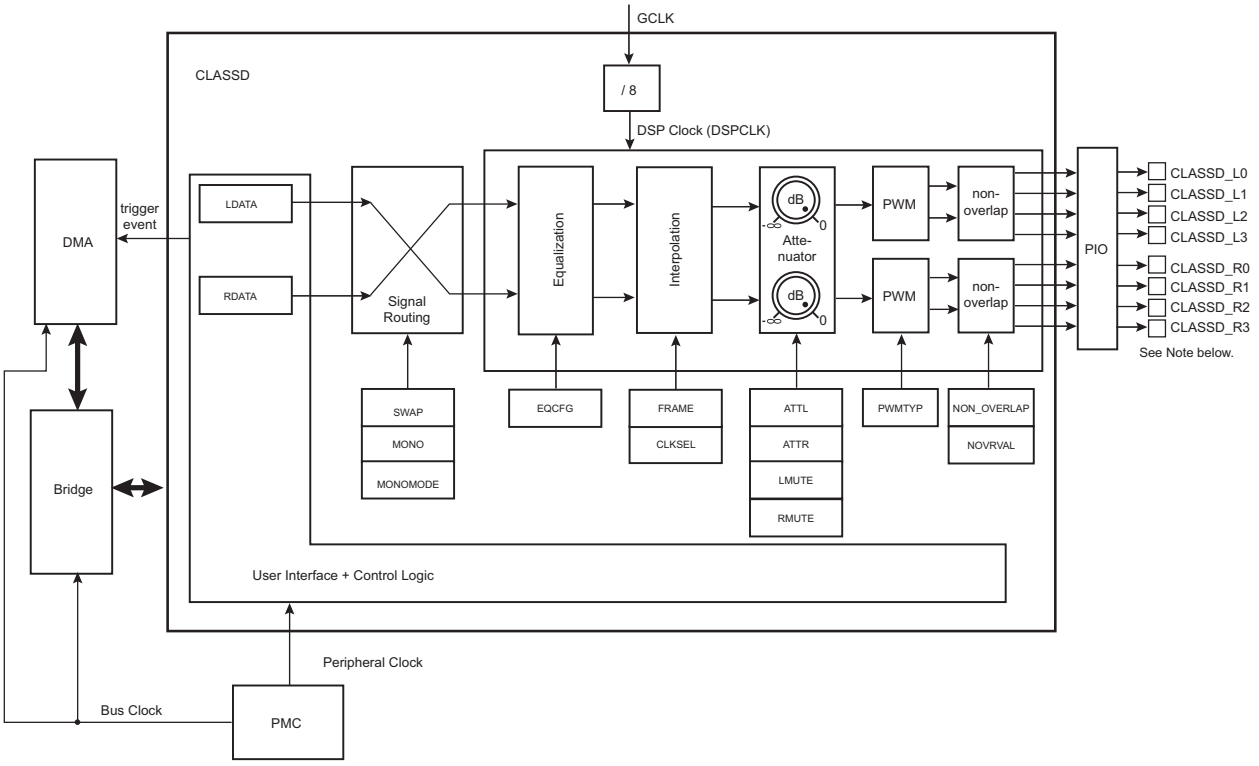
54.1. Description

The Audio Class D Amplifier (CLASSD) is a digital input, Pulse Width Modulated (PWM) output stereo Class D amplifier. It features a high-quality interpolation filter embedding a digitally-controlled gain, an equalizer and a de-emphasis filter.

On its input side, the CLASSD is compatible with most common audio data rates. On the output side, its PWM output can drive either:

- high-impedance single-ended or differential output loads (Audio DAC application) or,
- external MOSFETs through an integrated non-overlapping circuit (Class D power amplifier application).

Note: CLASSD is stereo but depending on the available I/O at the product level, only one (right or left) channel may be accessed. Refer to the product "Pin Description" table.



54.2. Embedded Characteristics

- PWM Class D Amplifier
- 16-bit Audio Data
- DSP Clocks: 12.288 and 11.2896 MHz
- Input Sampling Rates: 8, 16, 32, 48, 96, 22.05, 44.1, 88.2 kHz
- 3-band Equalizer
- De-emphasis Filter
- Digital Volume Control
- Differential or Single-ended Outputs
- Non-overlapping Circuit to Control External MOSFETs
- Supports DMA

© 2026 Microchip Technology Inc. and its subsidiaries

54.3. Block Diagram

Figure 54.1. CLASSD Block Diagram

Note:
CLASSD is stereo but depending on the available I/O at the product level, only one (right or left) channel may be accessed.
Refer to the product pin description table.

54.4. Pin Name List

Table 54.1. Output Pins Assignment Versus Application Use Cases

Pin	External MOS Driver (NON_OVERLAP = 1)		Direct Load (NON_OVERLAP = 0)		Type
	Full H-Bridge (PWMTYP = 1)	Half H-Bridge (PWMTYP = 0)	Differential Load (PWMTYP = 1)	Single-Ended Load (PWMTYP = 0)	
	Use Case 1	Use Case 2	Use Cases 3A & 3B	Use Cases 4A & 4B	
CLASSD_L0	gate_pmos_leftp	gate_pmos_left	leftp	left	Output
CLASSD_L1	gate_nmos_leftp	gate_nmos_left	Not used (fixed to 0)	Not used (fixed to 0)	Output
CLASSD_L2	gate_pmos_leftn	Not used (fixed to 1)	leftn	Not used (fixed to 0)	Output
CLASSD_L3	gate_nmos_leftn	Not used (fixed to 1)	Not used (fixed to 0)	Not used (fixed to 0)	Output
CLASSD_R0	gate_pmos_rightp	gate_pmos_right	rightp	right	Output
CLASSD_R1	gate_nmos_rightp	gate_nmos_right	Not used (fixed to 0)	Not used (fixed to 0)	Output
CLASSD_R2	gate_pmos_rightn	Not used (fixed to 1)	rightn	Not used (fixed to 0)	Output
CLASSD_R3	gate_nmos_rightn	Not used (fixed to 1)	Not used (fixed to 0)	Not used (fixed to 0)	Output

© 2026 Microchip Technology Inc. and its subsidiaries

54.5. Product Dependencies

54.5.1. I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CLASSD pins to their peripheral functions.

54.5.2. Power Management

The CLASSD is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the CLASSD Peripheral Clock and provide a generic clock (GCLK).

The fields NOVRVAL, NON_OVERLAP and PWMTYP in CLASSD_MR, and DSPCLKFREQ and FREQ in CLASSD_INTPMR, must be configured prior to applying the GCLK.

54.5.3. Interrupt

The CLASSD has an interrupt line connected to the interrupt controller. Handling the CLASSD interrupt requires programming the interrupt controller before configuring the CLASSD.

54.6. Functional Description

54.6.1. Interpolator

54.6.1.1. Clock Configuration

The interpolator accepts input sampling frequencies (f_s) and the input DSP clock (DSPCLK) that can be configured in the CLASSD Interpolator Mode Register. GCLK must be configured in the PMC according to the desired DSPCLK so that DSPCLK = GCLK / 8.

The following table provides authorized DSPCLK / f_s ratios and associated filter types.

Table 54.2. Authorized DSPCLK / f_s Ratios & Filter Types

f_s	DSPCLK	
	12.288 MHz	11.2896 MHz
8 kHz	2	–
16 kHz	2	–
32 kHz	2	–
48 kHz	1	–
96 kHz	3	–
22.05 kHz	–	1
44.1 kHz	–	1
88.2 kHz	–	3

Note: Each dash (–) indicates a configuration that is not authorized and that raises the CFGERR flag in CLASSD_INTSR.

54.6.1.2. CLASSD Frequency Response

Interpolation is performed with a combination of Infinite Impulse Response (IIR) and Cascaded Integrator-Comb (CIC) filters. Given the input configuration, the coefficients of the filters are redefined to optimize their transfer function to optimize the audio bandwidth. The different types of filters are defined in section Clock Configuration.

Figure 54.2. Type 1 Frequency Response

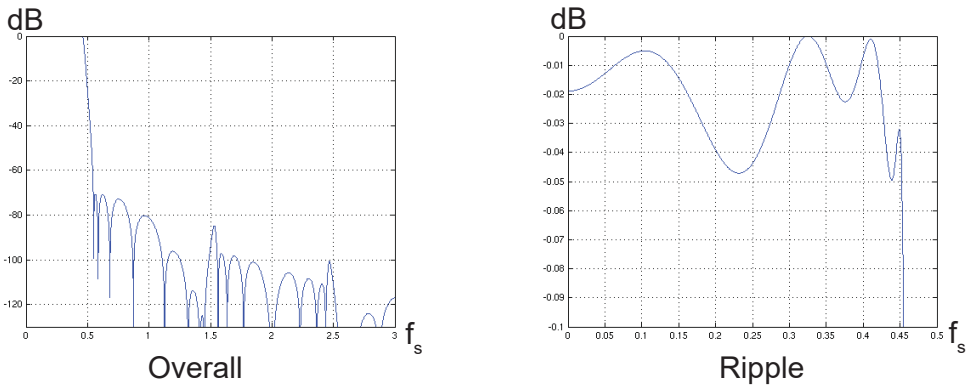

Figure 54.3. Type 2 Frequency Response

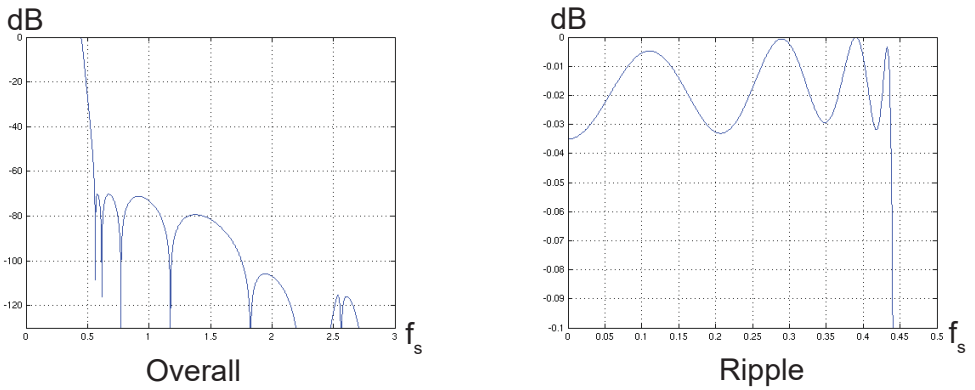

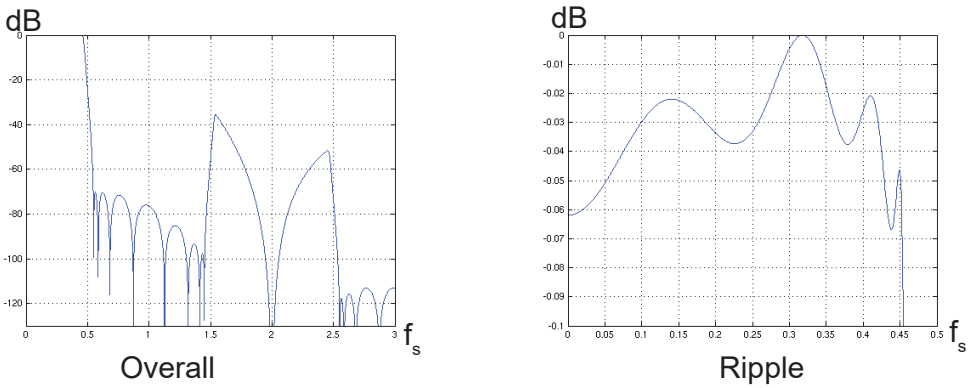

Figure 54.4. Type 3 Frequency Response

54.6.2. Equalizer

The CLASSD offers 12 pre-programmed equalization filters.

A zero-cross detection system is used to modify the equalizer on-the-fly with minimum disturbance on the output signal.

Programming of the equalization filter is detailed in section CLASSD Interpolator Mode Register.

The following figures show the frequency response of the equalizer function implemented in the D/A channels.

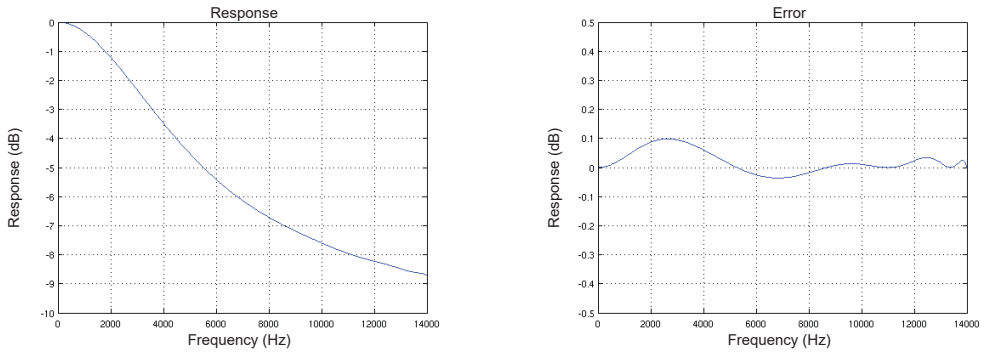
Figure 54.7. Treble Filters Response

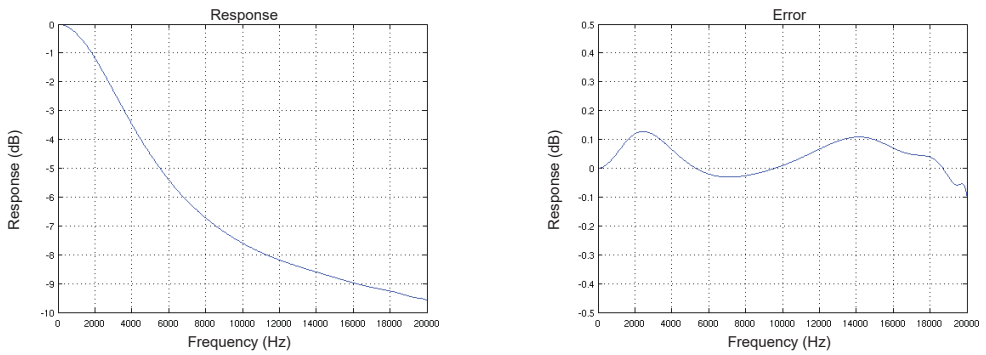
54.6.3. De-emphasis Filter Frequency Response

The CLASSD includes a de-emphasis filter which can be enabled for 32, 44.1 or 48 kHz sampling frequencies.

The response and the error generated by the digital approximation of the filter are illustrated in the following figures.

Figure 54.8. De-emphasis Filter: Frequency Response & Error (f_s = 32 kHz)





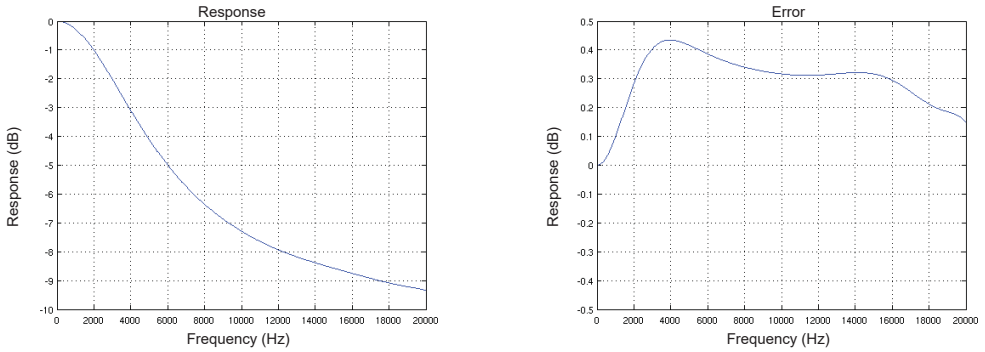


Figure 54.9. De-emphasis Filter: Frequency Response & Error (f_s = 44.1 kHz)

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 54.10. De-emphasis Filter: Frequency Response & Error (f_s = 48 kHz)

54.6.4. Attenuator and Recommended Input Levels

The CLASSD features a digital attenuator with an attenuation range of 0–77 dB and a step size of 1 dB. When attenuation greater than 77 dB is programmed, the attenuator mutes the channel.

To avoid saturations in the PWM stage, it is recommended to avoid input levels greater than 1 dB below the digital full scale (-1 dBFS). This can done by programming a minimum attenuation of 1 dB.

54.6.5. Pulse Width Modulator (PWM)

The CLASSD Pulse Width Modulator generates fixed frequency pulse width modulated output signals. For the 44.1 kS/s and 48 kS/s standard audio sample rates, the PWM output frequency is set to 16 × f_s: 705.6 kHz and 768 kHz respectively. For 8, 16, 24 and 96 kS/s, the 16× (interpolation) ratio is adapted to keep the output frequency at 768 kHz. In the same way, the output frequency is 705.6 kHz for the 22.05 and 88.2 kS/s cases.

The CLASSD functions either as a DAC loaded by a medium-to-high resistive load (e.g., 1 kΩ to 100 kΩ) or as a Class D power amplifier controller driving an external power stage. Depending on the value of CLASSD_MR.NON_OVERLAP, the CLASSD drives:

- Single-ended or differential resistive loads (NON_OVERLAP = 0)
- Full or Half MOSFET H-bridges (NON_OVERLAP = 1)

When driving an external power stage (NON_OVERLAP = 1), the CLASSD generates the signals to control complementary MOSFET pairs (PMOS and NMOS) with a non-overlapping delay between the NMOS and PMOS controls to avoid short circuit current. The non-overlapping delay can be adjusted in the CLASSD_MR.NOVRVAL field.

The CLASSD can have a single-ended or a differential output. A specific pulse width modulation type is associated to each case. For single-ended output (CLASSD_MR.PWMTYP = 0), the PWM acts only on the falling edge of the PWM waveform (trailing edge PWM). For differential output (CLASSD_MR.PWMTYP = 1), both the rising and the falling edges of the PWM waveform are modulated (symmetric PWM). Modulation principles are illustrated in the following figures for both types of PWM. In particular, when describing a null input, if PWMTYP = 0 (trailing edge PWM), the output waveform is a square wave with 50% duty cycle. With the same input and PWMTYP = 1, the differential output waveform is zero. This difference removes the classical L-C low-pass filter when PWMTYP = 1.

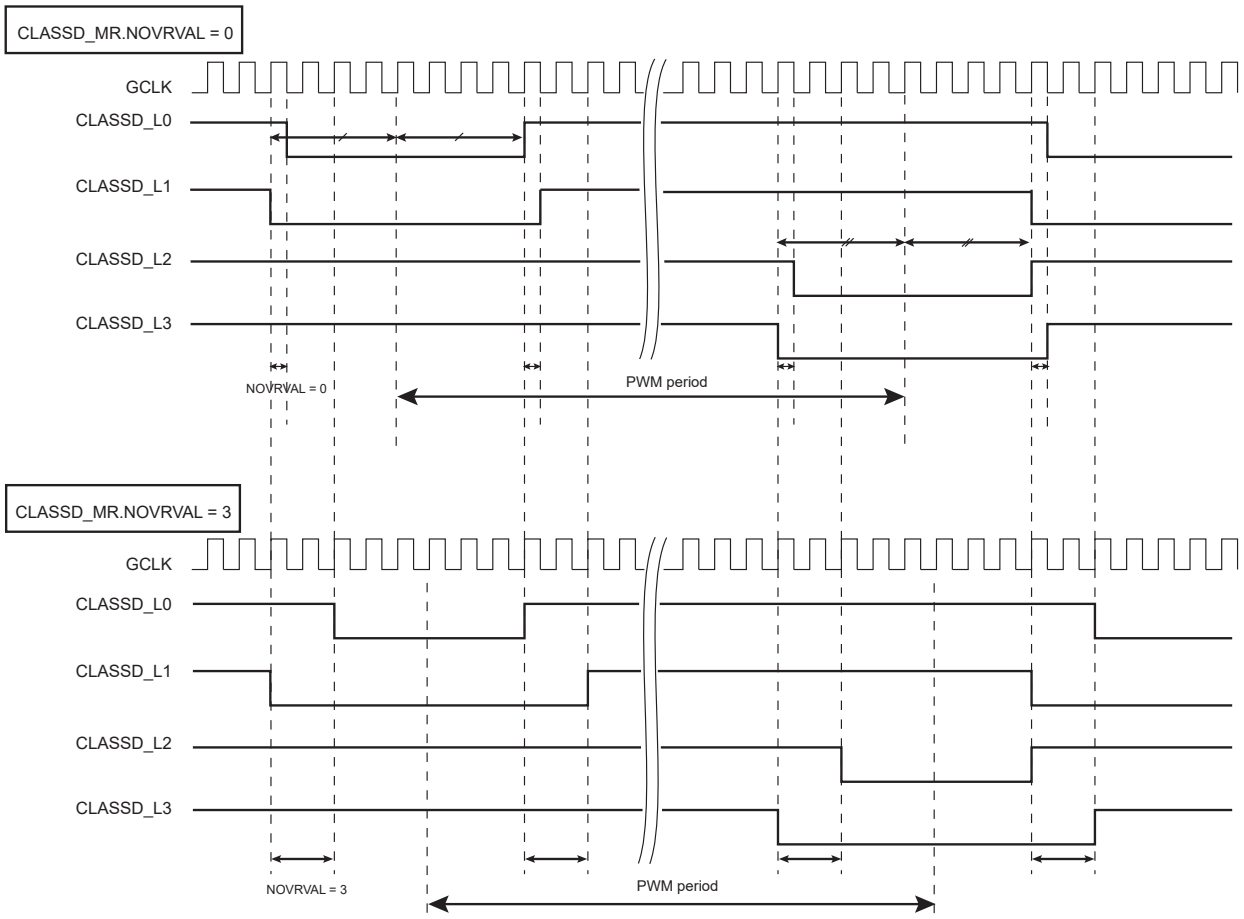
54.6.6. Application Schematics For Use Case Examples

Figure 54.13. Use Case 1: Stereo Class D Amplifier With External Differential Power Stage

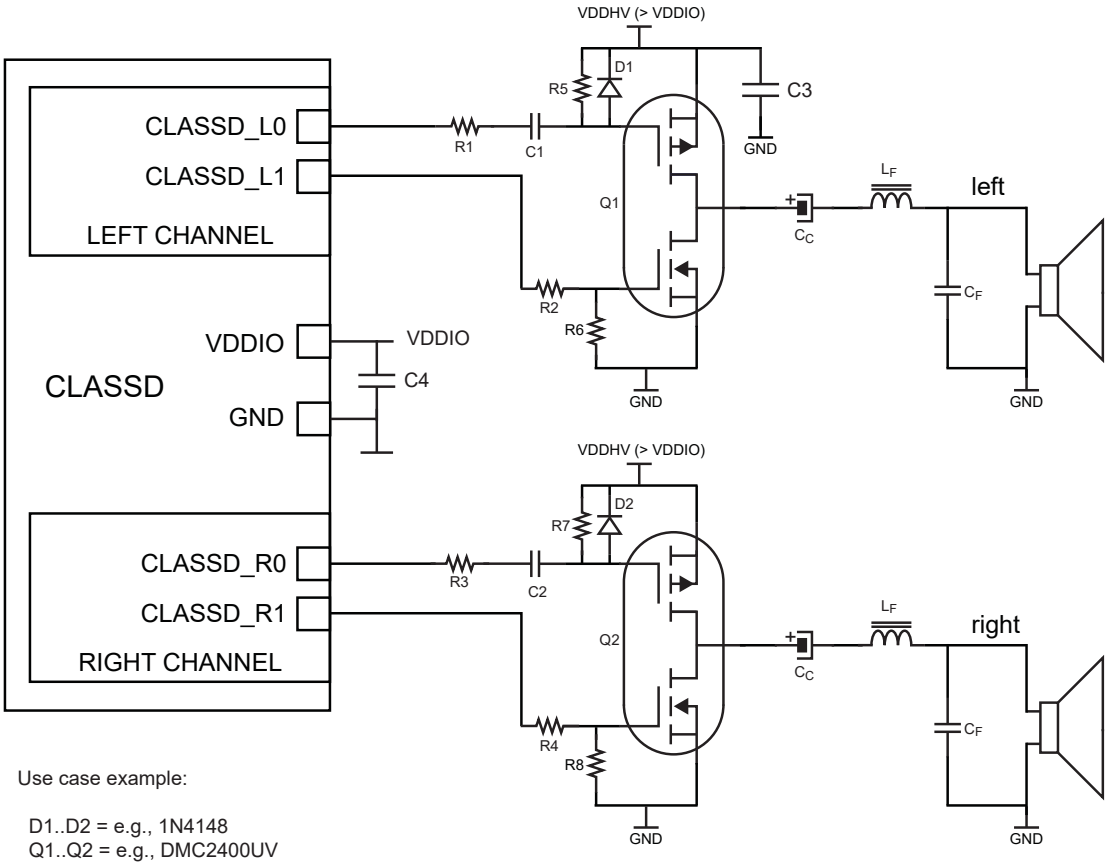


Use case example:

D1..D4 = e.g., 1N4148
Q1..Q4 = e.g., DMC2400UV
R1..R8 = 10 ohm
R9..R16 = 10 kohm
C1..C4 = 10 nF
C5..C6 = 10 µF
C7 = 1 µF

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 54.14. Use Case 1: Waveforms



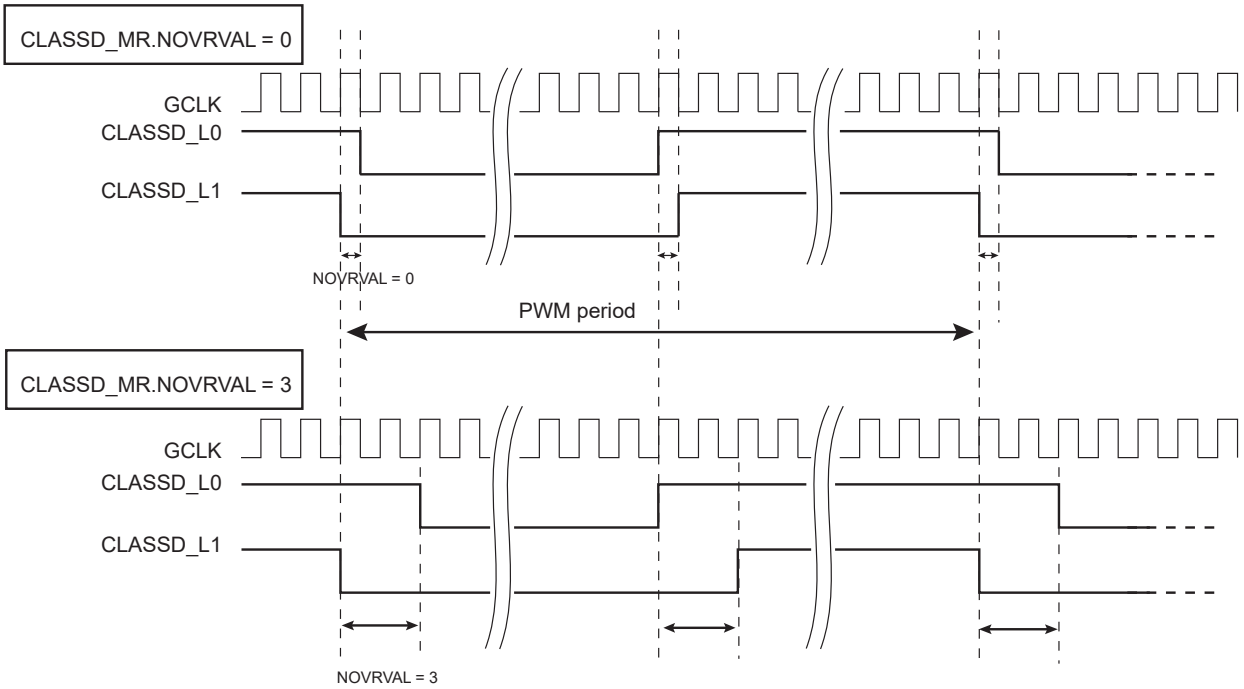
CLASSD_MR.PWMTYP = 1, CLASSD_MR.NON_OVERLAP = 1

In Use Case 1, the external power stages are made of complementary low-cost MOSFETs. In addition to the R_{DSON} and drain breakdown voltage characteristics, the choice of these components is driven by a low gate threshold voltage, a low input capacitance, a low total gate charge and a fast turn-on time characteristics. Series resistance (10 Ω) added to the gates of the MOSFETs are optional and may be adjusted to optimize the gate drive. They help to limit the output current peaks driven by the I/Os into the MOSFET gates in some cases. The 10 kΩ resistors ensure an off condition when not driven and the capacitor/diode network (C1..C2/D1..D2) shifts the PMOS drive from the typical V_{DDIO} level (3.3V) to a higher supply voltage (e.g., a 5V power domain).

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 54.15. Use Case 2: Stereo Class D Amplifier With External Single-ended Power Stage

Use case example:



D1..D2 = e.g., 1N4148
Q1..Q2 = e.g., DMC2400UV
R1..R4 = 10 ohm
R5..R8 = 10 kohm
C1..C2 = 10 nF
C3 = 10 µF
C4 = 1 µF

In the Use Case 2 application schematic, the drive network of the MOSFETs gates follows the principles described in Use Case 1.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 54.16. Use Case 2: Waveforms

CLASSD_MR.PWMTYP = 0, CLASSD_MR.NON_OVERLAP = 1

A coupling capacitor (C_C) and an L-C low-pass filter (L_F, C_F) are added to the output of the power stage to remove both the DC and the high frequency components of the PWM signal. C_C with the resistive part of the speaker (R_{SPK}) forms a C-R high pass filter with a corner frequency of $f_{HP} = 1 / (2 \times PI \times C_C \times R_{SPK})$.

L_F, C_F and R_{SPK} form a second-order low-pass filter of corner frequency $f_C = 1 / (2 \times PI \times sqrt (L_F \times C_F))$ and of quality factor $Q = R_{SPK} \times sqrt (C_F / L_F)$. As a numerical example, consider the case f_{HP} = 200 Hz, f_C = 30 kHz, Q = 0.707 (maximum flat response) with R_{SPK} = 8 Ω. This leads to C_C = 100 µF, L_F = 60 µH, C_F = 470 nF.

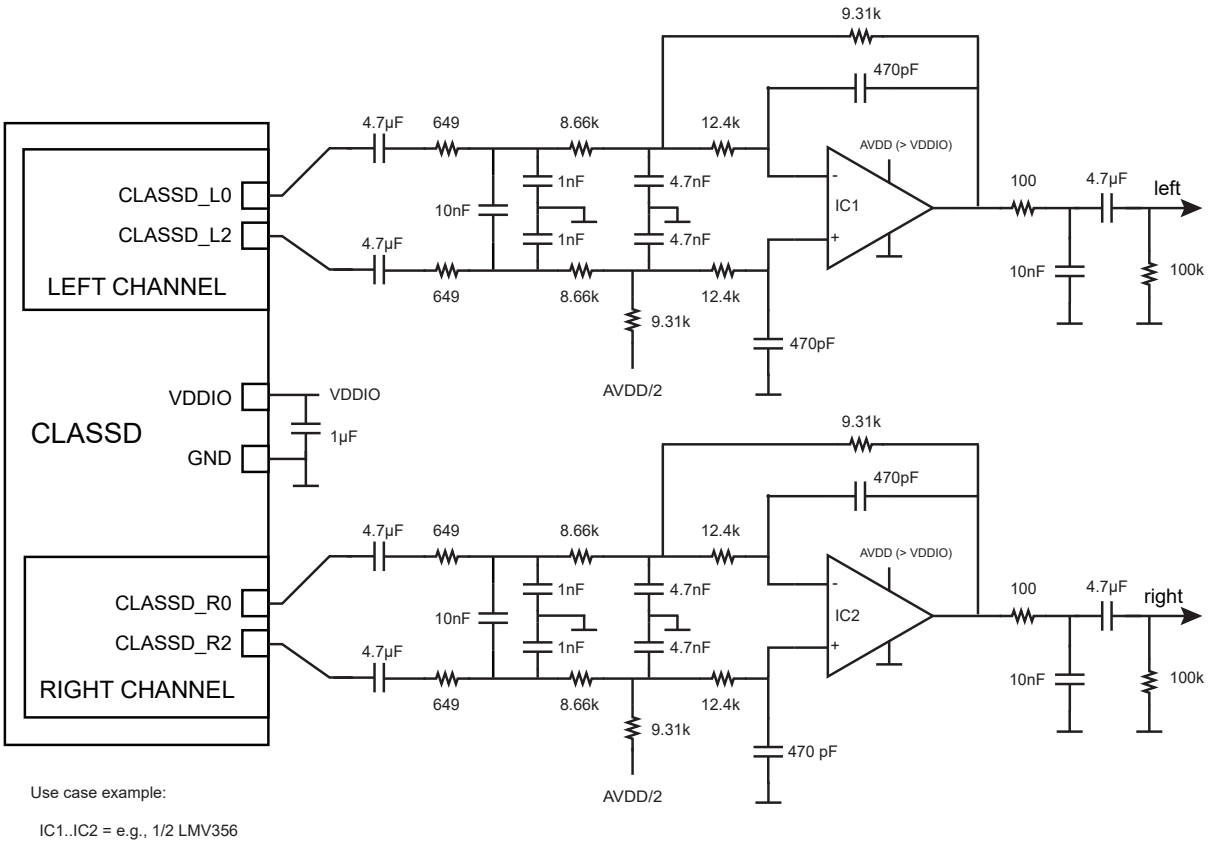
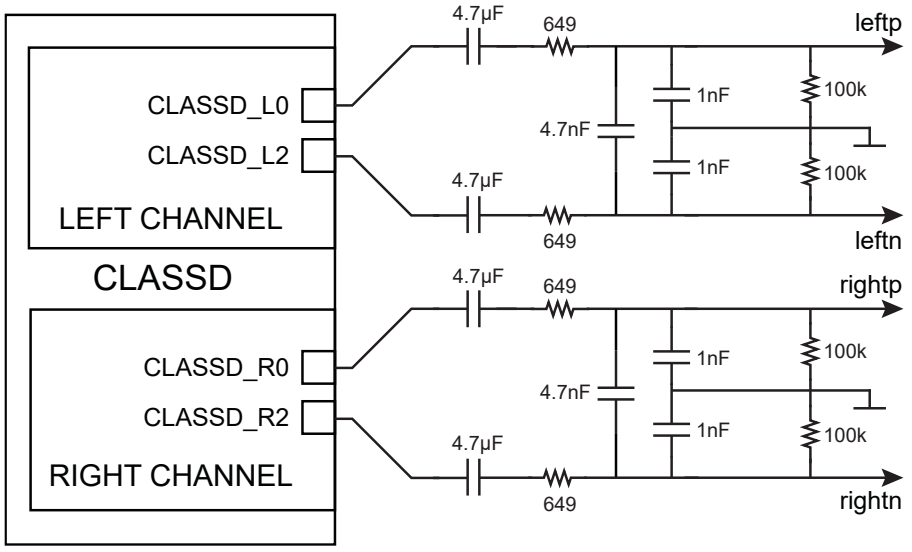
Figure 54.17. Use Case 3A: Stereo Audio DAC With Active Differential-to-Single Low-Pass Filter





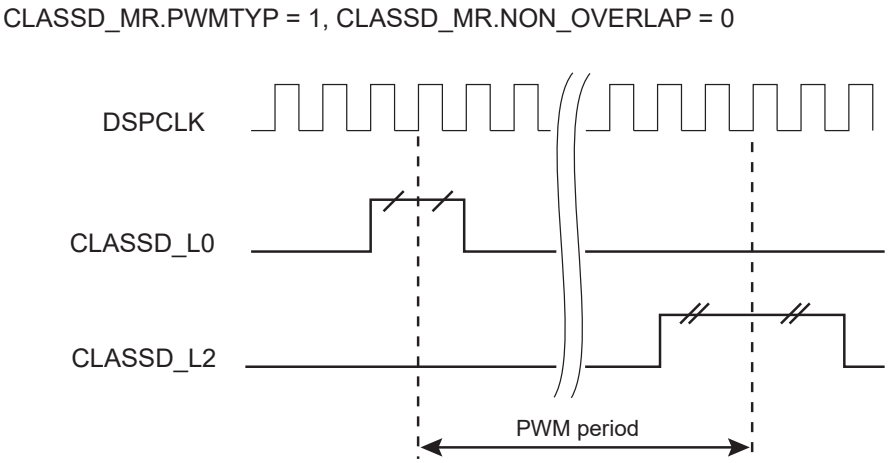


Figure 54.18. Use Case 3B: Stereo Audio DAC With Simple Passive Low-Pass Filter and Differential Outputs

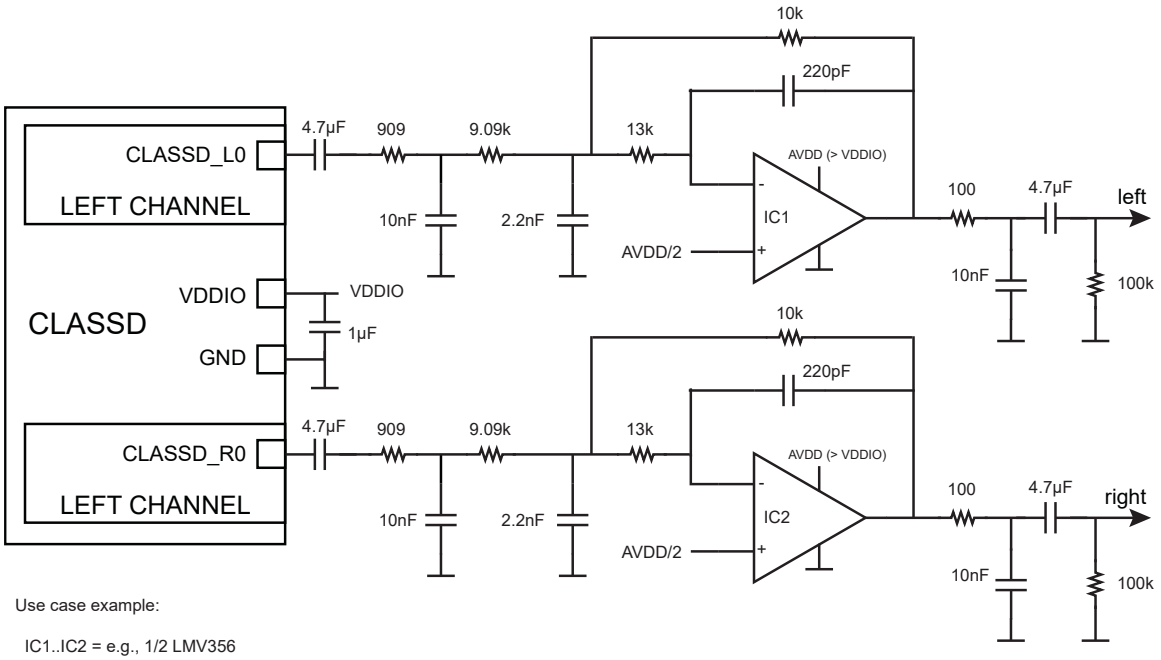


© 2026 Microchip Technology Inc. and its subsidiaries

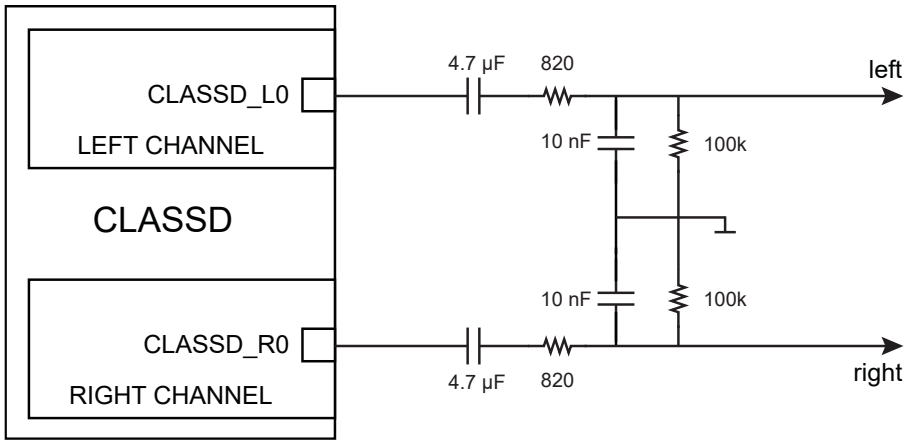
Figure 54.19. Use Cases 3A and 3B: Waveforms

In Use Case 3A, the CLASSD is used as an audio DAC. In this case, the differential outputs of the CLASSD are used. The application schematic suggested in figure "Use Case 3A: Stereo Audio DAC With Active differential to Single Low-Pass Filter" above implements a third-order 10 kHz low-pass Butterworth filter and makes the differential to single-ended conversion. Note that in this schematic, the AVDD/2 point needs to be fed at low impedance (e.g., a buffered voltage). A simpler schematic (Use Case 3B) may also be possible, as shown in figure "Use Case 3B: Stereo Audio DAC With Simple Passive Low-Pass Filter and Differential Outputs" above, at the cost of higher out-of-band noise and differential outputs which may be acceptable in some applications.

Figure 54.20. Use Case 4A: Stereo Audio DAC With Active Low-Pass Filter and Single-ended Outputs

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 54.21. Use Case 4B: Stereo Audio DAC With Passive Low-Pass Filter and Single-ended Outputs



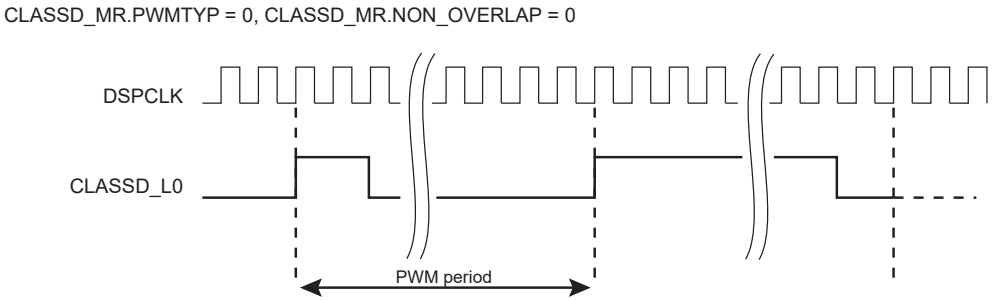


Figure 54.22. Use Cases 4A and 4B: Waveforms

In Use Case 4A, the CLASSD is used as an audio DAC with active low-pass filter. In this case, the single-ended outputs of the CLASSD are selected (PWMTYP = 0, trailing edge PWM) which leaves more I/Os to the application. A third-order 30 kHz low-pass Butterworth filter is shown in figure "Use Case 4A: Stereo Audio DAC With Active Low-Pass Filter and Single-ended Outputs". The AVDD/2 point can be fed at relatively high impedance as no current is drawn from this point (a simple resistive divider properly decoupled is acceptable). A reduced complexity schematic is presented in figure "Use Case 4B: Stereo Audio DAC With Passive Low-Pass Filter and Single-ended Outputs" above for less constrained applications.

54.6.7. Register Write Protection

To prevent any single software error from corrupting CLASSD behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the CLASSD Write Protection Mode Register (CLASSD_WPMR).

The following registers can be write-protected:

- CLASSD Mode Register
- CLASSD Interpolator Mode Register

© 2026 Microchip Technology Inc. and its subsidiaries

54.7.1. CLASSD Control Register

Name: CLASSD_CR
Offset: 0x00
Reset: –
Property: Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								SWRST
Access								W
Reset								–

Bit 0 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets CLASSD, simulating a hardware reset.

© 2026 Microchip Technology Inc. and its subsidiaries

54.7.2. CLASSD Mode Register

Name: CLASSD_MR
Offset: 0x04
Reset: 0x00010022
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the CLASSD Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
			NOVRVAL[1:0]					NON_OVERLAP
Access			R/W	R/W				R/W
Reset			0	0				1

Bit	15	14	13	12	11	10	9	8
								PWMTYP
Access								R/W
Reset								0

Bit	7	6	5	4	3	2	1	0
			RMUTE	REN			LMUTE	LEN
Access			R/W	R/W			R/W	R/W
Reset			1	0			1	0

Bits 21:20 – NOVRVAL[1:0] Non-Overlapping Value
This field has no effect when NON_OVERLAP = 0.

Value	Name	Description
0	5NS	Non-overlapping time is 5 ns
1	10NS	Non-overlapping time is 10 ns
2	15NS	Non-overlapping time is 15 ns
3	20NS	Non-overlapping time is 20 ns

Bit 16 – NON_OVERLAP Non-Overlapping Enable

Value	Description
0	Non-overlapping circuit is disabled.
1	Non-overlapping circuit is enabled.

Bit 8 – PWMTYP PWM Modulation Type
0 (TRAILING_EDGE): The signal is single-ended.
If NON_OVERLAP is cleared, the signal is sent to CLASSD_L0 and CLASSD_R0 (see figure Use Case 4A or figure Use Case 4B).
If NON_OVERLAP is set, the signal is sent to CLASSD_L0/L1 and CLASSD_R0/R1 (see figure Use Case 2).
1 (UNIFORM): The signal is differential.
If NON_OVERLAP is cleared, the signal is sent to CLASSD_L0/L2 and CLASSD_R0/R2 (see figure Use Case 3A or figure Use Case 3B).

© 2026 Microchip Technology Inc. and its subsidiaries

If NON_OVERLAP is set, the signal is sent to CLASSD_L0/L1/L2/L3 and CLASSD_R0/R1/R2/R3 (see figure Use Case 1).

Bit 5 – RMUTE Right Channel Mute

Value	Description
0	Right channel is unmuted.
1	Right channel is muted.

Bit 4 – REN Right Channel Enable

Value	Description
0	Right channel is disabled.
1	Right channel is enabled.

Bit 1 – LMUTE Left Channel Mute

Value	Description
0	Left channel is unmuted.
1	Left channel is muted.

Bit 0 – LEN Left Channel Enable

Value	Description
0	Left channel is disabled.
1	Left channel is enabled.

54.7.3. CLASSD Interpolator Mode Register

Name: CLASSD_INTPMR
Offset: 0x08
Reset: 0x00304E4E
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the CLASSD Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
		MONOMODE[1:0]		MONO	EQCFG[3:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
		FRAME[2:0]			SWAP	DEEMP		DSPCLKFREQ
Access		R/W	R/W	R/W	R/W	R/W		R/W
Reset		0	1	1	0	0		0

Bit	15	14	13	12	11	10	9	8
		ATTR[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		1	0	0	1	1	1	0

Bit	7	6	5	4	3	2	1	0
		ATTL[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		1	0	0	1	1	1	0

Bits 30:29 – MONOMODE[1:0] Mono Mode Selection
Defines which signal is sent to both channels when the MONO bit is set.

Value	Name	Description
0	MONOMIX	(left + right) / 2 is sent to both channels
1	MONOSAT	(left + right) is sent to both channels. If the sum is too high, the result is saturated.
2	MONOLEFT	THR[15:0] is sent to both the left and the right channels
3	MONORIGHT	THR[31:16] is sent to both the left and the right channels

Bit 28 – MONO Mono Signal
0 (DISABLED): The signal is sent stereo to the left and right channels.
1 (ENABLED): The same signal is sent to both the left and the right channels. The sent signal is defined by the MONOMODE field value.

Bits 27:24 – EQCFG[3:0] Equalization Selection
EQCFG field values 13–15 = flat response

Value	Name	Description
0	FLAT	Flat response
1	BBOOST12	Bass boost +12 dB
2	BBOOST6	Bass boost +6 dB
3	BCUT12	Bass cut -12 dB
4	BCUT6	Bass cut -6 dB
5	MBOOST3	Medium boost +3 dB
6	MBOOST8	Medium boost +8 dB

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
7	MCUT3	Medium cut -3 dB
8	MCUT8	Medium cut -8 dB
9	TBOOST12	Treble boost +12 dB
10	TBOOST6	Treble boost +6 dB
11	TCUT12	Treble cut -12 dB
12	TCUT6	Treble cut -6 dB

Bits 22:20 – FRAME[2:0] CLASSD Incoming Data Sampling Frequency

Value	Name	Description
0	FRAME_8K	8 kHz
1	FRAME_16K	16 kHz
2	FRAME_32K	32 kHz
3	FRAME_48K	48 kHz
4	FRAME_96K	96 kHz
5	FRAME_22K	22.05 kHz
6	FRAME_44K	44.1 kHz
7	FRAME_88K	88.2 kHz

Bit 19 – SWAP Swap Left and Right Channels
0 (LEFT_ON_LSB): Left channel is on CLASSD_THR[15:0], right channel is on CLASSD_THR[31:16].
1 (RIGHT_ON_LSB): Right channel is on CLASSD_THR[15:0], left channel is on CLASSD_THR[31:16].

Bit 18 – DEEMP Enable De-emphasis Filter
0 (DISABLED): De-emphasis filter is disabled.
1 (ENABLED): De-emphasis filter is enabled.

Bit 16 – DSPCLKFREQ DSP Clock Frequency
0 (12M288): DSP Clock (DSPCLK) is 12.288 MHz.
1 (11M2896): DSP Clock (DSPCLK) is 11.2896 MHz.

Bits 14:8 – ATTR[6:0] Right Channel Attenuation
Right channel attenuation is defined as follows:
– if ATTR ≤ 77 the attenuation is -ATTR dB
– else the right signal is muted

Bits 6:0 – ATTL[6:0] Left Channel Attenuation
Left channel attenuation is defined as follows:
– if ATTL ≤ 77 the attenuation is -ATTL dB
– else the left signal is muted

55. Inter-IC Sound Multi-Channel Controller (I2SMCC)

55.1. Description

The Inter-IC Sound Controller (I2SMCC) provides a 5-wire, bidirectional, synchronous, digital audio link to external audio devices: I2SMCC_DIN, I2SMCC_DOUT, I2SMCC_WS, I2SMCC_CK, and I2SMCC_MCK pins.

The I2SMCC complies with the Inter-IC Sound (I^2S) bus specification and supports a Time Division Multiplexed (TDM) interface with external multi-channel audio codecs.

The I2SMCC consists of a receiver, a transmitter and a common clock generator that can be enabled separately to provide Host, Client or Controller modes with receiver and/or transmitter active.

DMA Controller channels, separate for the receiver and for the transmitter, allow a continuous high bit rate data transfer without processor intervention to the following:

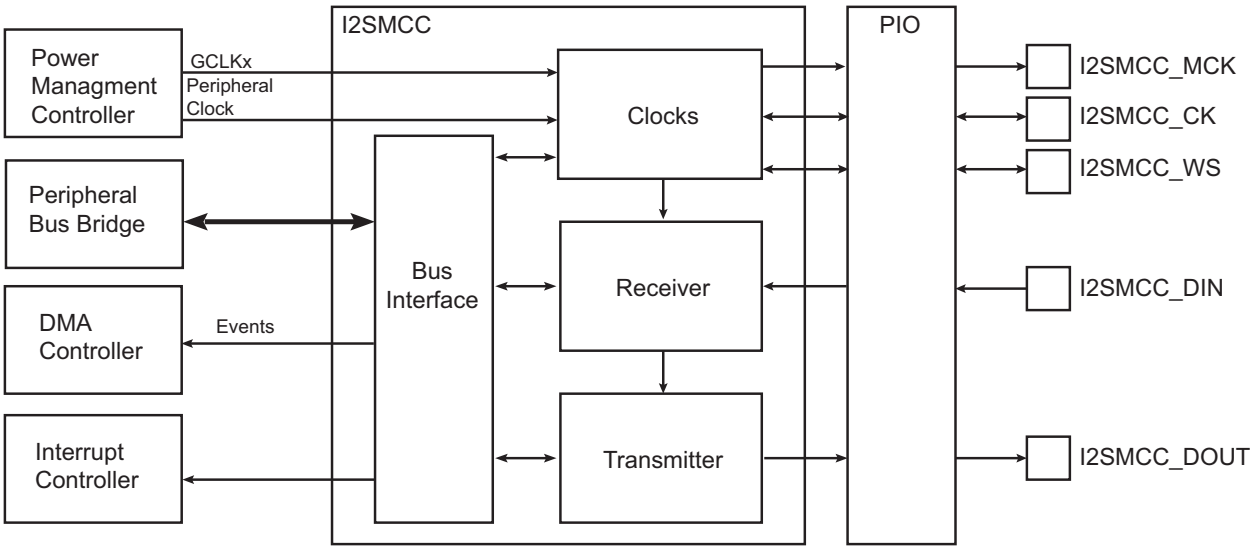
- Audio CODECs in Host, Client, or Controller mode
- Stereo DAC or ADC through a dedicated I^2S serial interface
- Multi-channel or multiple stereo DACs or ADCs, using the TDM format

The I2SMCC uses a single DMA Controller channel for all audio channels.

The 8- and 16-bit compact stereo formats reduce the required DMA Controller bandwidth by transferring the left and right samples within the same data word.

In Host mode, the I2SMCC can produce a 16 f_s to 1024 f_s host clock that provides an over-sampling clock to an external audio codec or digital signal processor (DSP).

55.2. Embedded Characteristics



- Compliant with Inter-IC Sound (I^2S) Bus Specification
- Host, Client, and Controller Modes
  - Client: Data received/transmitted
  - Host: Data received/transmitted and clocks generated
  - Controller: Clocks generated
- Individual Enable and Disable of Receiver, Transmitter and Clocks
- Configurable Clock Generator Common to Receiver and Transmitter
  - Suitable for a wide range of sample frequencies (f_s), including 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, and 192 kHz
  - 16 f_s to 1024 f_s host clock generated for external oversampling data converters
- Support for Multiple Data Formats
  - 32-, 24-, 20-, 18-, 16-, and 8-bit mono or stereo format
  - 16- and 8-bit compact stereo format, with left and right samples packed in the same word to reduce data transfers
- Support for Multiple Data Frame Formats
  - 2-channel I^2S with word select
  - 1- to 8-channel Time Division Multiplexed (TDM) with frame synchronization
- DMA Controller Interfaces the Receiver and Transmitter to Reduce Processor Overhead
- Smart Holding Registers Management to Avoid Audio Channel Mix After Overrun or Underrun
- Functional Safety Monitors and Reports
  - Internal sequencer integrity check reports

55.3. Block Diagram

Figure 55.1. I2SMCC Block Diagram

55.4. I/O Lines Description

Table 55.1. I/O Lines Description

Pin Name	Pin Description	Type
I2SMCC_MCK	Host Clock	Output
I2SMCC_CK	Serial Clock	Input/Output
I2SMCC_WS	I^2S Word Select or TDM Frame Synchronization	Input/Output
I2SMCC_DIN	Serial Data Input	Input
I2SMCC_DOUT	Serial Data Output	Output

55.5. Product Dependencies

To use the I2SMCC, other parts of the system must be configured correctly, as described below.

Note: In Device mode, the clock provided by the pad I2SMCC_CK must be free from glitch. It is recommended to enable hysteresis on the pad buffer driving these signals. This also applies to I2SMCC_WS.

55.5.1. I/O Lines

The I2SMCC pins may be multiplexed with I/O Controller lines. The user must first program the PIO Controller to assign the required I2SMCC pins to their peripheral function. If the I2SMCC I/O lines are not used by the application, they can be used for other purposes by the PIO Controller. The user must enable the I2SMCC inputs and outputs that are used.

55.5.2. Power Management

If the processor enters a Sleep mode that disables clocks used by the I2SMCC, the I2SMCC stops functioning and resumes operation after the system wakes up from Sleep mode.

55.5.3. Clocks

The I2SMCC runs from the peripheral clock and the generic clock (GCLK), both generated by the Power Management Controller (PMC). Prior to using the I2SMCC, the user must first program the

© 2026 Microchip Technology Inc. and its subsidiaries

PMC. The I^2S host and serial clock can be generated either from the peripheral clock or the generic clock.

In a similar way, the I2SMCC must be disabled before removing its clock source to avoid freezing it in an undefined state.

55.5.4. Pad Hysteresis Control

In Client mode, the pad buffer driving I2SMCC_CK must be configured to manage the input voltage hysteresis.

55.5.5. DMA Controller

The I2SMCC interfaces to the DMA Controller. Using the I2SMCC DMA functionality requires the DMA Controller to be programmed first.

55.5.6. Interrupt Sources

The I2SMCC interrupt line is connected to the Interrupt Controller. Using the I2SMCC interrupt requires the Interrupt Controller to be programmed first.

55.6. Functional Description

55.6.1. Initialization

The I2SMCC features a receiver, a transmitter and a clock generator for Host and Controller modes. Receiver and transmitter share the same serial clock and word select.

Before enabling the I2SMCC, the selected configuration must be written to the I2SMCC Mode Register A (I2SMCC_MRA). If I2SMCC_MRA.FORMAT is configured in one of the TDM formats, then the I2SMCC_MRA.NBCHAN and I2SMCC_MRA.TDMFS fields must also be written.

Once the I2SMCC_MRA has been written, the I2SMCC clock generator, receiver, and transmitter can be enabled by writing a '1' to the CKEN, RXEN, and TXEN bits in the Control Register (I2SMCC_CR). The clock generator can be enabled alone in Controller mode to output clocks to the I2SMCC_MCK, I2SMCC_CK, and I2SMCC_WS pins. The clock generator must also be enabled if the receiver or the transmitter is enabled.

The clock generator, receiver, and transmitter can be disabled independently by writing a '1' to I2SMCC_CR.CXDIS, I2SMCC_CR.RXDIS and/or I2SMCC_CR.TXDIS, respectively. Once requested to stop, they stop only when the transmission of the pending frame transmission is completed.

55.6.2. Basic Operation

The receiver can be operated by reading the Receiver Holding register (I2SMCC_RHR), whenever the Receive Left x Ready (RXLRDYx) bit or the Receive Right Ready (RXRRDYx) bit in the Interrupt Status register A (I2SMCC_ISRA) is set. Successive values read from I2SMCC_RHR correspond to the samples from the first left audio channel to the last left audio channel enabled then from the first right audio channel to the last right audio channel enabled, or from channels 0 to I2SMCC_MRA.NBCHAN in TDM mode for the successive frames.

The transmitter can be operated by writing to the Transmitter Holding register (I2SMCC_THR), whenever the Transmit Left x Ready (TXLRDYx) bit or the Transmit Right x Ready (TXRRDYx) bit in the I2SMCC_ISRA is set. Successive values written to I2SMCC_THR correspond to the samples from the first left audio channel to the last left audio channel enabled, then from the first right audio channel to the last right audio channel enabled, or from channels 0 to I2SMCC_MRA.NBCHAN in TDM mode for the successive frames.

RXLRDYx, RXRRDYx, TXLRDYx and TXRRDYx can be polled by reading the I2SMCC_ISRA.

The I2SMCC processor load can be reduced by enabling interrupt-driven operation. The RXLRDYx, RXRRDYx, TXLRDYx and/or TXRRDYx interrupt requests can be enabled by writing a '1' to the corresponding bit in the Interrupt Enable Register A (I2SMCC_IERA). The interrupt service routine

© 2026 Microchip Technology Inc. and its subsidiaries

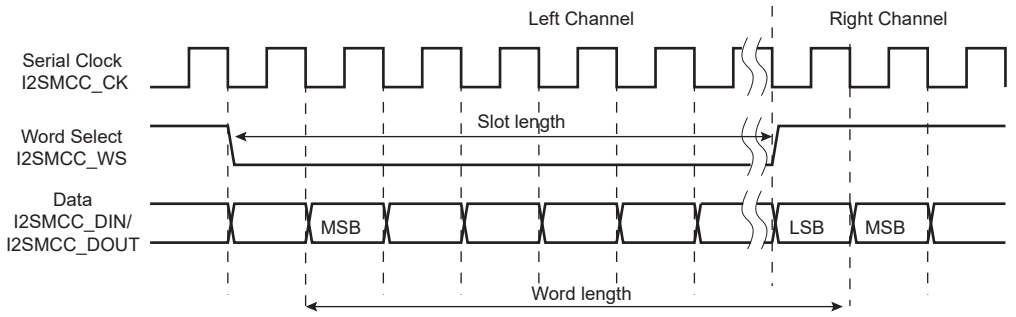
associated to the I2SMCC interrupt request is executed when at least one of the RXLRDYx, RXRRDYx, TXLRDYx and TXRRDYx status bits is set.

55.6.3. Host, Controller and Client Modes

In Host and Controller modes, the I2SMCC provides the host clock, the serial clock and the word select. I2SMCC_MCK, I2SMCC_CK, and I2SMCC_WS pins are outputs.

In Controller mode, the I2SMCC receiver and transmitter are disabled. Only the clocks are enabled and used by an external receiver and/or transmitter.

In Client mode, the I2SMCC receives the serial clock and the word select from an external host. I2SMCC_CK and I2SMCC_WS pins are inputs.



The mode is selected by writing I2SMCC_MRA.MODE. Since the MODE field changes the direction of the I2SMCC_WS and I2SMCC_CK pins, the I2SMCC_MRA must only be written when the I2SMCC is stopped in order to avoid unwanted glitches on the I2SMCC_WS and I2SMCC_CK pins.

Note: When the Client mode is configured and TDM format is selected, the high level duration of the WS input signal can be one-slot (1 sample duration), half-slot or one-bit. The duration must be configured in I2SMCC_MRA.TDMFS (See I2SMCC_MRA).

55.6.4. I²S Reception and Transmission Sequence

As specified in the I²S protocol, data bits are left-justified in the word select time slot, with the MSB transmitted first, starting one clock period after the transition on the word select line.

Figure 55.2. I²S Reception and Transmission Sequence

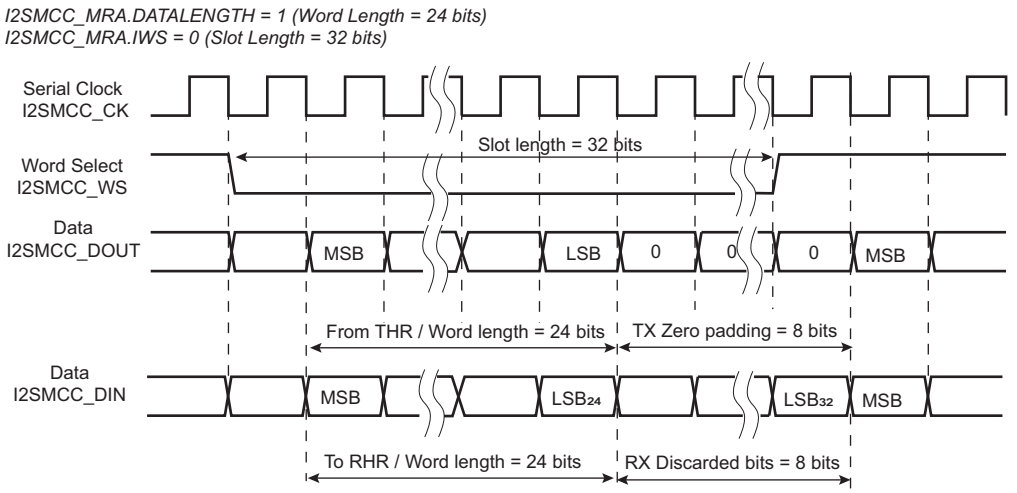
Data bits are sent on the falling edge of the serial clock and sampled on the rising edge of the serial clock. The word select line indicates the channel in transmission, a low level for the left channel and a high level for the right channel.

The length of words managed in transmit and/or receive holding registers can be chosen among 8, 16, 18, 20, 24, and 32 bits by writing I2SMCC_MRA.DATALENGTH. The length of the data transmitted or received on the I2S line (Slot length) depends on I2SMCC_MRA.DATALENGTH/IWS.

The slot length is defined in the following table.

Table 55.2. Slot Length (I²S format)

I2SMCC_MRA.DATALENGTH	Word Length	Slot Length
0	32 bits	32
1	24 bits	32 if I2SMCC_MRA.IWS = 0 24 if I2SMCC_MRA.IWS = 1
2	20 bits	
3	18 bits	
4	16 bits	16
5	16 bits compact stereo	



© 2026 Microchip Technology Inc. and its subsidiaries

Table 55.2. Slot Length (I^2S format) (continued)

I2SMCC_MRA.DATALENGTH	Word Length	Slot Length
6	8 bits	8
7	8 bits compact stereo	

If the time slot allows for more data bits than written in I2SMCC_MRA.DATALENGTH, zeroes are appended to the transmitted data word or extra received bits are discarded (see examples in the following figure).

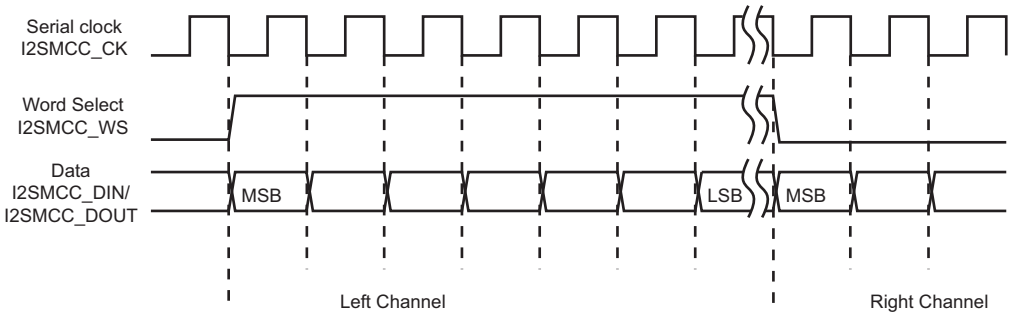


Figure 55.3. I^2S Transfer Format with TX Zero Padding and RX LSB Discarding

55.6.5. Left-Justified Reception and Transmission Sequence

As specified in the I^2S protocol, data bits are left-justified in the word select time slot, with the MSB transmitted first, starting at the same clock period as the transition on the word select line.

Figure 55.4. Left-Justified Reception and Transmission Sequence

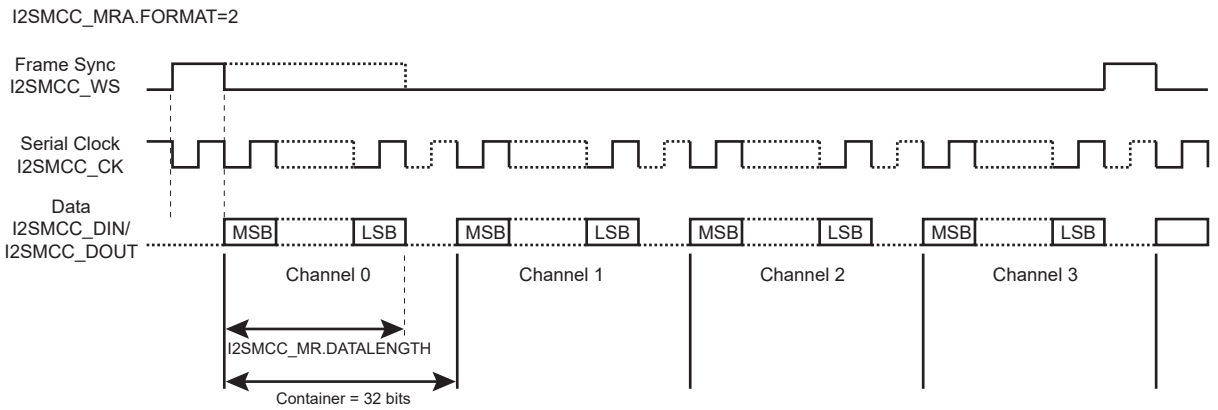
Data bits are sent on the falling edge of the serial clock and sampled on the rising edge of the serial clock. The word select line indicates the channel in transmission, with a low level for the right channel and a high level for the left channel.

55.6.6. TDM Reception and Transmission Sequence

In Time Division Multiplexed (TDM) format, one to eight data words are sent or received within each frame. As specified in the I^2S protocol, data bits are left-justified in the channel time slot, with the MSB transmitted first, starting one clock period after the transition on the word select line. Each time slot is 32 bits long.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 55.5. TDM Reception and Transmission Sequence



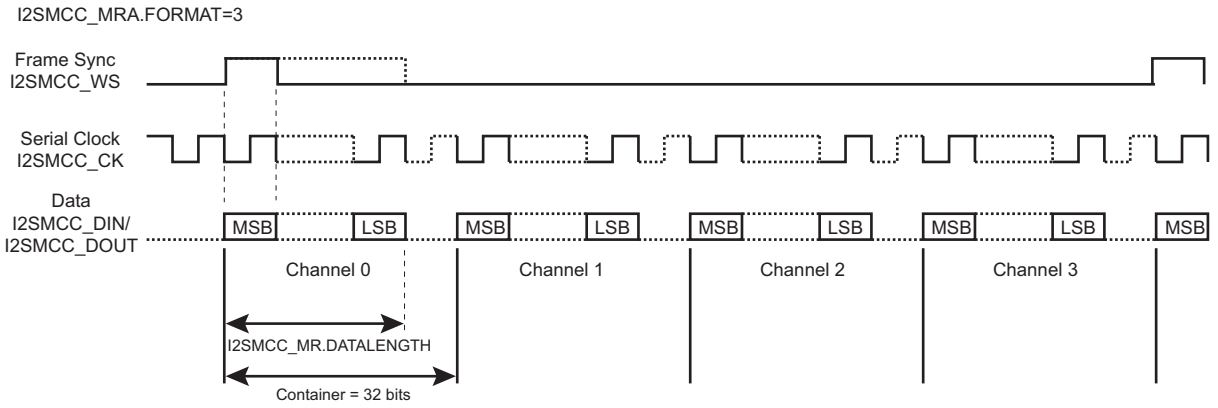


Figure 55.6. TDM Left-Justified Reception and Transmission Sequence

Data bits are sent on the falling edge of the serial clock and sampled on the rising edge of the serial clock. The I2SMCC_WS pin provides a frame synchronization signal, starting one I2SMCC_CK period before the MSB of channel 0.

The TDM format is selected when I2SMCC_MRA.FORMAT=2.

The TDM Left-Justified format is selected when I2SMCC_MRA.FORMAT=3.

The Frame Synchronization pulse can be either one I2SMCC_CK period, 16-bit I2SMCC_CK period (half time slot) or one 32-bit time slot. This selection is done by writing I2SMCC_MRA.TDMFS.

Note: In Client mode (I2SMCC_MRA.MODE = 0), the I2SMCC_MRA.TDMFS configuration must correspond to I2SMCC_WS high level period of the audio codec.

The number of channels is selected by writing I2SMCC_MRA.NBCHAN.

The Frame Synchronization pulse set to 32-bit time slot with the number of channel set to 1 configuration is not supported.

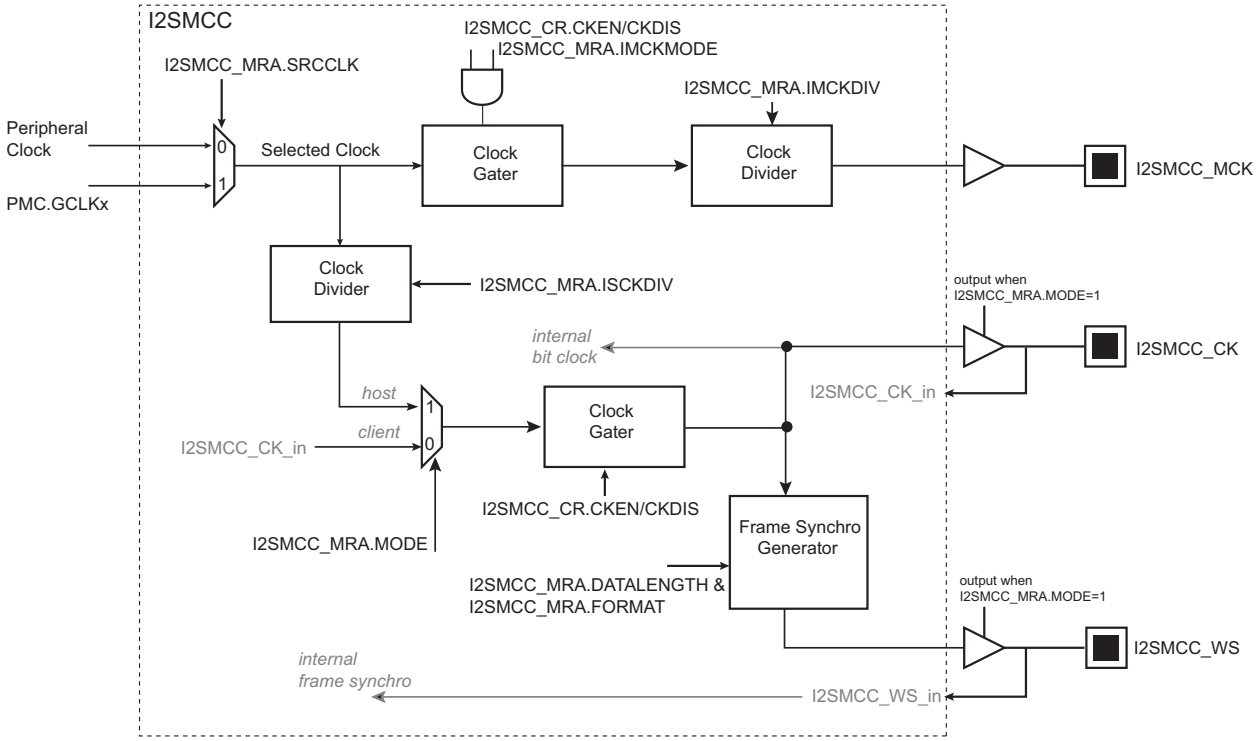
The length of transmitted words can be chosen among 8, 16, 18, 20, 24, and 32 bits by writing I2SMCC_MRA.DATALENGTH.

If the time slot allows for more data bits than programmed in I2SMCC_MRA.DATALENGTH, zeroes are appended to the transmitted data word or extra received bits are discarded.

55.6.7. Serial Clock and Word Select Generation

The generation of clocks in the I2SMCC is described in the following figure.

© 2026 Microchip Technology Inc. and its subsidiaries



In Client mode, the word select clock is driven by an external host and the serial clock is driven by either an external host or the internal clock circuitry. I2SMCC_CK and I2SMCC_WS pins are inputs.

In Host mode, the user configures the host clock, serial clock, and word select clock through the I2SMCC_MRA. I2SMCC_MCK, I2SMCC_CK, and I2SMCC_WS pins are outputs, MCK and CK frequencies are configured independently using I2SMCC_MRA.IMCKDIV and I2SMCC_MRA.ISCKDIV, respectively.

If a host clock output is not required, the MCK clock is used as I2SMCC_CK by clearing I2SMCC_MRA.IMCKMODE.

The I2SMCC_WS pin is used as word select in I^2S format and as frame synchronization in TDM format, as described in I2S Reception and Transmission Sequence and TDM Reception and Transmission Sequence, respectively.

Figure 55.7. I2SMCC Clock Generation

55.6.8. Mono

When the Transmit Mono bit (TXMONO) in I2SMCC_MRA is set, data written to the left channel is duplicated to the right output channel. In TDM mode, with more than two channels numbered from 0, data written to the even-numbered channels is duplicated to the following odd-numbered channel. When TXMONO is set, I2SMCC_ISRA.TXRRDYx are always read as '0' and the behavior of TXRUNFx is unchanged.

When the Receive Mono bit (RXMONO) in I2SMCC_MRA is set, data received from the left channel is duplicated to the right input channel. In TDM mode, with more than two channels numbered from 0, data received from the even-numbered channels is duplicated to the following odd-numbered channel. When RXMONO is set, the behavior of RXRRDYx and RXROVFx is unchanged.

55.6.9. Holding Registers

The I2SMCC user interface includes two common holding registers—the Receive Holding Register (I2SMCC_RHR) and the Transmit Holding Register (I2SMCC_THR). The common registers are used to access audio samples for all audio channels.

© 2026 Microchip Technology Inc. and its subsidiaries

Each I²S or TDM channel has its own register. The register depth depending on the configuration is available in the following table.

Table 55.3. Registers Depth

I2SMCC_MRA.FORMAT	I2SMCC_MRA.NBCHAN	Register Depth
0 or 1 (I²S or LJ)	NA	4 words
2 or 3 (TDM or TDMLJ)	0 or 1	4 words
	2 or 3	2 words
	4, 5, 6 or 7	1 word

55.6.9.1. Common Registers

The Receiver Holding Register (I2SMCC_RHR) and the Transmitter Holding Register (I2SMCC_THR) provide an access to all channels enabled through a single location.

When a new data word is available, the corresponding bit RXLRDYx or RXRRDYx in I2SMCC_ISRA is set. Reading I2SMCC_RHR clears this bit. In I²S or Left-Justified mode, consecutive access to I2SMCC_RHR reads first the left channel then the right channel. In TDM or TDM Left-Justified mode, consecutive access to I2SMCC_RHR reads the TDM channels enabled.

When a receive overrun condition occurs, the corresponding bit RXLOVFx or RXROVFx in I2SMCC_ISRA is set. Reading I2SMCC_ISRA clears this bit.

When data is being received (i.e., stored in the internal shift register), it is stored in internal holding registers. As an example, when 2-wire mode is configured, up to two data for each wire can be stored because four internal holding registers are available.

If nothing is read from I2SMCC_RHR, or from I2MCC_RHLxR and I2SMCC_RHRxR, the overflow occurs if a new data becomes available for the left channel x or right channel x.

When a data can be written in I2SMCC_THR, the corresponding bit TXLRDYx bit or TXRRDYx in I2SMCC_ISRA is set. Writing to I2SMCC_THR clears this bit. In I²S or Left-Justified mode, consecutive access to I2SMCC_THR writes first the left channel then the right channel. In TDM or TDM Left-Justified mode, consecutive access to I2SMCC_THR writes the TDM channels enabled.

A transmit underrun condition occurs if a new data word needs to be transmitted before it has been written to I2SMCC_THR. In this case, the corresponding bit TXLUNFx or TXRUNFx in I2SMCC_ISRA is set. Reading I2SMCC_ISRA clears this bit.

In case of transmit underrun, if the value of I2SMCC_MRA.TXSAME is '0', then a '0' is transmitted. If the value of I2SMCC_MRA.TXSAME is '1', then the previous data word for the current transmit channel number is transmitted.

After a transmit underrun, the data written in I2SMCC_THR is discarded to keep the left and right channels synchronized.

Data words are right-justified in the common registers (I2SMCC_RHR and I2SMCC_THR). For the 16-bit compact stereo data format, the left sample uses bits [15:0] and the right sample uses bits [31:16] of the same data word. For the 8-bit compact stereo data format, the left sample uses bits [7:0] and the right sample uses bits [15:8] of the same data word.

55.6.10. DMA Controller Operation

All receiver audio channels and all transmitter audio channels are each assigned to a single DMA Controller channel.

The DMA Controller reads from the I2SMCC_RHR and writes to the I2SMCC_THR for all audio channels successively.

The DMA Controller transfers may use 32-bit word, 16-bit halfword, or 8-bit byte depending on the value of the I2SMCC_MRA.DATALENGTH field.

© 2026 Microchip Technology Inc. and its subsidiaries

The DMA chunk size field (DMACHUNK) of the Mode Register B (I2SMCC_MRB) should correspond to the DMA channel configuration. The supported chunk according to the configuration is available in the two tables below

Table 55.4. TX DMA Chunk Configurations

FORMAT	TXMONO	DATALENGTH	NBCHAN	I2SMCC_MRB.DMACHUNK Configuration	Maximum DMA Chunk Size Allowed
0 or 1 (I^2S or LJ)	0 (Stereo)	0,1,2,3,4 or 6 (32, 24, 20, 18, 16 or 8 bits)	No effect	0	1-word chunk
				1	2-word chunk
	1 (Mono)			0	1-word chunk
	No effect	5 or 7 (16 bits compact or 8 bits compact)			
2 or 3 (TDM or TDMLJ)	No effect	No effect	0 (1 channel)	0	1-word chunk
	0 (Stereo)	0, 1, 2, 3, 4 or 6 (32, 24, 20, 18, 16 or 8 bits)	1, 3, 5 or 7 (2, 4, 6 or 8 channels)	0	1-word chunk
				1	2-word chunk
			2, 4, 6 (3, 5 or 7 channels)	0	1-word chunk
		5 or 7 (16 bits compact or 8 bits compact)	No effect		
	1 (Mono)	No effect			

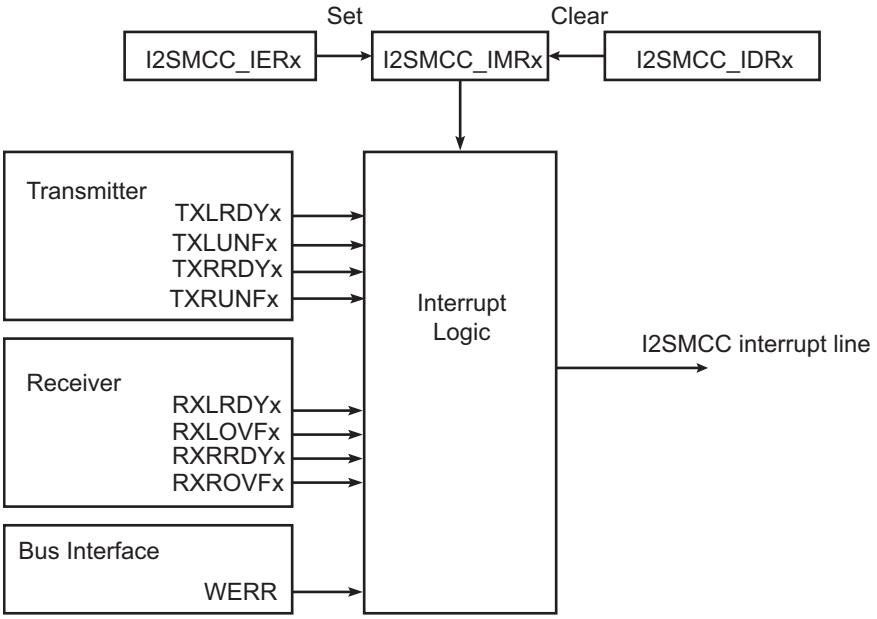
Table 55.5. RX DMA Chunk Configurations

FORMAT	DATALENGTH	NBCHAN	I2SMCC_MRB.DMACHUNK Configuration	Maximum DMA Chunk Size Allowed
0 or 1 (I^2S or LJ)	0, 1, 2, 3, 4 or 6 (32, 24, 20, 18, 16 or 8 bits)	No effect	0	1-word chunk
			1	2-word chunk
	5 or 7 (16 bits compact or 8 bits compact)		0	1-word chunk
2 or 3 (TDM or TDMLJ)	No effect	0 (1 channel)	0	1-word chunk
	0, 1, 2, 3, 4 or 6 (32, 24, 20, 18, 16 or 8 bits)	1, 3, 5 or 7 (2, 4, 6 or 8 channels)	0	1-word chunk
			1	2-word chunk
		2, 4, 6 (3, 5 or 7 channels)	0	1-word chunk
	5 or 7 (16 bits compact or 8 bits compact)	No effect	0	1-word chunk

55.6.11. Loop-back Mode

For debug purposes, the I2SMCC can be configured to loop back the transmitter to the receiver. Writing a '1' to I2SMCC_MRA.RXLOOP internally connects I2SMCC_DOUTx to I2SMCC_DINx, so that the transmitted data is also received. Writing a '0' to I2SMCC_MRA.RXLOOP restores the normal behavior with independent receiver and transmitter. As for other changes to the receiver or transmitter configuration, the I2SMCC receiver and transmitter must be disabled before writing to I2SMCC_MRA to update I2SMCC_MRA.RXLOOP.

55.6.12. Interrupts



An I2SMCC interrupt request can be triggered whenever one or several of the following bits are set in I2SMCC_ISRA and/or I2SMCC_ISRB:

© 2026 Microchip Technology Inc. and its subsidiaries

- Receive Left x Ready (RXLRDYx)
- Receive Right x Ready (RXRRDYx)
- Receive Left x Overrun (RXLOVFx)
- Receive Right x Overrun (RXROVFx)
- Transmit Left x Ready (TXLRDYx)
- Transmit Right x Ready (TXRRDYx)
- Transmit Left x Underrun (TXLUNFx)
- Transmit Right x Underrun (TXRUNFx)
- Write Error (WERR)

The interrupt request is generated if the corresponding bit in the Interrupt Mask registers (I2SMCC_IMRA and I2SMCC_IMRB) is set. Bits in I2SMCC_IMRx are set by writing a '1' to the corresponding bit in I2SMCC_IERx and cleared by writing a '1' to the corresponding bit in I2SMCC_IDRx. The interrupt request remains active until the corresponding bit in I2SMCC_ISRx is cleared.

Figure 55.8. Interrupt Block Diagram

55.6.13. Register Write Protection

To prevent any single software error from corrupting I2SMCC behavior, certain registers in the address space can be write-protected by setting the Write Protection Configuration Enable (WPCFEN), Write Protection Interrupt Enable (WPITEN) and/or Write Protection Control Enable (WPCTEN) bit(s) in the Write Protection Mode register (I2SMCC_WPMR).

If a write access to the protected registers is detected, the Write Protection Violation Status (WPVS) flag in the Write Protection Status register (I2SMCC_WPSR) is set and the field Write Protection Violation Source (WPVSRC) indicates the register in which the write access has been attempted. An interrupt can be raised if the Write Error (WERR) interrupt is set in I2SMCC_IMRB.

The WPVS flag is automatically reset by reading I2SMCC_WPSR.

The following register can be write-protected with the I2SMCC_WPMR.WPCFEN bit:

- Inter-IC Sound Multi Channel Controller Mode Register A

© 2026 Microchip Technology Inc. and its subsidiaries

- Inter-IC Sound Multi Channel Controller Mode Register B

The following registers can be write-protected with the I2SMCC_WPMR.WPITEN bit:

- Inter-IC Sound Multi Channel Controller Interrupt Enable Register A
- Inter-IC Sound Multi Channel Controller Interrupt Disable Register A
- Inter-IC Sound Multi Channel Controller Interrupt Enable Register B
- Inter-IC Sound Multi Channel Controller Interrupt Disable Register B

The following register can be write-protected with the I2SMCC_WPMR.WPCTEN bit:

- Inter-IC Sound Multi Channel Controller Control Register

55.6.14. Functional Safety (Protection, Monitors and Reports)

55.6.14.1.Protections

The configuration, interrupt and control registers can be protected against unintentional write accesses resulting from an erroneous software, bad DMA configuration or any abnormal single event upset that would create a spurious access on the bus. See Register Write Protection for a detailed description.

55.6.14.2.Monitors and Reports

When register write protection is enabled, any incorrect access is reported in I2SMCC_WPSR.WPVS and in I2SMCC_ISRB.WERR. It is possible to trigger an interrupt by writing a ‘1’ in I2SMCC_IERB.WERR.

When an error is reported, it is possible to trigger an interrupt by writing a ‘1’ in I2SMCC_IER.SECE.

55.7.1. I2SMCC Control Register

Name: I2SMCC_CR
Offset: 0x00
Reset: –
Property: Write-only

This register can only be writtent if WPCTEN is cleared in the Inter-IC Sound Write Protection Mode Register.

Mute Mode operates only on I2SMCC_THR and I2SMCC_RHR.

Bit	31	30	29	28	27	26	25	24

Reset	–		–	–	–	–	–	–

Bit 7 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets all the registers in the I2SMCC. The I2SMCC is disabled after the reset.

Bit 5 – TXDIS Transmitter Disable

Value	Description
0	No effect.
1	Disables the I2SMCC transmitter. I2SMCC_SR.TXEN is cleared when the Transmitter is stopped.

Bit 4 – TXEN Transmitter Enable

Value	Description
0	No effect.
1	Enables the I2SMCC transmitter, if TXDIS is not ‘1’. I2SMCC_SR.TXEN is set when the Transmitter is started.

Bit 3 – CKDIS Clocks Disable

Value	Description
0	No effect.
1	Disables the I2SMCC clock generation.

Bit 2 – CKEN Clocks Enable

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Enables the I2SMCC clock generation, if CKDIS is not ‘1’.

Bit 1 – RXDIS Receiver Disable

Value	Description
0	No effect.
1	Disables the I2SMCC receiver. I2SMCC_SR.RXEN is cleared when the receiver is stopped.

Bit 0 – RXEN Receiver Enable

Value	Description
0	No effect.
1	Enables the I2SMCC receiver, if RXDIS is not ‘1’. I2SMCC_SR.RXEN is set when the receiver is activated.

© 2026 Microchip Technology Inc. and its subsidiaries

55.7.2. I2SMCC Mode Register A

Name: I2SMCC_MRA
Offset: 0x04
Reset: 0x00000000
Property: Read/Write

This register can only be written if WPCFEN is cleared in Inter-IC Sound Write Protection Mode Register.

The I2SMCC_MRA must only be written when the I2SMCC is stopped in order to avoid unexpected behavior on the I2SMCC_WS, I2SMCC_CK and I2SMCC_DOUT outputs. The proper sequence is to write to I2SMCC_MRA, then write to I2SMCC_CR to enable the I2SMCC or to disable the I2SMCC before writing a new value to I2SMCC_MRA.

Bit	31	30	29	28	27	26	25	24
	IWS	IMCKMODE	ISCKDIV[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	TDMFS[1:0]		IMCKDIV[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	NBCHAN[2:0]			SRCCLK	TXSAME	TXMONO	RXLOOP	RXMONO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	FORMAT[1:0]		ZERO[1:0]		DATALENGTH[2:0]			MODE
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 31 – IWS I2SMCC_WS Slot Length
See Slot Length (I^2S format) .

Value	Description
0	I2SMCC_WS slot is 32 bits long for DATALENGTH = 18/20/24 bits.
1	I2SMCC_WS slot is 24 bits long for DATALENGTH = 18/20/24 bits.

Bit 30 – IMCKMODE Host Clock Mode

Value	Description
0	No host clock generated.
1	Host clock generated.

Bits 29:24 – ISCKDIV[5:0] Selected Clock to I2SMCC Serial Clock Ratio
I2SMCC_CK Serial clock output frequency is Selected Clock divided by (2 * ISCKDIV). If ISCKDIV is 0, the I2SMCC_CK Serial clock output frequency is equal to the Selected Clock frequency.

Bits 23:22 – TDMFS[1:0] TDM Frame Synchronization
In Client mode (I2SMCC_MRA.MODE = 0), the I2SMCC_MRA.TDMFS configuration must correspond to I2SMCC_WS high level period of the audio codec.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	SLOT	I2SMCC_WS pulse is high for one time slot at beginning of frame.
1	HALF	I2SMCC_WS pulse is high for half the time slots at beginning of frame.
2	BIT	I2SMCC_WS pulse is high for one bit period at beginning of frame, i.e., one I2SMCC_CK period.

Bits 21:16 – IMCKDIV[5:0] Selected Clock to I2SMCC Host Clock Ratio
I2SMCC_MCK Host clock output frequency is Selected Clock divided by (2 * IMCKDIV). If IMCKDIV is 0, the I2SMCC_MCK Host clock output frequency is equal to the Selected Clock frequency.

Bits 15:13 – NBCHAN[2:0] Number of TDM Channels-1
Must be written with the number of TDM channels minus one.

Bit 12 – SRCCLK Source Clock Selection

Value	Description
0	The Peripheral clock is selected as source clock for I2SMCC_MCK/WS/CK pins.
1	The PMC.GCLKx clock is selected as source clock (I2SMCC_MCK/WS/CK rate can be independent of system bus clock).

Bit 11 – TXSAME Transmit Data when Underrun

Value	Description
0	'0' is transmitted when underrun.
1	Previous sample transmitted when underrun.

Bit 10 – TXMONO Transmit Mono

Value	Description
0	Stereo
1	Mono, with left audio samples duplicated to right audio channel by the I2SMCC.

Bit 9 – RXLOOP Loop-back Test Mode

Value	Description
0	Normal mode
1	I2SMCC_DOUT output of I2SMCC are internally connected to I2SMCC_DIN inputs.

Bit 8 – RXMONO Receive Mono

Value	Description
0	Stereo
1	Mono, with left audio samples duplicated to right audio channel by the I2SMCC.

Bits 7:6 – FORMAT[1:0] Data Format

Value	Name	Description
0	I2S	I^2S format, stereo with I2SMCC_WS low for left channel, and MSB of sample starting one I2SMCC_CK period after I2SMCC_WS edge.
1	LJ	Left-justified format, stereo with I2SMCC_WS high for left channel, and MSB of sample starting on I2SMCC_WS edge.
2	TDM	TDM format, with (NBCHAN + 1) channels, I2SMCC_WS high at beginning of first channel, and MSB of sample starting one I2SMCC_CK period after I2SMCC_WS edge.
3	TDMLJ	TDM format, left-justified, with (NBCHAN + 1) channels, I2SMCC_WS high at beginning of first channel, and MSB of sample starting on I2SMCC_WS edge.

Bits 5:4 – ZERO[1:0] Must always be written to 0

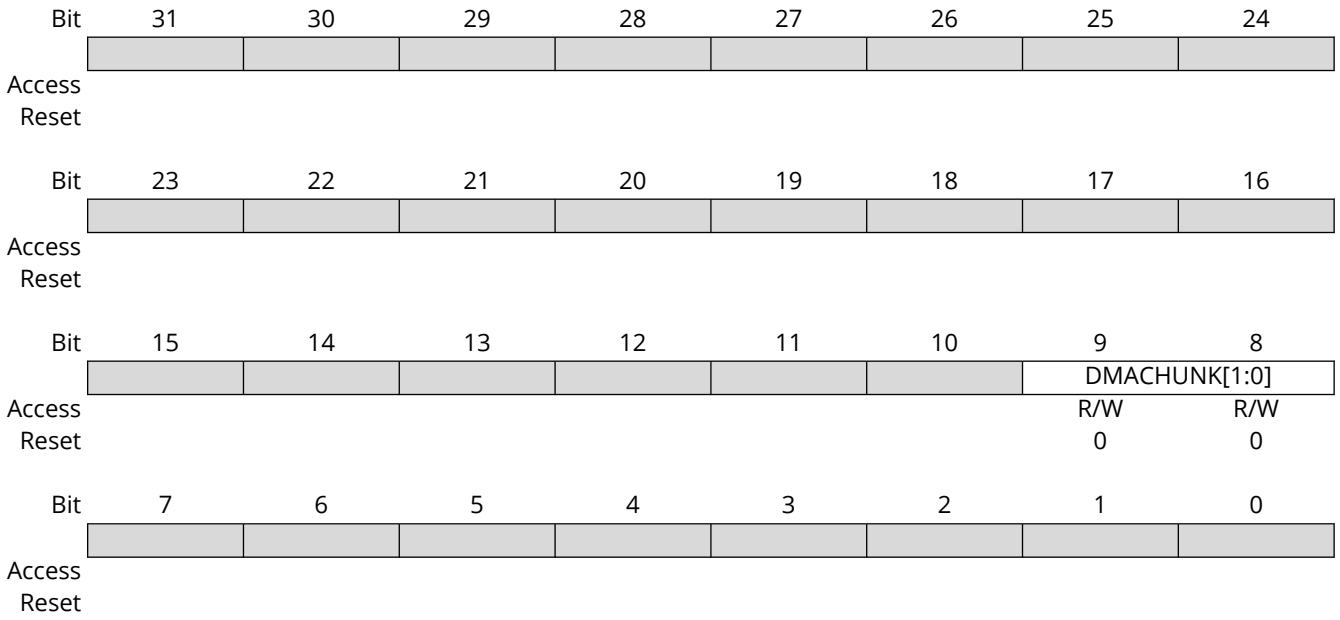
Bits 3:1 – DATALENGTH[2:0] Data Word Length

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	32_BITS	Data length is set to 32 bits.
1	24_BITS	Data length is set to 24 bits.
2	20_BITS	Data length is set to 20 bits.
3	18_BITS	Data length is set to 18 bits.
4	16_BITS	Data length is set to 16 bits.
5	16_BITS_COMPACT	Data length is set to 16-bit compact stereo. Left sample in bits [15:0] and right sample in bits [31:16] of same word.
6	8_BITS	Data length is set to 8 bits.
7	8_BITS_COMPACT	Data length is set to 8-bit compact stereo. Left sample in bits [7:0] and right sample in bits [15:8] of the same word.

Bit 0 – MODE I2SMCC Mode

Value	Name	Description
0	SLAVE	Client mode. I2SMCC_CK and I2SMCC_WS pin inputs used as bit clock and word select/frame synchronization.
1	MASTER	Host mode. Bit clock and word select/frame synchronization generated by I2SMCC from Peripheral Clock or GCLK if I2SMCC_MCK/WS/CK rates must be independent of system bus clock (See I2SMCC_MR.SRCCLK) and output to I2SMCC_CK and I2SMCC_WS pins. MCK is output as host clock on I2SMCC_MCK if I2SMCC_MRA.IMCKMODE is set.



© 2026 Microchip Technology Inc. and its subsidiaries

55.7.3. I2SMCC Mode Register B

Name: I2SMCC_MRB
Offset: 0x08
Reset: 0x00000000
Property: Read/Write

This register can only be written if WPCFEN is cleared in the Inter-IC Sound Write Protection Mode Register.

The I2SMCC_MRB must only be written when the I2SMCC is stopped in order to avoid unexpected behavior on the I2SMCC_WS, I2SMCC_CK and I2SMCC_DOUT outputs. The proper sequence is to write to I2SMCC_MRB, then write to I2SMCC_CR to enable the I2SMCC or to disable the I2SMCC before writing a new value to I2SMCC_MRB.

Bit	7	6	5	4	3	2	1	0
				TXEN				RXEN
Access				R				R
Reset				0				0

Bit 4 – TXEN Transmitter Enabled

TXEN=1 if the selected clock (internal bit clock, see the figure I2SMCC Clock Generation) is active and WS is active.

Value	Description
0	Cleared when the transmitter is disabled, following a I2SMCC_CR.TXDIS or I2SMCC_CR.SWRST request.
1	Set when the transmitter is enabled, following a I2SMCC_CR.TXEN request.

Bit 0 – RXEN Receiver Enabled

RXEN=1 if the selected clock (internal bit clock, see the figure I2SMCC Clock Generation) is active and WS is active.

Value	Description
0	Cleared when the receiver is disabled, following an RXDIS or SWRST request in I2SMCC_CR.
1	Set when the receiver is enabled, following an RXEN request in I2SMCC_CR.

© 2026 Microchip Technology Inc. and its subsidiaries

55.7.5. I2SMCC Interrupt Enable Register A

Name: I2SMCC_IERA
Offset: 0x10
Reset: –
Property: Write-only

This register can only be written if WPITEN is cleared in the Inter-IC Sound Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
							RXROVF0	RXLOVF0
Access							W	W
Reset							–	–

Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
							TXRRDY0	TXLRDY0
Access							R	R
Reset							1	1

Bit 25 – RXROVFx I²S Receive Right x (x=0 only) or TDM Channel [2x]+1 Overrun Flag (cleared on read)

Value	Description
0	Cleared when I2SMCC_ISRA is read.
1	Set when an overrun error occurs in I2SMCC_RHR.

Bit 24 – RXLOVFx I²S Receive Left x (x=0 only) or TDM Channel 2x Overrun Flag (cleared on read)

Value	Description
0	Cleared when I2SMCC_ISRA is read.
1	Set when an overrun error occurs in I2SMCC_RHR.

Bit 17 – RXRRDYx I²S Receive Right x (x=0 only) or TDM Channel [2x]+1 Ready Flag (cleared by reading I2SMCC_RHR)

Value	Description
0	Cleared when a predefined number of read accesses are performed in I2SMCC_RHR. The predefined number depends on the configuration of I2SMCC_MRA.WIRECFG / FORMAT and varies from 1 to 8.
1	Set when received data is available in I2SMCC_RHR.

Bit 16 – RXLRDYx I²S Receive Left x (x=0 only) or TDM Channel 2x Ready Flag (cleared by reading I2SMCC_RHR)

Value	Description
0	Cleared when a predefined number of read accesses is performed in I2SMCC_RHR. The predefined number depends on the configuration of I2SMCC_MRA.WIRECFG/FORMAT and varies from 1 to 7.
1	Set when received data is available in I2SMCC_RHR.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 9 – TXRUNFx I²S Transmit Right x (x=0 only) or TDM Channel [2x]+1 Underrun Flag (cleared on read)

Value	Description
0	Cleared when the I2SMCC_ISRA is read.
1	Set when an underrun error occurs in I2SMCC_THR.

Bit 8 – TXLUNFx I²S Transmit Left x (x=0 only) or TDM Channel 2x Underrun (cleared on read)

Value	Description
0	Cleared when I2SMCC_ISRA is read.
1	Set when an underrun error occurs in I2SMCC_THR.

Bit 1 – TXRRDYx I²S Transmit Right x (x=0 only) or TDM Channel [2x]+1 Ready Flag (cleared by writing I2SMCC_THR)

Value	Description
0	Cleared when a predefined number of write accesses is performed in I2SMCC_THR. The predefined number depends on the configuration of I2SMCC_MRA.WIRECFG/FORMAT and varies from 1 to 8.
1	Set when I2SMCC_THR is empty.

Bit 0 – TXLRDYx I²S Transmit Left x (x=0 only) or TDM Channel 2x Ready Flag (cleared by writing I2SMCC_THR)

Value	Description
0	Cleared when a predefined number of write accesses is performed in I2SMCC_THR. The predefined number depends on the configuration of I2SMCC_MRA.WIRECFG/FORMAT and varies from 1 to 7.
1	Set when I2SMCC_THR is empty.

Bit	7	6	5	4	3	2	1	0
						WPCTEN	WPITEN	WPCFEN
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x493253	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

Bit 2 – WPCTEN Write Protection Control Enable

Value	Description
0	Disables the write protection of the control if WPKEY matches to 0x493253 (I2S in ASCII).
1	Enables the write protection of the control if WPKEY matches to 0x493253 (I2S in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection of the interruption if WPKEY matches to 0x493253 (I2S in ASCII).
1	Enables the write protection of the interruption if WPKEY matches to 0x493253 (I2S in ASCII).

Bit 0 – WPCFEN Write Protection Configuration Enable

Value	Description
0	Disables the write protection of the configuration if WPKEY matches to 0x493253 (I2S in ASCII).
1	Enables the write protection of the configuration if WPKEY matches to 0x493253 (I2S in ASCII).

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

Bits 31:8 – WPVSRC[23:0] Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the I2SMCC_WPSR.
1	A write protection violation has occurred since the last read of the I2SMCC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

56. Synchronous Serial Controller (SSC)

56.1. Description

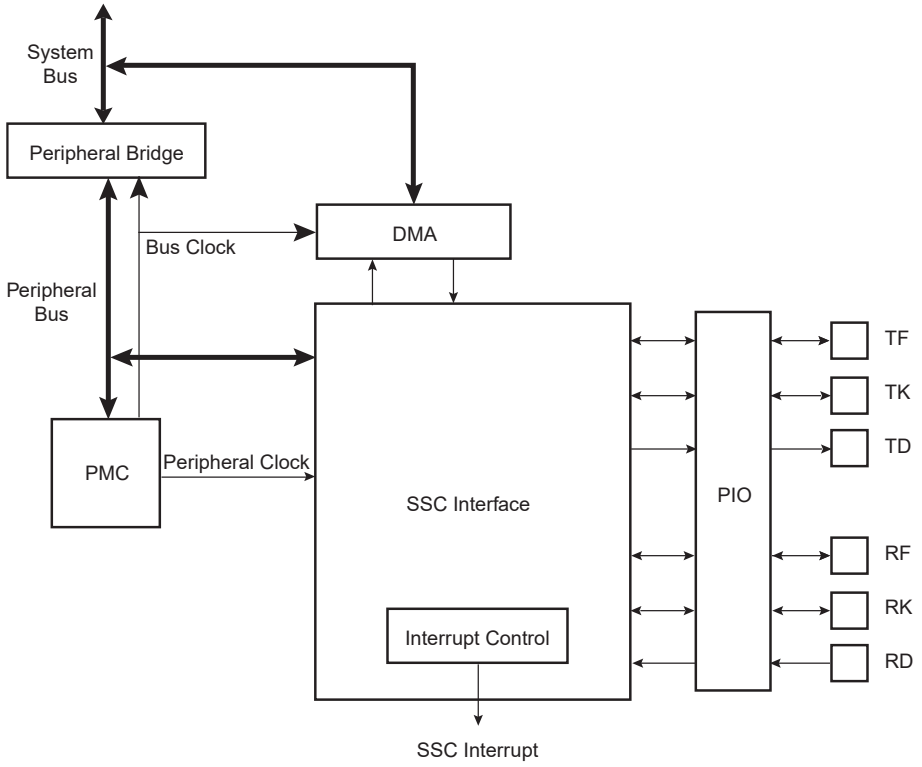
The Synchronous Serial Controller (SSC) provides a synchronous communication link with external devices. It supports many serial synchronous communication protocols generally used in audio and telecom applications such as I2S, Short Frame Sync, Long Frame Sync, etc.

The SSC contains an independent receiver and transmitter and a common clock divider. The receiver and the transmitter each interface with three signals: the TD/RD signal for data, the TK/RK signal for the clock and the TF/RF signal for the Frame Sync. The transfers can be programmed to start automatically or on different events detected on the Frame Sync signal.

The SSC high-level of programmability and its use of DMA enable a continuous high bit rate data transfer without processor intervention.

Featuring connection to the DMA, the SSC enables interfacing with low processor overhead to:

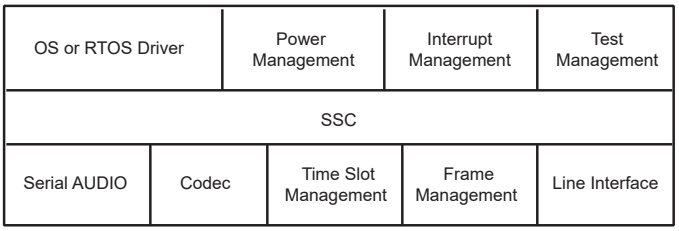
- Codecs in Host or Client mode
- DAC through dedicated serial interface, particularly I2S
- Magnetic card reader



56.2. Embedded Characteristics

- Provides Serial Synchronous Communication Links Used in Audio and Telecom Applications
- Contains an Independent Receiver and Transmitter and a Common Clock Divider
- Interfaced with the DMA Controller (DMAC) to Reduce Processor Overhead
- Offers a Configurable Frame Sync and Data Length
- Receiver and Transmitter can be Programmed to Start Automatically or on Detection of Different Events on the Frame Sync Signal
- Receiver and Transmitter Include a Data Signal, a Clock Signal and a Frame Sync Signal
- Up to 16 Channels in TDM Mode

© 2026 Microchip Technology Inc. and its subsidiaries



56.3. Block Diagram

Figure 56.1. SSC Block Diagram

56.4. Application Block Diagram

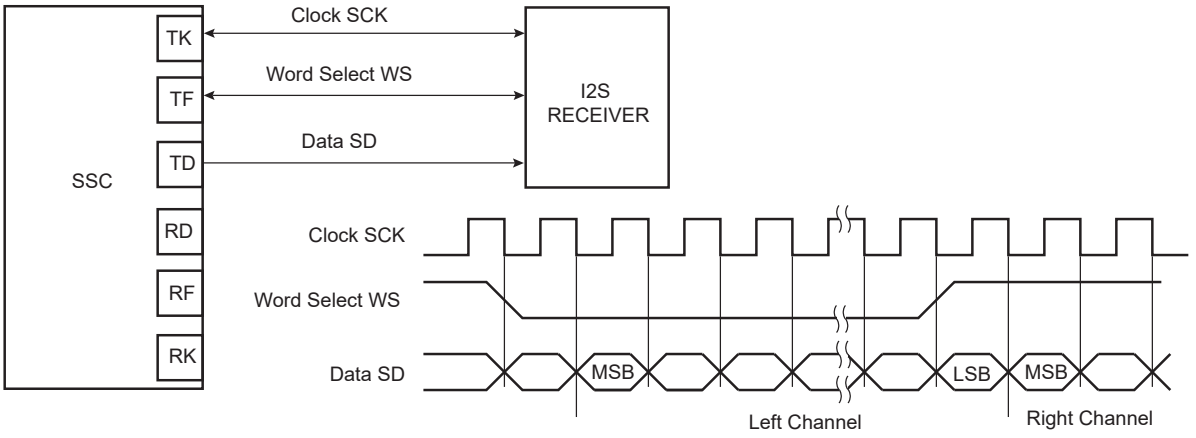
Figure 56.2. SSC Application Block Diagram

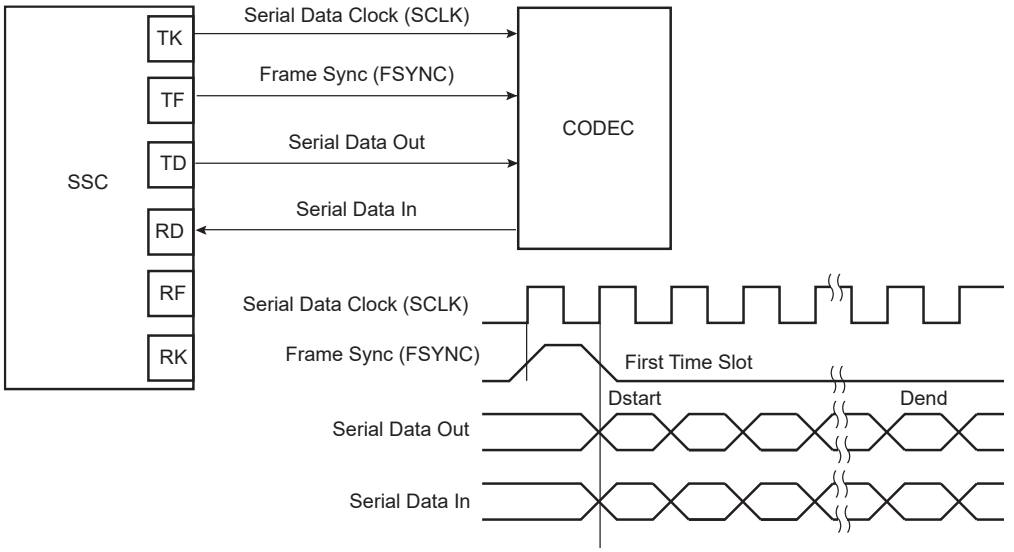
56.5. SSC Application Examples

The SSC can support several serial communication modes used in audio or high speed serial links. Some standard applications are shown in the following figures. All serial link applications supported by the SSC are not listed here.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 56.3. Audio Application Block Diagram





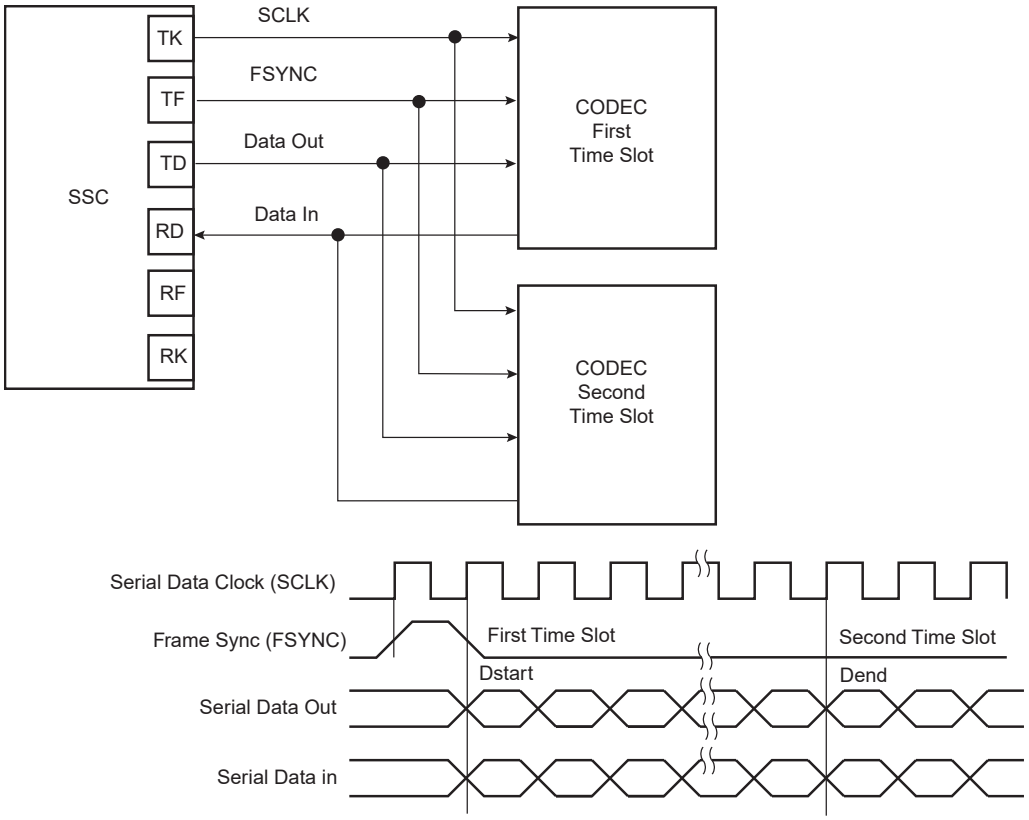


Figure 56.4. Codec Application Block Diagram

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 56.5. Time Slot Application Block Diagram

56.6. Pin Name List

Table 56.1. I/O Lines Description

Pin Name	Pin Description	Type
RF	Receive Frame Synchronization	Input/Output
RK	Receive Clock	Input/Output
RD	Receive Data	Input
TF	Transmit Frame Synchronization	Input/Output
TK	Transmit Clock	Input/Output
TD	Transmit Data	Output

56.7. Product Dependencies

56.7.1. I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines.

Before using the SSC receiver, the PIO controller must be configured to dedicate the SSC receiver I/O lines to the SSC Peripheral mode.

Before using the SSC transmitter, the PIO controller must be configured to dedicate the SSC transmitter I/O lines to the SSC Peripheral mode.

56.7.2. Power Management

The SSC is not continuously clocked. The SSC interface may be clocked through the Power Management Controller (PMC), therefore the programmer must first configure the PMC to enable the SSC clock.

© 2026 Microchip Technology Inc. and its subsidiaries

56.7.3. Interrupt

The SSC interface has an interrupt line connected to the interrupt controller. Handling interrupts requires programming the interrupt controller before configuring the SSC.

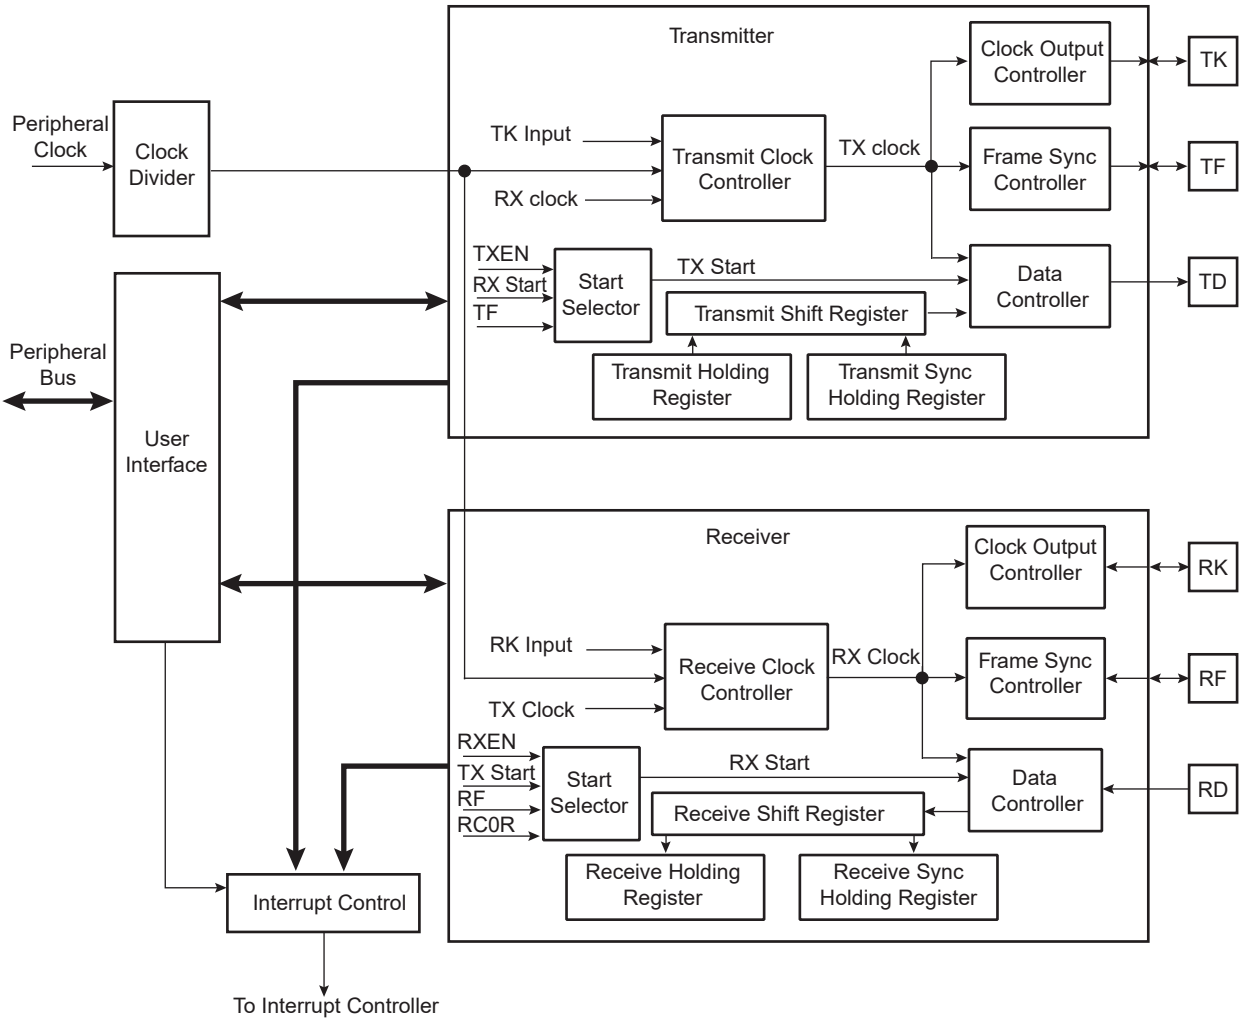
All SSC interrupts can be enabled/disabled configuring the SSC Interrupt Mask Register. Each pending and unmasked SSC interrupt asserts the SSC interrupt line. The SSC interrupt service routine can get the interrupt origin by reading the SSC Interrupt Status Register.

56.7.4. Audio Sampling Rate Limitations

The maximum audio sampling rate that can be processed depends on the peripheral clock frequency and number of audio channels.

When operating in I2S mode (2 channels) the maximum rate in kilo samples per second (ksps) is the peripheral clock frequency given in kHz divided by 448 (i.e., 224 x 2).

When operating in TDM mode (2 to 8 channels), the maximum rate in ksps is the peripheral clock frequency given in kHz divided by 224 x number of channels.



56.8. Functional Description

This section contains the functional description of the following: SSC Functional Block, Clock Management, Data Format, Start, Transmit, Receive and Frame Synchronization.

The receiver and transmitter operate separately. However, they can work synchronously by programming the receiver to use the transmit clock and/or to start a data transfer when transmission starts. Alternatively, this can be done by programming the transmitter to use the receive clock and/or to start a data transfer when reception starts. The transmitter and the receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many Client mode data transfers. The maximum clock speed allowed on the TK and RK pins is the peripheral clock divided by 2.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 56.6. SSC Functional Block Diagram

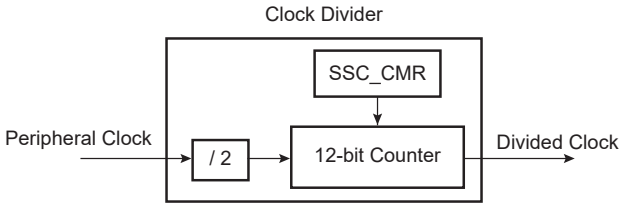
56.8.1. Clock Management

The transmit clock can be generated by:

- an external clock received on the TK I/O pad
- the receive clock
- the internal clock divider

The receive clock can be generated by:

- an external clock received on the RK I/O pad
- the transmit clock
- the internal clock divider



Furthermore, the transmitter block can generate an external clock on the TK I/O pad, and the receive block can generate an external clock on the RK I/O pad.

This allows the SSC to support many Host and Client mode data transfers.

© 2026 Microchip Technology Inc. and its subsidiaries

56.8.1.1.Clock Divider

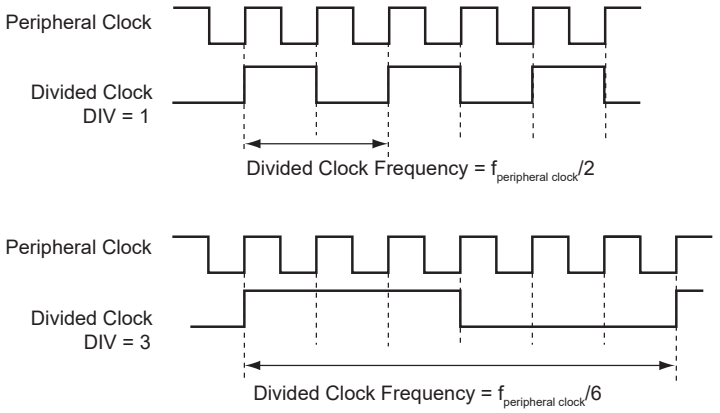


Figure 56.7. Divided Clock Block Diagram

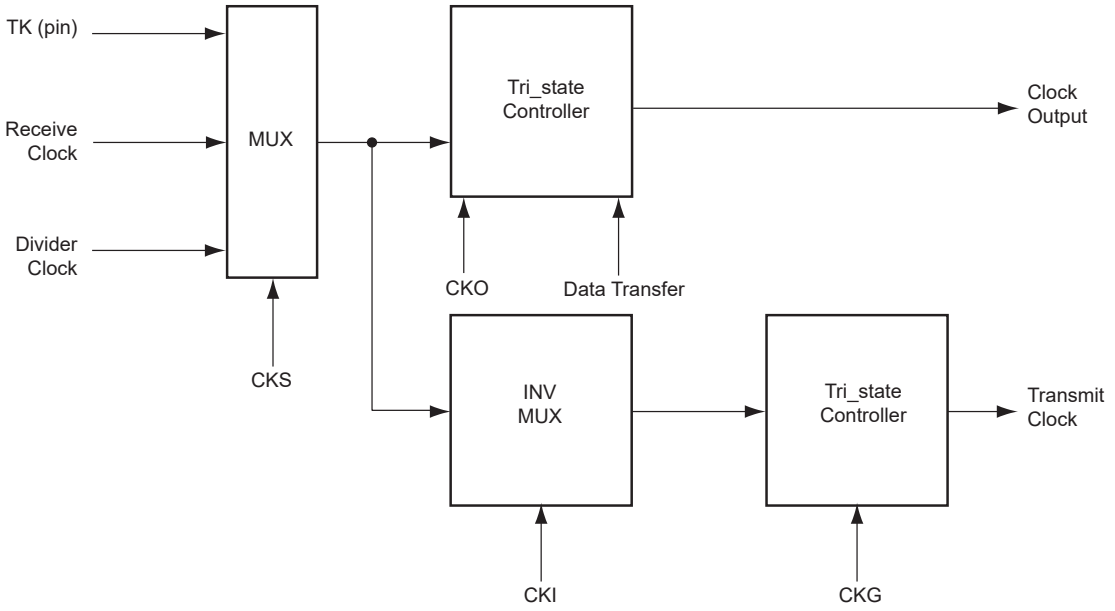
The peripheral clock divider is determined by the 12-bit field DIV counter and comparator (so its maximal value is 4095) in the Clock Mode Register (SSC_CMR), allowing a peripheral clock division by up to 8190. The Divided Clock is provided to both the receiver and the transmitter. When this field is programmed to 0, the Clock Divider is not used and remains inactive.

When DIV is set to a value equal to or greater than 1, the Divided Clock has a frequency of peripheral clock divided by 2 times DIV. Each level of the Divided Clock has a duration of the peripheral clock multiplied by DIV. This ensures a 50% duty cycle for the Divided Clock regardless of whether the DIV value is even or odd.

Figure 56.8. Divided Clock Generation



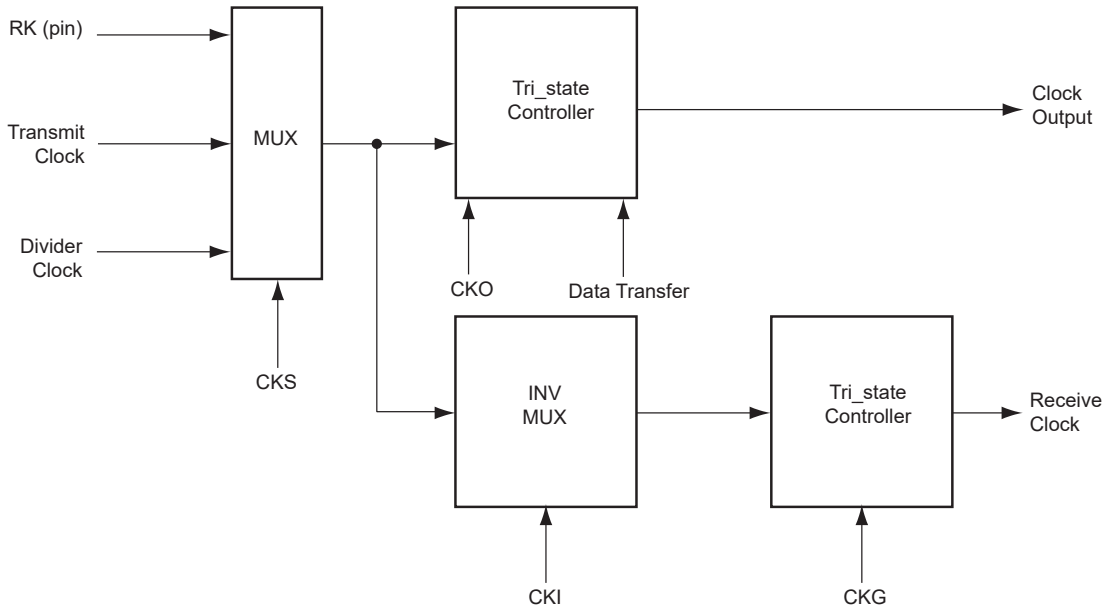
56.8.1.2.Transmit Clock Management

The transmit clock is generated from the receive clock or the divider clock or an external clock scanned on the TK I/O pad. The transmit clock is selected by the CKS field in the Transmit Clock Mode Register (SSC_TCMR). Transmit Clock can be inverted independently by the CKI bits in the SSC_TCMR.

The transmitter can also drive the TK I/O pad continuously or be limited to the current data transfer. The clock output is configured by the SSC_TCMR. The Transmit Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC_TCMR to select TK pin (CKS field) and at the same time Continuous Transmit Clock (CKO field) can lead to unpredictable results.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 56.9. Transmit Clock Management



56.8.1.3.Receive Clock Management

The receive clock is generated from the transmit clock or the divider clock or an external clock scanned on the RK I/O pad. The Receive Clock is selected by the CKS field in SSC_RCMR (Receive Clock Mode Register). Receive Clocks can be inverted independently by the CKI bits in SSC_RCMR.

The receiver can also drive the RK I/O pad continuously or be limited to the current data transfer. The clock output is configured by the SSC_RCMR. The Receive Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC_RCMR to select RK pin (CKS field) and at the same time Continuous Receive Clock (CKO field) can lead to unpredictable results.

Figure 56.10. Receive Clock Management

© 2026 Microchip Technology Inc. and its subsidiaries

56.8.1.4.Serial Clock Ratio Considerations

The transmitter and the receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many Client mode data transfers. In this case, the maximum clock speed allowed on the RK pin is:

- Peripheral clock divided by 2 if Receive Frame Synchronization is input
- Peripheral clock divided by 3 if Receive Frame Synchronization is output

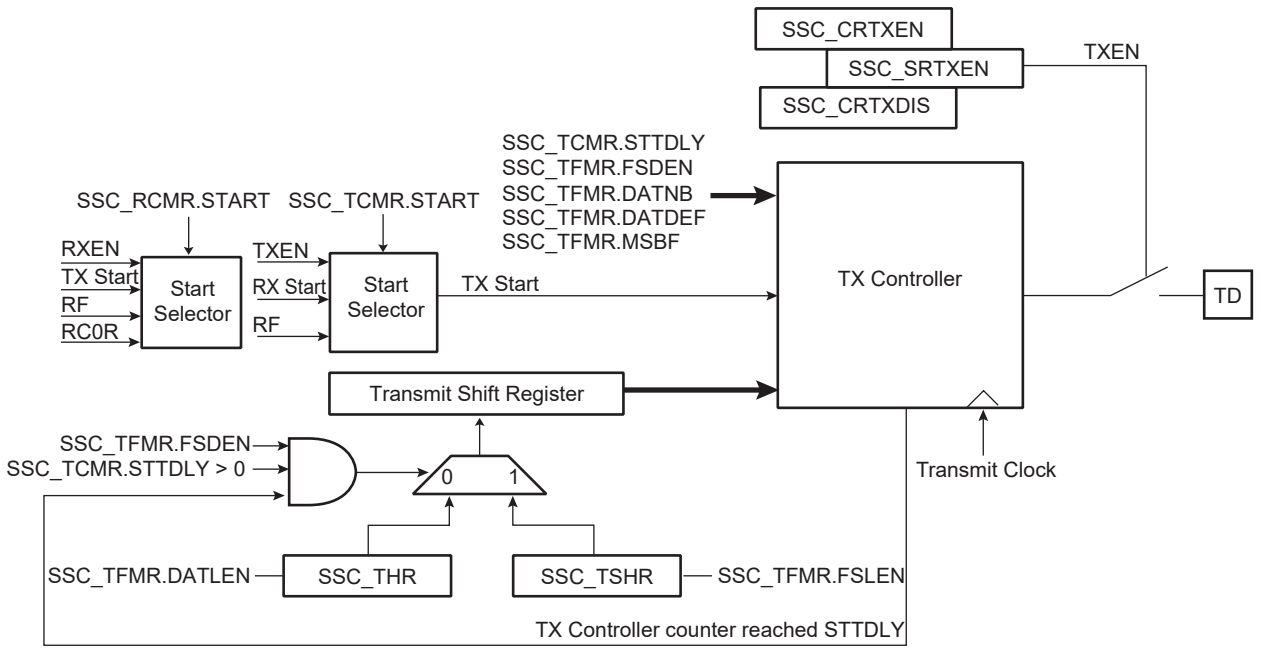
In addition, the maximum clock speed allowed on the TK pin is:

- Peripheral clock divided by 7 if Transmit Frame Synchronization is input
- Peripheral clock divided by 2 if Transmit Frame Synchronization is output

These are only theoretical speed limits for first order calculations. Refer to the section "Electrical Characteristics" for exact speed limits on TK and RK.

56.8.2. Transmit Operations

A transmit frame is triggered by a start event and can be followed by synchronization data before data transmission.



The start event is configured by setting the SSC_TCMR. See Start.

The frame synchronization is configured setting the Transmit Frame Mode Register (SSC_TFMR). See Frame Synchronization.

To transmit data, the transmitter uses a shift register clocked by the transmit clock signal and the start mode selected in the SSC_TCMR. Data is written by the application to the Transmit Holding register (SSC_THR) then transferred to the transmit shift register according to the data format selected.

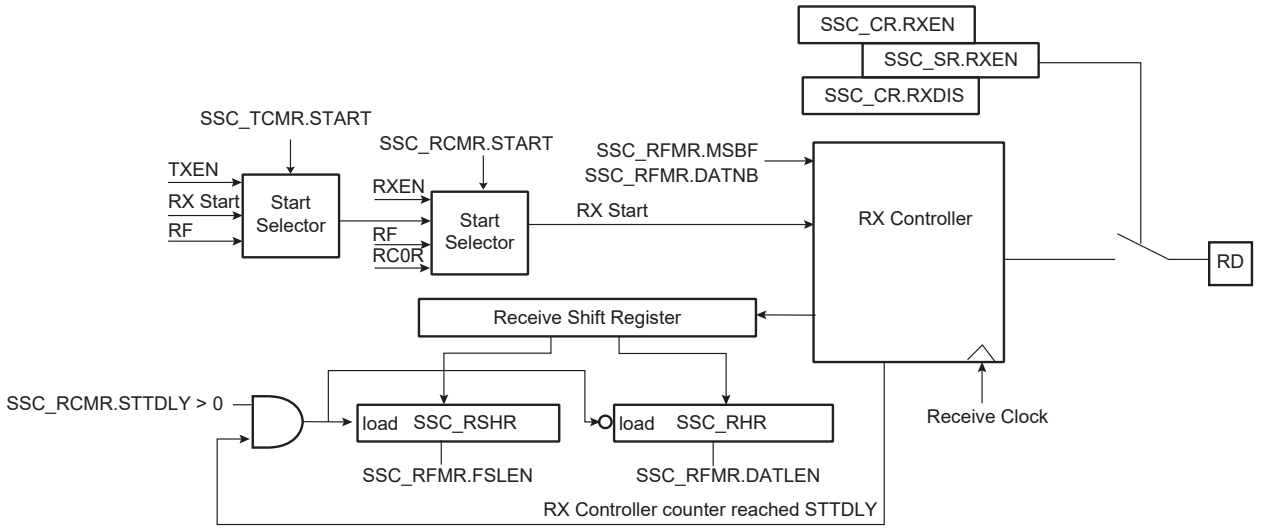
When both the SSC_THR and the transmit shift register are empty, the status flag TXEMPTY is set in the Status register (SSC_SR). When the Transmit Holding register is transferred in the transmit shift register, the status flag TXRDY is set in the SSC_SR and additional data can be loaded in the Transmit Holding register.

Figure 56.11. Transmit Block Diagram

© 2026 Microchip Technology Inc. and its subsidiaries

56.8.3. Receive Operations

A receive frame is triggered by a start event and can be followed by synchronization data before data transmission.



The start event is configured by setting the Receive Clock Mode Register (SSC_RCMR). See Start.

The frame synchronization is configured by setting the Receive Frame Mode Register (SSC_RFMR). See Frame Synchronization.

The receiver uses a shift register clocked by the receive clock signal and the start mode selected in the SSC_RCMR. The data is transferred from the shift register depending on the data format selected.

When the receive shift register is full, the SSC transfers the data into the Receive Holding register (SSC_RHR), the status flag RXRDY is set in the SSC_SR and the data can be read in the Receive Holding register. If another transfer occurs before read of the Receive Holding register, the status flag OVRUN is set in the SSC_SR and the receive shift register is transferred in the SSC_RHR. The old unread data is then lost.

Figure 56.12. Receive Block Diagram

56.8.4. Start

The transmitter and receiver can both be programmed to start their operations when an event occurs, respectively in the Transmit Start Selection (START) field of SSC_TCMR and in the Receive Start Selection (START) field of SSC_RCMR.

Under the following conditions the start event is independently programmable:

- Continuous. In this case, the transmission starts as soon as a word is written in SSC_THR and the reception starts as soon as the receiver is enabled.
- Synchronously with the transmitter/receiver
- On detection of a falling/rising edge on TF/RF
- On detection of a low level/high level on TF/RF
- On detection of a level change or an edge on TF/RF

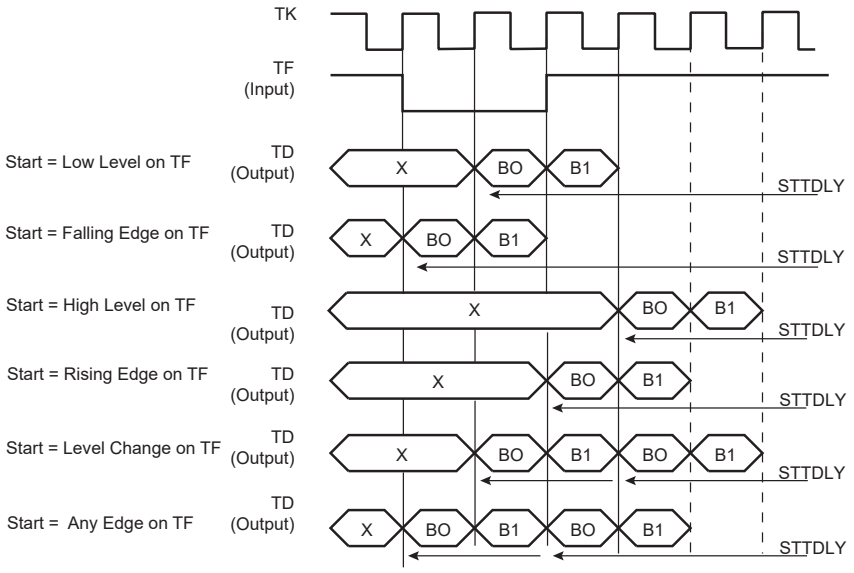
A start can be programmed in the same manner on either side of the Transmit/Receive Clock Register (SSC_RCMR/SSC_TCMR). Thus, the start could be on TF (Transmit) or RF (Receive).

Moreover, the receiver can start when data is detected in the bit stream with the Compare Functions.

© 2026 Microchip Technology Inc. and its subsidiaries

Detection on TF/RF input/output is done by the field FSOS of the Transmit/Receive Frame Mode Register (SSC_TFMR/SSC_RFMR).

Figure 56.13. Transmit Start Mode



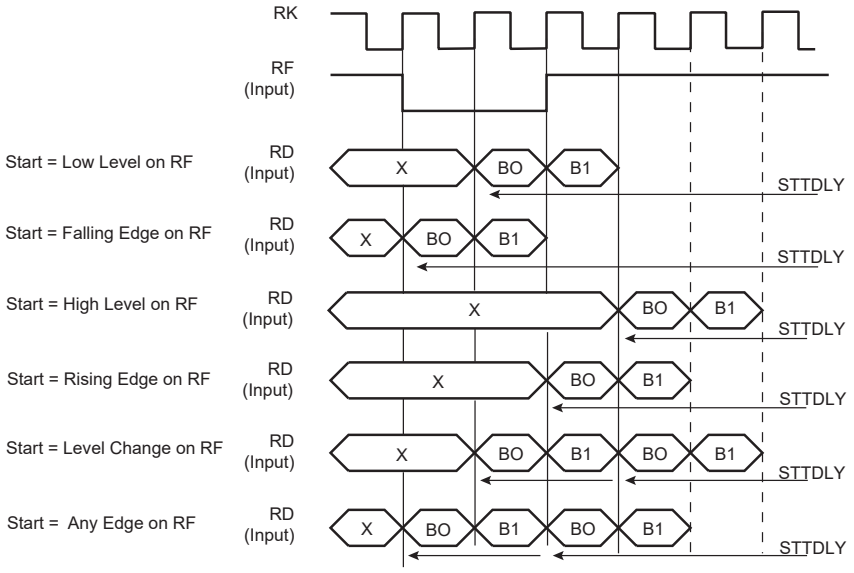


Figure 56.14. Receive Pulse/Edge Start Modes

56.8.5. Frame Synchronization

The Transmit and Receive Frame Sync pins, TF and RF, can be programmed to generate different kinds of Frame Sync signals. The Frame Sync Output Selection (FSOS) field in the Receive Frame Mode Register (SSC_RFMR) and in the Transmit Frame Mode Register (SSC_TFMR) are used to select the required waveform.

- Programmable low or high levels during data transfer are supported.
- Programmable high levels before the start of data transfers or toggling are also supported.

If a pulse waveform is selected, the Frame Sync Length (FSLEN) field in SSC_RFMR and SSC_TFMR programs the length of the pulse, from 1 bit time up to 256 bit times.

© 2026 Microchip Technology Inc. and its subsidiaries

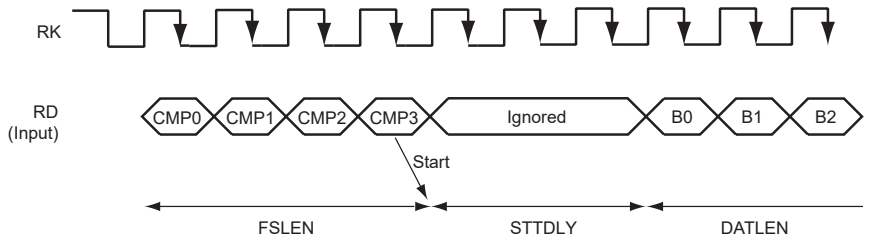
The periodicity of the Receive and Transmit Frame Sync pulse output can be programmed through the Period Divider Selection (PERIOD) field in SSC_RCMR and SSC_TCMR.

56.8.5.1. Frame Sync Data

Frame Sync Data transmits or receives a specific tag during the Frame Sync signal.

During the Frame Sync signal, the receiver can sample the RD line and store the data in the Receive Sync Holding Register and the transmitter can transfer Transmit Sync Holding Register in the shift register. The data length to be sampled/shifted out during the Frame Sync signal is programmed by the FSLEN field in SSC_RFMR/SSC_TFMR and has a maximum value of 256.

Concerning the Receive Frame Sync Data operation, if the Frame Sync Length is equal to or lower than the delay between the start event and the current data reception, the data sampling operation is performed in the Receive Sync Holding Register through the receive shift register.



The Transmit Frame Sync Operation is performed by the transmitter only if the bit Frame Sync Data Enable (FSDEN) in SSC_TFMR is set. If the Frame Sync length is equal to or lower than the delay between the start event and the current data transmission, the normal transmission has priority and the data contained in the Transmit Sync Holding Register is transferred in the Transmit Register, then shifted out.

56.8.5.2. Frame Sync Edge Detection

The Frame Sync Edge detection is programmed by the FSEDGE field in SSC_RFMR/SSC_TFMR. This sets the corresponding flags RXSYN/TXSYN in the SSC Status Register (SSC_SR) on Frame Sync Edge detection (signals RF/TF).

56.8.6. Receive Compare Modes

Figure 56.15. Receive Compare Modes

56.8.6.1. Compare Functions

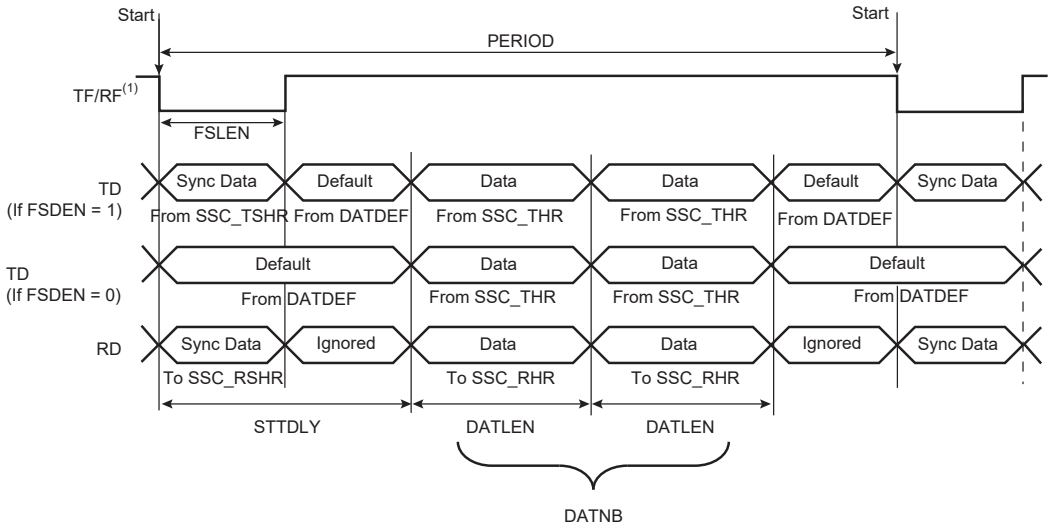
The length of the comparison patterns (Compare 0, Compare 1) and thus the number of bits they are compared to is defined by FSLEN, but with a maximum value of 256 bits. Comparison is always done by comparing the last bits received with the comparison pattern. Compare 0 can be one start event of the receiver. In this case, the receiver compares at each new sample the last bits received at the Compare 0 pattern contained in the Compare 0 Register (SSC_RC0R). When this start event is selected, the user can program the receiver to start a new data transfer either by writing a new Compare 0, or by receiving continuously until Compare 1 occurs. This selection is done with the STOP bit in the SSC_RCMR.

56.8.7. Data Format

The data framing format of both the transmitter and the receiver are programmable through the Transmitter Frame Mode Register (SSC_TFMR) and the Receive Frame Mode Register (SSC_RFMR). In either case, the user can independently select the following parameters:

- Event that starts the data transfer (START)
- Delay in number of bit periods between the start event and the first data bit (STTDLY)
- Length of the data (DATLEN)

© 2026 Microchip Technology Inc. and its subsidiaries



- Number of data to be transferred for each start event (DATNB)
- Length of synchronization transferred for each start event (FSLEN)
- Bit sense: most or least significant bit first (MSBF)

Additionally, the transmitter can be used to transfer synchronization and select the level driven on the TD pin while not in data transfer operation. This is done respectively by the Frame Sync Data Enable (FSDEN) and by the Data Default Value (DATDEF) bits in SSC_TFMR.

Table 56.2. Data Frame Registers

Transmitter	Receiver	Field	Length	Comment
SSC_TFMR	SSC_RFMR	DATLEN	Up to 32	Size of word
SSC_TFMR	SSC_RFMR	DATNB	Up to 16	Number of words transmitted in frame
SSC_TFMR	SSC_RFMR	MSBF	–	Most significant bit first
SSC_TFMR	SSC_RFMR	FSLEN	Up to 256	Size of Synchro data register
SSC_TFMR	–	DATDEF	0 or 1	Data default value ended
SSC_TFMR	–	FSDEN	–	Enable send SSC_TSHR
SSC_TCMR	SSC_RCMR	PERIOD	Up to 512	Frame size
SSC_TCMR	SSC_RCMR	STTDLY	Up to 255	Size of transmit start delay

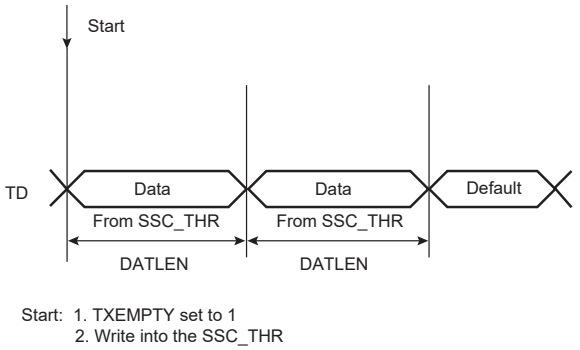
Figure 56.16. Transmit and Receive Frame Format in Edge/Pulse Start Modes

Note: 1. Example of input on falling edge of TF/RF.

In the example illustrated above, the SSC_THR is loaded twice. The FSDEN value has no effect on the transmission. SyncData cannot be output in Continuous mode.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 56.17. Transmit Frame Format in Continuous Mode (STTDLY = 0)



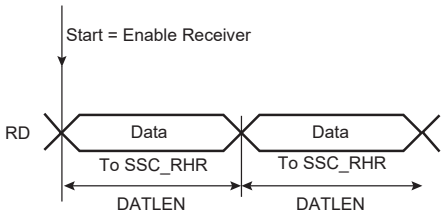


Figure 56.18. Receive Frame Format in Continuous Mode (STTDLY = 0)

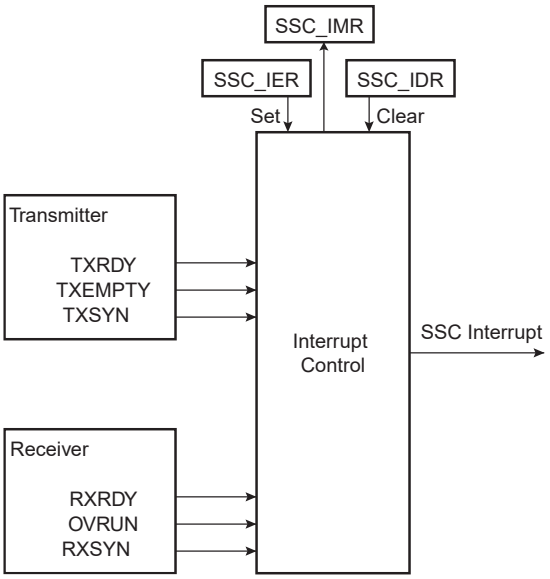
56.8.8. Loop Mode

The receiver can be programmed to receive transmissions from the transmitter. This is done by setting the Loop Mode (LOOP) bit in the SSC_RFMR. In this case, RD is connected to TD, RF is connected to TF and RK is connected to TK.



56.8.9. Interrupt

Most bits in the SSC_SR have a corresponding bit in interrupt management registers.

The SSC can be programmed to generate an interrupt when it detects an event. The interrupt is controlled by writing the Interrupt Enable Register (SSC_IER) and Interrupt Disable Register (SSC_IDR). These registers enable and disable, respectively, the corresponding interrupt by setting and clearing the corresponding bit in the Interrupt Mask Register (SSC_IMR), which controls the generation of interrupts by asserting the SSC interrupt line connected to the interrupt controller.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 56.19. Interrupt Block Diagram

56.8.10. Register Write Protection

To prevent any single software error from corrupting SSC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the SSC Write Protection Mode Register (SSC_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the SSC Write Protection Status Register (SSC_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the SSC_WPSR.

The following registers can be write-protected:

- SSC Clock Mode Register
- SSC Receive Clock Mode Register
- SSC Receive Frame Mode Register
- SSC Transmit Clock Mode Register
- SSC Transmit Frame Mode Register
- SSC Receive Compare 0 Register
- SSC Receive Compare 1 Register

							RXDIS	RXEN
Access							W	W
Reset							–	–

Bit 15 – SWRST Software Reset

Value	Description
0	No effect.
1	Performs a software reset. Has priority on any other bit in SSC_CR.

Bit 9 – TXDIS Transmit Disable

Value	Description
0	No effect.
1	Disables Transmit. If a character is currently being transmitted, disables at end of current character transmission.

Bit 8 – TXEN Transmit Enable

Value	Description
0	No effect.
1	Enables Transmit if TXDIS is not set.

Bit 1 – RXDIS Receive Disable

Value	Description
0	No effect.
1	Disables Receive. If a character is currently being received, disables at end of current character reception.

Bit 0 – RXEN Receive Enable

Value	Description
0	No effect.

	DIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 11:0 – DIV[11:0] Clock Divider

Value	Description
0	The Clock Divider is not active.
Any other value	The divided clock equals the peripheral clock divided by 2 times DIV. The maximum bit rate is $f_{peripheral\ clock}/2$. The minimum bit rate is $f_{peripheral\ clock}/2 \times 4095 = f_{peripheral\ clock}/8190$.

56.9.3. SSC Receive Clock Mode Register

Name: SSC_RCMR
Offset: 0x10
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	PERIOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	STTDLY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
				STOP	START[3:0]			
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CKG[1:0]		CKI	CKO[2:0]			CKS[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:24 – PERIOD[7:0] Receive Period Divider Selection
This field selects the divider to apply to the selected Receive Clock in order to generate a new Frame Sync signal. If 0, no PERIOD signal is generated. If not 0, a PERIOD signal is generated each 2 x (PERIOD + 1) Receive Clock.

Bits 23:16 – STTDLY[7:0] Receive Start Delay
If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the current start of reception. When the receiver is programmed to start synchronously with the transmitter, the delay is also applied.
Note: STTDLY must be configured in relation to the receive synchronization data to be stored in SSC_RSHR.

Bit 12 – STOP Receive Stop Selection

Value	Description
0	After completion of a data transfer when starting with a Compare 0, the receiver stops the data transfer and waits for a new compare 0.
1	After starting a receive with a Compare 0, the receiver operates in a continuous mode until a Compare 1 is detected.

Bits 11:8 – START[3:0] Receive Start Selection

Value	Name	Description
0	CONTINUOUS	Continuous, as soon as the receiver is enabled, and immediately after the end of transfer of the previous data.
1	TRANSMIT	Transmit start

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
2	RF_LOW	Detection of a low level on RF signal
3	RF_HIGH	Detection of a high level on RF signal
4	RF_FALLING	Detection of a falling edge on RF signal
5	RF_RISING	Detection of a rising edge on RF signal
6	RF_LEVEL	Detection of any level change on RF signal
7	RF_EDGE	Detection of any edge on RF signal
8	CMP_0	Compare 0

Bits 7:6 – CKG[1:0] Receive Clock Gating Selection

Value	Name	Description
0	CONTINUOUS	None
1	EN_RF_LOW	Receive Clock enabled only if RF Low
2	EN_RF_HIGH	Receive Clock enabled only if RF High

Bit 5 – CKI Receive Clock Inversion

CKI affects only the Receive Clock and not the output clock signal.

Value	Description
0	The data inputs (Data and Frame Sync signals) are sampled on Receive Clock falling edge. The Frame Sync signal output is shifted out on Receive Clock rising edge.
1	The data inputs (Data and Frame Sync signals) are sampled on Receive Clock rising edge. The Frame Sync signal output is shifted out on Receive Clock falling edge.

Bits 4:2 – CKO[2:0] Receive Clock Output Mode Selection

Value	Name	Description
0	NONE	None, RK pin is an input
1	CONTINUOUS	Continuous Receive Clock, RK pin is an output
2	TRANSFER	Receive Clock only during data transfers, RK pin is an output

Bits 1:0 – CKS[1:0] Receive Clock Selection

Value	Name	Description
0	MCK	Divided Clock
1	TK	TK Clock signal
2	RK	RK pin

© 2026 Microchip Technology Inc. and its subsidiaries

56.9.4. SSC Receive Frame Mode Register

Name: SSC_RFMR
Offset: 0x14
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	FSLEN_EXT[3:0]							FSEDGE
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0

Bit	23	22	21	20	19	18	17	16
		FSOS[2:0]			FSLEN[3:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
					DATNB[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MSBF		LOOP	DATLEN[4:0]				
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

Bits 31:28 – FSLEN_EXT[3:0] FSLEN Field Extension
Extends FSLEN field. For details, see FSLEN: Receive Frame Sync Length.

Bit 24 – FSEDGE Frame Sync Edge Detection
Determines which edge on Frame Sync will generate the interrupt RXSYN in the SSC Status Register.

Value	Name	Description
0	POSITIVE	Positive Edge Detection
1	NEGATIVE	Negative Edge Detection

Bits 22:20 – FSOS[2:0] Receive Frame Sync Output Selection

Value	Name	Description
0	NONE	None, RF pin is an input
1	NEGATIVE	Negative Pulse, RF pin is an output
2	POSITIVE	Positive Pulse, RF pin is an output
3	LOW	Driven Low during data transfer, RF pin is an output
4	HIGH	Driven High during data transfer, RF pin is an output
5	TOGGLING	Toggling at each start of data transfer, RF pin is an output

Bits 19:16 – FSLEN[3:0] Receive Frame Sync Length
This field defines the number of bits sampled and stored in the Receive Sync Data Register. When this mode is selected by the START field in the Receive Clock Mode Register, it also determines the length of the sampled data to be compared to the Compare 0 or Compare 1 register.
This field is used with FSLEN_EXT to determine the pulse length of the Receive Frame Sync signal.

© 2026 Microchip Technology Inc. and its subsidiaries

Pulse length is equal to FSLEN + (FSLEN_EXT × 16) + 1 Receive Clock periods.

Bits 11:8 – DATNB[3:0] Data Number per Frame
This field defines the number of data words to be received after each transfer start, which is equal to (DATNB + 1).

Bit 7 – MSBF Most Significant Bit First

Value	Description
0	The lowest significant bit of the data register is sampled first in the bit stream.
1	The most significant bit of the data register is sampled first in the bit stream.

Bit 5 – LOOP Loop Mode

Value	Description
0	Normal operating mode.
1	RD is driven by TD, RF is driven by TF and TK drives RK.

Bits 4:0 – DATLEN[4:0] Data Length

Value	Description
0	Forbidden value (1-bit data length not supported).
Any other value	The bit stream contains DATLEN + 1 data bit.

© 2026 Microchip Technology Inc. and its subsidiaries

56.9.5. SSC Transmit Clock Mode Register

Name: SSC_TCMR
Offset: 0x18
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	PERIOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	STTDLY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
					START[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CKG[1:0]		CKI	CKO[2:0]			CKS[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:24 – PERIOD[7:0] Transmit Period Divider Selection
This field selects the divider to apply to the selected Transmit Clock to generate a new Frame Sync signal. If 0, no period signal is generated. If not 0, a period signal is generated at each 2 × (PERIOD + 1) Transmit Clock.

Bits 23:16 – STTDLY[7:0] Transmit Start Delay
If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the current start of transmission of data. When the transmitter is programmed to start synchronously with the receiver, the delay is also applied.
Note: STTDLY must be set carefully. If STTDLY is too short in respect to TAG (Transmit Sync Data) transmission, data is transmitted instead of the end of TAG.

Bits 11:8 – START[3:0] Transmit Start Selection

Value	Name	Description
0	CONTINUOUS	Continuous, as soon as a word is written in the SSC_THR (if Transmit is enabled), and immediately after the end of transfer of the previous data
1	RECEIVE	Receive start
2	TF_LOW	Detection of a low level on TF signal
3	TF_HIGH	Detection of a high level on TF signal
4	TF_FALLING	Detection of a falling edge on TF signal
5	TF_RISING	Detection of a rising edge on TF signal
6	TF_LEVEL	Detection of any level change on TF signal
7	TF_EDGE	Detection of any edge on TF signal

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 7:6 – CKG[1:0] Transmit Clock Gating Selection

Value	Name	Description
0	CONTINUOUS	None
1	EN_TF_LOW	Transmit Clock enabled only if TF Low
2	EN_TF_HIGH	Transmit Clock enabled only if TF High

Bit 5 – CKI Transmit Clock Inversion

CKI affects only the Transmit Clock and not the Output Clock signal.

Value	Description
0	The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock falling edge. The Frame Sync signal input is sampled on Transmit Clock rising edge.
1	The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock rising edge. The Frame Sync signal input is sampled on Transmit Clock falling edge.

Bits 4:2 – CKO[2:0] Transmit Clock Output Mode Selection

Value	Name	Description
0	NONE	None, TK pin is an input
1	CONTINUOUS	Continuous Transmit Clock, TK pin is an output
2	TRANSFER	Transmit Clock only during data transfers, TK pin is an output

Bits 1:0 – CKS[1:0] Transmit Clock Selection

Value	Name	Description
0	MCK	Divided Clock
1	RK	RK Clock signal
2	TK	TK pin

© 2026 Microchip Technology Inc. and its subsidiaries

56.9.6. SSC Transmit Frame Mode Register

Name: SSC_TFMR
Offset: 0x1C
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	FSLEN_EXT[3:0]							FSEDGE
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0

Bit	23	22	21	20	19	18	17	16
	FSDEN	FSOS[2:0]			FSLEN[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
					DATNB[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MSBF		DATDEF	DATLEN[4:0]				
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

Bits 31:28 – FSLEN_EXT[3:0] FSLEN Field Extension
Extends FSLEN field. For details, see the description of FSLEN.

Bit 24 – FSEDGE Frame Sync Edge Detection
Determines which edge on frame synchronization will generate the interrupt TXSYN (Status Register).

Value	Name	Description
0	POSITIVE	Positive Edge Detection
1	NEGATIVE	Negative Edge Detection

Bit 23 – FSDEN Frame Sync Data Enable

Value	Description
0	The TD line is driven with the default value during the Transmit Frame Sync signal.
1	SSC_TSHR value is shifted out during the transmission of the Transmit Frame Sync signal.

Bits 22:20 – FSOS[2:0] Transmit Frame Sync Output Selection

Value	Name	Description
0	NONE	None, TF pin is an input
1	NEGATIVE	Negative Pulse, TF pin is an output
2	POSITIVE	Positive Pulse, TF pin is an output
3	LOW	Driven Low during data transfer
4	HIGH	Driven High during data transfer
5	TOGGLING	Toggling at each start of data transfer

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 19:16 – FSLEN[3:0] Transmit Frame Sync Length

This field defines the length of the Transmit Frame Sync signal and the number of bits shifted out from SSC_TSHR if FSDEN is 1.
This field is used with FSLEN_EXT to determine the pulse length of the Transmit Frame Sync signal. Pulse length is equal to FSLEN + (FSLEN_EXT × 16) + 1 Transmit Clock period.

Bits 11:8 – DATNB[3:0] Data Number per Frame

This field defines the number of data words to be transferred after each transfer start, which is equal to (DATNB + 1).

Bit 7 – MSBF Most Significant Bit First

Value	Description
0	The lowest significant bit of the data register is shifted out first in the bit stream.
1	The most significant bit of the data register is shifted out first in the bit stream.

Bit 5 – DATDEF Data Default Value

This bit defines the level driven on the TD pin while out of transmission. Note that if the pin is defined as multi-drive by the PIO Controller, the pin is enabled only if the SCC TD output is 1.
When the TD pin is configured in Multi-drive (Open-drain) mode by the PIO controller, a 0 is driven if SSC data output equals 0 and the pin is in high-impedance when SSC data output is 1.

Bits 4:0 – DATLEN[4:0] Data Length

Value	Description
0	Forbidden value (1-bit data length not supported).
Any other value	The bit stream contains DATLEN + 1 data bit.

Bit 17 – RXEN Receive Enable

Value	Description
0	Receive is disabled.
1	Receive is enabled.

Bit 16 – TXEN Transmit Enable

Value	Description
0	Transmit is disabled.
1	Transmit is enabled.

Bit 11 – RXSYN Receive Sync

Value	Description
0	No Rx Sync has occurred since the last read of the Status register.
1	An Rx Sync has occurred since the last read of the Status register.

Bit 10 – TXSYN Transmit Sync

Value	Description
0	No Tx Sync has occurred since the last read of the Status register.
1	A Tx Sync has occurred since the last read of the Status register.

Bit 9 – CP1 Compare 1

Value	Description
0	No compare 1 has occurred since the last read of the Status register.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	A compare 1 has occurred since the last read of the Status register.

Bit 8 – CP0 Compare 0

Value	Description
0	No compare 0 has occurred since the last read of the Status register.
1	A compare 0 has occurred since the last read of the Status register.

Bit 5 – OVRUN Receive Overrun

Value	Description
0	No data has been loaded in SSC_RHR while previous data has not been read since the last read of the Status Register.
1	Data has been loaded in SSC_RHR while previous data has not yet been read since the last read of the Status Register.

Bit 4 – RXRDY Receive Ready

Value	Description
0	SSC_RHR is empty.
1	Data has been received and loaded in SSC_RHR.

Bit 1 – TXEMPTY Transmit Empty

Value	Description
0	Data remains in SSC_THR or is currently transmitted from TSR.
1	Last data written in SSC_THR has been loaded in TSR and last data loaded in TSR has been transmitted.

Bit 0 – TXRDY Transmit Ready

Value	Description
0	Data has been loaded in SSC_THR and is waiting to be loaded in the Transmit Shift register (TSR).
1	SSC_THR is empty.

Security and Cryptography Subsystem

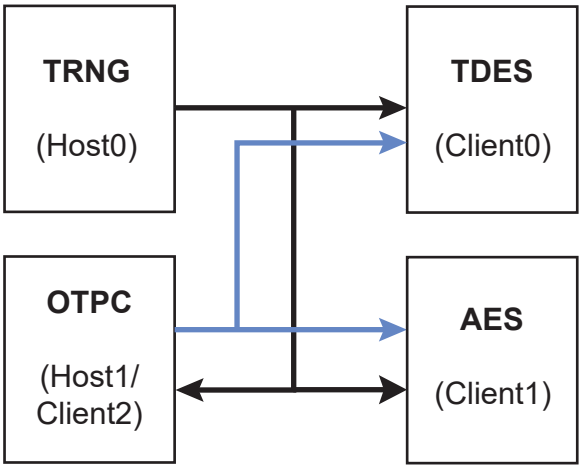
57. Overview

57.1. Components

- Advanced Encryption Standard (AES) engine
- Triple Data Encryption Standard (TDES) engine
- Secure Hash Algorithm (SHA)
- True Random Number Generator (TRNG)
- One-Time-Programming Memory Controller (OTPC)
- One Physically Unclonable Function (PUF)

Data is moved into and out of the different blocks using a Direct Memory Access (DMA) engine.

57.1.1. Cryptography Subsystem Keybus



The keybus is a private bus transferring keys from hosts (TRNG, OTPC) to clients (AES, TDES, OTPC) with no possibility for the processor or software to read the keys.

The key used by the crypto IPs is provided either by the keybus internal register or by the IPs internal key register (KEYWR). To select the keybus as a source for AES and TDES, the PKRS bit must be set in the MR/EMR register.

At host level, the client destination and the key length must be defined before starting the transfer.

The device features a keybus system with two hosts and three clients, connected as shown in the following figure.

Figure 57.1. Cryptography Keybus

57.2. Product Dependencies

57.2.1. Clocks

All clocks are controlled by the PMC, which is part of the system controller.

57.2.2. Interrupts

Refer to the table Peripheral Identifiers.

© 2026 Microchip Technology Inc. and its subsidiaries

57.2.3. Reset

Cryptography peripherals are connected to the processor and peripherals reset line.

57.2.4. I/Os

None.

57.3. Special Functions in SFR

The PUF is controlled with several registers:

- SFR_PUFCTL manages power and enable/disable of the peripheral.
- SFR_PUFDIS manages the allowed functions.
- SFR_PUFRUCR0, SFR_PUFWOCR0, SFR_PUFRUCR1 and SFR_PUFWOCR1 manages the key generation allowed for the consumers (ROM code, bootstrap, various applications).

© 2026 Microchip Technology Inc. and its subsidiaries

58. Advanced Encryption Standard (AES)

58.1. Description

The Advanced Encryption Standard (AES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 197 specification.

The AES supports the following confidentiality modes of operation for symmetrical key block cipher algorithms: ECB, CBC, OFB, CFB, CTR and XTS, as specified in the NIST Special Publication 800-38A Recommendation and NIST Special Publication 800-38E Recommendation, as well as Galois/Counter Mode (GCM) as specified in the NIST Special Publication 800-38D Recommendation. It is compatible with all these modes via DMA Controller channels, minimizing processor intervention for large buffer transfers.

The AES key can be either loaded by the software or loaded in an invisible manner from the software.

The 128-bit/192-bit/256-bit AES key is stored in the AES Key register made of four/six/eight 32-bit write-only AES Key Word registers (AES_KEYWR0–7). For a software-invisible key transfer, the Private Key Bus accesses the Private Key Internal Register from the TRNG or OTPC. The bit PKRS in the Extended Mode register (AES_EMR) selects either AES_KEYWRx or the Private Key Internal Register.

The 128-bit input data and initialization vector (for some modes) are each stored in four 32-bit write-only AES Input Data registers (AES_IDATAR0–3) and AES Initialization Vector registers (AES_IVR0–3).

As soon as the initialization vector, the input data and the key are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data are ready to be read out on the four 32-bit AES Output Data registers (AES_ODATAR0–3) or through the DMA channels.

58.2. Embedded Characteristics

- Compliant with FIPS Publication 197, Advanced Encryption Standard (AES)
- 128-bit/192-bit/256-bit Cryptographic Key
- 10/12/14 Clock Cycles Encryption/Decryption Inherent Processing Time with a 128-bit/192-bit/256-bit Cryptographic Key
- Double Input Buffer Optimizes Runtime
- Automatic Padding supported for IPSec and SSL standards
- IPSec and SSL Protocol Layers Improved Performances (Tightly coupled with SHA)
- Support of the Modes of Operation Specified in the NIST Special Publication 800-38A and NIST Special Publication 800-38D and NIST Special Publication 800-38E:
  - Electronic Codebook (ECB)
  - Cipher Block Chaining (CBC) including CBC-MAC
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
  - Counter (CTR)
  - Galois/Counter Mode (GCM)
  - XEX-Based Tweaked-Codebook Mode (XTS)
- 8, 16, 32, 64 and 128-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allows Optimized Message Authentication Code (MAC) Generation
- Temporary Secure Storage for Keys
- Private Key Bus Access to the Private Key Internal Registers Not Readable from any Peripheral or Software

© 2026 Microchip Technology Inc. and its subsidiaries

- Abnormal Software Access and Internal Sequencer Integrity Check Reports
- Register Write Protection
- Connection to DMA Optimizes Data Transfers for all Operating Modes

58.3. Product Dependencies

58.3.1. Power Management

The AES is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the AES clock.

58.3.2. Interrupt Sources

The AES interface has an interrupt line connected to the Interrupt Controller.

Handling the AES interrupt requires programming the Interrupt Controller before configuring the AES.

58.4. Functional Description

The Advanced Encryption Standard (AES) specifies a FIPS-approved cryptographic algorithm that can be used to protect electronic data. The AES algorithm is a symmetric block cipher that can encrypt (encipher) and decrypt (decipher) information.

Encryption converts data to an unintelligible form called ciphertext. Decrypting the ciphertext converts the data back into its original form, called plaintext. The CIPHER bit in the Mode register (AES_MR) allows selection between the encryption and the decryption processes.

The AES is capable of using cryptographic keys of 128/192/256 bits to encrypt and decrypt data in blocks of 128 bits. This 128-bit/192-bit/256-bit key is defined in the user interface AES_KEYWRx register or in the Private Key internal registers, only writable from the Private Key bus to make the key invisible to the software.

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 128-bit data block called the initialization vector (IV), which must be set in AES_IVRx. The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message. AES_IVRx are also used by the CTR mode to set the counter value.

58.4.1. AES Register Endianness

In Arm processor-based products, the system bus and processors manipulate data in little-endian form. The AES interface requires little-endian format words. However, in accordance with the protocol of the FIPS 197 specification, data is collected, processed and stored by the AES algorithm in big-endian form.

The following example illustrates how to configure the AES:

If the first 64 bits of a message (according to FIPS 197, i.e., big-endian format) to be processed is 0xcafedeca_01234567, then AES_IDATAR0 and AES_IDATAR1 registers must be written with the following pattern:

- AES_IDATAR0 = 0xcadefeca
- AES_IDATAR1 = 0x67452301

58.4.2. Operating Modes

The AES supports the following modes of operation:

- ECB: Electronic Codebook
- CBC: Cipher Block Chaining
  - CBC-MAC: Useful for CMAC hardware acceleration

© 2026 Microchip Technology Inc. and its subsidiaries

- OFB: Output Feedback
- CFB: Cipher Feedback
  - CFB8 (CFB where the length of the data segment is 8 bits)
  - CFB16 (CFB where the length of the data segment is 16 bits)
  - CFB32 (CFB where the length of the data segment is 32 bits)
  - CFB64 (CFB where the length of the data segment is 64 bits)
  - CFB128 (CFB where the length of the data segment is 128 bits)
- CTR: Counter
- GCM: Galois/Counter Mode
- XTS: XEX-based Tweaked-codebook Mode

Data pre-processing, data post-processing and data chaining for the concerned modes are performed automatically. Refer to the *NIST Special Publication 800-38A* and *NIST Special Publication 800-38D* for more complete information.

Mode selection is done by configuring AES_MR.OPMOD.

When switching from an operating mode requiring the initialization vectors (e.g. CBC, GCM) to another operating mode that does not require initialization vectors (e.g. ECB) and a message of one block has been processed, initialization vector registers (AES_IVRx) must be cleared before switching to the new mode.

In CFB mode, five data sizes are possible (8, 16, 32, 64 or 128 bits), configurable by means of AES_MR.CFBS.

In CTR mode, the size of the block counter embedded in the module is 16 bits. Therefore, there is a rollover after processing 1 Mbyte of data. If the file to be processed is greater than 1 Mbyte, this file must be split into fragments of 1 Mbyte or less for the first fragment if the initial value of the counter is greater than 0. Prior to loading the first fragment into AES_IDATARx, AES_IVRx must be fully programmed with the initial counter value. For any fragment, after the transfer is completed and prior to transferring the next fragment, AES_IVRx must be programmed with the appropriate counter value.

If the initial value of the counter is greater than 0 and the data buffer size to be processed is greater than 1 Mbyte, the size of the first fragment to be processed must be 1 Mbyte minus 16 × (initial value) to prevent a rollover of the internal 16-bit counter.

To have a sequential increment, the counter value must be programmed with the value programmed for the previous fragment + 2^{16} (or less for the first fragment).

All AES_IVRx fields must be programmed to take into account the possible carry propagation.

58.4.3. Double Input Buffer

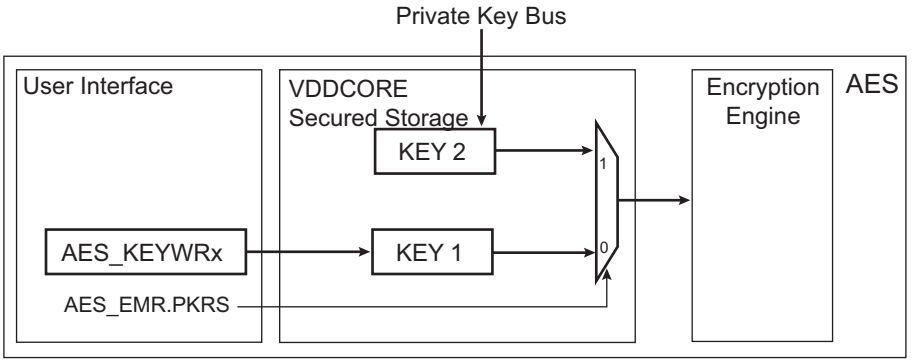
AES_IDATARx can be double-buffered to reduce the runtime of large files.

This mode allows a new message block to be written when the previous message block is being processed. This is only possible when DMA accesses are performed (AES_MR.SMOD = 2).

AES_MR.DUALBUFF must be set to ‘1’ to access the double buffer.

58.4.4. Temporary Secured Storage for Keys

The AES provides secure storage for up to 2x 256-bit keys. The storage is available while VDDCORE voltage is supplied.



The keys can be only written in AES internal registers and are not readable. Moreover, the internal registers holding the keys are buried in the overall product logic area during the physical implementation.

© 2026 Microchip Technology Inc. and its subsidiaries

One key can be loaded by software by writing the Key Word registers (AES_KEYWRx).

One key can be loaded by Private Key bus only.

Figure 58.1. Temporary Secured Storage for Keys

58.4.5. Start Modes

AES_MR.SMOD defines the way the encryption (or decryption) starts: manually, automatically after a data is loaded or via DMA operation.

58.4.5.1. Manual Mode

The sequence of actions is as follows:

1. Write AES_MR with all required fields, including but not limited to SMOD and OPMOD. (Write AES_EMR.PKRS according to the type of key to be loaded).
2. Write the 128-bit/192-bit/256-bit AES key in AES_KEYWRx or in the Private Key internal registers.
3. Write the initialization vector (or counter) in AES_IVRx.
   Note: AES_IVRx concerns all modes except ECB.
4. Set the bit DATRDY (Data Ready) in the AES Interrupt Enable register (AES_IER), depending on whether an interrupt is required or not at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized AES_IDATARx (see the following table).
6. Set the START bit in the Control register (AES_CR) to begin the encryption or the decryption process.
7. When processing completes, the DATRDY flag in the Interrupt Status register (AES_ISR) is raised. If an interrupt has been enabled by setting AES_IER.DATRDY, the interrupt line of the AES is activated.
8. When software reads one of AES_ODATARx, AES_IER.DATRDY is automatically cleared.

Table 58.1. Authorized Input Data Registers

Operating Mode	Input Data Registers to Write
ECB	All
CBC	All
OFB	All
128-bit CFB	All
64-bit CFB	AES_IDATAR0 and AES_IDATAR1
32-bit CFB	AES_IDATAR0
16-bit CFB	AES_IDATAR0
8-bit CFB	AES_IDATAR0
CTR	All

© 2026 Microchip Technology Inc. and its subsidiaries

Table 58.1. Authorized Input Data Registers (continued)

Operating Mode	Input Data Registers to Write
GCM	All
XTS	All

Notes:

1. In 64-bit CFB mode, writing to AES_IDATAR2 and AES_IDATAR3 is not allowed and may lead to errors in processing.
2. In 32, 16, and 8-bit CFB modes, writing to AES_IDATAR1, AES_IDATAR2 and AES_IDATAR3 is not allowed and may lead to errors in processing.

58.4.5.2. Auto Mode

Auto mode is similar to Manual mode, except that in this mode, as soon as the correct number of AES_IDATARx is written, processing is automatically started without any action in AES_CR.

58.4.5.3. DMA Mode

The DMA Controller can be used in association with the AES to perform an encryption/decryption of a buffer without any action by software during processing.

AES_MR.SMOD must be configured to 2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (AES_MR.LOD=1), 2 DMA channels must be programmed (transmit and receive). In CBC-MAC, only 1 transmit channel must be programmed.

The start address of any transfer descriptor must be configured with the address of AES_IDATAR0.

The DMA chunk size configuration depends on the AES mode of operation and is summarized in the following table.

When writing data to AES with a first DMA channel, data are first fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the AES with the second DMA channel, the source data is the data read from AES and data destination is the memory buffer. In this case, the source data size depends on the AES mode of operation, as shown in the following table.

Table 58.2. DMA Data Transfer Type for the Different Operating Modes

Operating Mode	Chunk Size	Destination/Source Data Transfer Type
ECB	4	Word
CBC	4	Word
OFB	4	Word
CFB 128-bit	4	Word
CFB 64-bit	1	Word
CFB 32-bit	1	Word
CFB 16-bit	1	Half-word
CFB 8-bit	1	Byte
CTR	4	Word
GCM	4	Word
XTS	4	Word

58.4.6. Last Output Data Mode (CBC-MAC)

This mode is used to generate cryptographic checksums on data (MAC) by means of cipher block chaining encryption algorithm (CBC-MAC algorithm for example).

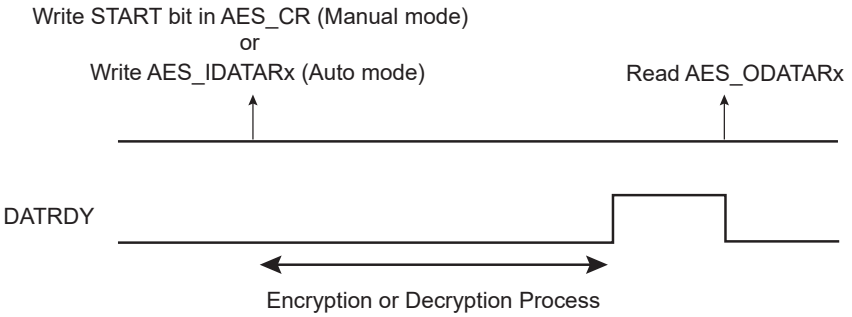
© 2026 Microchip Technology Inc. and its subsidiaries

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data are available either on AES_ODATARx for Manual and Auto modes, or at the address specified in the receive buffer pointer for DMA mode (see Table 58.3).

AES_MR.LOD allows retrieval of only the last data of several encryption/decryption processes.

Therefore, there is no need to define a read buffer in DMA mode.



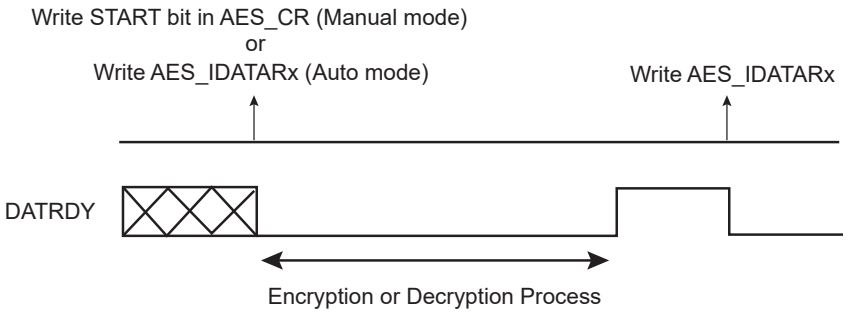
Those data are only available in AES_ODATARx.

58.4.6.1.Manual and Auto Modes

58.4.6.1.1.If AES_MR.LOD = 0

The DATRDY flag is cleared when at least one AES_ODATARx is read (see the following figure).

Figure 58.2. Manual and Auto Modes with AES_MR.LOD = 0



If the user does not want to read AES_ODATARx between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user cannot know the end of the following encryptions/decryptions.

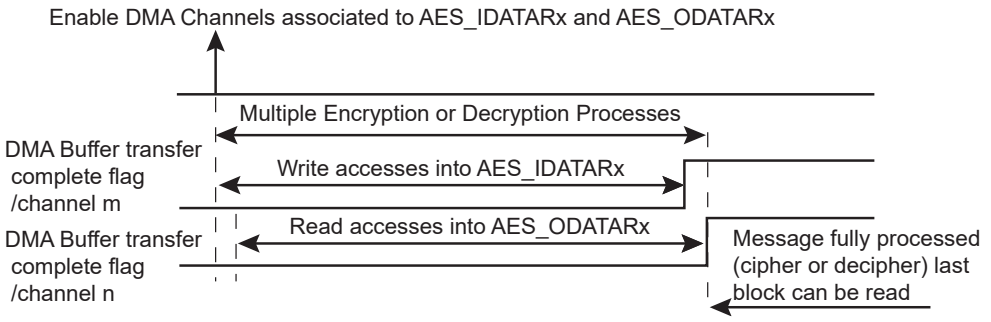
58.4.6.1.2.If AES_MR.LOD = 1

This mode is optimized to process AES CBC-MAC operating mode.

The DATRDY flag is cleared when at least one AES_IDATAR is written (see the following figure). No additional AES_ODATAR reads are necessary between consecutive encryptions/decryptions.

Figure 58.3. Manual and Auto Modes with AES_MR.LOD = 1

58.4.6.2.DMA Mode



58.4.6.2.1.If AES_MR.LOD = 0

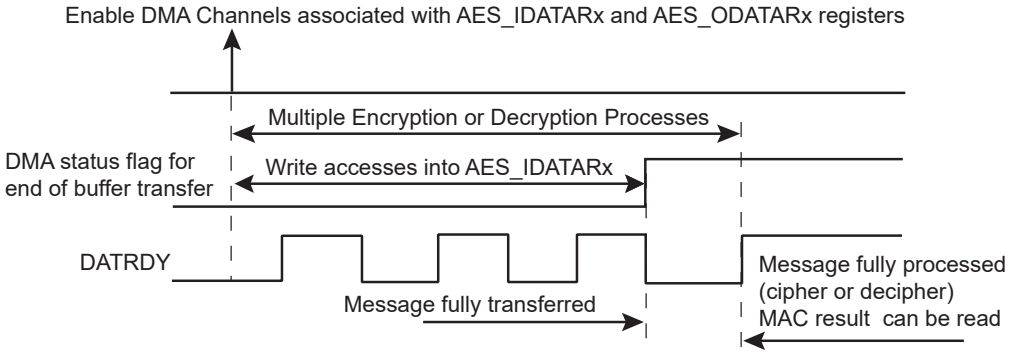
This mode may be used for all AES operating modes except CBC-MAC where AES_MR.LOD = 1 mode is recommended.

© 2026 Microchip Technology Inc. and its subsidiaries

The end of the encryption/decryption is indicated by the end of DMA transfer associated to AES_ODATARx (see the following figure). Two DMA channels are required: one for writing message blocks to AES_IDATARx and one to obtain the result from AES_ODATARx.

Figure 58.4. DMA Transfer with AES_MR.LOD = 0

58.4.6.2.2.If AES_MR.LOD = 1



This mode is optimized to process AES CBC-MAC operating mode.

The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the following figure).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, AES_MR.SMOD must be written to '0'. To restart a CBC-MAC on a new buffer, AES_MR.SMOD must be written to '2'.

The output data are only available on AES_ODATARx.

Figure 58.5. DMA Transfer with AES_MR.LOD = 1

The following table summarizes the different cases.

Table 58.3. Last Output Data Mode Behavior versus Start Modes

Sequence	Manual and Auto Modes		DMA Transfer	
	AES_MR.LOD = 0	AES_MR.LOD = 1	AES_MR.LOD = 0	AES_MR.LOD = 1
DATRDY Flag Clearing Condition[1]	At least one AES_ODATAR must be read	At least one AES_IDATAR must be written	Not used	Managed by the DMA
End of Encryption/ Decryption Notification	DATRDY	DATRDY	2 DMA Buffer transfer complete flags (channel m and channel n)	DMA buffer transfer complete flag, then AES DATRDY flag
Encrypted/ Decrypted Data Result Location	In AES_ODATARx	In AES_ODATARx	At the address specified in the Channel Buffer Transfer Descriptor	In AES_ODATARx

© 2026 Microchip Technology Inc. and its subsidiaries

Note:

1. Depending on the mode, there are other ways of clearing the DATRDY flag. See AES_ISR.

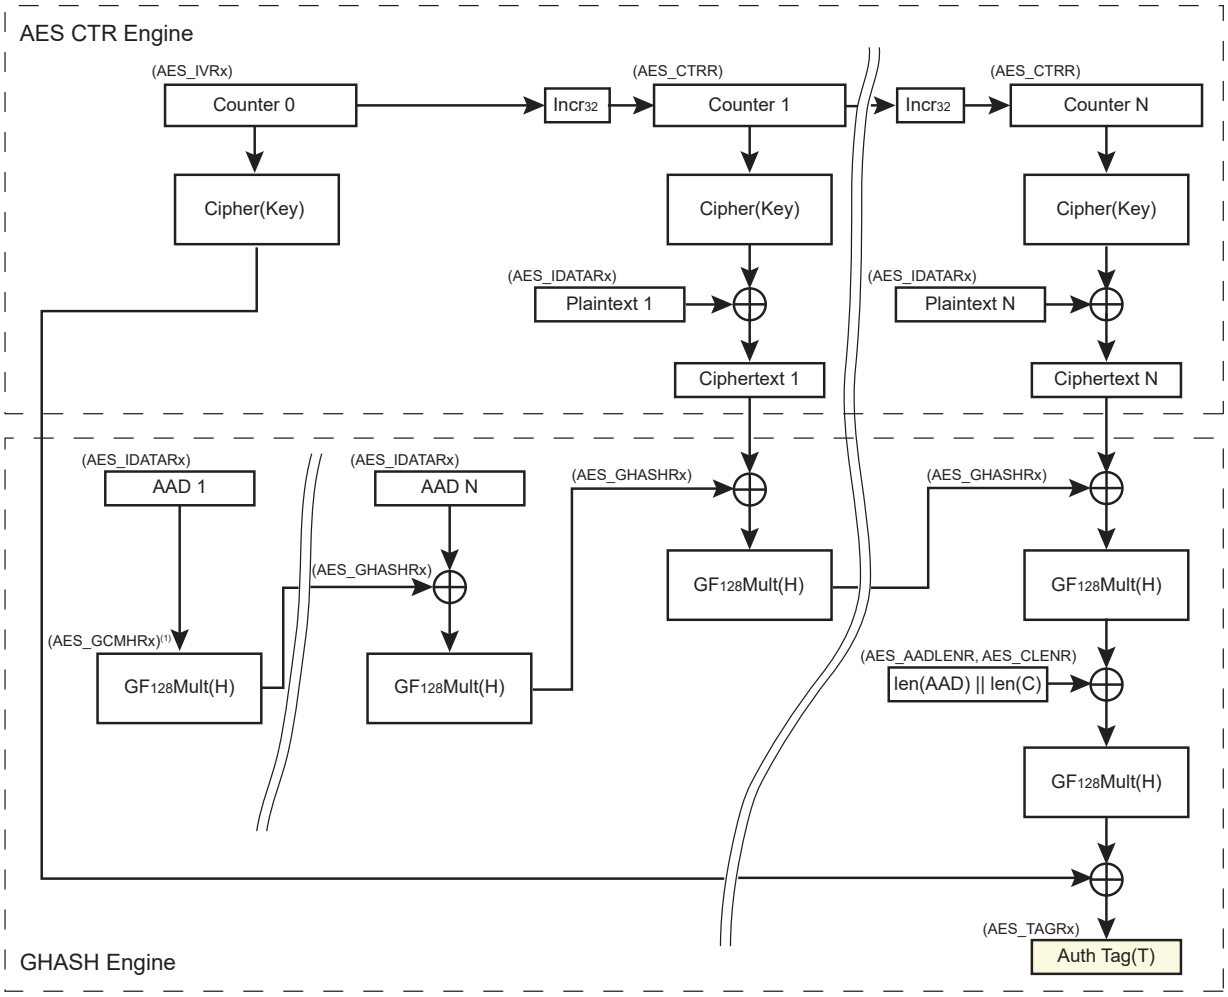
WARNING In DMA mode, reading AES_ODATARx before the last data transfer may lead to unpredictable results.

58.4.7. Galois/Counter Mode (GCM)

58.4.7.1. Description

GCM comprises the AES engine in CTR mode along with a universal hash function (GHASH engine) that is defined over a binary Galois field to produce a message authentication tag (the AES CTR engine and the GHASH engine are depicted in the following figure.

The GHASH engine processes data packets after the AES operation. GCM assures the confidentiality of data through the AES Counter mode of operation for encryption. Authenticity of the confidential data is assured through the GHASH engine. GCM can also provide assurance of data that is not encrypted. Refer to *NIST Special Publication 800-38D* for more complete information.



GCM can be used with or without the DMA host. Messages may be processed as a single complete packet of data or they may be broken into multiple packets of data over time.

GCM processing is computed on 128-bit input data fields. There is no support for unaligned data. The AES key can be any length supported by the AES module.

The recommended programming procedure when using DMA is described in the section GCM Processing.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 58.6. GCM Block Diagram

Note: 1. Optional

58.4.7.2.Key Writing and Automatic Hash Subkey Calculation

Whenever a new key is written to the hardware, two automatic actions are processed:

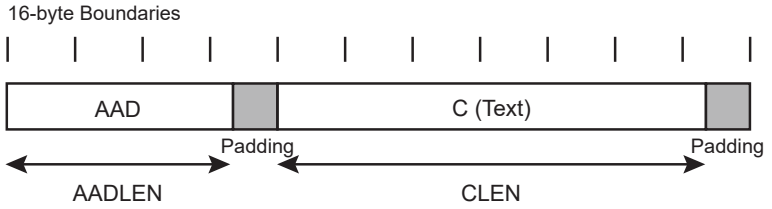
- GCM Hash Subkey *H* generation—The GCM hash subkey (*H*) is automatically generated. The GCM hash subkey generation must be complete before doing any other action. AES_ISR.DATRDY indicates when the subkey generation is complete (with interrupt if configured). The GCM hash subkey calculation is processed with the formula *H* = CIPHER(Key, <128 bits to zero>). The generated GCM *H* value is then available in AES_GCMHRx. If the application software requires a specific hash subkey, the automatically generated *H* value can be overwritten in AES_GCMHRx. AES_GCMHRx can be written after the end of the hash subkey generation (see AES_ISR.DATRDY) and prior to starting the input data feed.
- AES_GHASHRx Clear—AES_GHASHRx are automatically cleared. If a hash initial value is needed for the GHASH, it must be written to AES_GHASHRx
  - after writing AES_KEYWRx, if any
  - before starting the input data feed

58.4.7.3.GCM Processing

GCM processing is made up of three phases:

© 2026 Microchip Technology Inc. and its subsidiaries

1. Processing the Additional Authenticated Data (*AAD*), hash computation only.
2. Processing the Ciphertext (C), hash computation + ciphering/deciphering.
3. Generating the Tag using length of *AAD*, length of C and J_0 (refer to NIST documentation for details).



The Tag generation can be done either automatically, after the end of *AAD*/C processing if AES_MR.GTAGEN is set, or manually using AES_GHASHRx.GHASH (see subsections Processing a Complete Message with Tag Generation and Manual GCM Tag Generation for details).

58.4.7.3.1.Processing a Complete Message with Tag Generation

Use this procedure only if J0 four LSB bytes ≠ 0xFFFFFFFF.

Note: If J_0 four LSB bytes = 0xFFFFFFFF or if the value is unknown, use the procedure described in Processing a Complete Message without Tag Generation followed by the procedure in Manual GCM Tag Generation.

Figure 58.7. Full Message Alignment

To process a complete message with Tag generation, the sequence is as follows:

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '1'.
2. Write the key and wait until AES_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. See Key Writing and Automatic Hash Subkey Calculation.
3. Calculate the J_0 value as described in NIST documentation $J_0 = IV \,||\, 0^{31} \,||\, 1$ when len(IV) = 96 and $J_0 = GHASH_H(IV \,||\, 0^{s+64} \,||\, [len(IV)]64)$ if len(IV) ≠ 96. See Processing a Message with only AAD (GHASHH) for J_0 generation.
4. Set AES_IVRx.IV with inc32(J_0) (J_0 + 1 on 32 bits).
5. Configure AES_AADLENR.AADLEN and AES_CLENR.CLEN.
6. Fill AES_IDATARx.IDATA with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing *AAD*).
7. Wait for TAGRDY to be set (use interrupt if needed), then read AES_TAGRx.TAG to obtain the authentication tag of the message.

58.4.7.3.2.Processing a Complete Message without Tag Generation

Processing a message without generating the Tag can be used to customize the Tag generation, or to process a fragmented message. To manually generate the GCM Tag, see Manual GCM Tag Generation.

To process a complete message without Tag generation, the sequence is as follows:

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.
2. Write the key and wait until AES_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.

© 2026 Microchip Technology Inc. and its subsidiaries

3. Calculate the J0 value as described in NIST documentation J_0 = IV || 0^{31} || 1 when len(IV) = 96 and J_0 = $GHASH_H$(IV || 0^{s+64} || [len(IV)]64) if len(IV) ≠ 96. See Processing a Message with only AAD (GHASHH) for J_0 generation example when len(IV) ≠ 96.
4. Set AES_IVRx.IV with inc32(J_0) (J_0 + 1 on 32 bits).
5. Configure AES_AADLENR.AADLEN and AES_CLENR.CLEN.
6. Fill AES_IDATARx.IDATA with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing *AAD*).
7. Make sure the last output data have been read if AES_CLENR.CLEN ≠ 0 (or wait for DATRDY), then read AES_GHASHRx.GHASH to obtain the hash value after the last processed data.

58.4.7.3.3.Processing a Fragmented Message without Tag Generation

If needed, a message can be processed by fragments, in such case automatic GCM Tag generation is not supported.

To process a message by fragments, the sequence is as follows:

- First fragment:

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.
2. Write the key and wait for AES_ISR.DATRDY to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.
3. Calculate the J_0 value as described in NIST documentation J_0 = IV || 0^{31} || 1 when len(IV) = 96 and J_0 = $GHASH_H$(IV || 0^{s+64} || [len(IV)]64) if len(IV) ≠ 96. See Processing a Message with only AAD (GHASHH) for J_0 generation example when len(IV) ≠ 96.
4. Set AES_IVRx.IV with inc32(J_0) (J_0 + 1 on 32 bits).
5. Configure AES_AADLENR.AADLEN and AES_CLENR.CLEN according to the length of the first fragment, or set the fields with the full message length (both configurations work).
6. Fill AES_IDATARx.IDATA with the first fragment of the message to process (aligned on 16-byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing *AAD*).
7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in *AAD* phase), then read AES_GHASHRx.GHASH to obtain the value of the hash after the last processed data and finally read AES_CTR.CTR to obtain the value of the CTR encryption counter (not needed when the fragment ends in AAD phase).

- Next fragment (or last fragment):

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.
2. Write the key and wait until AES_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.
3. Set AES_IVRx.IV as follows:
   - If the first block of the fragment is a block of Additional Authenticated data, set AES_IVRx.IV with the J_0 initial value
   - If the first block of the fragment is a block of Plaintext data, set AES_IVRx.IV with a value constructed as follows: 'LSB96(J_0) || CTR' value, (96 bit LSB of J_0 concatenated with saved CTR value from previous fragment).

© 2026 Microchip Technology Inc. and its subsidiaries

4. Configure AES_AADLENR.AADLEN and AES_CLENR.CLEN according to the length of the current fragment, or set the fields with the remaining message length, both configurations work.
5. Fill AES_GHASHRx.GHASH with the value stored after the previous fragment.
6. Fill AES_IDATARx.IDATA with the current fragment of the message to process (aligned on 16 byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing *AAD*).
7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in AAD phase), then read AES_GHASHRx.GHASH to obtain the value of the hash after the last processed data and finally read AES_CTR.CTR to obtain the value of the CTR encryption counter (not needed when the fragment ends in *AAD* phase).

Note: Step 1 and 2 are required only if the value of the concerned registers has been modified.

Once the last fragment has been processed, the GHASH value will allow manual generation of the GCM tag. See Manual GCM Tag Generation.

58.4.7.3.4.Manual GCM Tag Generation

This section describes the last steps of the GCM Tag generation.

The Manual GCM Tag Generation is used to complete the GCM Tag Generation when the message has been processed without Tag Generation.

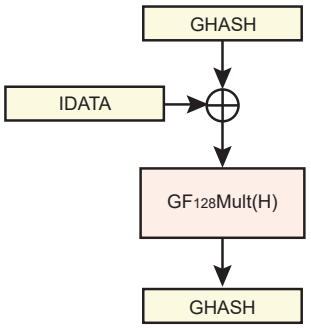
Note: The Message Processing without Tag Generation must be finished before processing the Manual GCM Tag Generation.

To generate a GCM Tag manually, the sequence is as follows:

Processing S = $GHASH_H$ (*AAD* || 0v || C || 0u || [len(*AAD*)]64 || [len(C)]64):

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.
2. Write the key and wait for AES_ISR.DATRDY to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.
3. Configure AES_AADLENR.AADLEN to 0x10 (16 bytes) and AES_CLENR.CLEN to '0'. This will allow running a single $GHASH_H$ on a 16-byte input data (see the following figure).
4. Fill AES_GHASHRx.GHASH with the state of the GHASH field stored at the end of the message processing.
5. Fill AES_IDATARx.IDATA according to the SMOD configuration used with 'len(*AAD*)64 || len(*C*)64' value as described in the NIST documentation and wait for DATRDY to be set; use interrupt if needed.
6. Read AES_GHASHRx.GHASH to obtain the current value of the hash.

Processing *T* = GCTRK(J_0, S):



1. Set AES_MR.OPMOD to CTR.
2. Set AES_IVRx.IV with 'J_0' value.
3. Fill AES_IDATARx.IDATA with the GHASH value read at step 6 and wait for DATRDY to be set (use interrupt if needed).
4. Read AES_ODATARx.ODATA to obtain the GCM Tag value.

Note: Step 4 is optional if the GHASH field is to be filled with value '0' (0 length packet for instance).

© 2026 Microchip Technology Inc. and its subsidiaries

58.4.7.3.5.Processing a Message with only AAD (GHASHH)

Figure 58.8. Single $GHASH_H$ Block Diagram (AADLEN ≤ 0x10 and CLEN = 0)

It is possible to process a message with only *AAD* setting the CLEN field to '0' in AES_CLENR, this can be used for J0 generation when len(*IV*) ≠ 96 for instance.

Example: Processing J_0 when len(*IV*) ≠ 96

To process $J_0 = GHASH_H(IV \,||\, 0^{s+64} \,||\, [len(IV)]64)$, the sequence is as follows:

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.
2. Write AES_KEYWRx and wait until AES_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.
3. Configure AES_AADLENR.AADLEN with 'len($IV \,||\, 0^{s+64} \,||\, [len(IV)]64$)' in and AES_CLENR.CLEN to '0'. This will allow running a $GHASH_H$ only.
4. Fill AES_IDATARx.IDATA with the message to process ($IV \,||\, 0^{s+64} \,||\, [len(IV)]64$) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a $GHASH_H$ step is over (use interrupt if needed).
5. Read AES_GHASHRx.GHASH to obtain the J_0 value.
   Note: The GHASH value can be overwritten at any time by writing the value of AES_GHASHRx.GHASH, used to perform a $GHASH_H$ with an initial value for GHASH (write GHASH field between step 3 and step 4 in this case).

58.4.7.3.6.Processing a Single GF128 Multiplication

The AES can also be used to process a single multiplication in the Galois field on 128 bits (GF_{128}) using a single $GHASH_H$ with custom *H* value (see the figure above).

To run a GF_{128} multiplication (A x B), the sequence is as follows:

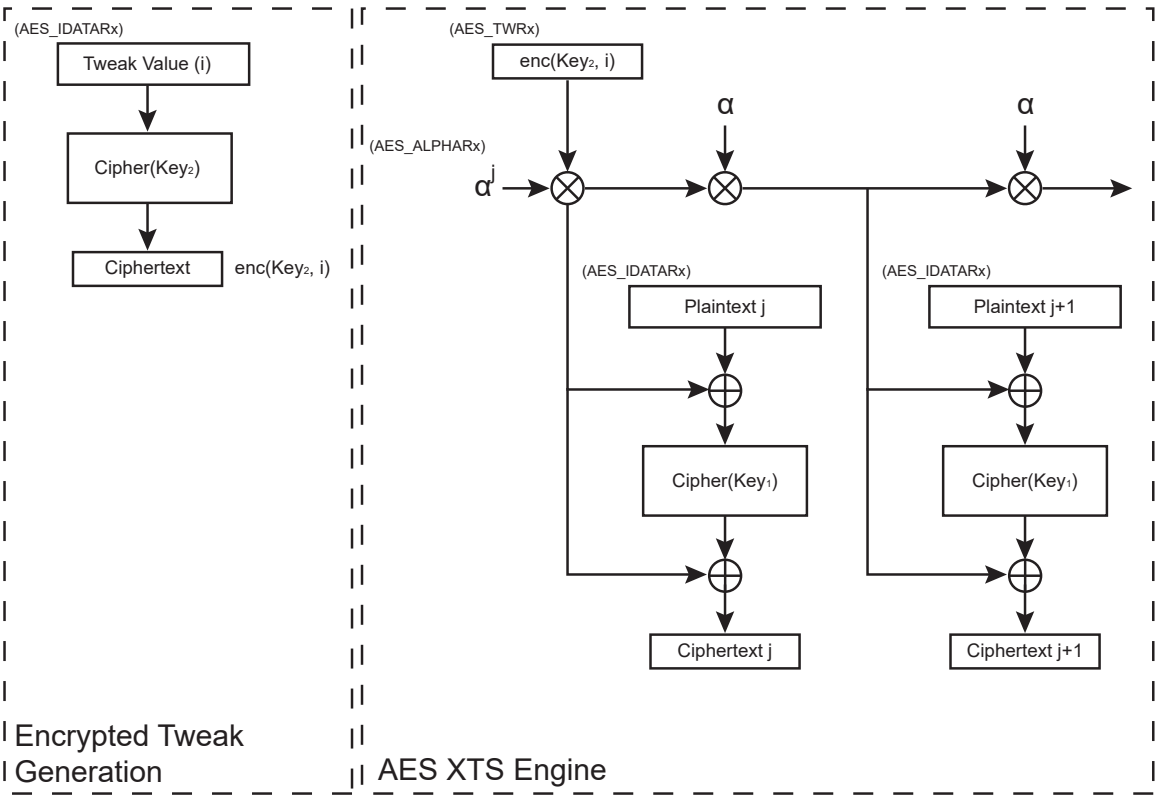
1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.

1. Configure AES_AADLENR.AADLEN with 0x10 (16 bytes) and AES_CLENR.CLEN to '0'. This will allow running a single $GHASH_H$.
2. Fill AES_GCMHRx.H with B value.
3. Fill AES_IDATARx.IDATA with the A value according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a GHASHH computation is over (use interrupt if needed).
4. Read AES_GHASHRx.GHASH to obtain the result.

Note: AES_GHASHRx.GHASH can be initialized with a value C between step 3 and step 4 to run a ((A XOR C) x B) GF_{128} multiplication.

© 2026 Microchip Technology Inc. and its subsidiaries

58.4.8. XEX-based Tweaked-codebook Mode (XTS)



XTS mode comprises the AES engine with XOR on inputs and outputs. After each encryption/decryption, the value used for the XOR is multiplied by the first GF(2^{128}) alpha primitive (0x2) and then used for the next encryption/decryption. The XTS mode uses two different keys and defines a Tweak Value (i) as additional input.

XTS processing is computed on 128-bit input data fields.

The data length can be any integer multiple of a byte. The AES embeds an auto-padding feature which can be disabled by writing AES_BCNT=0, so the length of the data (payload and padding) must be a multiple of 128 bits.

The AES key length can be any length supported by the AES module.

Figure 58.9. XTS Block Diagram

58.4.8.1.XTS Processing Procedure

XTS processing comprises two phases:

1. Generate encrypted tweak with KEY2 (this step is only required for the first processing, further consecutive processing does not require this step).
2. Process the data giving encrypted tweak and first alpha primitive for the first encryption/decryption.

58.4.8.1.1.Encrypted Tweak Generation

In the case of a new encryption/decryption, the Tweak Value (i) must be first encrypted with KEY2 as follows:

1. Set AES_MR.OPMODE to ECB and AES_MR.CIPHER to ‘1’.
2. Write KEY2.

© 2026 Microchip Technology Inc. and its subsidiaries

3. Fill AES_IDATARx.IDATA with the Tweak value (i) according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES_ODATARx.
4. The data read can be written in AES_TWRx for further data processing.

58.4.8.1.2.Data Processing

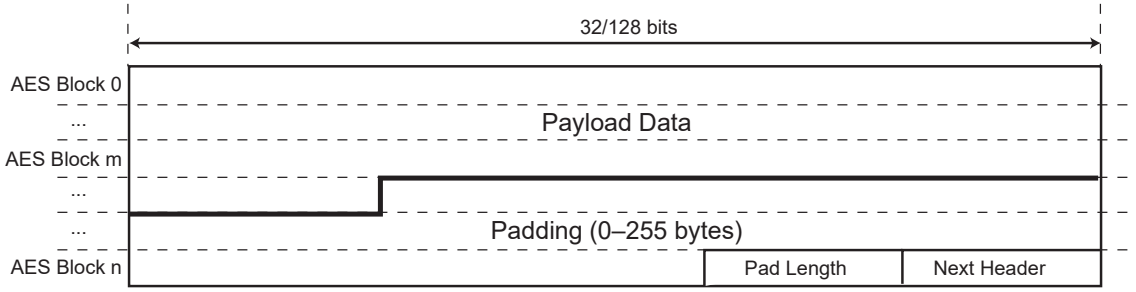
To process data using XTS mode:

1. Set AES_MR.OPMODE to XTS.
2. Write KEY1.
3. The following additional steps are required only if the data to process is the first to be processed in the data unit, or if the data block to process is not consecutive to the previous processed data block in the same data unit:
   a. AES_TWRx must be written with the encrypted Tweak Value (see Encrypted Tweak Generation for details) with bytes swapped as described in AES Register Endianness
   b. Write AES_ALPHARx with the alpha primitive corresponding to the block number in the data unit.
4. Write the data length (payload) information in AES_BCNT.
5. Fill AES_IDATARx.IDATA with the data to process according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES_ODATARx. Repeat this step for as long as consecutive data blocks are processed in the same data unit.

58.4.9. Automatic Padding Mode

When Automatic Padding mode is configured, the message is automatically padded after the last block is written. Depending on the size of the message, either a padding is performed after the last part of the message and padding blocks are added, or only padding blocks are added.

IPSec and SSL padding standards are both supported.



The auto padding feature only supports CBC and CTR modes.

Note: When automatic padding is enabled and AES_MR.SMOD=2, AES_MR.DUALBUFF must be cleared.

58.4.9.1.IPSec Padding

Automatic Padding is enabled by writing a ‘1’ to AES_EMR.APEN. IPSEC padding mode is selected by writing a ‘0’ to AES_EMR.APM.

Figure 58.10. IPSec Padding

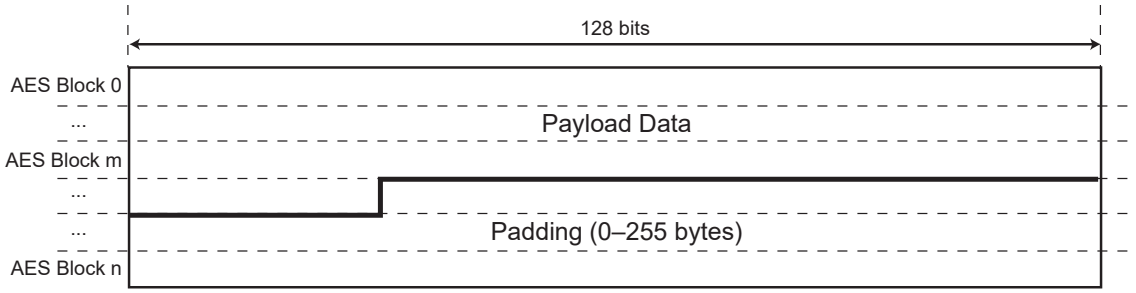
Each byte of the padding area contains incremental integer values.

The “Pad Length” in bytes is configured in AES_EMR.PADLEN and the “Next Header” value is configured in AES_EMR.NHEAD. AES_EMR.PADLEN must be configured with the length of the padding section, not including the length of the “Pad Length” and “Next Header” sections.

© 2026 Microchip Technology Inc. and its subsidiaries

The BCNT field in the Byte Counter register (AES_BCNT) defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES_IDATARx and the remaining bytes to process can be read at anytime (BCNT value is decremented after each AES_IDATARx access).

AES_BCNT.BCNT and AES_EMR.PADLEN must be configured so that the sum of the length of the message (Payload Data) and of the length of the Padding, Pad Length (1 byte) and Next Header (1 byte) sections is a multiple of the AES block size (128 bits).



To process an IPSec message using auto-padding, the sequence is as follows:

1. Set AES_MR.OPMOD to either CBC or CTR mode.
2. Set AES_EMR.APEN to '1', AES_EMR.APM to '0', AES_EMR.PADLEN to the desired padding length in byte and AES_EMR.NHEAD to the desired Next Header field value.
3. Configure AES_BCNT.BCNT with the whole message length, without padding, in byte.
4. Write the key.
5. Set AES_IVRx.IV if needed.
6. Fill AES_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block, write only what is necessary (e.g., write only AES_IDATAR0 if last block size is ≤ 32 bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

58.4.9.2.SSL Padding

Auto-padding is enabled by writing a '1' to AES_EMR.APEN and SSL padding mode is selected by writing a '1' to AES_EMR.APM.

Figure 58.11. SSL Padding

Each byte of the padding area contains the padding length.

The padding length is configured in AES_EMR.PADLEN.

AES_BCNT.BCNT defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES_IDATARx and the remaining bytes to process can be read at anytime (BCNT value is decremented after each AES_IDATARx access).

AES_BCNT.BCNT and AES_EMR.PADLEN must be configured so that the length of the message plus the length of the padding section is a multiple of the AES block size (128 bits).

To process a complete SSL message, the sequence is as follows:

1. Set AES_MR.OPMOD to either CBC or CTR mode.
2. Set AES_EMR.APEN to '1', AES_EMR.APM to '1', AES_EMR.PADLEN to the desired padding length in bytes.
3. Set AES_BCNT.BCNT with the whole message length, without padding, in bytes.

© 2026 Microchip Technology Inc. and its subsidiaries

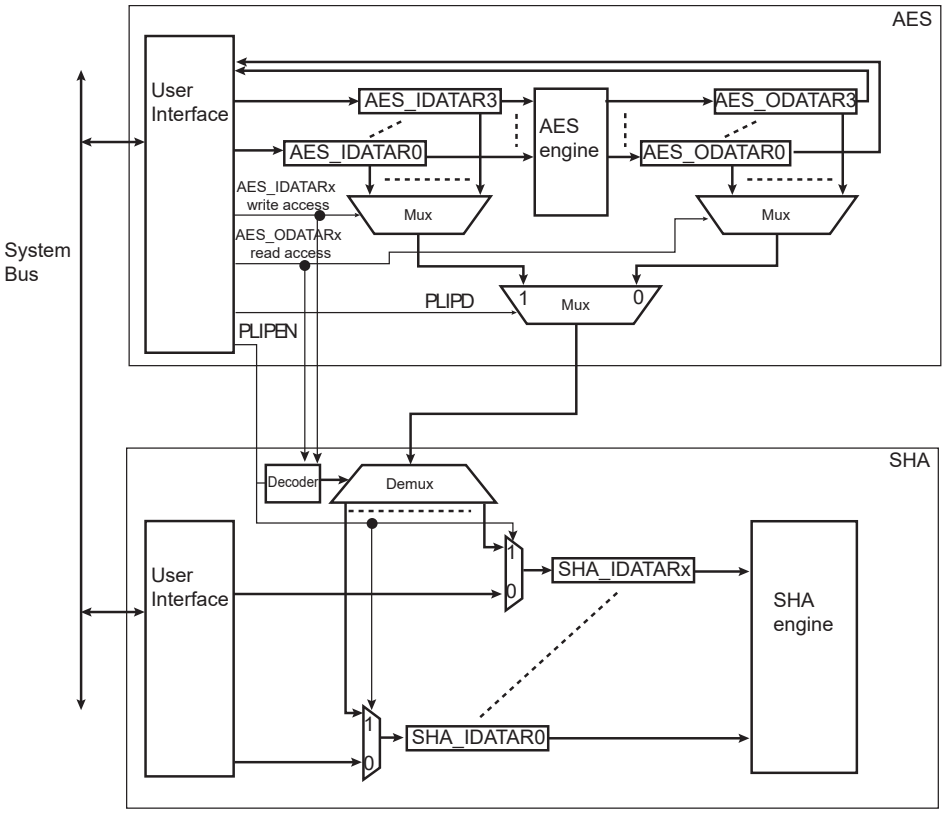
4. Write the key.
5. Set AES_IVRx.IV if needed.
6. Fill AES_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block write only what is necessary (e.g., write only AES_IDATAR0 if last block size is ≤ 32 bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

58.4.9.3. Flags

AES_ISR.EOPAD rises as soon as the automatic padding phase is over, meaning that all the extra padding blocks have been processed. Reading AES_ISR clears this flag.

AES_ISR.PLENERR indicates an error in the frame configuration, meaning that the whole message length including padding does not respect the standard selected. AES_ISR.PLENERR rises at the end of the frame in case of wrong message length and is cleared reading AES_ ISR.

In IPSec/SSL standard message length including padding must be a multiple of the AES block size when CBC mode is used and multiple of 32-bit if CTR mode is used.



58.4.10. Secure Protocol Layers Improved Performances

Secure protocol layers such as IPSec require encryption and authentication. For IPSec, the authentication is based on HMAC, thus SHA is required. To optimize performance, the AES embeds a mode of operation, used with DMA only, that enables the SHA module to process the input or output data of the AES module. If this mode is enabled, write access is required only into AES_IDATARx registers, since SHA input data registers are automatically written by AES without software intervention. When the DMA is configured to transfer a buffer of data (input frame), only one transfer descriptor is required for both authentication and encryption/decryption processes and only one buffer is transferred through the system bus (reducing the load of the system bus).

Improved performance for secure protocol layers requires AES_EMR.PLIPEN to be set.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 58.12. Secure Protocol Layers Improved Performances Block Diagram

58.4.10.1.Cipher Mode

When AES_EMR.PLIPD is cleared and AES_EMR.PLIPEN=1, the message written into AES_IDATARx is first encrypted with the AES module and the encrypted message is authenticated with the SHA module. Therefore, when AES_EMR.PLIPD is cleared, AES_ODATARx are selected and sent to SHA_IDATARx as soon as AES_ODATARx are read. A read access in AES corresponds to a write access to the corresponding SHA_IDATARx. The number of SHA_IDATARx is greater than the number of AES_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES_ODATARx values into the corresponding SHA_IDATARx without software intervention.

58.4.10.2.Decipher Mode

When AES_EMR.PLIPD is written to '1' and AES_EMR.PLIPEN=1, the message written into AES_IDATARx is decrypted with the AES module and also sent to SHA for authentication. Therefore, when AES_EMR.PLIPD=1, AES_IDATARx are selected and sent to SHA_IDATARx as soon as AES_IDATARx are written. A write access in AES corresponds to a write access to the corresponding SHA_IDATARx. The number of SHA_IDATARx is greater than the number of AES_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES_IDATARx values into the corresponding SHA_IDATARx without software intervention.

58.4.10.3.Encapsulating Security Payload (ESP) IPSec Examples

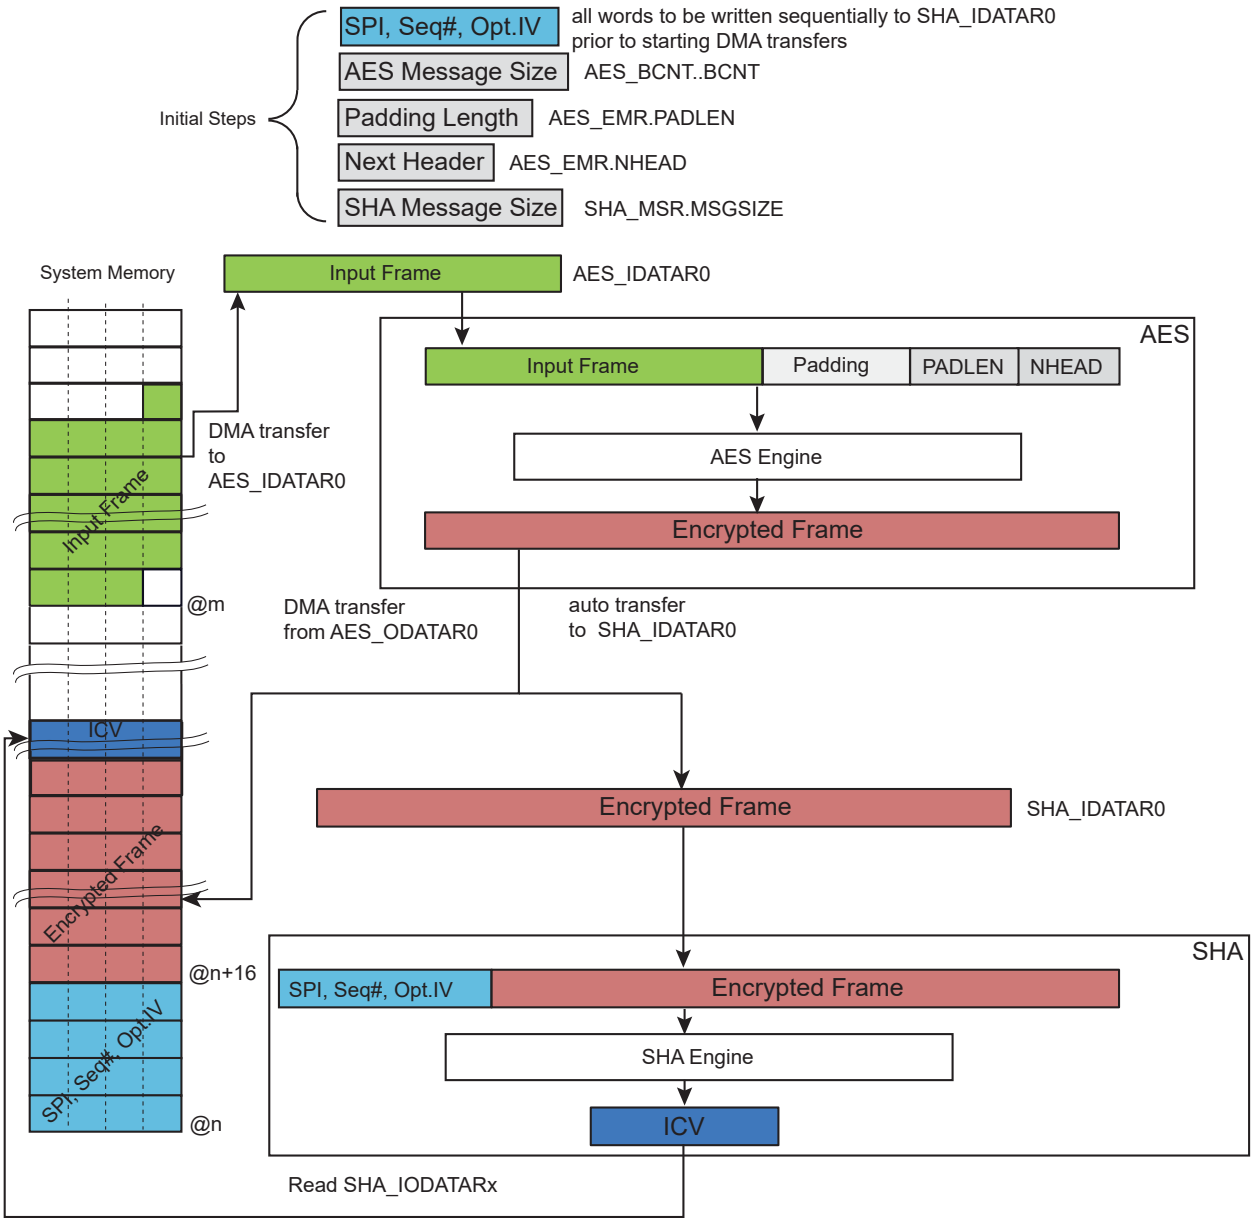
The following examples describe how to configure AES and SHA to optimize processing an ESP IPSec frame for maximum performance.

The cipher (or decipher) of an ESP IPSec frame requires both encryption (or decryption) and authentication.

For cipher, the input frame located in the system memory must first be padded and the resulting buffer encrypted. The encrypted frame must be written back to the system memory and sent to the authentication module.

© 2026 Microchip Technology Inc. and its subsidiaries

When the AES module is configured to improve the performance of the secure protocol layers (AES_EMR.PLIPEN = 1), the data transfers are simplified, limiting the bandwidth requirements on the system bus.



Before configuring the DMA to start the transfer of the data buffer (input frame) to the AES, the following actions must be taken in registers:

- AES_BCNT.BCNT must be configured with the length of the message (Input Frame).
- The padding length of the AES must be configured in AES_EMR.PADLEN. See Automatic Padding Mode to configure Automatic Padding mode.
- The next header value must be configured in AES_EMR.NHEAD.
- AES_MR.SMOD and SHA_MR.SMOD must be configured to 2.
  Note: When automatic padding is enabled and AES_MR.SMOD = 2 , AES_MR.DUALBUFF must be cleared.
- The SHA_MSR.MSGSIZE must be configured with the length of the authentication message including the optional extended sequence number (ESN) and header and trailer information required by the authentication algorithm used (HMAC, etc.). Refer to the section “Secure Hash Algorithm (SHA)” for more details on configuration for optimized processing of header information.
- The Security Parameter Index (SPI, sequence number (SEQ#)) and the optional Initialization Vector (IV) must be configured sequentially in SHA_IDATAR0.
- A first DMA transfer descriptor must be configured to transfer the input frame from the system memory to the AES input data registers (AES_IDATARx), and a second DMA descriptor must be configured to transfer the encrypted frame from AES to the system memory.
  Note: If AES_EMR.PLIPEN = 1 , there is no need to define a transfer descriptor to load the encrypted frame into the SHA input data registers because the transfer is automatically performed while the second descriptor transfer is in progress.

See the following figures.

© 2026 Microchip Technology Inc. and its subsidiaries

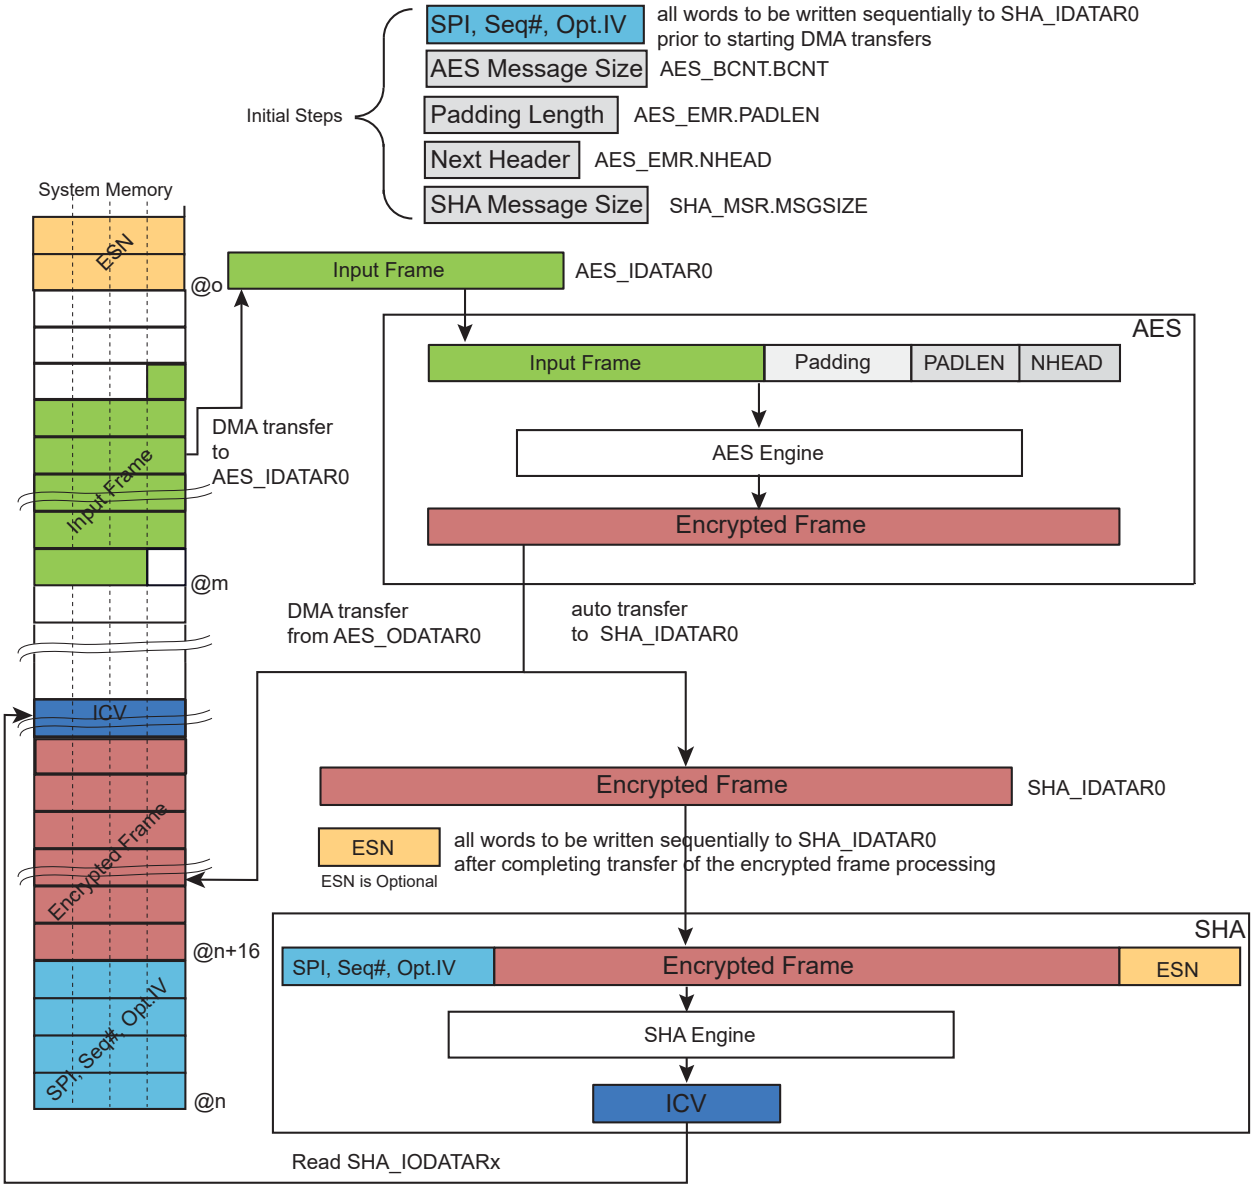


Figure 58.13. Generation of an ESP IPSec Frame without ESN

If the optional extended sequence number is required for authentication, wait for the AES-to-system memory DMA buffer transfer to complete before configuring the ESN value. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the SHA_IDATAR0 register. Wait for SHA_ISR.WRDY=1 before each write in the SHA_IDATAR0 register. See the following figure.

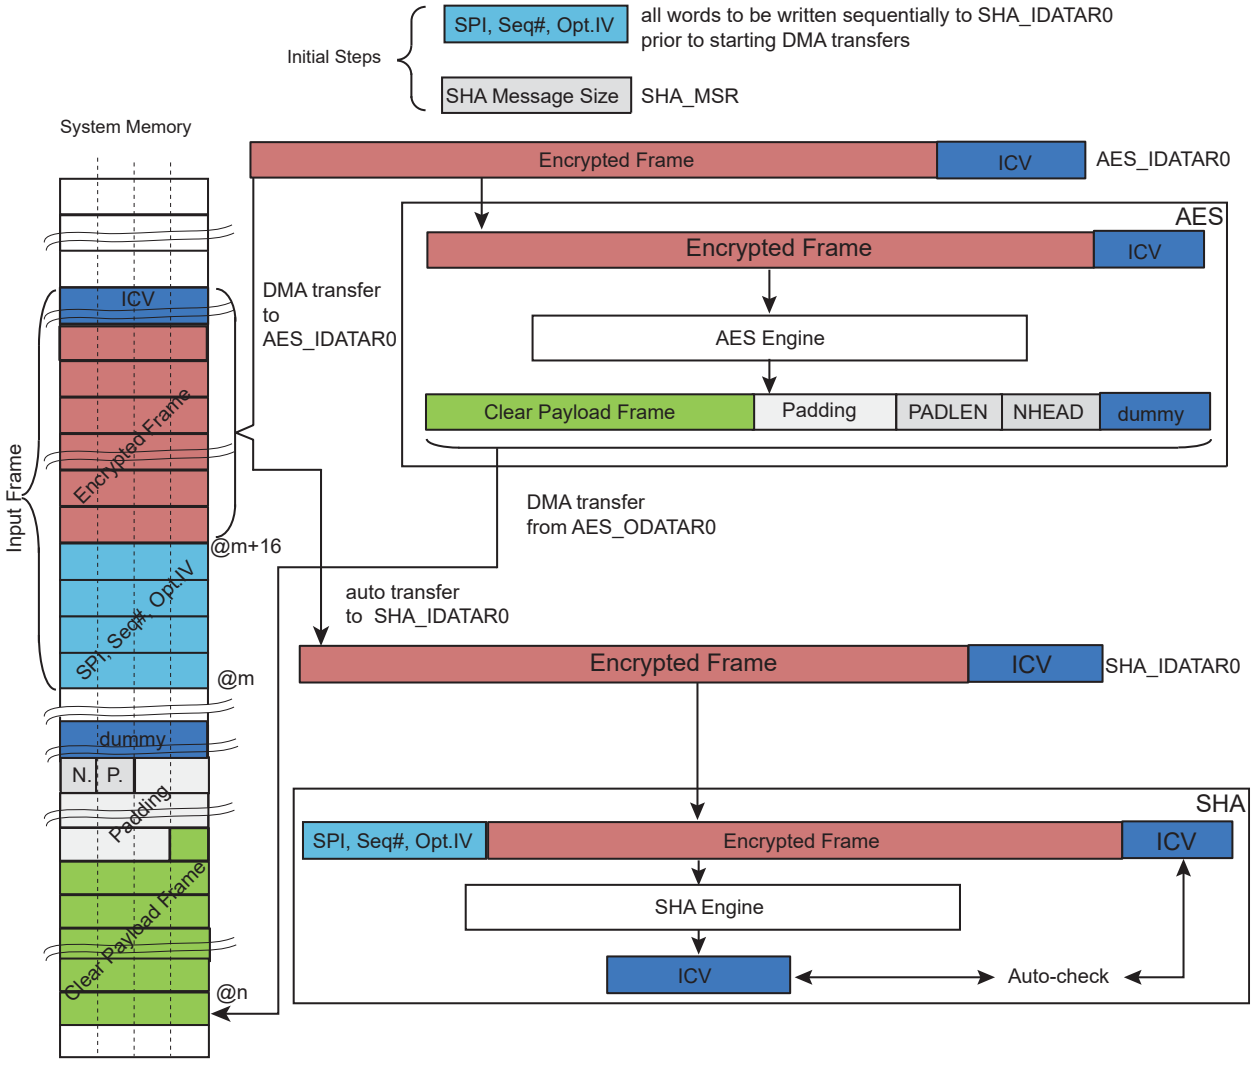
© 2026 Microchip Technology Inc. and its subsidiaries

Figure 58.14. Generation of an ESP IPSec Frame with ESN

To decipher an ESP IPSec frame without the optional ESN trailer information, two DMA channels are required and the SHA must be configured in Automatic padding mode.

Note: AES automatic padding must be disabled when deciphering a frame.

- A first DMA transfer descriptor must be configured to load the received encrypted frame from the system memory to AES_IDATARx for decryption. The start address of the first transfer descriptor must be defined after the SPI, SEQ#, and optional IV (see the following figure).
- A second DMA descriptor must be configured to transfer the decrypted frame from AES_ODATARx to the system memory.
- AES_EMR.PLIPEN and AES_EMR.PLIPD must be written to '1' so that the data buffer is written in AES_IDATARx and in SHA_IDATARx.



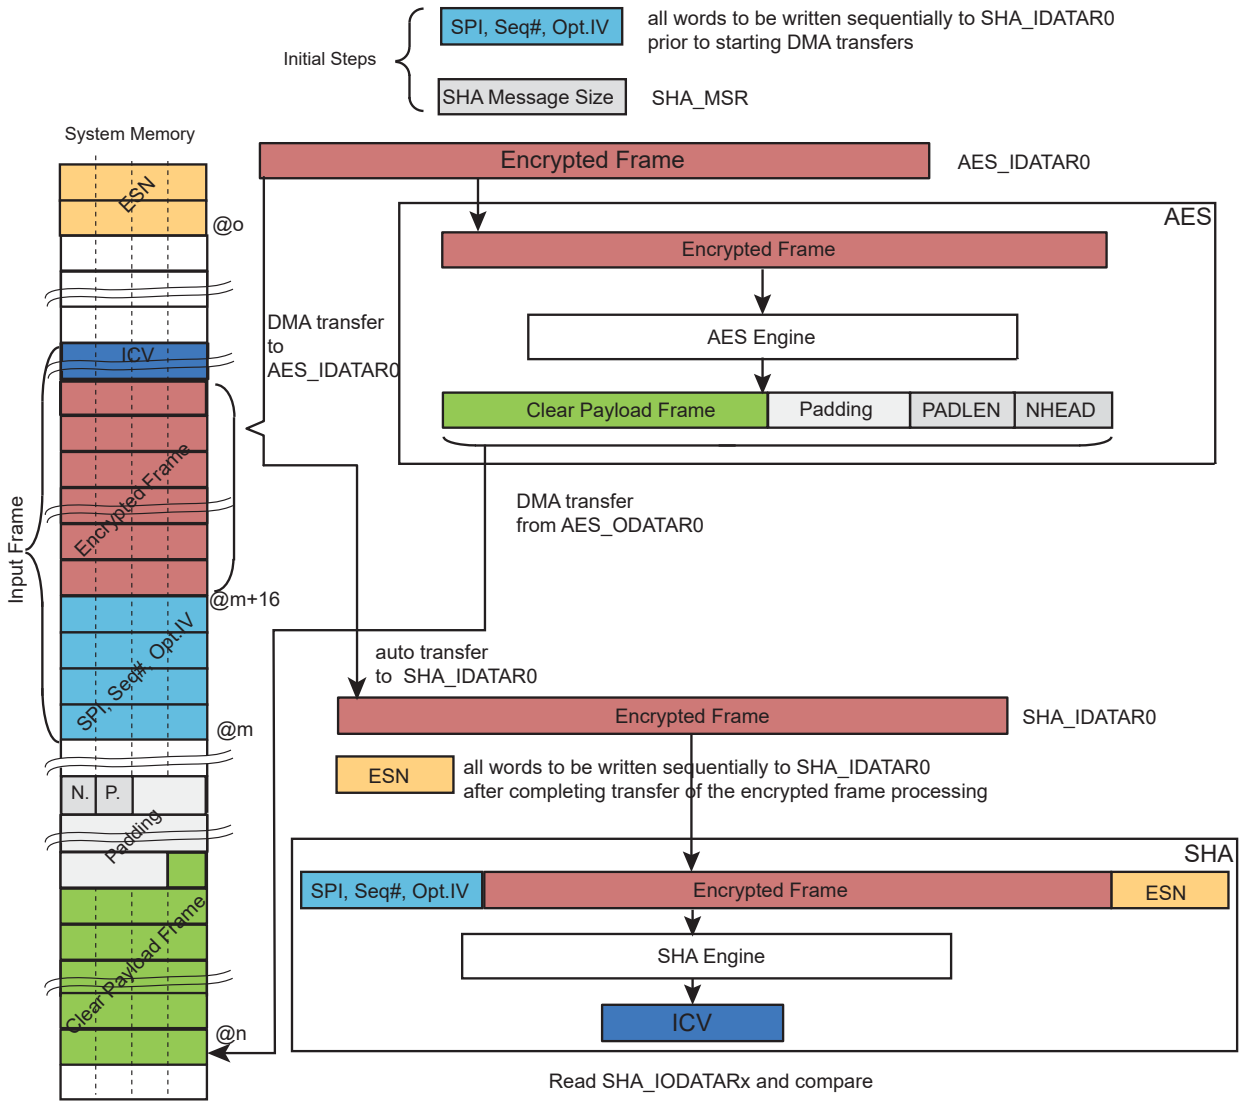
The SHA has the capability to perform an automatic check with an expected integrity check value if this value is appended at the end of the frame buffer (SHA_MR.CHECK=2). Thus, if the first transfer descriptor includes the ICV for SHA, the first DMA transfer allows the decryption and authentication

© 2026 Microchip Technology Inc. and its subsidiaries

processes including the automatic check. The decrypted part resulting from ICV is not required for downstream processing and must be considered as dummy data.

The end of the decryption and authentication processes occur when flag SHA_ISR.CHECKF=1. The authentication status is provided by SHA_ISR.CHKST.

Figure 58.15. Decryption of an ESP IP Sec Frame without ESN



If the optional ESN trailer information is part of the ICV (see the following figure), the ESN must be manually written into SHA_IDATAR0. The ESN value must be written after completion of the system memory-to-AES DMA buffer transfer. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the SHA_IDATAR0 register. Wait for SHA_ISR.WRDY=1 before each write in the SHA_IDATAR0 register.

When the optional ESN trailer information is part of the ICV, it is not possible to include the ICV received in the input frame to the first transfer descriptor. Moreover, if the HMAC algorithm is used for authentication, no automatic check can be performed when optimizing the processing performances of the SHA module. For more details, refer to the section “Secure Hash Algorithm (SHA)”. The result of the HMAC read in the SHA_IODATARx must be manually compared with the ICV value of the input frame. The comparison must be performed after the end of the authentication process. The authentication process is completed when the SHA_ISR.DATRDY flag is set.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 58.16. Decryption of an ESP IPSec Frame with ESN

58.4.11. Security Features

58.4.11.1.Private Key Bus

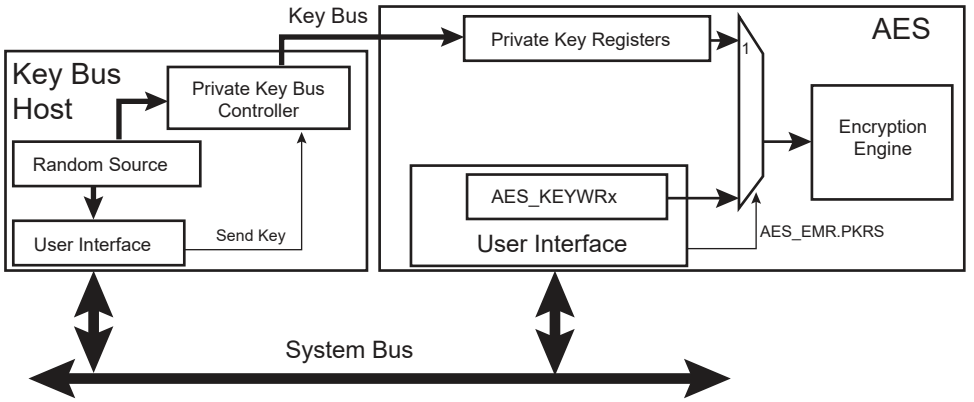
The AES provides secure key transfer that requires a transfer command only, thus avoiding any manipulation of the key by software.

The AES features a set of Private Key internal registers that can be accessed only through the dedicated Private Key bus from the TRNG or OTPC.

The Private Key internal registers cannot be read from any peripheral or from software.

The AES key used by the encryption/decryption engine is either the Private Key internal registers content or the AES_KEYWRx registers loaded via the AES_KEYWRx.

To select the Private Key internal registers as the source of the AES key, AES_EMR.PKRS must be written to ‘1’.



When AES_EMR.PKRS is modified, it is mandatory to load the corresponding key value even if the key has been previously written with same value.

© 2026 Microchip Technology Inc. and its subsidiaries

To write the Private Key internal registers, the software must:

1. Write a ‘1’ in AES_EMR.PKRS.
2. Trigger the key transfer over the Private Key bus from the TRNG or OTPC key bus host.
3. Wait for completion of the transfer signaled in the TRNG or OTPC Status register.
4. Check for any access violation in AES_WPSR.PKRPVS.

Figure 58.17. Key Selection

58.4.11.2.Unspecified Register Access Detection

When an unspecified register access occurs, AES_ISR.URAD is raised. Its source is then reported in AES_ISR.URAT. Only the last unspecified register access is available through the AES_ISR.URAT.

Several kinds of unspecified register accesses can occur:

- Input Data register written during the data processing when SMOD = IDATAR0_START
- Output Data register read during data processing
- Mode register written during data processing
- Output Data register read during sub-keys generation
- Mode register written during sub-keys generation
- Write-only register read access

AES_ISR.URAD and AES_ISR.URAT can only be reset by AES_CR.SWRST.

58.4.11.3.Clearing Key on Tamper Event

On a tamper detection event on WKUP[8:1] pins, an immediate clear of the key (internal registers) can be performed if AES_MR.TAMPCLR=1. For configuration details, refer to the section “Real-Time Clock (RTC)”.

58.4.11.4.Register Write Protection

To prevent any single software error from corrupting AES behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the AES Write Protection Mode Register (AES_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the AES Write Protection Status Register (AES_WPSR) is set and the Write Protection Violation Source (WPVSRC) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading AES_WPSR.

The following register(s) can be write-protected when WPEN is set in AES_WPMR:

© 2026 Microchip Technology Inc. and its subsidiaries

- AES Mode Register
- AES Key Word Register x
- AES Initialization Vector Register x
- AES Additional Authenticated Data Length Register
- AES Plaintext/Ciphertext Length Register
- AES GCM Intermediate Hash Word Register x
- AES GCM H Word Register x
- AES Extended Mode Register
- AES Byte Counter Register
- AES Tweak Word Register x
- AES Alpha Word Register x

The following register(s) can be write-protected when WPITEN is set:

- AES Interrupt Enable Register
- AES Interrupt Disable Register

The following register(s) can be write-protected when WPCREN is set:

- AES Control Register

58.4.11.5.Security and Safety Analysis and Reports

Several types of checks are performed when the AES is enabled.

The peripheral clock of the AES is monitored by specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the AES. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the flag AES_WPSR.CGD is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the AES is also monitored and if an abnormal state is detected, the flag AES_WPSR.SEQE is set. This flag is not set under normal operating conditions.

The software accesses to the AES are monitored and if an incorrect access is performed, the flag AES_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in AES_WPSR.SWETYP (see AES_WPSR for details). For example, writing the AES_ODATARx is an error, as well as reading the AES_IDATARx, when the AES_ISR.DATRDY flag is cleared. AES_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE and WPVS are automatically cleared when AES_WPSR is read.

If one of these flags is set, the flag AES_ISR.SECE is set and can trigger an interrupt if the AES_IMR.SECE bit is ‘1’. SECE is cleared by reading AES_ISR.

It is possible to configure an action to be performed by AES as soon as an abnormal event detection occurs. If AES_WPMR.ACTION > 0, either a lock is performed or a lock and immediate clear of the AES_KEYWRx key. If a lock is performed, the current processing is ended normally but any new processing is not performed regardless of the start mode of operation (see AES_MR.SMOD).

A locked state of the AES is unlocked as follows:

1. Read AES_WPSR.
2. Disable the source of tamper if the tamper is enabled to perform a clear of the key.
3. Write a ‘1’ to AES_CR.UNLOCK.

The user can select the type of event that will lock the AES when an abnormal event is detected. See AES_WPMR.ACTION for details.

© 2026 Microchip Technology Inc. and its subsidiaries

If AES_MR.TMPCLR=1 and the tamper pin is active, the AES is locked.

58.5.1. AES Control Register

Name: AES_CR
Offset: 0x00
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the AES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
								UNLOCK
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
								SWRST
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								START
Access								W
Reset								–

Bit 24 – UNLOCK Unlock Processing
AES_WPSR must be cleared before performing the unlock command.

Value	Description
0	No effect.
1	Unlocks the processing in case an abnormal event is detected if AES_WPMR.ACTION > 0.

Bit 8 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets the AES. A software-triggered reset of the AES interface is performed.

Bit 0 – START Start Processing

Value	Description
0	No effect.
1	Starts a manual encryption/decryption process.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.2. AES Mode Register

Name: AES_MR
Offset: 0x04
Reset: 0x00080000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the AES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	TAMPCLR							
Access	R/W							
Reset	–							

Bit	23	22	21	20	19	18	17	16
	CKEY[3:0]					CFBS[2:0]		
Access	W	W	W	W		R/W	R/W	R/W
Reset	–	–	–	–		0	0	0

Bit	15	14	13	12	11	10	9	8
	LOD	OPMOD[2:0]			KEYSIZE[1:0]		SMOD[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PROCDLY[3:0]				DUALBUFF		GTAGEN	CIPHER
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

Bit 31 – TAMPCLR Tamper Clear Enable

Value	Description
0	A tamper detection event has no effect on the AES_KEYWRx key.
1	A tamper detection event immediately clears the AES_KEYWRx key.

Bits 23:20 – CKEY[3:0] Key

Value	Name	Description
0xE	PASSWD	This field must be written with 0xE the first time AES_MR is programmed. For subsequent programming of AES_MR, any value can be written, including that of 0xE. Always reads as 0.

Bits 18:16 – CFBS[2:0] Cipher Feedback Data Size

Value	Name	Description
0	SIZE_128BIT	128-bit
1	SIZE_64BIT	64-bit
2	SIZE_32BIT	32-bit
3	SIZE_16BIT	16-bit
4	SIZE_8BIT	8-bit

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 15 – LOD Last Output Data Mode

> **WARNING** In DMA mode, reading to the Output Data registers before the last data encryption/decryption process may lead to unpredictable results.

Value	Description
0	No effect. After each end of encryption/decryption, the output data are available either on the output data registers (Manual and Auto modes) or at the address specified in the Channel Buffer Transfer Descriptor for DMA mode. In Manual and Auto modes, the DATRDY flag is cleared when at least one of the Output Data registers is read.
1	The DATRDY flag is cleared when at least one of the Input Data Registers is written. No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see Last Output Data Mode (CBC-MAC)).

Bits 14:12 – OPMOD[2:0] Operating Mode

For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.
When switching from an operating mode requiring the initialization vectors (e.g. CBC, GCM) to another operating mode that does not require initialization vectors (e.g. ECB) and a message of one block has been processed, initialization vector registers (AES_IVRx) must be cleared before switching to the new mode.

Value	Name	Description
0	ECB	ECB: Electronic Codebook mode
1	CBC	CBC: Cipher Block Chaining mode
2	OFB	OFB: Output Feedback mode
3	CFB	CFB: Cipher Feedback mode
4	CTR	CTR: Counter mode (16-bit internal counter)
5	GCM	GCM: Galois/Counter mode
6	XTS	XTS: XEX-based tweaked-codebook mode

Bits 11:10 – KEYSIZE[1:0] Key Size

Value	Name	Description
0	AES128	AES Key Size is 128 bits
1	AES192	AES Key Size is 192 bits
2	AES256	AES Key Size is 256 bits

Bits 9:8 – SMOD[1:0] Start Mode

If a DMA transfer is used, configure SMOD to 2. See DMA Mode for more details.

Value	Name	Description
0	MANUAL_START	Manual mode
1	AUTO_START	Auto mode
2	IDATAR0_START	AES_IDATAR0 access only Auto mode (DMA)

Bits 7:4 – PROCDLY[3:0] Processing Delay

Processing Time = N × (PROCDLY + 1)
where

- N = 10 when KEYSIZE = 0
- N = 12 when KEYSIZE = 1
- N = 14 when KEYSIZE = 2

The processing time represents the number of clock cycles that the AES needs in order to perform one encryption/decryption.

© 2026 Microchip Technology Inc. and its subsidiaries

Note: The best performance is achieved with PROCDLY = 0.

Bit 3 – DUALBUFF Dual Input Buffer

Value	Name	Description
0	INACTIVE	AES_IDATARx cannot be written during processing of previous block.
1	ACTIVE	AES_IDATARx can be written during processing of previous block when SMOD = 2. It speeds up the overall runtime of large files.

Bit 1 – GTAGEN GCM Automatic Tag Generation Enable

Value	Description
0	Automatic GCM Tag generation disabled.
1	Automatic GCM Tag generation enabled.

Bit 0 – CIPHER Processing Mode

Value	Description
0	Decrypts data.
1	Encrypts data.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.3. AES Interrupt Enable Register

Name: AES_IER
Offset: 0x10
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the AES Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					SECE	PLENERR	EOPAD	TAGRDY
Access					W	W	W	W
Reset					–	–	–	–

Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

Bit 19 – SECE Security and/or Safety Event Interrupt Enable

Bit 18 – PLENERR Padding Length Error Interrupt Enable

Bit 17 – EOPAD End of Padding Interrupt Enable

Bit 16 – TAGRDY GCM Tag Ready Interrupt Enable

Bit 8 – URAD Unspecified Register Access Detection Interrupt Enable

Bit 0 – DATRDY Data Ready Interrupt Enable

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.4. AES Interrupt Disable Register

Name: AES_IDR
Offset: 0x14
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the AES Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					SECE	PLENERR	EOPAD	TAGRDY
Access					W	W	W	W
Reset					–	–	–	–

Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

Bit 19 – SECE Security and/or Safety Event Interrupt Disable

Bit 18 – PLENERR Padding Length Error Interrupt Disable

Bit 17 – EOPAD End of Padding Interrupt Disable

Bit 16 – TAGRDY GCM Tag Ready Interrupt Disable

Bit 8 – URAD Unspecified Register Access Detection Interrupt Disable

Bit 0 – DATRDY Data Ready Interrupt Disable

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.5. AES Interrupt Mask Register

Name: AES_IMR
Offset: 0x18
Reset: 0x00000000
Property: Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					SECE	PLENERR	EOPAD	TAGRDY
Access					R	R	R	R
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
								URAD
Access								R
Reset								0

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								R
Reset								0

Bit 19 – SECE Security and/or Safety Event Interrupt Mask

Bit 18 – PLENERR Padding Length Error Interrupt Mask

Bit 17 – EOPAD End of Padding Interrupt Mask

Bit 16 – TAGRDY GCM Tag Ready Interrupt Mask

Bit 8 – URAD Unspecified Register Access Detection Interrupt Mask

Bit 0 – DATRDY Data Ready Interrupt Mask

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.6. AES Interrupt Status Register

Name: AES_ISR
Offset: 0x1C
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					SECE	PLENERR	EOPAD	TAGRDY
Access					R	R	R	R
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
	URAT[3:0]							URAD
Access	R	R	R	R				R
Reset	0	0	0	0				0

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								R
Reset								0

Bit 19 – SECE Security and/or Safety Event (cleared on read)

Value	Description
0	There is no security report in AES_WPSR.
1	One security flag is set in AES_WPSR.

Bit 18 – PLENERR Padding Length Error

Value	Description
0	No Padding Length Error occurred.
1	Padding Length Error detected.

Bit 17 – EOPAD End of Padding

Value	Description
0	Padding is not over.
1	The padding phase is over.

Bit 16 – TAGRDY GCM Tag Ready

Value	Description
0	GCM Tag is not valid.
1	GCM Tag generation is complete (cleared by reading GCM Tag, starting another processing or when writing a new key).

Bits 15:12 – URAT[3:0] Unspecified Register Access (cleared by writing SWRST in AES_CR)
Only the last Unspecified Register Access Type is available through the URAT field.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	IDR_WR_PROCESSING	Input Data register written during the data processing when SMOD = 2 mode.
1	ODR_RD_PROCESSING	Output Data register read during the data processing.
2	MR_WR_PROCESSING	Mode register written during the data processing.
3	ODR_RD_SUBKGEN	Output Data register read during the sub-keys generation.
4	MR_WR_SUBKGEN	Mode register written during the sub-keys generation.
5	WOR_RD_ACCESS	Write-only register read access.

Bit 8 – URAD Unspecified Register Access Detection Status (cleared by writing SWRST in AES_CR)

Value	Description
0	No unspecified register access has been detected since the last SWRST.
1	At least one unspecified register access has been detected since the last SWRST.

Bit 0 – DATRDY Data Ready (cleared by setting bit START or bit SWRST in AES_CR or by reading AES_ODATARx)

Value	Description
0	Output data not valid.
1	Encryption or decryption process is completed.

Note: If AES_MR.LOD = 1: In Manual and Auto modes, the DATRDY flag can also be cleared by writing at least one AES_IDATARx.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.7. AES Key Word Register x

Name: AES_KEYWRx
Offset: 0x20 + x*0x04 [x=0..7]
Reset: –
Property: Write-only

This register can only be written if the WPEN bit is cleared in the AES Write Protection Mode Register.

These registers are write-only to prevent the key from being read by another application.

Note: AES_KEYWRx registers are not used if the Private Key internal registers are selected (AES_EMR.PKRS=1).

Bit	31	30	29	28	27	26	25	24
	KEYW[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	23	22	21	20	19	18	17	16
	KEYW[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8
	KEYW[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	KEYW[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 31:0 – KEYW[31:0] Key Word

The four/six/eight 32-bit Key Word registers set the 128-bit/192-bit/256-bit cryptographic key used for AES encryption/decryption.
AES_KEYWR0 corresponds to the first word of the key and respectively AES_KEYWR3/AES_KEYWR5/AES_KEYWR7 to the last one.
Whenever a new key (AES_KEYWRx) is written to the hardware, two automatic actions are processed:

- GCM hash subkey generation
- AES_GHASHRx Clear

See Key Writing and Automatic Hash Subkey Calculation for details.
These registers are write-only to prevent the key from being read by another application.
Note: To write AES_KEYWRx and start using the key immediately, AES_EMR.PKRS must be written to 0 prior to writing AES_KEYWRx.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.8. AES Input Data Register x

Name: AES_IDATARx
Offset: 0x40 + x*0x04 [x=0..3]
Reset: –
Property: Write-only

Bit	31	30	29	28	27	26	25	24
	IDATA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

	IDATA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 31:0 – IDATA[31:0] Input Data Word
The four 32-bit Input Data registers set the 128-bit data block used for encryption/decryption. AES_IDATAR0 corresponds to the first word of the data to be encrypted/decrypted, and AES_IDATAR3 to the last one.
These registers are write-only to prevent the input data from being read by another application.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.9. AES Output Data Register x

Name: AES_ODATARx
Offset: 0x50 + x*0x04 [x=0..3]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	ODATA[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	ODATA[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ODATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ODATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ODATA[31:0] Output Data
The four 32-bit Output Data registers contain the 128-bit data block that has been encrypted/decrypted.
AES_ODATAR0 corresponds to the first word, AES_ODATAR3 to the last one.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.10. AES Initialization Vector Register x

Name: AES_IVRx
Offset: 0x60 + x*0x04 [x=0..3]
Reset: –
Property: Write-only

This register can only be written if the WPEN bit is cleared in the AES Write Protection Mode Register.

The four 32-bit Initialization Vector registers set the 128-bit Initialization Vector data block that is used by some modes of operation as an additional initial input.

AES_IVR0 corresponds to the first word of the Initialization Vector, AES_IVR3 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

For CBC, OFB and CFB modes, the IV input value corresponds to the initialization vector.

For CTR mode, the IV input value corresponds to the initial counter value.

These registers are not used in ECB mode and must not be written.

When switching from an operating mode requiring the initialization vectors (e.g. CBC, GCM) to another operating mode that does not require initialization vectors (e.g. ECB) and a message of one block has been processed, AES_IVRx must be cleared before switching to the new mode

Bit	31	30	29	28	27	26	25	24

58.5.11. AES Additional Authenticated Data Length Register

Name: AES_AADLENR
Offset: 0x70
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the AES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	AADLEN[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	AADLEN[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	AADLEN[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – AADLEN[31:0] Additional Authenticated Data Length
Length in bytes of the Additional Authenticated Data (AAD) that is to be processed.
Note: The maximum byte length of the AAD portion of a message is limited to the 32-bit counter length.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.12. AES Plaintext/Ciphertext Length Register

Name: AES_CLENR
Offset: 0x74
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the AES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	CLEN[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	CLEN[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8
	CLEN[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CLEN[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – CLEN[31:0] Plaintext/Ciphertext Length
Length in bytes of the plaintext/ciphertext (C) data that is to be processed.
Note: The maximum byte length of the C portion of a message is limited to the 32-bit counter length.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.13. AES GCM Intermediate Hash Word Register x

Name: AES_GHASHRx
Offset: 0x78 + x*0x04 [x=0..3]
Reset: 0x00000000
Property: R/W

This register can only be written if the WPEN bit is cleared in the AES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	GHASH[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	GHASH[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	GHASH[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	GHASH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – GHASH[31:0] Intermediate GCM Hash Word x

The four 32-bit Intermediate Hash Word registers expose the intermediate GHASH value. May be read to save the current GHASH value so processing can later be resumed, presumably on a later message fragment. Whenever a new key is written in AES_KEYWRx, two automatic actions are processed:

- GCM hash subkey generation
- AES_GHASHRx Clear

See Key Writing and Automatic Hash Subkey Calculation for details.
If an application software-specific hash initial value is needed for the GHASH, it must be written to AES_GHASHRx:

- after writing AES_KEYWRx, if any
- before starting the input data feed.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.14. AES GCM Authentication Tag Word Register x

Name: AES_TAGRx
Offset: 0x88 + x*0x04 [x=0..3]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	TAG[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	TAG[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	TAG[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TAG[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – TAG[31:0] GCM Authentication Tag x
The four 32-bit Tag registers contain the final 128-bit GCM Authentication tag (*T*) when GCM processing is complete. TAG0 corresponds to the first word, TAG3 to the last word.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.15. AES GCM Encryption Counter Value Register

Name: AES_CTRR
Offset: 0x98
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	CTR[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	CTR[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	CTR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CTR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – CTR[31:0] GCM Encryption Counter
Reports the current value of the 32-bit GCM counter.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.16. AES GCM H Word Register x

Name: AES_GCMHRx
Offset: 0x9C + x*0x04 [x=0..3]
Reset: 0x00000000
Property: R/W

This register can only be written if the WPEN bit is cleared in the AES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	H[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	H[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	H[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	H[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – H[31:0] GCM H Word x

The four 32-bit H Word registers contain the 128-bit GCM hash subkey *H*value.
Whenever a new key is written in AES_KEYWRx, two automatic actions are processed:

- GCM hash subkey *H* generation
- AES_GHASHRx Clear

If the application software requires a specific hash subkey, the automatically-generated H value can be overwritten in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation for details.
Generating a GCM hash subkey *H* by a write in AES_GCMHRx enables to:

- select the GCM hash subkey *H* for GHASH operations,
- select one operand to process a single GF128 multiply.

58.5.17. AES Extended Mode Register

Name: AES_EMR
Offset: 0xB0
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the AES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	BPE							
Access	R/W							
Reset	0							

Bit	23	22	21	20	19	18	17	16
	NHEAD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	PADLEN[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PKRS		PLIPD	PLIPEN			APM	APEN
Access	R/W		R/W	R/W			R/W	R/W
Reset	0		0	0			0	0

Bit 31 – BPE Block Processing End

Value	Description
0	The AES_ISR.DATRDY flag reports only the end message encryption processing. No intermediate block processing is reported when SMOD=2. When a DMA is used to transfer data, BPE must be cleared.
1	The AES_ISR.DATRDY flag reports each end of block processing when SMOD=2. When AES_IDATARx are not loaded by a DMA and SMOD=2, this bit can be written to 1 to rise the AES_ISR.DATRDY flag when a new data block can be written.

Bits 23:16 – NHEAD[7:0] IPSec Next Header

Value	Description
0–255	IPSec Next Header field

Bits 15:8 – PADLEN[7:0] Auto Padding Length

Value	Description
0–255	Padding length in bytes

Bit 7 – PKRS Private Key Internal Register Select

Value	Description
0	The key used by the AES is in the AES_KEYWRx registers.
1	The key used by the AES is in the Private Key internal registers written through the Private Key bus.

Bit 5 – PLIPD Protocol Layer Improved Performance Decipher

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Protocol layer improved performance is in Ciphering mode.
1	Protocol layer improved performance is in Deciphering mode.

Bit 4 – PLIPEN Protocol Layer Improved Performance Enable

Value	Description
0	Protocol layer improved performance is disabled.
1	Protocol layer improved performance is enabled.

Bit 1 – APM Auto-Padding Mode

Value	Description
0	Auto-padding is performed according to the IPSec standard.
1	Auto-padding is performed according to the SSL standard.

Bit 0 – APEN Auto-Padding Enable

Value	Description
0	The Auto-padding feature is disabled.
1	The Auto-padding feature is enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.18. AES Byte Counter Register

Name: AES_BCNT
Offset: 0xB4
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the AES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	BCNT[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16

Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ACTION[2:0]			FIRSTE		WPCREN	WPITEN	WPEN
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x414553	PASSWD	Writing any other value in this field aborts the write operation of the WPEN,WPITEN,WPCREN bits. Always reads as 0.

Bits 7:5 – ACTION[2:0] Action on Abnormal Event Detection

When the field AES_WPMR.ACTION differs from 0 and an abnormal event or internal state is detected, the AES is locked until the unlock command is issued (AES_CR.UNLOCK=1). The lock source must be cleared before performing the unlock command. If AES_WPSR.SEQE=1, the following two actions must be performed:
1/ Read AES_WPSR.
2/ Issue software reset by writing a 1 in AES_CR.SWRST.
A specific configuration applies where the sequence does not clear the lock source (AES_WPSR=0). If AES_WPSR.SEQE remains high after the clearing sequence, then only a hardware reset will unlock the AES. A hardware reset can be performed by issuing a reset controller software reset (refer to the section “Reset Controller (RSTC)”). This condition can be met when AES_EMR.PKWL=1 and a key has been loaded through the Private Key bus. The key loaded through the key bus is corrupted, but it is impossible to reload a new key unless a hardware reset is issued.

Value	Name	Description
0	REPORT_ONLY	No action (stop or clear key) is performed when one of PKRPVS, WPVS, CGD, SEQE, or SWE flags is set.
1	LOCK_PKRPVS_WPVS_SWE	If a processing is in progress when the AES_WPSR.PKRPVS/WPVS/SWE event detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
2	LOCK_CGD_SEQE	If a processing is in progress when the AES_WPSR.CGD/SEQE event detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued.
3	LOCK_ANY_EV	If a processing is in progress when the AES_WPSR.PKRPVS/WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued.
4	CLEAR_PKRPVS_WPVS_SWE	If a processing is in progress when the AES_WPSR.PKRPVS/WPVS/SWE events detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued. Moreover, the AES_KEYWRx key is immediately cleared.
5	CLEAR_CGD_SEQE	If a processing is in progress when the AES_WPSR.CGD/SEQE events detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued. Moreover, the AES_KEYWRx key is immediately cleared.
6	CLEAR_ANY_EV	If a processing is in progress when the AES_WPSR.PKRPVS/WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued. Moreover, the AES_KEYWRx key is immediately cleared.

Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in AES_WPSR.WPVSRC and the last software control error type is reported in AES_WPSR.SWETYP. The AES_ISR.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in AES_WPSR.WPVSRC and only the first software control error type is reported in AES_WPSR.SWETYP. The AES_ISR.SECE flag is set at the first error occurrence within a series.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x414553 (“AES” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x414553 (“AES” in ASCII).

Bit 1 – WPITEN Write Protection Interruption Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x414553 (“AES” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x414553 (“AES” in ASCII).

Bit 0 – WPEN Write Protection Configuration Enable
See Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on configuration registers if WPKEY corresponds to 0x414553 (“AES” in ASCII).
1	Enables the write protection on configuration registers if WPKEY corresponds to 0x414553 (“AES” in ASCII).

© 2026 Microchip Technology Inc. and its subsidiaries

58.5.22. AES Write Protection Status Register

Name: AES_WPSR
Offset: 0xE8
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS				SWETYP[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
				PKRPVS	SWE	SEQE	CGD	WPVS
Access				R	R	R	R	R
Reset				0	0	0	0	0

Bit 31 – ECLASS Software Error Class (cleared on read)
0 (WARNING): An abnormal access that does not affect system functionality
1 (ERROR): An access is performed into key, input data, control registers while the AES is performing an encryption/decryption or a start is request by software or DMA while the key is not fully configured.

Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read (Warning).
1	WRITE_RO	AES is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address (Warning).
3	CTRL_START	Abnormal use of AES_CR.START command when DMA access is configured.
4	WEIRD_ACTION	A key write, init value write, output data read, AES_MR and AES_EMR write, GCM configuration registers write, AES_TWRx and AES_ALPHARx registers write, AES_BCNT write, Private Key Bus access has been performed while a current processing is in progress (abnormal).
5	INCOMPLETE_KEY	A tentative of start is required while the key is not fully loaded into the AES_KEYWRx registers.

Bits 15:8 – WPVSRC[7:0] Write Protection Violation Source
When WPVS=1, WPVSRC indicates the register address offset at which a write access has been attempted.
When WPVS=0 and SWE=1, WPVSRC reports the address of the incorrect software access. As soon as WPVS=1, WPVSRC returns the address of the write-protected violation.

Bit 4 – PKRPVS Private Key Internal Register Protection Violation Status (cleared on read)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No Private Key Internal Register access violation has occurred since the last read of AES_WPSR.
1	A Private Key Internal Register access violation has occurred since the last read of AES_WPSR.

Bit 3 – SWE Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of AES_WPSR.
1	A software error has occurred since the last read of AES_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSRC (if WPVS=0).

Bit 2 – SEQE Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of AES_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of AES_WPSR. This flag can only be set under abnormal operating conditions.

Bit 1 – CGD Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring circuitry has not been corrupted since the last read of AES_WPSR. Under normal operating conditions, this bit is always cleared.
1	The clock monitoring circuitry has been corrupted since the last read of AES_WPSR. This flag can only be set in case of abnormal clock signal waveform (glitch).

Bit 0 – WPVS Write Protection Violation Status (cleared on read)

Value	Description
0	No write protect violation has occurred since the last read of AES_WPSR.
1	A write protect violation has occurred since the last read of AES_WPSR. The address offset of the violated register is reported into field WPVSRC.

© 2026 Microchip Technology Inc. and its subsidiaries

59. Secure Hash Algorithm (SHA)

59.1. Description

The Secure Hash Algorithm (SHA) is compliant with the American *FIPS (Federal Information Processing Standard) Publication 180-4* specification.

The SHA supports Secure Hash Algorithm (SHA1, SHA224, SHA256, SHA384, SHA512).

The SHA also supports Hash-based Message Authentication Code (HMAC) algorithm.

The 512/1024-bit block of message is respectively stored in 16/32 x 32-bit registers, (SHA_IDATARx/SHA_IODATARx) which are write-only.

As soon as the input data is written, hash processing can be started. The registers comprising the block of a message must be entered consecutively. Then, after the processing period, the message digest is ready to be read out on the 5 up to 8/16 x 32-bit output data registers (SHA_IODATARx) or through the DMA channels.

59.2. Embedded Characteristics

- Supports Secure Hash Algorithm (SHA1, SHA224, SHA256, SHA384, SHA512)
- Supports Hash-based Message Authentication Code (HMAC) Algorithm (HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512)
- Compliant with FIPS Publication 180-4
- Supports Automatic Padding of Messages
- Supports Up to 2 Sets of Initial Hash Values Registers (HMAC Acceleration or other)
- Supports Automatic Check of the Hash (HMAC Acceleration or other)
- Tightly Coupled to AES for Protocol Layers Improved Performances
- Configurable Processing Period:
  - 85 clock cycles to obtain a fast SHA1 runtime, 88 clock cycles for SHA384, SHA512 or 209 Clock Cycles for Maximizing Bandwidth of Other Applications
  - 72 clock cycles to obtain a fast SHA224, SHA256 runtime or 194 clock cycles for maximizing bandwidth of other applications
- Connection to DMA Channel Capabilities Optimizes Data Transfers
- Double Input Buffer Optimizes Runtime
- Register Write Protection

59.3. Product Dependencies

59.3.1. Power Management

The SHA may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SHA clock.

59.3.2. Interrupt Sources

The SHA interface has an interrupt line connected to the Interrupt Controller.

Handling the SHA interrupt requires programming the Interrupt Controller before configuring the SHA.

59.4. Functional Description

The Secure Hash Algorithm (SHA) module requires a padded message according to the FIPS 180 specification. This message can be provided with the padding to the SHA module, or the padding

© 2026 Microchip Technology Inc. and its subsidiaries

can be automatically computed by the SHA module if the size of the message is provided. The first block of the message must be indicated to the module by a specific command. The SHA module produces an N-bit message digest each time a block is written and processing period ends, where N is 160 for SHA1, 224 for SHA224, 256 for SHA256, 384 for SHA384, 512 for SHA512. The SHA module is also capable of computing a Hash-based Message Authentication Code (HMAC) algorithm.

59.4.1. SHA Algorithm

The SHA can process SHA1, SHA224, SHA256, SHA384, SHA512 by configuring the ALGO field in the Mode register (SHA_MR).

The block size depends on the algorithm and determines the number of bytes to write per block into the SHA_IDATARx registers. See the following table.

Table 59.1. Block Sizes

Algorithm	Block Size (Bytes)
SHA-1	64
SHA-224	64
SHA-256	64
SHA-384	128
SHA-512	128
SHA-512/224	128
SHA-512/256	128

59.4.2. HMAC Algorithm

The HMAC algorithm is as follows:

$HMAC_K(m) = h((K_0 \oplus opad) || h((K_0 \oplus ipad) || m))$

where:

- h = SHA function
- K_0 = the key K after any necessary pre-processing to form a block size key
- m = message to authenticate
- || = concatenation operator
- ⊕ = XOR operator
- ipad = predefined constant (0x3636...3636)
- opad = predefined constant (0x5C5C...5C5C)

The SHA provides a fully optimized processing of the HMAC algorithm by executing the following operations:

- starting the SHA algorithm from any user predefined hash value, thus 'h(K_0 ⊕ ipad)' for first HMAC hash and 'h(K_0 ⊕ opad)' for second HMAC hash
- performing automatic padding
- routing automatically the first hash result 'h((K_0 ⊕ ipad) || m)' to the source of the second hash processing 'h((K_0 ⊕ opad) || (first hash result))' including the concatenation of the first hash result to 'K_0 ⊕ opad'.

To perform the HMAC operation, the ALGO field value must be greater than 7, the automatic padding feature must be enabled (MSGSIZE and BYTCNT fields differ from 0) and the SHA internal initial hash value registers 0 and 1 must be configured, respectively, with the hash results of input blocks "K_0 ⊕ ipad" and "K_0 ⊕ opad" (see Internal Registers for Initial Hash Value or Expected Hash Result).

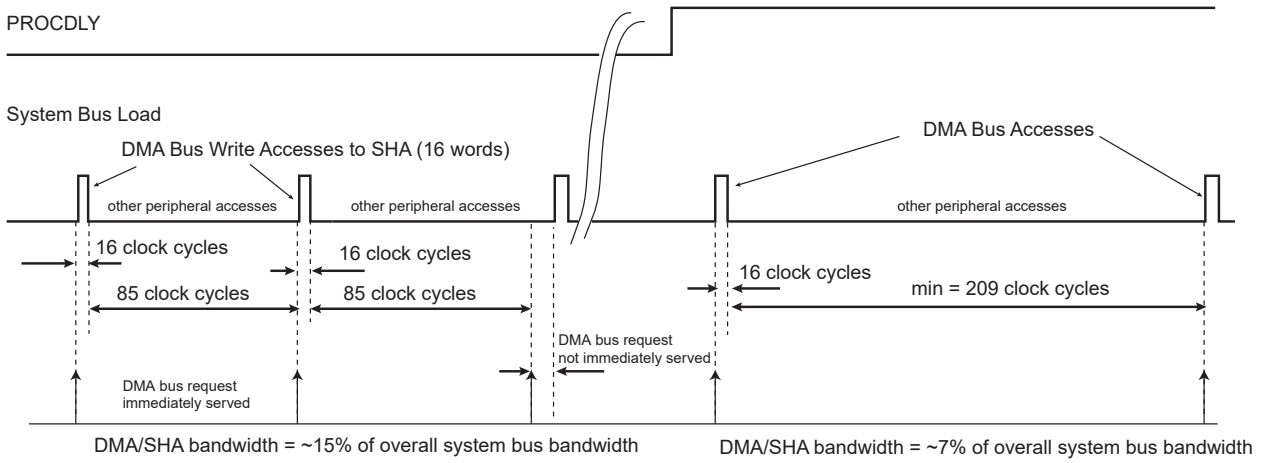
The size of the message ('m') must be written in the MSGSIZE and BYTCNT fields.

© 2026 Microchip Technology Inc. and its subsidiaries

The FIRST bit in the Control register (SHA_CR) should be set before writing the first block of the message.

The SHA can process HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512 by configuring the SHA_MR.ALGO field.

59.4.3. Processing Period



When the SHA is enabled and DMA is used to write the messages, the inherent processing period may result, depending on the application, in a significant bandwidth usage at system bus level. In some applications, it may be important to keep as much bandwidth as possible for the other peripherals (CPU or other DMA channels, for example). The SHA engine inherent processing period can be configured to reduce the bandwidth required by writing SHA_MR.PROCDLY=1.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization (SHA_MR.PROCDLY=0). The longest period is 209 clock cycles + 2 clock cycles when SHA_MR.PROCDLY=1 (see the figure below).

In SHA256 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization (SHA_MR.PROCDLY=0). The longest period is 194 clock cycles + 2 clock cycles when SHA_MR.PROCDLY=1.

In SHA384 or SHA512 mode, the shortest processing period is 88 clock cycles + 2 clock cycles for start command synchronization. The longest period is 209 clock cycles + 2 clock cycles.

Figure 59.1. Bandwidth Usage in SHA-1 Mode

59.4.4. Double Input Buffer

The Input Data registers (SHA_IDATARx) can be double-buffered to reduce the runtime of large messages.

Double buffering allows a new message block to be written while the previous message block is being processed. This is only possible when DMA accesses are performed (SMOD = 2).

The SHA_MR.DUALBUFF bit must be set to have double input buffer access.

59.4.5. Internal Registers for Initial Hash Value or Expected Hash Result

The SHA module embeds two sets of internal registers (IR0, IR1) to store different data used by the SHA or HMAC algorithms (see Figure 59.2). These internal registers are accessed through the Input Data registers (SHA_IDATARx).

When the ALGO field selects SHA algorithms, IR0 can be configured with a user initial hash value. This initial hash value can be used to compute a custom hash algorithm with two sets of different

© 2026 Microchip Technology Inc. and its subsidiaries

initial constants, or to continue a hash computation by providing the intermediate hash value previously returned by the SHA module.

When the ALGO field selects SHA algorithms, IR1 can be configured with either a user initial hash value or an expected hash result. The expected hash result must be configured in the IR1 if the field CHECK = 1 (see Automatic Check). If the field CHECK = 0 or 2, IR1 can be configured with a user initial hash value that differs from IR0 value.

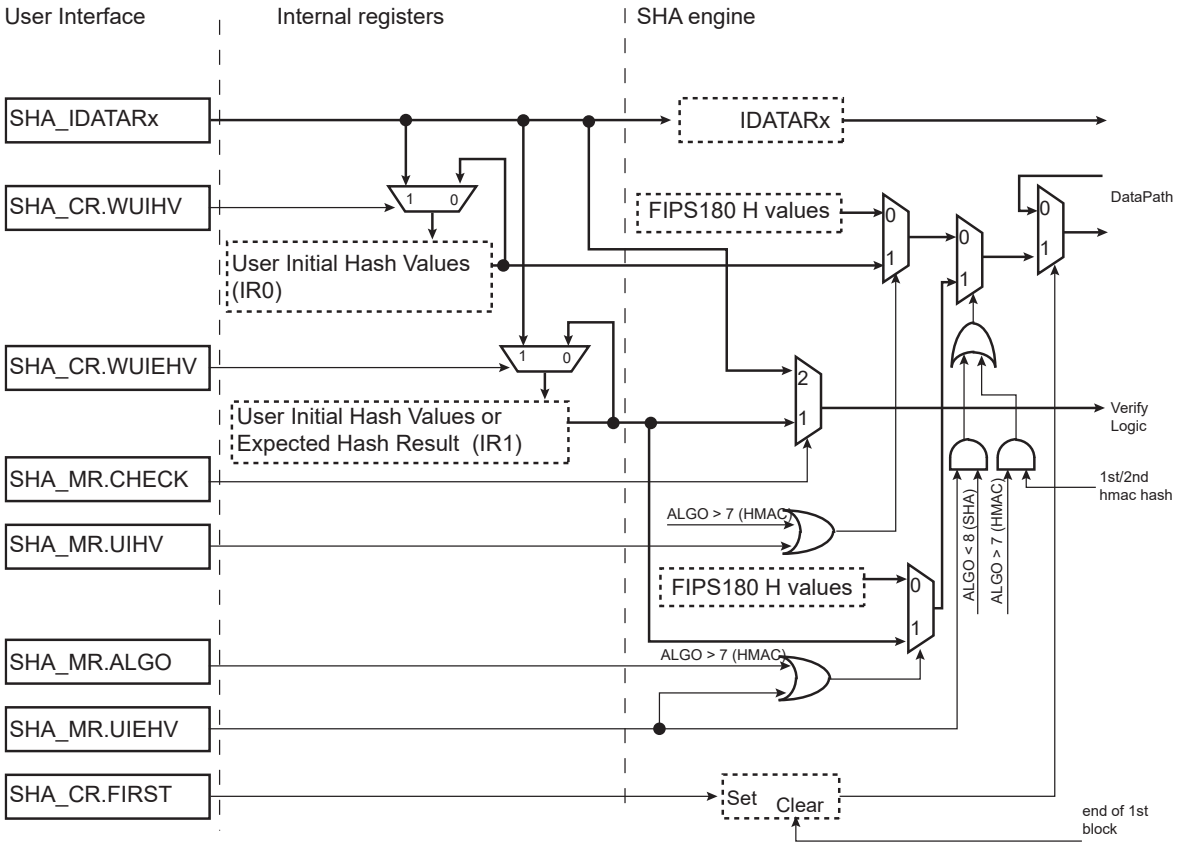
When the ALGO field selects HMAC algorithms, IR0 must be configured with the hash result of $K_0 \oplus$ ipad and IR1 must be configured with the hash result of $K_0 \oplus$ opad. These pre-computed first blocks speed up the HMAC computation by saving the time to compute the intermediate hash values of the first block which is constant while the secret key is constant (see HMAC Algorithm).

Table 59.2. Configuration Values of Internal Registers

Register	SHA Modes (ALGO < 8)			HMAC Modes (ALGO > 7)
	CHECK = 0	CHECK = 1	CHECK = 2	
IR0	User Initial Hash	User Initial Hash	User Initial Hash	hash($K_0 \oplus$ ipad)
IR1	User Initial Hash	Expected Hash Result	User Initial Hash	hash($K_0 \oplus$ opad)

To calculate the initial HMAC values, follow this sequence:

1. Calculate K_0.
2. Calculate $K_0 \oplus$ ipad and $K_0 \oplus$ opad.
3. Perform a hash of the result of $K_0 \oplus$ ipad and $K_0 \oplus$ opad (auto-padding must be disabled for that type of hash).
4. Write h($K_0 \oplus$ ipad) and h($K_0 \oplus$ opad) in IR0 and IR1 respectively.



To write IR0 or IR1, follow this sequence:

1. Set SHA_CR. WUIHV (IR0) or SHA_CR.WUIEHV (IR1).
2. Write the data in SHA_IDATARx. The number of registers to write depends on the type of data (user initial hash values or expected hash result) and on the type of algorithm selected:
   - For user initial hash values:
     - SHA_IDATAR0 to SHA_IDATAR4 for SHA1
     - SHA_IDATAR0 to SHA_IDATAR7 for SHA224 or SHA256
     - SHA_IDATAR0 to SHA_IDATAR15 for SHA384, SHA512
   - For expected hash result:
     - SHA_IDATAR0 to SHA_IDATAR4 for SHA1
     - SHA_IDATAR0 to SHA_IDATAR6 for SHA224
     - SHA_IDATAR0 to SHA_IDATAR7 for SHA256
     - SHA_IDATAR0 to SHA_IDATAR11 for SHA384
     - SHA_IDATAR0 to SHA_IDATAR16 for SHA512
3. Clear SHA_CR.WUIHV or SHA_CR.WUIEHV.

IR0 and IR1 are automatically selected for HMAC processing if the field ALGO selects HMAC algorithms. If SHA algorithms are selected, the internal registers are selected if the corresponding UIHV or UIEHV bits are set.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 59.2. User Initial Hash Value and Expected Hash Internal Register Access

59.4.6. Automatic Padding

The SHA module features an automatic padding computation to speed up the execution of the algorithm.

The automatic padding function requires the following information:

- Complete message size in bytes to be written in the MSGSIZE field of the Message Size register (SHA_MSR).
  The size of the message is written at the end of the last block, as required by the FIPS 180 specification (the size is automatically converted into a bit-size).
  Note: SHA_MSR is a 32-bit register, thus the automatic padding capability is limited to messages of less than 4 gigabytes. For messages greater than 4 gigabytes, padding must be performed by software.
- Number of remaining bytes (to write in the SHA_IDATARx) to be written in the BYTCNT field of the Bytes Count register (SHA_BCR).
  Automatic padding occurs when the BYTCNT field reaches 0. At each write in the Input registers, the BYTCNT field value is decreased by the number of bytes written.

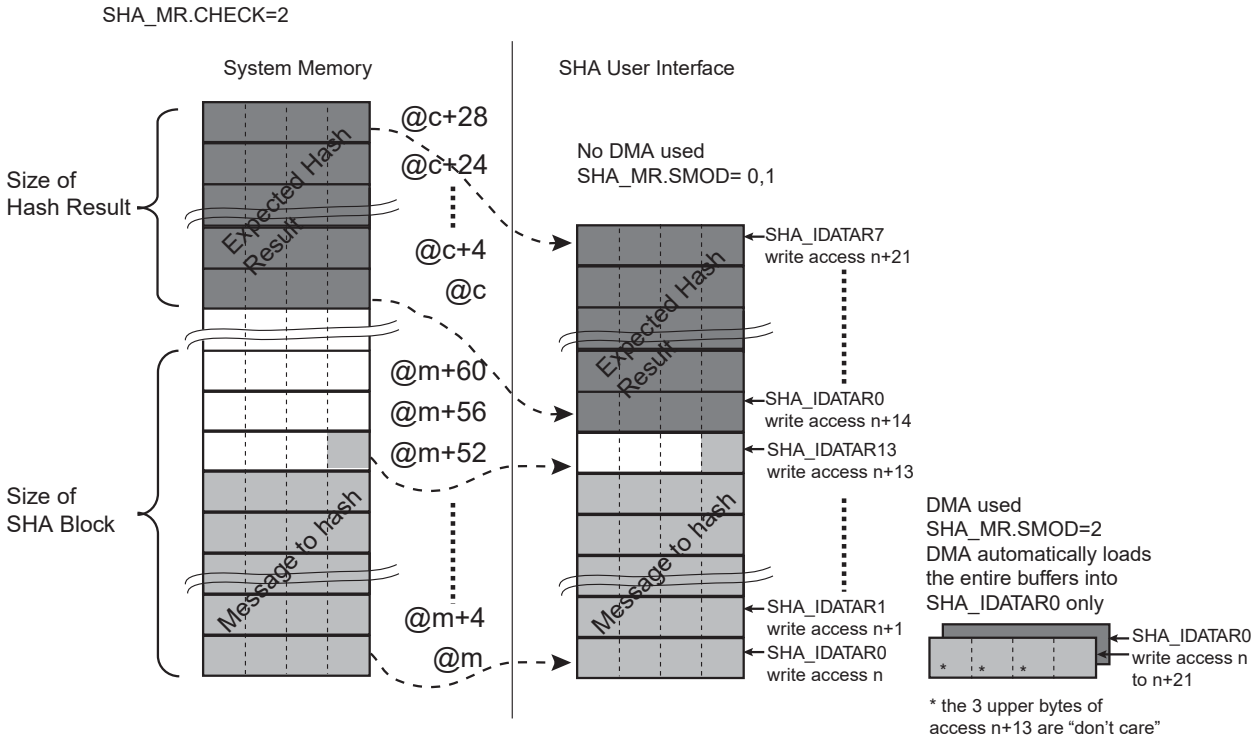
The BYTCNT field value must be written with the same value as the MSGSIZE field value if the full message is processed. If the message is partially preprocessed and an initial hash value is used, BYTCNT must be written with the remaining bytes to hash while MSGSIZE holds the message size.

To disable the automatic padding feature, the MSGSIZE and BYTCNT fields must be configured with 0.

© 2026 Microchip Technology Inc. and its subsidiaries

59.4.7. Automatic Check

The SHA module features an automatic check of the hash result with the expected hash. A check failure can generate an interrupt if configured in the SHA Interrupt Enable register (SHA_IER).



Automatic check requires the automatic padding feature to be enabled (the MSGSIZE and BYTCNT fields must be greater than 0).

Two methods can be used to configure the expected hash result:

- if SHA_MR.CHECK = 1, the expected hash result is read from the internal register (IR1). This method cannot be used when HMAC algorithm is selected because this register is already used to store user initial hash values for the second hash processing. IR1 cannot be read by software.
- If SHA_MR.CHECK = 2, the expected hash result is written in the SHA_IDATARx after the message.

When SHA_MR.CHECK = 2, the method can provide more flexibility of use if a message is stored in system memory together with its expected hash result. A DMA with a linked list can be used to ease the transfer of the message and its expected hash result.

Figure 59.3. Message and Expected Hash Result Memory Mapping

The number of 32-bit words of the hash result to check with the expected hash can be selected with SHA_MR.CHKCNT. The status of the check is available in the CHKST field in the Interrupt Status register (SHA_ISR).

An interrupt can be generated (if enabled) when the check is completed. The check occurs several clock cycles after the computation of the requested hash, so the interrupt and the CHECKF bit are set several clock cycles after the SHA_ISR.DATRDY flag.

59.4.8. Protocol Layers Improved Performances

The SHA can be tightly coupled to the AES module to improve performances when processing protocol layers such as IPsec.

When the AES is configured to be tightly coupled to SHA (AES_MR), SHA must be always configured in Double Buffer mode (SHA_MR.DUALBUFF = 1).

© 2026 Microchip Technology Inc. and its subsidiaries

Refer to the “Advanced Encryption Standard (AES)” section for details.

59.4.9. Context Save and Restore

The SHA supports interrupting a multi-block hash computation, saving the internal state, and resuming it later. The final digest is identical to computing the entire message without interruption.

To save the internal state after processing K blocks, read SHA_IODATARx. The number of words to read depends on the algorithm: 5 for SHA1, 8 for SHA224/SHA256, 16 for SHA384/SHA512/SHA512-derivatives

To restore the state and resume, perform a software reset, configure SHA_MR with UIHV=1, set SHA_MSR to the full message size and SHA_BCR to the remaining bytes, write the saved state into UIHV0 (via SHA_CR.WUIHV), set FIRST, then continue feeding the remaining blocks.

59.4.10. Start Modes

SHA_MR.SMOD is used to select the Hash Processing Start mode.

59.4.10.1. Manual Mode

In Manual mode, the sequence is as follows:

1. Set SHA_IER.DATRDY (Data Ready), depending on whether an interrupt is required at the end of processing.
2. If the initial hash values differ from the FIPS standard, set SHA_MR.UIHV and/or SHA_MR.UIEHV. If the initial hash values comply with the FIPS180 specification, clear SHA_MR.UIHV and/or SHA_MR.UIEHV.
3. If automatic padding is required, configure SHA_MSR.MSGSIZE with the number of bytes of the message, and configure SHA_BCR.BYTCNT with the remaining number of bytes to write. The BYTCNT field must be written with a value different from MSGSIZE field value if the message is preprocessed and completed by using user initial hash values.
   If automatic padding is not required, configure SHA_MSR.MSGSIZE and SHA_BCR.BYTCNT to 0.
4. The FIRST command must be set by writing a 1 into the corresponding bit of the Control register (SHA_CR) to start a hash computation with initial constants (first block of a message) or to resume after message processing was interrupted. When a first message processing is interrupted to process another message, the intermediate hash results must be stored in the system memory and they must be reloaded in user initial values registers (IR0 accessed via SHA_IDATAR when SHA_CR.WUIHV=1) before resuming and continuing the processing of the first message. For the other blocks, there is nothing to write.
5. Write the block to process in SHA_IDATARx.
6. To begin processing, set SHA_CR.START.
7. When processing is completed, the bit DATRDY in the Interrupt Status register (SHA_ISR) rises. If an interrupt has been enabled by setting SHA_IER.DATRDY, the interrupt line of the SHA is activated.
8. Repeat the write procedure for each block (step 5), start procedure (step 6) and wait for the interrupt procedure (step 7) up to the last block of the entire message. Each time the start procedure is complete, the DATRDY flag is cleared.
9. After the last block is processed (the DATRDY flag is set, if an interrupt was enabled by setting SHA_IER.DATRDY, the interrupt line of the SHA is activated), read the message digest in the Output Data registers. The DATRDY flag is automatically cleared when reading the SHA_IODATARx registers.

59.4.10.2. Auto Mode

In Auto mode, processing starts as soon as the correct number of SHA_IDATARx is written. No action is required in SHA_CR.

© 2026 Microchip Technology Inc. and its subsidiaries

59.4.10.3.DMA Mode

The DMA can be used in association with the SHA to perform the algorithm on a complete message without any action by the software during processing.

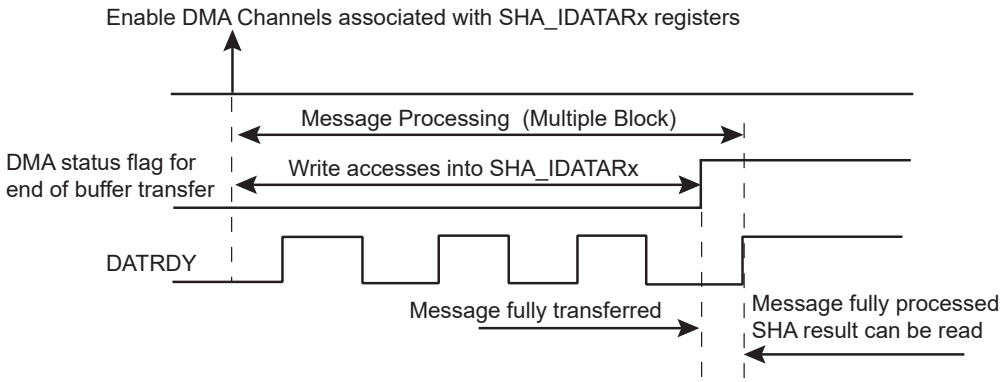
SHA_MR.SMOD must be configured to 2.

The DMA must be configured with non-incremental addresses.

The start address of any transfer descriptor must be set to point to the SHA_IDATAR0.

The DMA chunk size must be set to transfer, for each trigger request, 16 words of 32 bits.

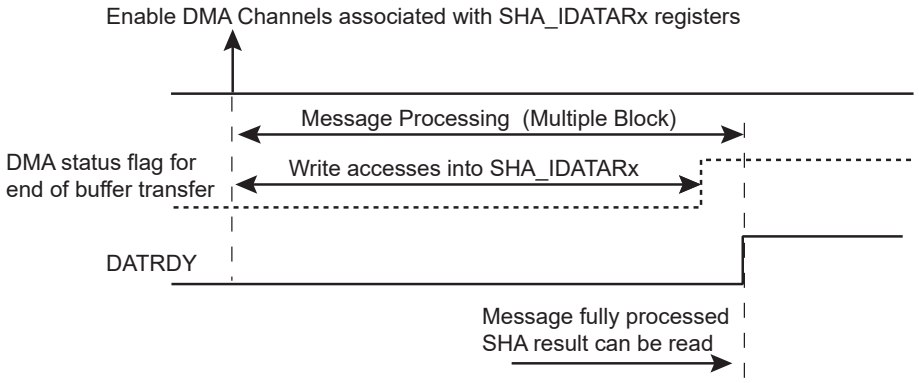
The SHA_CR.FIRST bit must be set before starting the DMA when the first block is transferred.



Note: The FIRST bit command is also used to resume after message processing was interrupted. When a first message processing is interrupted to process another message, the intermediate hash results must be stored in the system memory and they must be reloaded in user initial values registers (IR0 accessed via SHA_IDATAR when SHA_CR.WUIHV=1) before resuming and continuing processing of first message. The DMA data buffers and the SHA_CR.FIRST command must be managed accordingly.

The DMA generates an interrupt when the end of buffer transfer is completed but SHA processing is still in progress. The end of SHA processing is indicated by the flag DATRDY in the SHA_ISR.

If automatic padding is disabled, the end of SHA processing requires two interrupts to be verified. The DMA end of transfer interrupt must be verified first, then the SHA DATRDY interrupt must be enabled and verified (see Figure 59.4).



If automatic padding is enabled, the end of SHA processing requires only one interrupt to be verified (see Figure 59.5). The DMA end of transfer is not required, so the SHA DATRDY interrupt must be enabled before starting the DMA, and the DATRDY interrupt is the only one to be verified.

Figure 59.5. Interrupts Processing with DMA and Automatic Padding

59.4.10.4.SHA Register Endianness

In Arm processor-based products, the system bus and processors manipulate data in little-endian form. The SHA interface requires little-endian format words. However, in accordance with the protocol of the FIPS 180 specification, data is collected, processed and stored by the SHA algorithm in big-endian form.

The following example illustrates how to configure the SHA:

If the first 64 bits of a message (according to FIPS 180, i.e., big-endian format) to be processed is 0xcafedeca_01234567, then the SHA_IDATAR0 and SHA_IDATAR1 registers must be written with the following pattern:

- SHA_IDATAR0 = 0xcadefeca
- SHA_IDATAR1 = 0x67452301

In a little-endian system, the message (according to FIPS 180) starting with pattern 0xcafedeca_01234567 is stored into memory as follows:

- 0xca stored at initial offset (for example 0x00),
- then 0xfe stored at initial offset + 1 (i.e., 0x01),
- 0xde stored at initial offset + 2 (i.e., 0x02),
- 0xca stored at initial offset + 3 (i.e., 0x03).

If the message is received through a serial-to-parallel communication channel, the first received character is 0xca and it is stored at the first memory location (initial offset). The second byte, 0xfe, is stored at initial offset + 1.

When reading on a 32-bit little-endian system bus, the first word read back from system memory is 0xcadefeca.

When the SHA_IODATARx registers are read, the hash result is organized in little-endian format, allowing system memory storage in the same format as the message.

Taking an example from the FIPS 180 specification Appendix B.1, the endian conversion can be observed.

For this example, the 512-bit message is:

0x6162638000000000

If the message has not already been stored in the system memory, the first step is to convert the input message to little-endian before writing to the SHA_IDATARx registers. This would result in a write of:

SHA_IDATAR0 = 0x80636261..... SHA_IDATAR15 = 0x18000000

The data in the output message digest registers, SHA_IODATARx, contain SHA_IODATAR0 = 0xbf1678ba... SHA_IODATAR7 = 0xad1500f2 which is the little-endian format of 0xba7816bf,..., 0xf20015ad.

Reading SHA_IODATAR0 to SHA_IODATAR1 and storing into a little-endian memory system forces hash results to be stored in the same format as the message.

When the output message is read, the user can convert back to big-endian for a resulting message value of:

0xba7816bf_8f01cfea_414140de_5dae2223_b00361a3_96177a9c_b410ff61_f20015ad

59.4.11. Security Features

59.4.11.1. Unspecified Register Access Detection

When an unspecified register access occurs, the URAD bit in the SHA_ISR is set. Its source is then reported in the Unspecified Register Access Type field (URAT). Only the last unspecified register access is available through the URAT field.

Several types of unspecified register accesses can occur:

- SHA_IDATARx written during data processing in DMA mode
- SHA_IODATARx read during data processing
- SHA_MR written during data processing
- Write-only register read access

Note: The URAD bit and the URAT field can only be reset by the SHA_CR.SWRST bit.

59.4.11.2. Register Write Protection

To prevent any single software error from corrupting SHA behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the SHA Write Protection Mode register (SHA_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the SHA Write Protection Status register (SHA_WPSR) is set and the Write Protection Violation Source (WPVSRC) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading SHA_WPSR.

The following registers can be write-protected when SHA_WPMR.WPEN is set:

- SHA Mode Register
- SHA Message Size Register
- SHA Bytes Count Register

The following registers can be write-protected when WPITEN is set:

- SHA Interrupt Enable Register
- SHA Interrupt Disable Register

The following registers can be write-protected when WPCREN is set:

- SHA Control Register

© 2026 Microchip Technology Inc. and its subsidiaries

59.4.11.3.Security and Safety Analysis and Reports

Several types of checks are performed when the SHA is enabled.

The peripheral clock of the SHA is monitored by a specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the SHA. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the SHA_WPSR.CGD flag is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the SHA is also monitored, and if an abnormal state is detected, the SHA_WPSR.SEQE flag is set. This flag is not set under normal operating conditions.

Software accesses to the SHA are monitored and if an incorrect access is performed, the SHA_WPSR.SWE flag is set. The type of incorrect/abnormal software access is reported in the SHA_WPSR.SWETYP field (see SHA Write Protection Status Register for details). For example, reading SHA_ODATARx when the SHA_ISR.DATRDY flag is cleared is an error. SHA_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The CGD, SEQE, SWE and WPVS flags are automatically cleared when SHA_WPSR is read.

If one of these flags is set, the SHA_ISR.SECE flag is set and can trigger an interrupt if SHA_IMR.SECE is ‘1’. SECE is cleared by reading SHA_ISR.

It is possible to configure an action to be performed by SHA as soon as an abnormal event detection occurs. If SHA_WPMR.ACTION > 0, a lock is performed. When a lock occurs, the current processing is ended normally but any new processing is not performed whatever the start mode of operation (see SHA_MR.SMOD).

A locked state of the SHA is unlocked as follows:

1. Read SHA_WPSR.
2. Disable the source of tamper if the tamper is enabled.
3. Write a ‘1’ to SHA_CR.UNLOCK.

It is possible to select the type of event that will lock the SHA in case of abnormal event detection. See SHA_WPMR.ACTION for details.

If SHA_MR.TMPLCK=1 and the tamper pin is active, the SHA is locked whatever the value of the field SHA_WPMR.ACTION.

59.5.1. SHA Control Register

Name: SHA_CR
Offset: 0x00
Reset: –
Property: Write-only

Bit	31	30	29	28	27	26	25	24
								UNLOCK
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
			WUIEHV	WUIHV				SWRST
Access			W	W				W
Reset			–	–				–

Bit	7	6	5	4	3	2	1	0
				FIRST				START
Access				W				W
Reset				–				–

Bit 24 – UNLOCK Unlock Processing
SHA_WPSR must be cleared before performing the unlock command.

Value	Description
0	No effect.
1	Unlocks the processing in case of abnormal event detection if SHA_WPMR.ACTION > 0.

Bit 13 – WUIEHV Write User Initial or Expected Hash Values

Value	Description
0	SHA_IDATARx accesses are routed to the data registers.
1	SHA_IDATARx accesses are routed to the internal registers (IR1).

Bit 12 – WUIHV Write User Initial Hash Values

Value	Description
0	SHA_IDATARx accesses are routed to the data registers.
1	SHA_IDATARx accesses are routed to the internal registers (IR0).

Bit 8 – SWRST Software Reset
SWRST does not clear the User Initial Hash Value registers. Hash values previously loaded via WUIHV (or WUIEHV) in SHA_CR are preserved across a software reset.

Value	Description
0	No effect.
1	Resets the SHA. A software-triggered hardware reset of the SHA interface is performed.

Bit 4 – FIRST First Block of a Message

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Indicates that the next block to process is the first one of a message or the first block of a fragment of a message.

Bit 0 – START Start Processing

Value	Description
0	No effect.
1	Starts manual hash algorithm process.

© 2026 Microchip Technology Inc. and its subsidiaries

59.5.2. SHA Mode Register

Name: SHA_MR
Offset: 0x04
Reset: 0x0000100
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	CHKCNT[3:0]						CHECK[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0

Bit	23	22	21	20	19	18	17	16
								DUALBUFF
Access								R/W
Reset								0

Bit	15	14	13	12	11	10	9	8
	TMPLCK				ALGO[3:0]			
Access	R/W				R/W	R/W	R/W	R/W
Reset	0				0	0	0	1

Bit	7	6	5	4	3	2	1	0
	BPE	UIEHV	UIHV	PROCDLY	AOE		SMOD[1:0]	
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

Bits 31:28 – CHKCNT[3:0] Check Counter
Number of 32-bit words to check. The value 0 indicates that the number of words to compare will be based on the algorithm selected (5 words for SHA1, 7 words for SHA224, 8 words for SHA256, 12 words for SHA384, 16 words for SHA512).

Bits 25:24 – CHECK[1:0] Hash Check
Values not listed in the table must be considered as “reserved”.

Value	Name	Description
0	NO_CHECK	No check is performed.
1	CHECK_EHV	Check is performed with expected hash stored in internal expected hash value registers.
2	CHECK_MESSAGE	Check is performed with expected hash provided after the message.

Bit 16 – DUALBUFF Dual Input Buffer

Value	Name	Description
0	INACTIVE	SHA_IDATARx and SHA_IODATARx cannot be written during processing of previous block.
1	ACTIVE	SHA_IDATARx and SHA_IODATARx can be written during processing of previous block when SMOD value = 2. It speeds up the overall runtime of large files.

Bit 15 – TMPLCK Tamper Lock Enable

Value	Description
0	A tamper event has no effect.
1	A tamper event locks the SHA until the tamper root cause is cleared and SHA_CR.UNLOCK is written to 1.

Bits 11:8 – ALGO[3:0] SHA Algorithm

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	SHA1	SHA1 algorithm processed
1	SHA256	SHA256 algorithm processed
2	SHA384	SHA384 algorithm processed
3	SHA512	SHA512 algorithm processed
4	SHA224	SHA224 algorithm processed
5	Reserved	–
6	Reserved	–
7	Reserved	–
8	HMAC_SHA1	HMAC algorithm with SHA1 Hash processed
9	HMAC_SHA256	HMAC algorithm with SHA256 Hash processed
10	HMAC_SHA384	HMAC algorithm with SHA384 Hash processed
11	HMAC_SHA512	HMAC algorithm with SHA512 Hash processed
12	HMAC_SHA224	HMAC algorithm with SHA224 Hash processed
13	Reserved	–
14	Reserved	–

Bit 7 – BPE Block Processing End

When SMOD=2 and ALGO<5, the SHA_ISR.DATRDY flag rises when each block has been processed.
When SMOD=2 and ALGO>7, the SHA_ISR.DATRDY rises when all blocks except the last one have been processed.

Value	Description
0	BPE must be cleared when a DMA transfers data. When SMOD=2, SHA_ISR.DATRDY flag rises only when the SHA or HMAC processing cycle has completed. No intermediate block processing is reported.
1	When processing small messages, data transfer by software can improve performance compared to DMA. In this case, BPE can be written to 1, forcing the SHA_ISR.DATRDY to rise when a data must be loaded into SHA_IDATARx.

Bit 6 – UIEHV User Initial or Expected Hash Value Registers

Value	Description
0	The SHA algorithm is started with the standard initial values as defined in the FIPS 180 specification.
1	The SHA algorithm is started with the user initial hash values stored in the internal register 1 (IR1). If HMAC is configured, UIEHV has no effect (i.e. IR1 is always selected).

Bit 5 – UIHV User Initial Hash Values

Value	Description
0	The SHA algorithm is started with the standard initial values as defined in the FIPS 180 specification.
1	The SHA algorithm is started with the user initial hash values stored in the internal register 0 (IR0). If HMAC is configured, UIHV has no effect (IR0 is selected).

Bit 4 – PROCDLY Processing Delay

When SHA1 algorithm is processed, the runtime period is either 85 or 209 clock cycles.
When SHA256 or SHA224 algorithm is processed, the runtime period is either 72 or 194 clock cycles.
When SHA384 or SHA512 algorithm is processed, the runtime period is either 88 or 209 clock cycles.

Value	Name	Description
0	SHORTEST	SHA processing runtime is the shortest one
1	LONGEST	SHA processing runtime is the longest one (reduces the SHA bandwidth requirement, reduces the system bus overload)

Bit 3 – AOE Always On Enable

Value	Description
0	The SHA operates in functional operating modes.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	As soon as a START command is written, the SHA processes dummy calculations until AOE=0, without software intervention. This can be used to create an additional current consumption when AES is used to encrypt/ decrypt.

Bits 1:0 – SMOD[1:0] Start Mode

Values not listed in the table must be considered as “reserved”.
If a DMA transfer is used, configure the SMOD value to 2. See DMA Mode for details.

Value	Name	Description
0	MANUAL_START	Manual mode
1	AUTO_START	Auto mode
2	IDATAR0_START	SHA_IDATAR0 access only mode (mandatory when DMA is used)

© 2026 Microchip Technology Inc. and its subsidiaries

59.5.3. SHA Interrupt Enable Register

Name: SHA_IER
Offset: 0x10
Reset: –
Property: Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								SECE
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
								CHECKF
Access								W
Reset								–

Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

Bit 24 – SECE Security and/or Safety Event Interrupt Enable

Bit 16 – CHECKF Check Done Interrupt Enable

Bit 8 – URAD Unspecified Register Access Detection Interrupt Enable

Bit 0 – DATRDY Data Ready Interrupt Enable

© 2026 Microchip Technology Inc. and its subsidiaries

59.5.4. SHA Interrupt Disable Register

Name: SHA_IDR
Offset: 0x14
Reset: –
Property: Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								SECE
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
								CHECKF
Access								W
Reset								–

Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

Bit 24 – SECE Security and/or Safety Event Interrupt Disable

Bit 16 – CHECKF Check Done Interrupt Disable

Bit 8 – URAD Unspecified Register Access Detection Interrupt Disable

Bit 0 – DATRDY Data Ready Interrupt Disable

© 2026 Microchip Technology Inc. and its subsidiaries

59.5.5. SHA Interrupt Mask Register

Name: SHA_IMR
Offset: 0x18
Reset: 0x00000000
Property: Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
								SECE
Access								R
Reset								0

Bit	23	22	21	20	19	18	17	16
								CHECKF
Access								R
Reset								0

Bit	15	14	13	12	11	10	9	8
								URAD
Access								R
Reset								0

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								R
Reset								0

Bit 24 – SECE Security and/or Safety Event Interrupt Mask

Bit 16 – CHECKF Check Done Interrupt Mask

Bit 8 – URAD Unspecified Register Access Detection Interrupt Mask

Bit 0 – DATRDY Data Ready Interrupt Mask

© 2026 Microchip Technology Inc. and its subsidiaries

59.5.6. SHA Interrupt Status Register

Name: SHA_ISR
Offset: 0x1C
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
								SECE
Access								R
Reset								0

Bit	23	22	21	20	19	18	17	16
	CHKST[3:0]							CHECKF
Access	R	R	R	R				R
Reset	0	0	0	0				0

Bit	15	14	13	12	11	10	9	8
		URAT[2:0]						URAD
Access		R	R	R				R
Reset		0	0	0				0

Bit	7	6	5	4	3	2	1	0
				WRDY				DATRDY
Access				R				R
Reset				0				0

Bit 24 – SECE Security and/or Safety Event

Value	Description
0	There is no report in SHA_WPSR.
1	There is a Security and/or Safety Event reported in SHA_WPSR.

Bits 23:20 – CHKST[3:0] Check Status (cleared by writing SHA_CR.START or SHA_CR.SWRST or by reading SHA_IODATARx)
Value 5 indicates identical hash values (expected hash = hash result). Any other value indicates different hash values.

Bit 16 – CHECKF Check Done Status (cleared by writing SHA_CR.START or SHA_CR.SWRST or by reading SHA_IODATARx)

Value	Description
0	Hash check has not been computed.
1	Hash check has been computed, status is available in the CHKST bits.

Bits 14:12 – URAT[2:0] Unspecified Register Access Type (cleared by writing a 1 to SWRST bit in SHA_CR)
Only the last Unspecified Register Access Type is available through the URAT field.

Value	Name
0	SHA_IDATAR0 to SHA_IDATAR15 written during data processing in DMA mode (URAD = 1 and URAT = 0 can occur only if DUALBUFF is cleared in SHA_MR)
1	Output Data register read during data processing
2	SHA_MR written during data processing
3	Reserved
4	Reserved

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name
5	Write-only register read access

Bit 8 – URAD Unspecified Register Access Detection Status (cleared by writing a 1 to SHA_CR.SWRST)

Value	Description
0	No unspecified register access has been detected since the last SWRST.
1	At least one unspecified register access has been detected since the last SWRST.

Bit 4 – WRDY Input Data Register Write Ready

Value	Description
0	SHA_IDATAR0 cannot be written.
1	SHA_IDATAR0 can be written.

Bit 0 – DATRDY Data Ready (cleared by writing a 1 to bit SWRST or START in SHA_CR, or by reading SHA_IODATARx)

Value	Description
0	Output data is not valid.
1	512/1024-bit block process is completed. DATRDY is cleared when one of the following conditions is met: • Bit START in SHA_CR is set. • Bit SWRST in SHA_CR is set. • The hash result is read.

© 2026 Microchip Technology Inc. and its subsidiaries

59.5.7. SHA Message Size Register

Name: SHA_MSR
Offset: 0x20
Reset: 0x0
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	MSGSIZE[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	MSGSIZE[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	MSGSIZE[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MSGSIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – MSGSIZE[31:0] Message Size

The size in bytes of the message. When MSGSIZE differs from 0, the SHA appends the corresponding value converted in bits after the padding section, as described in the FIPS180 specification.
To disable automatic padding, MSGSIZE field must be written to 0.
Note: SHA_MSR is a 32-bit register, thus the automatic padding capability is limited to messages of less than 4 gigabytes. For messages greater than 4 gigabytes, padding must be performed by the software.

© 2026 Microchip Technology Inc. and its subsidiaries

59.5.8. SHA Bytes Count Register

Name: SHA_BCR
Offset: 0x30
Reset: 0x00000000
Property: Read/Write

Bits 31:0 – BYTCNT[31:0] Remaining Byte Count Before Auto Padding

When the hash processing starts from the beginning of a message (without preprocessed hash part), BYTCNT must be written with the same value as MSGSIZE. If a part of the message has been already hashed and the hash does not start from the beginning, BYTCNT must be configured with the number of bytes remaining to process before the padding section.

When read, provides the size in bytes of the message remaining to be written before the automatic padding starts.

BYTCNT is automatically updated each time a write occurs in SHA_IDATARx and SHA_IODATARx.

When BYTCNT reaches 0, the MSGSIZE is converted into a bit count and appended at the end of the message after the padding, as described in the FIPS 180 specification.

To disable automatic padding, the MSGSIZE and BYTCNT fields must be written to 0.

Reset	–	–	–	–	–	–	–	–

Bits 31:0 – IDATA[31:0] Input Data
32-bit Input Data registers load the data block used for hash processing.
These registers are write-only to prevent reading of input data by another application.
SHA_IDATAR0 corresponds to the first word of the block, SHA_IDATAR15 to the last word of the last block in case SHA algorithm is set to SHA1, SHA224, SHA256, or SHA_IODATAR15 to the last word of the block if SHA algorithm is SHA384 or SHA512 (see SHA Input/Output Data Register x).
SHA_IDATARx can be also written to configure the hash result of the previous fragment of a message when starting the processing of the next fragment when the SHA has processed another message in between fragments.

	IODATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – IODATA[31:0] Input/Output Data

These registers can be used to read the resulting message digest and to write the second part of the message block when the SHA algorithm is SHA-384 or SHA-512.
SHA_IODATAR0 to SHA_IODATAR15 can be written or read but reading these offsets does not return the content of corresponding parts (words) of the message block. Only results from SHA calculation can be read through these registers.
When SHA processing is in progress, these registers return 0x0000.
SHA_IODATAR0 corresponds to the first word of the message digest; SHA_IODATAR4 to the last one in SHA1 mode, SHA_IODATAR6 in SHA224, SHA_IODATAR7 in SHA256, SHA_IODATAR11 in SHA384 or SHA_IODATAR15 in SHA512.
When SHA224 is selected, the content of SHA_IODATAR7 must be ignored.
When SHA384 is selected, the content of SHA_IODATAR12 to SHA_IODATAR15 must be ignored.

		ACTION[1:0]		FIRSTE		WPCREN	WPITEN	WPEN
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x534841	PASSWD	Writing any other value in this field aborts the write operation of the WPEN,WPITEN,WPCREN bits. Always reads as 0.

Bits 6:5 – ACTION[1:0] Action on Abnormal Event Detection

Value	Name	Description
0	REPORT_ONLY	No action (stop or clear key) is performed when one of WPVS,CGD,SEQE, or SWE flag is set. When SHA_MR.TMPLCK=1 and an event occurs on a tamper pin, SHA processing stops.
1	LOCK_WPVS_SWE	If a processing is in progress when the SHA_WPSR.WPVS/SWE event detection occurs, the current processing is ended normally but no other processing is started while a SHA_CR.UNLOCK command is issued. When SHA_MR.TMPLCK=1 and an event occurs on a tamper pin, SHA processing stops.
2	LOCK_CGD_SEQE	If a processing is in progress when the SHA_WPSR.CGD/SEQE event detection occurs, the current processing is ended normally but no other processing is started while a SHA_CR.UNLOCK command is issued. When SHA_MR.TMPLCK=1 and an event occurs on a tamper pin, SHA processing stops.
3	LOCK_ANY_EV	If a processing is in progress when the SHA_WPSR.WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a SHA_CR.UNLOCK command is issued. When SHA_MR.TMPLCK=1 and an event occurs on a tamper pin, SHA processing stops.

Bit 4 – FIRSTE First Error Report Enable

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	The last write protection violation source is reported in SHA_WPSR.WPVSRC and the last software control error type is reported in SHA_WPSR.SWETYP. The SHA_ISR.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in SHA_WPSR.WPVSRC and only the first software control error type is reported in SHA_WPSR.SWETYP. The SHA_ISR.SECE flag is set at the first error occurrence within a series.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x534841 (“SHA” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x534841 (“SHA” in ASCII).

Bit 1 – WPITEN Write Protection Interruption Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x534841 (“SHA” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x534841 (“SHA” in ASCII).

Bit 0 – WPEN Write Protection Configuration Enable
See Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on configuration registers if WPKEY corresponds to 0x534841 (“SHA” in ASCII).
1	Enables the write protection on configuration registers if WPKEY corresponds to 0x534841 (“SHA” in ASCII).

Access	R				R	R	R	R
Reset	0				0	0	0	0

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPVS
Access					R	R	R	R
Reset					0	0	0	0

Bit 31 – ECLASS Software Error Class (cleared on read)
0 (WARNING): An abnormal access that does not affect system functionality
1 (ERROR): An access is performed into key, input data, control registers while the SHA is performing an encryption/decryption or a start is request by software or DMA while the key is not fully configured.

Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read (Warning).
1	WRITE_RO	SHA is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address (Warning).
3	CTRL_START	SHA is locked and a start command with SHA_CR.START has been performed.
4	AUTO_START	SHA is locked and a tentative automatic start has been performed by writing input data registers (SHA_MR.SMOD>0).
5	BAD_START	SHA is not locked and a start command with SHA_CR.START has been performed whereas Start mode is automatic (SHA_MR.SMOD>0)

Bits 15:8 – WPVSRC[7:0] Write Protection Violation Source
When WPVS=1, WPVSRC indicates the register address offset at which a write access has been attempted.
When WPVS=0 and SWE=1, WPVSRC reports the address of the incorrect software access. As soon as WPVS=1, WPVSRC returns the address of the write-protected violation.

Bit 3 – SWE Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of SHA_WPSR.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	A software error has occurred since the last read of SHA_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSRC (if WPVS=0).

Bit 2 – SEQE Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of SHA_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of SHA_WPSR. This flag can only be set under abnormal operating conditions.

Bit 1 – CGD Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring circuitry has not been corrupted since the last read of SHA_WPSR. Under normal operating conditions, this bit is always cleared.
1	The clock monitoring circuitry has been corrupted since the last read of SHA_WPSR. This flag can only be set in case of an abnormal clock signal waveform (glitch).

Bit 0 – WPVS Write Protection Violation Status (cleared on read)

Value	Description
0	No write protect violation has occurred since the last read of SHA_WPSR.
1	A write protect violation has occurred since the last read of SHA_WPSR. The address offset of the violated register is reported into field WPVSRC.

© 2026 Microchip Technology Inc. and its subsidiaries

60. Triple Data Encryption Standard (TDES)

60.1. Description

The Triple Data Encryption Standard (TDES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 46-3 specification.

The TDES supports the four different confidentiality modes of operation (ECB, CBC, OFB and CFB), specified in the FIPS (Federal Information Processing Standard) Publication 81 and is compatible with the Peripheral Data Controller channels for all of these modes, minimizing processor intervention for large buffer transfers.

The TDES key can be either loaded by the software or loaded in an invisible manner from the software.

The software can write up to three 64-bit keys, each stored in two 32-bit write-only registers, i.e., Key x Word registers TDES_KEYxWR0 and TDES_KEYxWR1. For a software-invisible key transfer, the Private Key bus accesses the Private Key internal registers from the TRNG or OTPC. The PKRS bit in the Mode register selects either TDES_KEYxWR0/TDES_KEYxWR1 or the Private Key internal registers.

The input data (and initialization vector for some modes) are stored in two corresponding 32-bit write-only registers:

- Input Data registers TDES_IDATAR0 and TDES_IDATAR1
- Initialization Vector registers TDES_IVR0 and TDES_IVR1

As soon as the initialization vector, the input data and the keys are configured, the encryption/decryption process can be started. Then the encrypted/decrypted data is ready to be read out on the two 32-bit Output Data registers (TDES_ODATARx) or through the DMA channels.

60.2. Embedded Characteristics

- Supports Single Data Encryption Standard (DES) and Triple Data Encryption Standard (TDES)
- Compliant with *FIPS Publication 46-3, Data Encryption Standard (DES)*
- 64-bit Cryptographic Key for TDES
- Two-key or Three-key Algorithms for TDES
- 18 Clock Cycles Encryption/Decryption Processing Time for DES
- 50 Clock Cycles Encryption/Decryption Processing Time for TDES
- Supports eXtended Tiny Encryption Algorithm (XTEA)
- 128-bit Key for XTEA and Programmable Round Number up to 64
- Supports the Four Standard Modes of Operation specified in the *FIPS Publication 81, DES Modes of Operation*
  - Electronic Code Book (ECB)
  - Cipher Block Chaining (CBC)
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
- 8-, 16-, 32- and 64-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allowing Optimized Message (Data) Authentication Code (MAC) Generation
- Abnormal Software Access Reports and Automatic Lock
- Abnormal Internal Sequence Detection and Automatic Lock
- Register Write Protection

© 2026 Microchip Technology Inc. and its subsidiaries

- Temporary Secured Storage for Keys
- Private Key Bus Access to the Private Key Internal Register Not Readable from any Peripheral or Software
- Connection to DMA Optimizes Data Transfers for all Operating Modes

60.3. Product Dependencies

60.3.1. Power Management

The TDES is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the TDES clock.

60.3.2. Interrupt Sources

The TDES interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TDES.

60.4. Functional Description

The Data Encryption Standard (DES) and the Triple Data Encryption Algorithm (TDES) specify FIPS-approved cryptographic algorithms that can be used to protect electronic data. TDES_MR.TDES is used to select either the single DES or the Triple DES mode.

Encryption (enciphering) converts data to an unintelligible form called ciphertext. Decrypting (deciphering) the ciphertext converts the data back into its original form, called plaintext. TDES_MR.CIPHER is used to choose between encryption and decryption.

A DES is capable of using cryptographic keys of 64 bits to encrypt and decrypt data in blocks of 64 bits. This 64-bit key is defined in the Key 1 registers (TDES_KEY1WRx or Private Key internal registers, only writable from the Private Key bus).

A TDES key consists of three DES keys, which is also referred to as a key bundle. These three 64-bit keys are defined, respectively, in the Key 1, 2 and 3 Registers (TDES_KEY1WRy, TDES_KEY2WRy and TDES_KEY3WRy or the Private Key internal registers). In Triple DES mode (TDESMOD = 1 in TDES_MR), TDES_MR.KEYMOD is used to choose between a two- and a three-key algorithm, as summarized in the table below.

Table 60.1. TDES Algorithms Summary

Algorithm	Mode	Data Processing Sequence Steps		
		First	Second	Third
Three-key	Encryption	Encryption with Key 1	Decryption with Key 2	Encryption with Key 3
	Decryption	Decryption with Key 3	Encryption with Key 2	Decryption with Key 1
Two-key	Encryption	Encryption with Key 1	Decryption with Key 2	Encryption with Key 1
	Decryption	Decryption with Key 1	Encryption with Key 2	Decryption with Key 1

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 64-bit data block called the initialization vector (IV), which must be set in TDES_IVRx. The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message.

The XTEA algorithm can be used instead of DES/TDES by configuring TDES_MR.TDESMOD with the appropriate value 0x2. An XTEA key consists of a 128-bit key. They are defined in the Key 1 and 2 Registers.

The number of rounds of XTEA is defined in TDES_XTEA_RNDR and can be programmed up to 64 (1 round = 2 Feistel network rounds).

All the start and operating modes of the TDES algorithm can be applied to the XTEA algorithm.

© 2026 Microchip Technology Inc. and its subsidiaries

60.4.1. Operating Modes

The TDES supports the following operating modes:

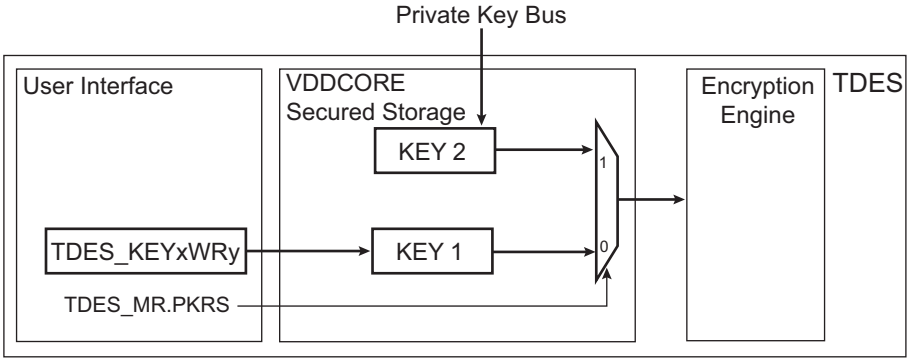
- ECB—Electronic Code Book
- CBC—Cipher Block Chaining
- OFB—Output Feedback
- CFB—Cipher Feedback
  - CFB8 (CFB where the length of the data segment is 8 bits)
  - CFB16 (CFB where the length of the data segment is 16 bits)
  - CFB32 (CFB where the length of the data segment is 32 bits)
  - CFB64 (CFB where the length of the data segment is 64 bits)

The data pre-processing, post-processing and data chaining for each mode are automatically performed. Refer to *FIPS Publication 81* for more details.

These modes are selected by setting TDES_MR.OPMOD.

CFB mode supports four data sizes (8, 16, 32 and 64 bits) configurable in TDES_MR.CFBS. See TDES Mode Register.

60.4.2. Temporary Secured Storage for Keys



The TDES provides secure storage for two sets of three 64-bit keys. The storage is available while VDDCORE voltage is supplied.

The keys can only be written in TDES internal registers and are not readable. Moreover, the internal registers holding the keys are buried in the overall product logic area during the physical implementation.

One set of keys can be loaded by software by writing the Key Word registers (TDES_KEYxWRy).

One key can be loaded by Private Key bus only.

Figure 60.1. Temporary Secured Storage for Keys

60.4.3. Start Modes

TDES_MR.SMOD selects the Encryption (or Decryption) start mode.

60.4.3.1. Manual Mode

The sequence is as follows:

1. Write TDES_MR with all required fields, including but not limited to SMOD and OPMOD.
2. Write the 64-bit key(s) in TDES_KEYxWRy or the Private Key internal register, depending on whether one, two or three keys are required.

© 2026 Microchip Technology Inc. and its subsidiaries

3. Write the initialization vector (or counter) in TDES_IVRx.
   Note: TDES_IVRx relates to all modes except ECB.
4. Set DATRDY (Data Ready) in the TDES Interrupt Enable register (TDES_IER), depending on whether an interrupt is required or not at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized TDES_IDATARx (see the following table).
   Note: In 32-, 16- and 8-bit CFB modes, TDES_IDATAR1 must not be written.
6. Set the START bit in the TDES Control register (TDES_CR) to begin the encryption or decryption process.
7. When the processing completes, DATRDY in the TDES Interrupt Status register (TDES_ISR) rises. If an interrupt has been enabled by setting TDES_IER.DATRDY, the TDES interrupt line is activated.
8. When the software reads a TDES_ODATARx, TDES_IER.DATRDY is automatically cleared.

Table 60.2. Authorized Input Data Registers

Operating Mode	Input Data Registers to Write
ECB	All
CBC	All
OFB	All
CFB 64-bit	All
CFB 32-bit	TDES_IDATAR0
CFB 16-bit	TDES_IDATAR0
CFB 8-bit	TDES_IDATAR0

60.4.3.2.Auto Mode

The Auto mode is similar to the Manual mode, except that as soon as the correct number of TDES_IDATARx is written, processing is automatically started without any action in TDES_CR.

60.4.3.3.DMA Mode

The DMA Controller can be used in association with the TDES to perform an encryption/decryption of a buffer without any action by the software during processing.

TDES_MR.SMOD must be set to 2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (TDES_MR.LOD=1), two DMA channels must be programmed (transmit and receive). In CBC-MAC, only one transmit channel must be programmed.

The start address of any transfer descriptor must be set in TDES_IDATAR0.

The DMA chunk size configuration depends on the TDES mode of operation and is listed in the following table.

When writing data to TDES with the first DMA channel, data will be fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the TDES with the second DMA channel, the source data is the data read from TDES and data destination is the memory buffer. In this case, source data size depends on the TDES mode of operation and is listed in the table below.

Table 60.3. DMA Data Transfer Type for the Different Operating Modes

Operating Mode	Chunk Size	Destination/Source Data Transfer Type
ECB	1	Word
CBC	1	Word
OFB	1	Word
CFB 64-bit	1	Word

© 2026 Microchip Technology Inc. and its subsidiaries

Table 60.3. DMA Data Transfer Type for the Different Operating Modes (continued)

Operating Mode	Chunk Size	Destination/Source Data Transfer Type
CFB 32-bit	1	Word
CFB 16-bit	1	Half-word
CFB 8-bit	1	Byte

60.4.4. Last Output Data Mode (CBC-MAC)

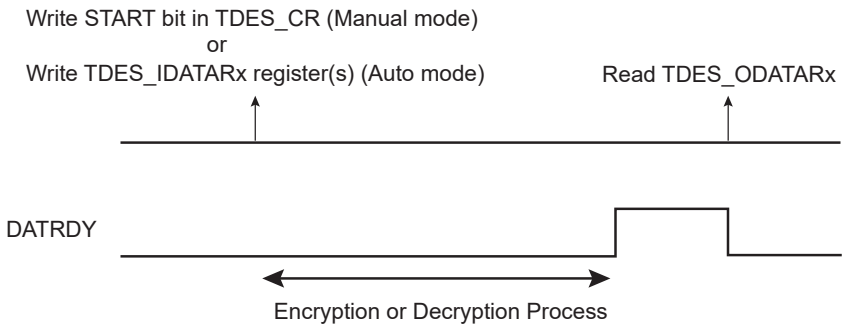
This mode is used to generate cryptographic checksums on data (MAC) using a CBC-MAC or a CFB encryption algorithm (refer to *FIPS Publication 81 Appendix F*).

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data is available either on the output data registers for Manual and Auto modes or at the address specified in the receive buffer pointer for DMA mode (see Table 60.4).

TDES_MR.LOD can be used to retrieve only the last data of several encryption/decryption processes.

This data is only available in TDES_ODATARx.



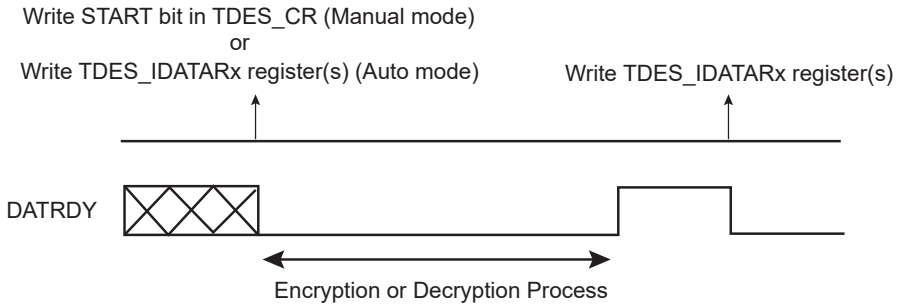
Therefore, there is no need to define a read buffer in DMA mode.

60.4.4.1.Manual and Auto Modes

60.4.4.1.1.TDES_MR.LOD = 0

The DATRDY flag is cleared when at least one TDES_ODATARx is read. See the figure below.

Figure 60.2. Manual and Auto Modes with LOD = 0



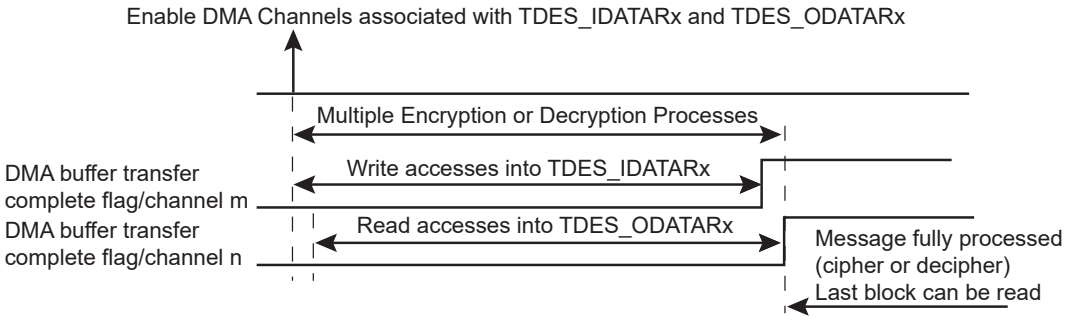
If the user does not want to read TDES_ODATARx between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user will not be informed of the end of the encryptions/decryptions that follow.

60.4.4.1.2.TDES_MR.LOD = 1

The DATRDY flag is cleared when at least one TDES_IDATARx is written, before the start of a new transfer. See the figure below. No further TDES_ODATARx reads are necessary between consecutive encryptions/decryptions.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 60.3. Manual and Auto Modes with LOD = 1



60.4.4.2.DMA Mode

60.4.4.2.1.TDES_MR.LOD = 0

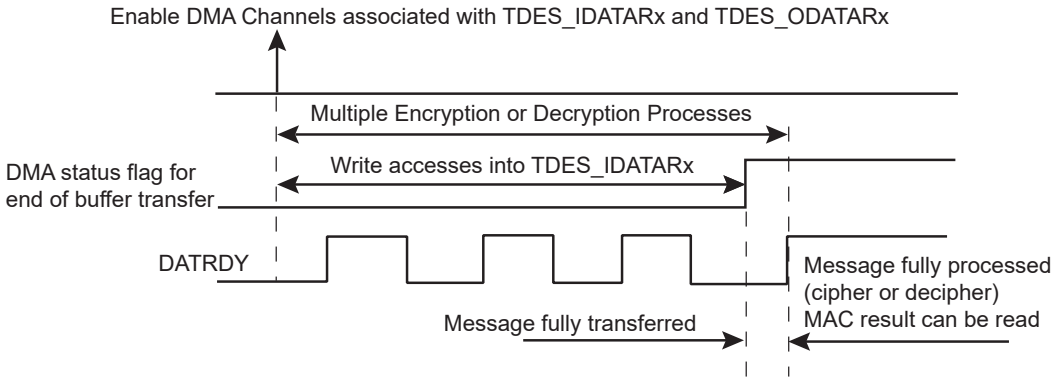
This mode can be used for all TDES operating modes except CBC-MAC where LOD = 1 mode is recommended.

The end of the encryption/decryption is indicated by the end of DMA transfer associated to TDES_ODATARx (see the figure below). Two DMA channels are required: one for writing message blocks to TDES_IDATARx and one to obtain the result from TDES_ODATARx.

Figure 60.4. DMA Transfer with LOD = 0

60.4.4.2.2.TDES_MR.LOD = 1

This mode is optimized to process the TDES CBC-MAC operating mode.



The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the figure below).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, TDES_MR.SMOD must be written to 0. To restart a CBC-MAC on a new buffer, TDES_MR.SMOD must be written to 2.

The output data is only available on TDES_ODATARx.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 60.5. DMA Transfer with LOD = 1

The table below summarizes the different cases.

Table 60.4. Last Output Data Mode Behavior versus Start Modes

Sequence	Manual and Auto Modes		DMA Transfer	
	LOD = 0	LOD = 1	LOD = 0	LOD = 1
DATRDY Flag Clearing Condition(1)	At least one TDES_ODATARx must be read	At least one TDES_IDATARx must be written	Not used	Managed by the DMA
End of Encryption/ Decryption	DATRDY	DATRDY	2 DMA buffer transfer complete flags (channel m and channel n)	DMA buffer transfer complete flag, then TDES DATRDY flag
Encrypted/ Decrypted Data Result Location	In TDES_ODATARx	In TDES_ODATARx	Not available	In TDES_ODATARx

Note: Depending on the mode, there are other ways to clear the DATRDY flag. See TDES Interrupt Status Register.

WARNING In DMA mode, to prevent incorrect results, reading the TDES_ODATARx before the last data transfer is prohibited.

60.4.5. Security Features

60.4.5.1. Private Key Bus

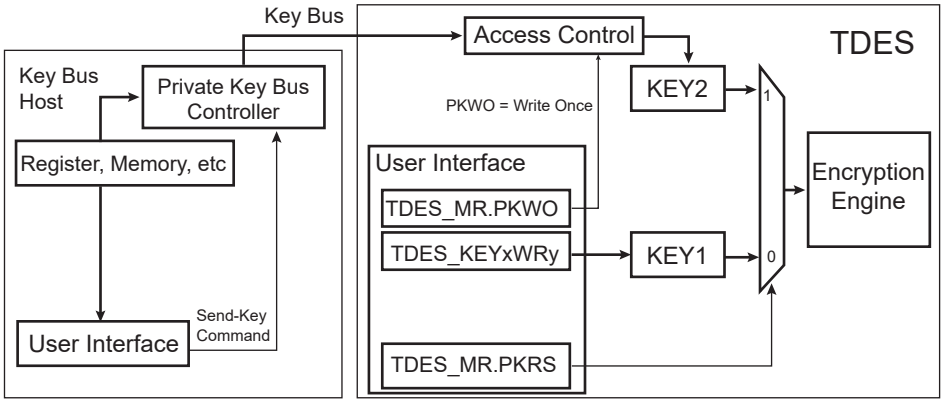
The TDES provides secure key transfer that requires a transfer command only, thus avoiding any manipulation of the key by software.

The TDES features a set of Private Key internal registers that can be accessed only through the dedicated Private Key bus from the TRNG or OTPC.

The Private Key internal registers cannot be read from any peripheral or from software.

The TDES key used by the encryption/decryption engine is either the Private Key internal registers content or the internal key registers loaded via the TDES_KEYxWRy.

To select the Private Key internal registers as the source of the TDES key, TDES_MR.PKRS must be written to '1'.



To write the Private Key internal registers, the software must:

1. Write a '1' in TDES_MR.PKRS.

© 2026 Microchip Technology Inc. and its subsidiaries

2. Trigger the key transfer over the Private Key bus from the KEY_BUS_MASTERS key bus host.
3. Wait for completion of the transfer signaled in the KEY_BUS_MASTERS status register.
4. Check for any access violation in TDES_WPSR.PKRPVS.

Figure 60.6. Key Selection

While TDES_MR.PKWO=0, the Private Key internal registers can be written as many times as required.

As soon as TDES_MR.PKWO=1, the next write sequence on Private Key internal registers is the last one. Any additional write sequence in the Private Key internal registers has no effect, thus providing write-protection of these registers. A hardware reset is the only way to exit from the write-protected state.

60.4.5.2. Unspecified Register Access Detection

When an unspecified register access occurs, TDES_ISR.URAD is set. Its source is then reported in TDES_ISR.URAT. Only the last unspecified register access is available through TDES_ISR.URAT.

Several kinds of unspecified register accesses can occur:

- TDES_IDATARx written during the data processing in DMA mode
- TDES_ODATARx read during the data processing
- TDES_MR written during the data processing
- Write-only register read access

URAD and URAT can only be reset by TDES_CR.SWRST.

60.4.5.3. Clearing Key on Tamper Event

On a tamper detection event on WKUP[8:1] pins, an immediate clear of the key (internal registers) can be performed if TDES_MR.TAMPCLR=1. For configuration details, refer to section Real-Time Clock (RTC).

60.4.5.4. Register Write Protection

To prevent any single software error from corrupting TDES behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the TDES Write Protection Mode Register (TDES_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the TDES Write Protection Status Register (TDES_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

© 2026 Microchip Technology Inc. and its subsidiaries

The WPVS flag is automatically cleared by reading TDES_WPSR.

The following register can be write-protected when WPEN is set:

- TDES Mode Register
- TDES Key 1 Word Register x
- TDES Key 2 Word Register x
- TDES Key 3 Word Register x
- TDES Initialization Vector Register x
- TDES XTEA Rounds Register

The following registers can be write-protected when WPITEN is set:

- TDES Interrupt Enable Register
- TDES Interrupt Disable Register

The following register can be write-protected when WPCREN is set:

- TDES Control Register

60.4.5.5. Security and Safety Analysis and Reports

Several types of checks are performed when the TDES is enabled.

When the flag TDES_WPSR.CGD is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the TDES is also monitored and if an abnormal state is detected, the flag TDES_WPSR.SEQE is set. This flag is not set under normal operating conditions.

The software accesses to the TDES are monitored and if an incorrect access is performed, the flag TDES_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in the TDES_WPSR.SWETYP field (see TDES Write Protection Status Register for details). For example, writing the TDES_ODATARx is an error, as well as reading the TDES_IDATARx, when the TDES_ISR.DATRDY flag is cleared. TDES_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE and WPVS are automatically cleared when TDES_WPSR is read.

If one of these flags is set, the flag TDES_ISR.SECE is set and can trigger an interrupt if the TDES_IMR.SECE bit is ‘1’. SECE is cleared by reading TDES_ISR.

It is possible to configure an action to be performed by the TDES as soon as an abnormal event detection occurs. If the field TDES_WPMR.ACTION is greater than 0, either a lock is performed or a lock and immediate clear of TDES_KEYxWRy. If a lock is performed, the current processing is ended normally but any new processing is not performed regardless of the start mode of operation (see TDES_MR.SMOD).

A locked state of the TDES is unlocked as follows:

1. Read the TDES_WPSR.
2. Disable the source of tamper if the tamper is enabled to perform a clear of the key.
3. Write a ‘1’ to TDES_CR.UNLOCK.

It is possible to select the type of event that will lock the TDES in case of abnormal event detection. See TDES_WPMR.ACTION for details.

If the TDES_MR.TMPCLR=1 and the tamper pin is active, the TDES is locked.

60.5.1. TDES Control Register

Name: TDES_CR
Offset: 0x00
Reset: –
Property: Write-only

This register can only be written if the WPEN bit is cleared in the TDES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
								UNLOCK
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
								SWRST
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								START
Access								W
Reset								–

Bit 24 – UNLOCK Unlock Processing

Value	Description
0	No effect.
1	Unlocks the processing in case of abnormal event detection if TDES_WPMR.ACTION > 0.

Bit 8 – SWRST Software Reset

Value	Description
0	No effect
1	Resets the TDES. A software-triggered reset of the TDES interface is performed.

Bit 0 – START Start Processing

Value	Description
0	No effect
1	Starts Manual encryption/decryption process.

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.2. TDES Mode Register

Name: TDES_MR
Offset: 0x04
Reset: 0x00000002
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TDES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	TAMPCLR							
Access	R/W							
Reset	0							

Bit	23	22	21	20	19	18	17	16
							CFBS[1:0]	
Access							R/W	R/W
Reset							0	0

Bit	15	14	13	12	11	10	9	8
	LOD		OPMOD[1:0]				SMOD[1:0]	
Access	R/W		R/W	R/W			R/W	R/W
Reset	0		0	0			0	0

Bit	7	6	5	4	3	2	1	0
	PKRS	PKWO		KEYMOD		TDESMOD[1:0]		CIPHER
Access	R/W	R/W		R/W		R/W	R/W	R/W
Reset	0	0		0		0	1	0

Bit 31 – TAMPCLR Tamper Pin Clear Key Enable

Value	Description
0	A tamper detection event has no effect on TDES_KEYxWRy.
1	A tamper detection event immediately clears TDES_KEYxWRy.

Bits 17:16 – CFBS[1:0] Cipher Feedback Data Size

Value	Name	Description
0	SIZE_64BIT	64 bits
1	SIZE_32BIT	32 bits
2	SIZE_16BIT	16 bits
3	SIZE_8BIT	8 bits

Bit 15 – LOD Last Output Data Mode

WARNING In DMA mode, to prevent incorrect result, reading TDES_ODATARx before the last data encryption/decryption process is prohibited.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect. After each end of encryption/decryption, the output data is available either on TDES_ODATARx (Manual and Auto modes) . In Manual and Auto modes, the DATRDY flag is cleared when at least one of the TDES_ODATARx is read.
1	The DATRDY flag is cleared when at least one of the Input Data Registers is written. No further TDES_ODATARx reads are necessary between consecutive encryptions/decryptions (see Last Output Data Mode).

Bits 13:12 – OPMOD[1:0] Operating Mode

For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.

Value	Name	Description
0	ECB	Electronic Code Book mode
1	CBC	Cipher Block Chaining mode
2	OFB	Output Feedback mode
3	CFB	Cipher Feedback mode

Bits 9:8 – SMOD[1:0] Start Mode

If a DMA transfer is used, 0x2 must be configured. See DMA Mode for more details.

Value	Name	Description
0	MANUAL_START	Manual mode
1	AUTO_START	Auto mode
2	IDATAR0_START	TDES_IDATAR0 accesses only Auto mode

Bit 7 – PKRS Private Key Internal Register Select

Value	Description
0	The keys used by the TDES are in the internal registers written via TDES_KEY1WRy, TDES_KEY2WRy and TDES_KEY3WRy.
1	The keys used by the TDES are in the Private Key internal registers written through the Private Key bus.

Bit 6 – PKWO Private Key Write Once

Once PKWO is set to ‘1’, only a hardware reset sets this bit to ‘0’ internally. Writing it to ‘0’ with a register access has no impact (although the field will be read to value ‘0’).

Value	Description
0	The Private Key internal register can be written multiple times through the Private Key bus.
1	The Private Key internal register can be written only once through the Private Key bus until hardware reset.

Bit 4 – KEYMOD Key Mode

Value	Description
0	Three-key algorithm is selected.
1	Two-key algorithm is selected. There is no need to write TDES_KEY3WRy (or Private Pey internal registers with more than 128 bits).

Bits 2:1 – TDESMOD[1:0] ALGORITHM Mode

Values which are not listed in the table must be considered as “reserved”.

Value	Name	Description
0	SINGLE_DES	Single DES processing using TDES_KEY1WRy.
1	TRIPLE_DES	Triple DES processing using TDES_KEY1WRy, TDES_KEY2WRy and TDES_KEY3WRy if KEYMOD=0
2	XTEA	XTEA processing using TDES_KEY1WRy and TDES_KEY2WRy

Bit 0 – CIPHER Processing Mode

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	DECRYPT	Decrypts data.
1	ENCRYPT	Encrypts data.

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.3. TDES Interrupt Enable Register

Name: TDES_IER
Offset: 0x10
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TDES Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								W
Reset								–

Bit	15	14	13	12	11	10	9	8
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
Access								W
Reset								–

Bit 16 – SECE Security and/or Safety Event Interrupt Enable

Bit 8 – URAD Unspecified Register Access Detection Interrupt Enable

Bit 0 – DATRDY Data Ready Interrupt Enable

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.4. TDES Interrupt Disable Register

Name: TDES_IDR
Offset: 0x14
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TDES Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
								SECE
Access								W
Reset								–

Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

Bit 16 – SECE Security and/or Safety Event Interrupt Disable

Bit 8 – URAD Unspecified Register Access Detection Interrupt Disable

Bit 0 – DATRDY Data Ready Interrupt Disable

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.5. TDES Interrupt Mask Register

Name: TDES_IMR
Offset: 0x18
Reset: 0x000000000
Property: Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
								SECE
Access								R
Reset								0

Bit	15	14	13	12	11	10	9	8

Access								R
Reset								0

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								R
Reset								0

Bit 16 – SECE Security and/or Safety Event Interrupt Mask

Bit 8 – URAD Unspecified Register Access Detection Interrupt Mask

Bit 0 – DATRDY Data Ready Interrupt Mask

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.6. TDES Interrupt Status Register

Name: TDES_ISR
Offset: 0x1C
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
								SECE
Access								R
Reset								0

Bit	15	14	13	12	11	10	9	8
			URAT[1:0]					URAD
Access			R	R				R
Reset			0	0				0

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								R
Reset								0

Bit 16 – SECE Security and/or Safety Event Interrupt Mask

Value	Description
0	There is no security report in TDES_WPSR.
1	One security flag is set in TDES_WPSR.

Bits 13:12 – URAT[1:0] Unspecified Register Access (cleared by setting bit TDES_CR.SWRST)
Only the last Unspecified Register Access Type is available through the URAT field.

Value	Name	Description
0	IDR_WR_PROCESSING	TDES_IDATAR written during data processing when SMOD = 0x2 mode.
1	ODR_RD_PROCESSING	TDES_ODATAR read during data processing.
2	MR_WR_PROCESSING	TDES_MR written during data processing.
3	WOR_RD_ACCESS	Write-only register read access.

Bit 8 – URAD Unspecified Register Access Detection Status (cleared by setting TDES_CR.SWRST)

Value	Description
0	No unspecified register access has been detected since the last write of TDES_CR.SWRST.
1	At least one unspecified register access has been detected since the last write of TDES_CR.SWRST.

Bit 0 – DATRDY Data Ready (cleared by setting TDES_CR.START or TDES_CR.SWRST, or by reading TDES_ODATARx)
If TDES_MR.LOD = 1: In Manual and Auto modes, the DATRDY flag can also be cleared by writing at least one TDES_IDATARx.

Value	Description
0	Output data is not valid.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Encryption or decryption process is completed.

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.7. TDES Key 1 Word Register y

Name: TDES_KEY1WRy
Offset: 0x20 + y*0x04 [y=0..1]
Reset: –
Property: Write-only

This register can only be written if the WPEN bit is cleared in the TDES Write Protection Mode Register.

Immediately cleared on tamper detection event if TDES_MR.TAMPCLR=1.

Bit	31	30	29	28	27	26	25	24
	KEY1W[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	23	22	21	20	19	18	17	16
	KEY1W[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8
	KEY1W[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	KEY1W[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 31:0 – KEY1W[31:0] Key 1 Word

The two 32-bit Key 1 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.
TDES_KEY1WR0.KEY1W refers to the first word of the key and TDES_KEY1WR1.KEY1W to the last one.
These registers are write-only to prevent the key from being read by another application.
In XTEA mode, the key is defined on 128 bits. These registers contain the 64 LSB bits of the encryption/decryption key.
TDES_KEY1WRy registers are not used if the Private Key internal register is selected instead by writing a 1 to TDES_MR.PKRS.

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.8. TDES Key 2 Word Register y

Name: TDES_KEY2WRy
Offset: 0x28 + y*0x04 [y=0..1]
Reset: –
Property: Write-only

This register can only be written if the WPEN bit is cleared in the TDES Write Protection Mode Register.

Immediately cleared on tamper detection event if TDES_MR.TAMPCLR=1.

Bit	31	30	29	28	27	26	25	24
	KEY2W[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	23	22	21	20	19	18	17	16
	KEY2W[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8
	KEY2W[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	KEY2W[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 31:0 – KEY2W[31:0] Key 2 Word

The two 32-bit Key 2 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.
TDES_KEY2WR0.KEY2W refers to the first word of the key and TDES_KEY2W1.KEY2W to the last one.
These registers are write-only to prevent the key from being read by another application.
TDES_KEY2WRx registers are not used in DES mode.
In XTEA mode, the key is defined on 128 bits. These registers contain the 64 MSB bits of the encryption/decryption key.
TDES_KEY2WRy registers are not used if the Private Key internal register is selected instead by writing a 1 to TDES_MR.PKRS.

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.9. TDES Key 3 Word Register y

Name: TDES_KEY3WRy
Offset: 0x30 + y*0x04 [y=0..1]
Reset: –
Property: Write-only

This register can only be written if the WPEN bit is cleared in the TDES Write Protection Mode Register.

Immediately cleared on tamper detection event if TDES_MR.TAMPCLR=1.

Bit	31	30	29	28	27	26	25	24
	KEY3W[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	23	22	21	20	19	18	17	16
	KEY3W[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8

	KEY3W[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 31:0 – KEY3W[31:0] Key 3 Word

The two 32-bit Key 3 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.
TDES_KEY3WR0.KEY3W refers to the first word of the key and TDES_KEY3WR1.KEY3W to the last one.
These registers are write-only to prevent the key from being read by another application.
TDES_KEY3WRx registers are not used in DES mode, TDES with two-key algorithm selected and XTEA mode.
TDES_KEY3WRy registers are not used if the Private Key internal register is selected by writing a 1 to TDES_MR.PKRS.

Reset	–	–	–	–	–	–	–	–

Bits 31:0 – IDATA[31:0] Input Data
The two 32-bit TDES_IDATARx are used to set the 64-bit data block used for encryption/decryption. TDES_IDATAR0.IDATA refers to the first word of the data to be encrypted/decrypted, and TDES_IDATAR1.IDATA to the last one.
These registers are write-only to prevent the input data from being read by another application.

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.11. TDES Output Data Register x

Name: TDES_ODATARx
Offset: 0x50 + x*0x04 [x=0..1]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	ODATA[31:24]							
Access	R	R	R	R	R	R	R	R

Bits 31:0 – ODATA[31:0] Output Data
The two 32-bit TDES_ODATARx contain the 64-bit data block which has been encrypted/decrypted. TDES_ODATAR0.ODATA refers to the first word, TDES_ODATAR1.ODATA to the last one.

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.12. TDES Initialization Vector Register x

Name: TDES_IVRx
Offset: 0x60 + x*0x04 [x=0..1]
Reset: –
Property: Write-only

This register can only be written if the WPEN bit is cleared in the TDES Write Protection Mode Register.

These registers are write-only to prevent the Initialization Vector from being read by another application.

These registers are not used for the ECB mode and must not be written.

Bit	31	30	29	28	27	26	25	24
	IV[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 31:0 – IV[31:0] Initialization Vector
The two 32-bit TDES_IVRx are used to set the 64-bit initialization vector data block, which is used by some modes of operation as an additional initial input.
TDES_IVR1.IV refers to the first word of the Initialization Vector, TDES_IVR2.IV to the last one.

60.5.13. TDES XTEA Rounds Register

Name: TDES_XTEA_RNDR
Offset: 0x70
Reset: 0x000000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TDES Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

			XTEA_RNDS[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 5:0 – XTEA_RNDS[5:0] Number of Rounds
This 6-bit field is used to define the number of complete rounds (1 complete round = 2 Feistel rounds) processed in XTEA algorithm.
The value of XTEA_RNDS has no effect if TDES_MR.TDESMOD is set to 0x0 or 0x1.
0x00 corresponds to 1 complete round, 0x01 corresponds to 2 complete rounds, etc.

Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x444553	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

Bits 7:5 – ACTION[2:0] Action on Abnormal Event Detection

Value	Name	Description
0	REPORT_ONLY	No action (stop or clear key) is performed when one of PKRPVS, WPVS, CGD, SEQE, or SWE flags are set.
1	LOCK_PKRPVS_WPVS_SWE	If a processing is in progress when the TDES_WPSR.PKRPVS/WPVS/SWE event detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued.
2	LOCK_CGD_SEQE	If a processing is in progress when the TDES_WPSR.CGD/SEQE event detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued.
3	LOCK_ANY_EV	If a processing is in progress when the TDES_WPSR.PKRPVS/WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued.
4	CLEAR_PKRPVS_WPVS_SWE	If a processing is in progress when the TDES_WPSR.PKRPVS/WPVS/SWE events detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued. Moreover, TDES_KEYxWRy are immediately cleared.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
5	CLEAR_CGD_SEQE	If a processing is in progress when the TDES_WPSR.CGD/SEQE events detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued. Moreover, TDES_KEYxWRy are immediately cleared.
6	CLEAR_ANY_EV	If a processing is in progress when the TDES_WPSR.PKRPVS/WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued. Moreover, TDES_KEYxWRy are immediately cleared.

Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in TDES_WPSR.WPVSRC and the last software control error type is reported in TDES_WPSR.SWETYP. The TDES_ISR.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in TDES_WPSR.WPVSRC and only the first software control error type is reported in TDES_WPSR.SWETYP. The TDES_ISR.SECE flag is set at the first error occurrence within a series.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to0x444553 (“DES” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x444553 (“DES” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x444553 (“DES” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x444553 (“DES” in ASCII).

Bit 0 – WPEN Write Protection Enable

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x444553 (“DES” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x444553 (“DES” in ASCII).

© 2026 Microchip Technology Inc. and its subsidiaries

60.5.15. TDES Write Protection Status Register

Name: TDES_WPSR
Offset: 0xE8
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	ECLASS				SWETYP[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0

Bit	23	22	21	20	19	18	17	16
	WPVSRC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
				PKRPVS	SWE	SEQE	CGD	WPVS
Access				R	R	R	R	R
Reset				0	0	0	0	0

Bit 31 – ECLASS Software Error Class (cleared on read)

Value	Name	Description
0	WARNING	An abnormal access that does not affect system functionality.
1	ERROR	An access is performed into key, input data, control registers while the TDES is performing an encryption/decryption or a start is request by software or DMA while the key is not fully configured.

Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read (Warning).
1	WRITE_RO	TDES is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address (Warning).
3	CTRL_START	Abnormal use of TDES_CR.START command when DMA access is configured.
4	WEIRD_ACTION	A key write, init value write, output data read, Mode register write, Private Key bus access or XTEA round register has been performed while a current processing is in progress (abnormal).
5	INCOMPLETE_KEY	A tentative of start is required while the keys are not fully loaded into TDES_KEYxWRy.

Bits 23:8 – WPVSRC[15:0] Write Protection Violation Source (cleared on read)
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.
When WPVS=0 and SWE=1, WPVSRC reports the address of the incorrect software access. As soon as WPVS=1, WPVSRC returns the address of the write-protected violation.

Bit 4 – PKRPVS Private Key Register Protection Violation Status (cleared on read)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No Private Key internal register access violation has occurred since the last read of TDES_WPSR.
1	A Private Key internal register access violation has occurred since the last read of TDES_WPSR.

Bit 3 – SWE Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of TDES_WPSR.
1	A software error has occurred since the last read of TDES_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSRC (if WPVS=0).

Bit 2 – SEQE Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of TDES_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of TDES_WPSR. This flag is set under abnormal operating conditions.

Bit 1 – CGD Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring circuitry has not been corrupted since the last read of TDES_WPSR. Under normal operating conditions, this bit is always cleared.
1	The clock monitoring circuitry has been corrupted since the last read of TDES_WPSR. This flag is set in case of abnormal clock signal waveform (glitch).

Bit 0 – WPVS Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of TDES_WPSR.
1	A write protection violation has occurred since the last read of TDES_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

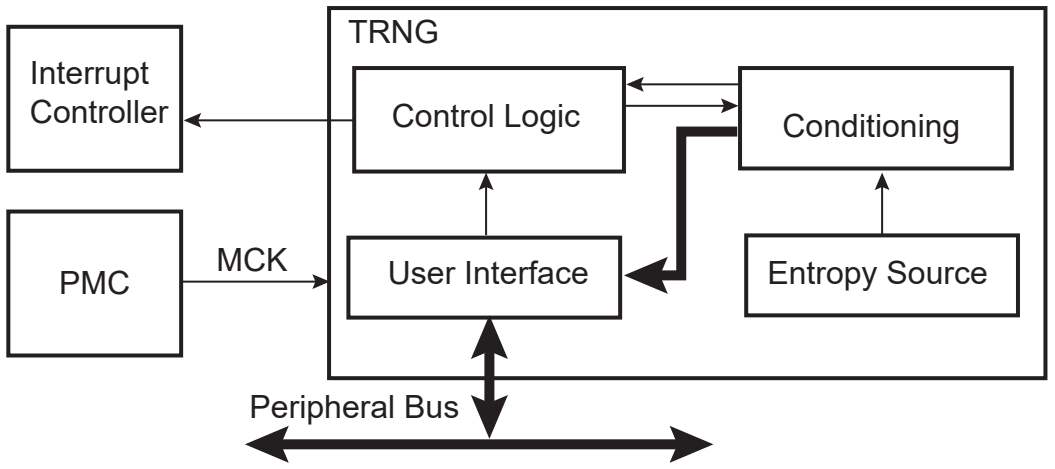
61. Random Number Generator (TRNG)

61.1. Description

The Random Number Generator (TRNG) passes the American *NIST Special Publication 800-22 (A Statistical Test Suite for Random and Pseudorandom Number Generators for Cryptographic Applications)* and the *Diehard Suite of Tests*.

The TRNG may be used as an entropy source for seeding an NIST approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3.



The TRNG is fully designed with digital cells, and under the specified operating conditions, external factors such as temperature, humidity, etc. affect TRNG ageing in the same manner as all other digital peripherals (CPU core, bus matrix, etc.) of the product.

61.2. Embedded Characteristics

- Passes *NIST Special Publication 800-22 Test Suite*
- Passes *Diehard Suite of Tests*
- Usable as Entropy Source for Seeding a NIST-approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3
- Provides a 32-bit Random Number at Maximum 84 Clock Cycles
- Functional Safety Monitors and Reports:
  - Monitoring of internal sequencer abnormal states
  - Abnormal software access reports
  - Register write protection
- Private Key Bus Interface to Transfer Cryptographic Keys Not Readable From Any Peripheral Nor From Software

61.3. Block Diagram

Figure 61.1. TRNG Block Diagram

© 2026 Microchip Technology Inc. and its subsidiaries

61.4. Product Dependencies

61.4.1. Power Management

The TRNG interface may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the TRNG user interface clock. The user interface clock is independent from any clock that may be used in the entropy source logic circuitry. The source of entropy can be enabled before enabling the user interface clock.

61.4.2. Interrupt Sources

The TRNG interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TRNG.

61.5. Functional Description

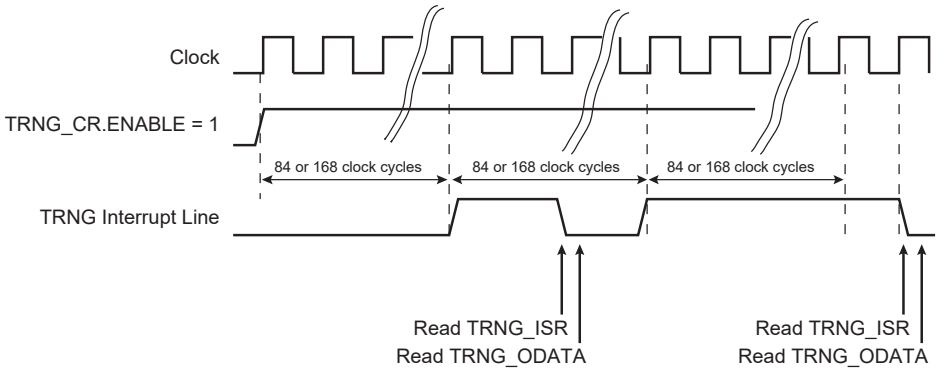
As soon as the TRNG is enabled in the Control register (TRNG_CR), the generator provides one 32-bit random value at a maximum streaming rate of 84 clock cycles. Entropy rate increases at a lower frequency. It is possible to divide by 2 the streaming rate by configuring the Mode register (TRNG_MR) to achieve better entropy if the streaming rate does not require new data every 84 clock cycles. For a lower streaming rate, the software intervention is required to skip, on a regular basis, the data ready information reported in the Status register (TRNG_ISR).

A sequence of random values can be generated by the TRNG and a random value can be directly loaded through the private key bus into specific private key internal registers of the private key bus clients (for example, AES or other encryption unit). There is no possibility of reading these keys from the processor and software from system bus. This is done by writing the Private Key Bus Control register (TRNG_PKBCR) with the appropriate destination (KSLAVE) and length of the key to be generated (KLENGTH).

This random value transferred through the private key bus cannot be used for encrypted communications with remote equipment, but is useful while the system remains in Active mode to reinforce the security of data processed by the application running on the system and stored temporarily in external memories. The cryptography keys are never known to application software, thus they cannot be exchanged or provided to the external world in any case.

Note: Putting the system into Backup mode causes the key stored in the encryption engine to be lost. Local encryption and decryption of data can still be performed by using a key unknown to the software if the key is stored in a non-volatile area, for example in the OTP memory. The TRNG can transfer a random value to the non-volatile memory of the system to store the key for further decryption. When the key is required for decryption, it can be transferred by the private key bus from the OTP memory to the encryption module.

By writing a ‘1’ to the HALFR bit in the Mode register (TRNG_MR), the random values are provided every 168 cycles instead of every 84 cycles. HALFR must be written to ‘1’ when the TRNG peripheral clock frequency is above 100 MHz.



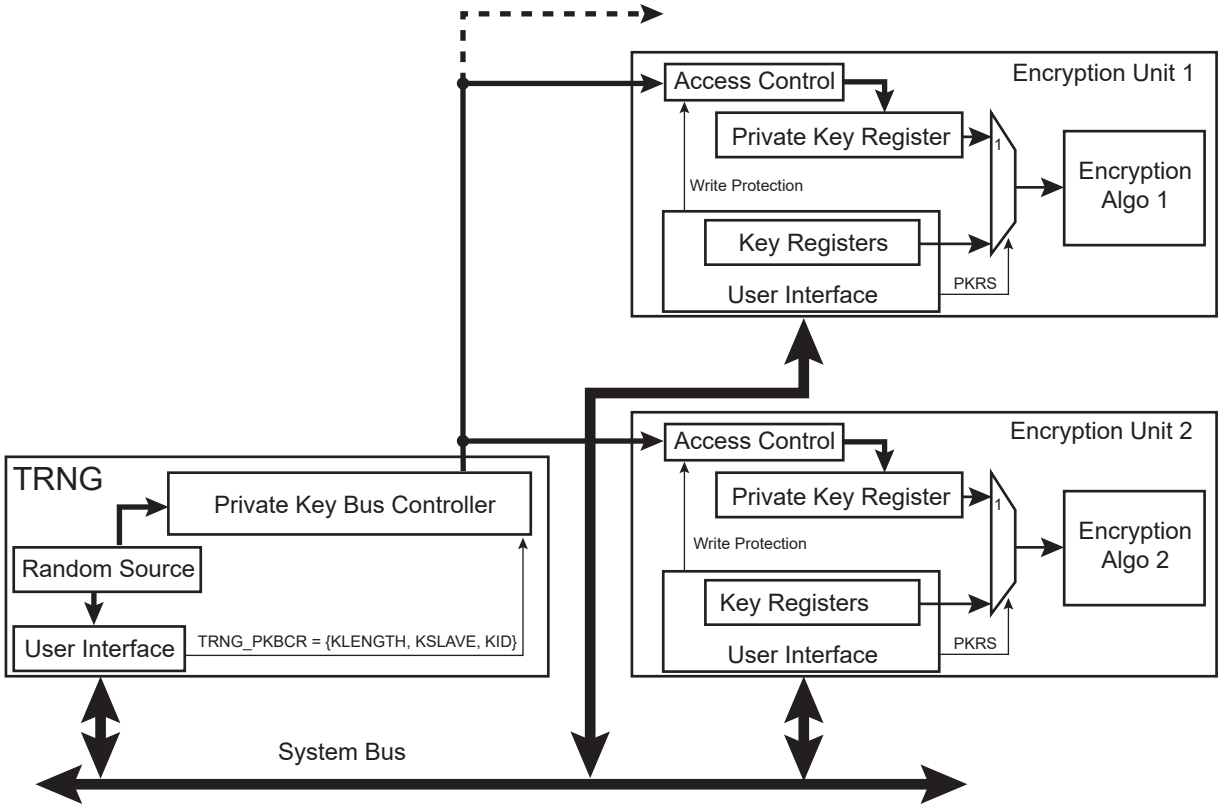
The TRNG interrupt line can be enabled in the Interrupt Enable register (TRNG_IER), and disabled in the Interrupt Disable register (TRNG_IDR). This interrupt is set when a new random value is available or when a transfer over the private key bus is complete and is cleared when the Status register (TRNG_ISR) is read. The flag TRNG_ISR.DATRDY is set when the random data is ready to be read out on the 32-bit Output Data register (TRNG_ODATA). The flag TRNG_ISR.EOTPKB is set when the transfer through the private key bus is complete.

Normal Operating Mode

The normal operating mode checks that the TRNG_ISR.DATRDY flag equals ‘1’ before reading TRNG_ODATA when a 32-bit random value is required by the software application.

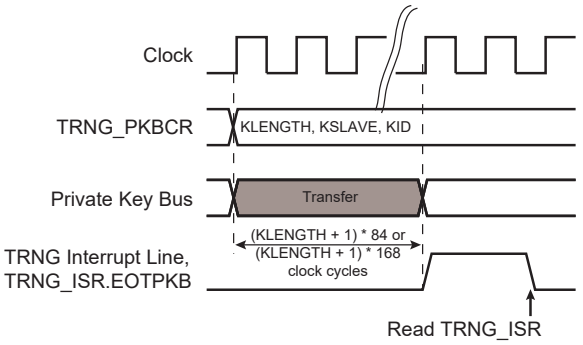
© 2026 Microchip Technology Inc. and its subsidiaries

Figure 61.2. TRNG Data Generation Sequence



Key Bus Operating Mode

After a write to KSLAVE and KLENGTH in TRNG_PKBCR, the software:



- waits for the end of transfer of the key indicated by the TRNG_ISR.EOTPKB flag being read at '1', optionally after a TRNG interrupt,
- checks for any key bus access violation in the selected private key bus destination client status register,
- uses the private key bus destination client or launches any other private key bus transfer.

Figure 61.3. TRNG Private Key Bus

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 61.4. TRNG Private Key Bus Transfer

61.5.1. First Value Read after Power-up

After a power-up and the first configuration to enable the TRNG, the first data can be read as soon as the flag DATRDY is set in the Interrupt Status register (TRNG_ISR). However, randomness (entropy) of a sequence of first value read after a power-up sequence is correct only if the TRNG has been enabled for a significant period of time.

When the first value after power-up is a key factor for the application, it is recommended to wait for 5 ms before reading the first value and after the power-up followed by the initial enable of the TRNG.

61.5.2. Entropy

The TRNG provides a new random data at a maximum rate of peripheral clock divided by 84. However, entropy increases as the reading rate decreases.

61.5.3. Enhanced Conditioning by Difference Checking

By default, the current data available when TRNG_ISR.DATRDY=1 is not compared against the previous value provided together with the previous assertion of the TRNG_ISR.DATRDY flag. There is no formal guarantee that two consecutive data differ. If a difference is required, by default the software must post-process the data.

When TRNG_MR.DIFF=1, any new internal data sample (every 84 or 168 MCK clock cycles) is first checked against the previous data and the TRNG_ISR.DATRDY flag is set only if a difference exists. When TRNG_MR.DIFF=1, the maximum streaming rate can be slightly slower compared to TRNG_MR.UDIFF=0.

61.5.4. Register Write Protection

To prevent any single software error from corrupting TRNG behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the TRNG Write Protection Mode Register (TRNG_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the TRNG Write Protection Status Register (TRNG_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS flag is automatically cleared by reading TRNG_WPSR.

The following register can be write-protected when WPEN is set:

- TRNG_MR

The following registers can be write-protected when WPITEN is set:

- TRNG_IER

© 2026 Microchip Technology Inc. and its subsidiaries

- TRNG_IDR

The following registers can be write-protected when WPCREN is set:

- TRNG_CR
- TRNG_PKBCR

61.5.5. Security and Functional Analysis and Reports

Several type of checks are performed when the TRNG is enabled.

The peripheral clock of the TRNG is monitored by specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the TRNG. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the flag TRNG_WPSR.CGD is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the TRNG is also monitored and if an abnormal state is detected, the flag TRNG_WPSR.SEQE is set. This flag is not set under normal operating conditions.

The software accesses to the TRNG are monitored and if an incorrect access is performed, the flag TRNG_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in the TRNG_WPSR.SWETYP field (see TRNG Write Protection Status Register for details). For example, reading the TRNG_ODATA when the TRNG is disabled is an error, as well as reading the TRNG_ODATA, when the TRNG_ISR.DATRDY flag is cleared. TRNG_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE and WPVS are automatically cleared when TRNG_WPSR is read.

If one of these flags is set, the flag TRNG_ISR.SECE is set and can trigger an interrupt if the TRNG_IMR.SECE bit is ‘1’. SECE is cleared by reading TRNG_ISR.

Reset								–

Bits 31:8 – WAKEY[23:0] Register Write Access Key

Value	Name	Description
0x524E47	PASSWD	Writing any other value in this field aborts the write operation.

Bit 0 – ENABLE Enable TRNG to Provide Random Values

Value	Description
0	Disables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time.
1	Enables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time.

61.6.2. TRNG Mode Register

Name: TRNG_MR
Offset: 0x04
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TRNG Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	DIFF							HALFR
Access	R/W							R/W
Reset	0							0

Bit 7 – DIFF Minimum Hamming Distance

Value	Name	Description
0	DISABLED	Delivers a new random sample without condition with the previous sample (unless HD=1).
1	ENABLED	Delivers a new random sample only if it differs from the previous delivered sample (unless HD=1).

Bit 0 – HALFR Half Rate Enable

Value	Name	Description
0	DISABLED	Maximum stream rate provided (1 sample every 84 MCK clock cycles).
1	ENABLED	Half maximum stream rate provided if the peripheral clock frequency is above 100 MHz (1 sample every 168 MCK clock cycles).

© 2026 Microchip Technology Inc. and its subsidiaries

61.6.3. TRNG Private Key Bus Control Register

Name: TRNG_PKBCR
Offset: 0x08
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the TRNG Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	WAKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
			KSLAVE[1:0]					KID
Access			W	W				W
Reset			–	–				–

Bits 31:16 – WAKEY[15:0] Register Write Access Key

Value	Name	Description
0x524B	PASSWD	Writing any other value in this field aborts the write operation.

Bits 15:8 – KLENGTH[7:0] Key Length
Length-1 in 32-bit words of the key(s) to be directly loaded from the TRNG into the private key internal registers of the private key bus client KSLAVE.
Example: for one 64-bit key to be loaded, KLENGTH must be written to 1. For 128-bit keys, KLENGTH must be written to 3.

Bits 5:4 – KSLAVE[1:0] Key Bus Client
Private key bus client identifier for the destination encryption unit to be loaded from the TRNG.

Value	Name	Description
0	TDES_ID	TDES
1	AES_ID	AES
2	OTPC_ID	OTPC
3	Reserved_ID	Reserved

Bit 0 – KID Key ID (Must always be written to 0)

© 2026 Microchip Technology Inc. and its subsidiaries

61.6.4. TRNG Interrupt Enable Register

Name: TRNG_IER
Offset: 0x10
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TRNG Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

61.6.5. TRNG Interrupt Disable Register

Name: TRNG_IDR
Offset: 0x14
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TRNG Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

61.6.6. TRNG Interrupt Mask Register

Name: TRNG_IMR
Offset: 0x18
Reset: 0x00000000
Property: Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Bit 2 – EOTPKB End Of Transfer on Private Key Bus Interrupt Mask

Bit 1 – SECE Security and/or Safety Event Interrupt Mask

Bit 0 – DATRDY Data Ready Interrupt Mask

© 2026 Microchip Technology Inc. and its subsidiaries

61.6.7. TRNG Interrupt Status Register

Name: TRNG_ISR
Offset: 0x1C
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						EOTPKB	SECE	DATRDY
Access						R	R	R
Reset						0	0	0

Bit 2 – EOTPKB End Of Transfer on Private Key Bus (cleared on read)

Value	Description
0	No private key bus transfer has ended since the last read of the Interrupt Status Register.
1	The private key bus transfer has ended.

Bit 1 – SECE Security and/or Safety Event (cleared on read)

Value	Description
0	No safety or security event occurred since the last read of the Interrupt Status Register.
1	One or more safety or security event occurred since the last read of TRNG_ISR. For details on the event, see TRNG Write Protection Status Register.

Bit 0 – DATRDY Data Ready (cleared on read)

Value	Description
0	Output data is not valid or TRNG is disabled.
1	New random value has been completed since the last read of TRNG_ISR.

© 2026 Microchip Technology Inc. and its subsidiaries

61.6.8. TRNG Output Data Register

Name: TRNG_ODATA
Offset: 0x50
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	ODATA[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	ODATA[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ODATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ODATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ODATA[31:0] Output Data
The 32-bit Output Data register contains the 32-bit random data.

© 2026 Microchip Technology Inc. and its subsidiaries

61.6.9. TRNG Write Protection Mode Register

Name: TRNG_WPMR
Offset: 0xE4
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
				FIRSTE		WPCREN	WPITEN	WPEN
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x524E47	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in TRNG_WPSR.WPVSRC and the last software control error type is reported in TRNG_WPSR.SWETYP. The TRNG_ISR.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in TRNG_WPSR.WPVSRC and only the first software control error type is reported in TRNG_WPSR.SWETYP. The TRNG_ISR.SECE flag is set at the first error occurrence within a series.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x524E47 (“RNG” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x524E47 (“RNG” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x524E47 (“RNG” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x524E47 (“RNG” in ASCII).

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 0 – WPEN Write Protection Enable

See Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x524E47 (“RNG” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x524E47 (“RNG” in ASCII).

© 2026 Microchip Technology Inc. and its subsidiaries

61.6.10. TRNG Write Protection Status Register

Name: TRNG_WPSR
Offset: 0xE8
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS				SWETYP[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPVSRC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPVS
Access					R	R	R	R
Reset					0	0	0	0

Bit 31 – ECLASS Software Error Class (cleared on read)

Value	Name	Description
0	WARNING	An abnormal access that does not affect system functionality.
1	ERROR	Reading TRNG_ODATA when TRNG is disabled or used for private key bus transfer does not provide a random value. Writing to the PKB_CTRL register while a private key bus transfer is ongoing does not launch a new private key bus transfer.

Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	TRNG is enabled and a write-only register has been read (Warning).
1	WRITE_RO	TRNG is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address.
3	TRNG_DIS	The TRNG_ODATA register has been read when TRNG is disabled or used for private key bus transfer (Error).
4	PKB_BUSY	A write access to the PKB_CTRL register has been attempted during a private key bus transfer (Error).
5	LOCK_ERR	A write access to TRNG_WPMR has been attempted when one of the write protection bits is already locked, its corresponding lock control bit is set and the corresponding write protection bit is cleared, which looks like an unlock tentative (Warning).

Bits 23:8 – WPVSRC[15:0] Write Protection Violation Source (cleared on read)
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.
When WPVS=0 and SWE=1, WPVSRC reports the address of the incorrect software access. As soon as WPVS=1, WPVSRC returns the address of the write-protected violation.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 3 – SWE Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of TRNG_WPSR.
1	A software error has occurred since the last read of TRNG_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSRC (if WPVS=0).

Bit 2 – SEQE Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of TRNG_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of TRNG_WPSR. This flag is set under abnormal operating conditions.

Bit 1 – CGD Clock Glitch Detected (cleared on read)

Value	Description
0	No clock glitch has occurred since the last read of TRNG_WPSR. Under normal operating conditions, this bit is always cleared.
1	A clock glitch has occurred since the last read of TRNG_WPSR. This flag is set in case of abnormal clock signal waveform (glitch).

Bit 0 – WPVS Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of TRNG_WPSR.
1	A write protection violation has occurred since the last read of TRNG_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

© 2026 Microchip Technology Inc. and its subsidiaries

62. Physical Unclonable Functions (PUF)

62.1. Description

Physical Unclonable Functions (PUF) use the behavior of standard embedded static RAM (SRAM) to differentiate chips from each other. They are virtually impossible to duplicate, clone or predict. This makes them very suitable for applications such as secure key generation and storage, device authentication, flexible key provisioning and chip asset management.

The start-up values of uninitialized SRAM provide randomness. These values form a unique chip fingerprint, called the SRAM PUF response.

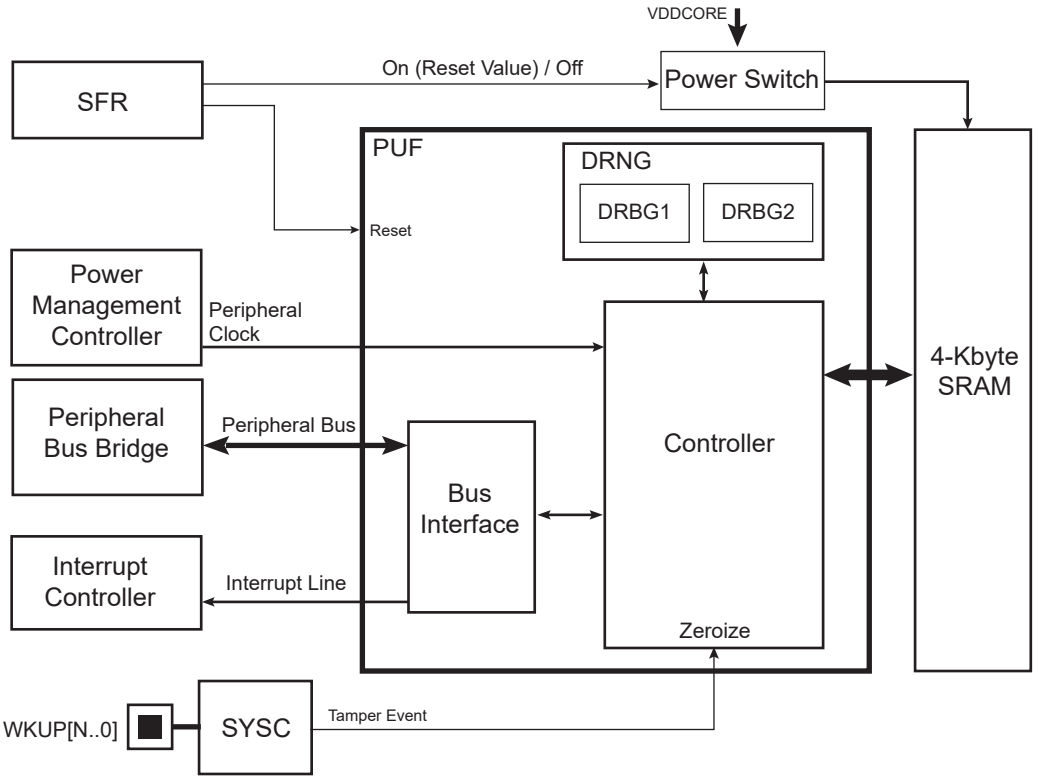
An SRAM PUF response is a noisy fingerprint, and turning it into a high-quality and secure key vault is done with the PUF controller. The PUF controller reliably reconstructs the same cryptographic key under all environmental circumstances.

The PUF generates an activation code during the enroll phase that allows further operations.

The activation code, in combination with the SRAM start-up behavior, is used to reconstruct, on demand, in real time, an intrinsic PUF key which is never stored. When the key is no longer needed, it can be removed from memory. When it is needed later it can be reconstructed.

The intrinsic PUF key can be used as a root key for key derivation and wrapping. A key protected by the PUF controller is integrity protected and can be retrieved only on the same device while it will be meaningless on other devices.

The benefits include device-unique high-quality keys, no secrets when power is off, and no root key programming.



62.2. Embedded Characteristics

- 256-bit Key Entropy
- On-chip Enrollment
- Key Derivation and Wrapping
- Deterministic Random Number Generator (DRNG) According to NIST SP800-90A/B
- PUF Diagnostics
- Built-In Self-Test (BIST)
- Functional Safety Monitors and Reports
  - Abnormal software access reports (undefined address, writing a read-only register, reading a write-only register)

© 2026 Microchip Technology Inc. and its subsidiaries

62.3. Block Diagram

Figure 62.1. PUF Block Diagram

62.4. Product Dependencies

62.4.1. SRAM Power Supply

The power supply of the PUF-dedicated SRAM can be enabled or disabled in the Special Function registers. Refer to the section “Special Function Registers (SFR)” for more details. The PUF SRAM must be powered prior to using the PUF controller. After a power-up sequence, the PUF SRAM is powered.

62.4.2. PUF Reset

The reset of the PUF is controlled by a configuration bit in the SFR. The PUF is active after a power-up sequence and the reset deassertion.

62.4.3. Peripheral clock

The PUF peripheral clock must be enabled in the PMC prior to using the PUF.

62.4.4. Interrupt Sources

The PUF has an interrupt line connected to the interrupt controller. In order to handle interrupts, the interrupt controller must be programmed before configuring the PUF controller.

62.4.5. Special Function Register (SFR)

Refer to the section “Special Function Registers (SFR)” for all configurations related to PUF.

© 2026 Microchip Technology Inc. and its subsidiaries

62.5. Functional Description

62.5.1. PUF Introduction

The PUF controller provides the following functionalities:

- Enrollment (usually only needed once)
- Reconstruction (Start or Reconstruct)
- Key derivation
- Wrapping and unwrapping of user-defined keys
- Wrapping and unwrapping of random intrinsic keys
- Random generation
- Zeroization from software or hardware external event
- Test functionality

62.5.2. PUF Operations

During start-up, the PUF controller first tests the PUF-dedicated SRAM for defects. If defects are found, the PUF SRAM is disqualified, and the PUF controller does not allow any operations. This prevents security breaches due to a malfunctioning PUF.

Enrollment is done to obtain the device's intrinsic PUF key, and as a result creates helper data (the activation code). This code must be stored in a non-volatile memory area. From then on, the device's activation code can be provided to reconstruct the intrinsic PUF key.

When the intrinsic PUF key is available (which is the case after enrollment and after successful reconstruction), key operations can be performed.

Table 62.1. List of Operations

Operation Name	Runtime (in clock cycles)
Initialization	36800 with memory test
	26400 without memory test
	14550 for a warm reset
Enroll	33800
Start (12.5% PUF noise)	53400
Start (worst case PUF noise)	55650
Reconstruct (12.5% PUF noise)	40450
Reconstruct (worst case PUF noise)	42700
Stop	1600
Get Key (256 bits)	1200
Wrap Generated Random (256 bits)	6000
Wrap (256 bits)	4450
Unwrap (256 bits)	2850
Generate Random (256 bits)	1650
Reseed (no external entropy)	4600
Reseed (external entropy)	5800
Test Memory	12800
Test PUF	2400
BIST	57100
Zeroize	1600

© 2026 Microchip Technology Inc. and its subsidiaries

When all required key operations have been completed, a Stop command removes all key material from the PUF controller. When more key operations need to be performed later, this can be enabled by a new reconstruction.

With PUF DRNG, bit strings can be generated for use in other parts of the system (for example, as IV, session key, nonce, etc.).

A Built-In Self-Test (BIST) is available to test digital logic in the field. It clears and then tests all digital logic. The result is provided via a register. After BIST has completed, operations can be resumed as if the PUF controller had just been reset.

62.5.3. Security Strength Versus Key Length

The PUF controller security strength is 256 bits, which reflects the strength of its internal secrets and hence determines the highest level of cryptographic security that any of PUF controller cryptographic operations can offer. Depending on the operation and the provided parameters, the effective security strength can be lower, but never higher than 256 bits.

62.5.4. PUF Controller States

The PUF controller provides several operations which are triggered by software commands or hardware events. For several reasons (security, etc.), not all operations are available at all times. The following figure illustrates the operation capabilities.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 62.2. Operation Diagram

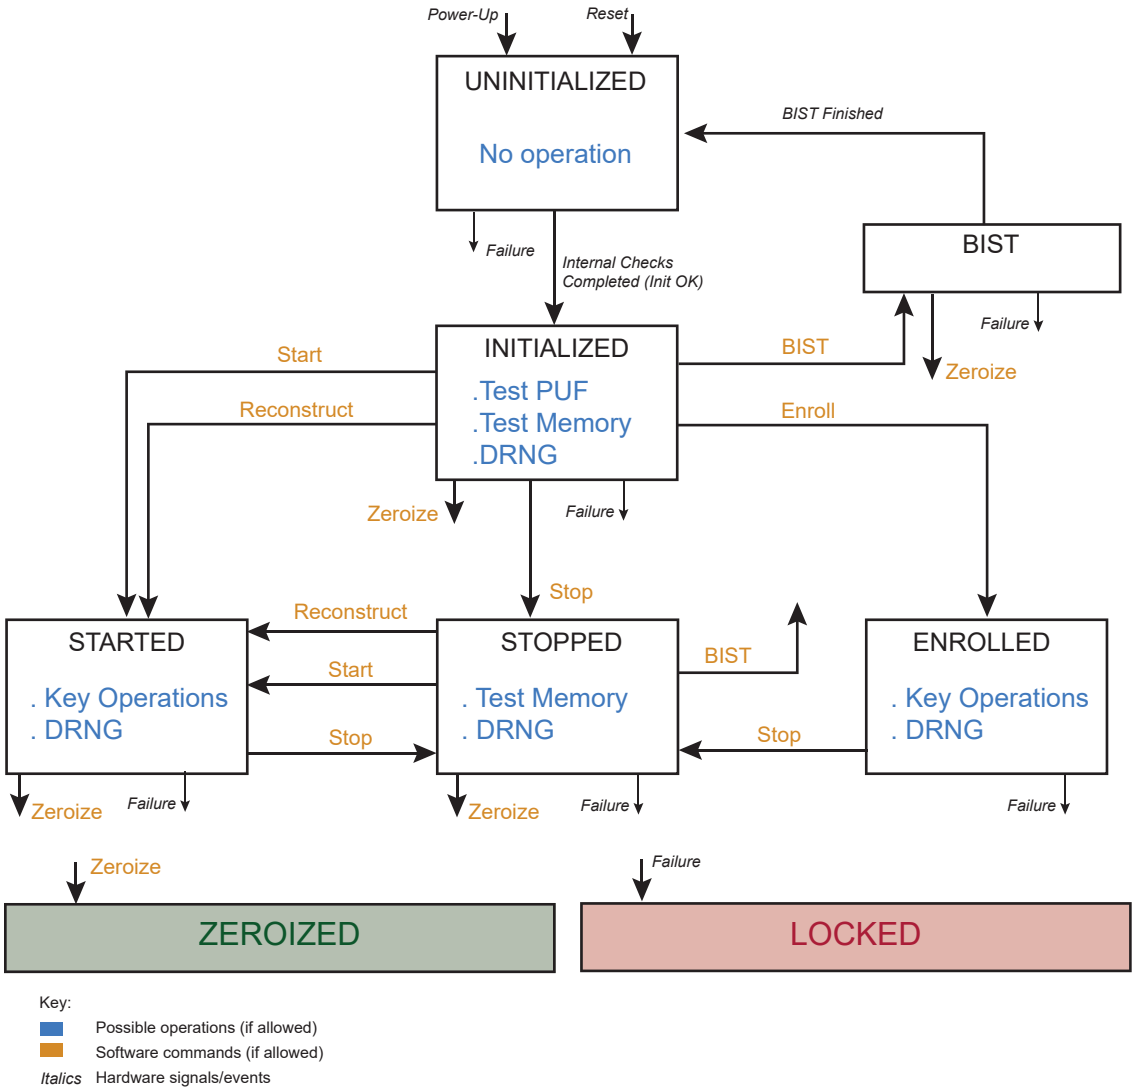


Figure 62.3. Operation Diagram

After power-up and reset is released (refer to the section “Special Function Registers (SFR)” for details on reset deassertion), the PUF controller begins in the Uninitialized state, and runs its initialization sequence (see Initialization Operation). This is indicated by the flag BUSY=1 in the Status register (PUF_SR).

Reset takes precedence over all PUF controller functionalities. As long as the reset is held active, the PUF controller stays in the Uninitialized state, and commands or hardware events have no effect.

When initialization finishes successfully, the PUF controller moves to the Initialized state. It moves to the Locked state on failure.

In the Initialized state, several operations can be performed: BIST, Test PUF, Test SRAM, Generate Random, Reseed, Enroll, Start, Reconstruct, Stop.

© 2026 Microchip Technology Inc. and its subsidiaries

Note: An operation can only be performed when it is not disabled (See PUF Hardware Settings Register). This is valid in all states. PUF Hardware Settings Register is controlled by the SFR.

After a successful Enroll operation (see Enroll Operation), the PUF controller is in the Enrolled state and can perform a Generate Random operation, a Reseed, key operations or a Stop operation (when no further actions is required at that moment).

After a successful Start (see Start Operation) or Reconstruct (see Reconstruct Operation), the PUF controller is in the Started state. In this state, a Generate Random operation, a Reseed, key operations or a Stop operation can be done.

A Stop operation (see Stop Operation) brings the PUF controller to the Stopped state. In this state, no sensitive data is present in the controller and the following operations can be performed: BIST, Test Memory, Generate Random, Reseed, Start, Reconstruct.

When in Started or Enrolled state, key operations can be performed (see Get Key Operation to Unwrap Operation). After such an operation is complete, the PUF controller returns to the state it was in before the operation.

In an Initialized, Enrolled, Started or Stopped state, random data can be generated with the Generate Random command (see Generate Random Operation). The random data is output via the Data Output register (PUF_DOR) in the user interface.

With the Reseed operation (see Reseed Operation), the DRNG is seeded with new entropy and its reseed counter is reset. This can be done at any moment that another operation can be started. The entropy can be provided via the Data Input register (PUF_DIR) in the user interface.

In Initialized or Stopped state, the PUF SRAM can be tested with the Test Memory operation (see Test Memory Operation). Details on the memory test are provided in PUF SRAM Test.

With the Test PUF operation (see Test PUF Operation), diagnostic information about the PUF quality is collected and presented in the Score register (PUF_PSR). This operation is intended for production test purposes. It can only be executed once per reset or power cycle. Details on the diagnostics are provided in PUF Diagnostics.

The Zeroize command (see Test PUF Operation) erases all critical security parameters and prevents the PUF controller from executing any more commands by entering the Zeroized state. The only way to leave this state consists in power-cycling the device, which puts the PUF controller in Uninitialized state and starts initialization. This command can be run via the Control register (PUF_CR).

If an operation is unsuccessful, the PUF_SR.ERROR flag is set. In this case, the PUF controller returns to the state it was in when the command was issued.

If a failure (unrecoverable error) occurs during any of the above-mentioned operations (including Initialization and Zeroize), the PUF controller goes to the Locked state. In this state, no commands can be executed except Zeroize. After a reset, the PUF controller attempts to initialize.

Errors and failures are detailed in PUF Error Handling. The Locked and Zeroized states are indicated by the OK, ERROR and ZEROIZED flags in PUF_SR. See the following table.

Table 62.2. Locked and Zeroized State Details

PUF_SR Flag	Locked State	Zeroized State
OK	0	1
ERROR	1	0
ZEROIZED	1	1

A BIST operation (see PUF Built-In Self-Test (BIST)) can be performed when the PUF controller is in Initialized or Stopped state.

© 2026 Microchip Technology Inc. and its subsidiaries

During BIST, no other operations can be performed. After BIST has finished, the PUF controller enters the Uninitialized state and begins initialization. It behaves the same way as for a reset, except that the BIST result is reported in the Test register (PUF_TEST) with the BISTOK and BISTERR flags.

The following table provides the list of operations with their inputs and outputs. Input, Result and Output columns are defined as follows:

- Input: data (via PUF_DIR) or settings (via other registers)
- Result: indicates whether the result of the operation is provided via PUF_SR and the Operation Result register (PUF_ORR)
- Output: data (via PUF_DOR) or information (via other registers)

Table 62.3. Overview of Operations

Operation	Input	Result	Output
Initialization	None	Yes	None
Enroll	None	Yes	Activation code via PUF_DOR. PUF Score via PUF_PSR
Start	Activation code (2x) via PUF_DIR	Yes	PUF score via PUF_PSR
Reconstruct	Activation code via PUF_DIR	Yes	PUF score via PUF_PSR
Stop	None	Yes	None
Get Key	Key destination context for keys via PUF_DIR	Yes	Keys via PUF_DOR

Test Memory	None	Yes	None
Test PUF	None	Yes	PUF score via PUF_PSR
Zeroize	None	Yes	None
BIST	None	None	Bist results via PUF_TEST

62.5.5. PUF Controller Operations

62.5.5.1. Introduction

Programming 1 to a command bit in PUF_CR starts the corresponding operation. Each operation follows the same protocol.

When a command bit is activated and the corresponding bit in the Allow register (PUF_AR) is set to 1, the operation is started and the flags PUF_SR.BUSY=1, PUF_SR.OK=0 and PUF_AR.ALLOW_*=0.

The command bit in PUF_CR is automatically cleared when the command is accepted.

After the operation is finished, the PUF controller sets the following status:

- PUF_SR.BUSY=0, while the OK and ERROR bits show the result of the operation.
- PUF_AR.ALLOW_x bits indicate which commands are allowed next.

When the result is successful, PUF_SR.OK=1 and PUF_SR.ERROR=0 and the PUF controller moves to the next state. If the result is not successful (OK=0 and ERROR =1), the software determines what to do next.

With result codes provided via PUF_ORR.RCODE, the PUF controller shows additional information about the cause of an error. Details about PUF controller errors, result codes and error handling are described in PUF Error Handling.

The PUF_SR.REJECTED flag indicates that a past command was not accepted. It is intended as a signal to software that something went wrong and specific actions are required. The PUF controller sets REJECTED=1 in the following cases:

© 2026 Microchip Technology Inc. and its subsidiaries

- More than one command bit is 1 at a time.
- A new command is issued while the current command is still running.
- An unallowed command is issued.
- A command with incorrect or unallowed parameters is issued.

The PUF_SR.REJECTED flag remains at 1 until it is cleared by writing PUF_SR.REJECTED=1. While PUF_SR.REJECTED=1, it is still possible to run commands, and when these commands are valid, the PUF controller accepts them and starts the corresponding operation.

Note: After a system reset or power-up, the PUF controller is initialized; it is busy and no commands are allowed. Any command issued during initialization is rejected.

The Zeroize command differs from the standard protocol: it can be issued at any time and will never be rejected, whether an operation (or initialization) is already running or not.

62.5.5.2. Initialization Operation

Initialization brings the PUF controller to a consistent state after each reset and power cycle.

That operation includes a memory test and initialization of the DRNG. A Known Answer Test and an Entropy Evaluation are performed according to the NIST SP 800-90 recommendations.

After a reset or a power cycle, the PUF controller runs a memory test on the PUF SRAM. The memory test automatically resumes when interrupted by a reset and, once completed, is not repeated until the next power cycle.

62.5.5.3. Enroll Operation

During the Enroll operation, the SRAM start-up values are read, an intrinsic PUF key is generated and the corresponding activation code is generated. The activation code must be stored in a non-volatile memory area for future use.

During enrollment, the PUF controller verifies that the PUF SRAM contains qualitative start-up data. If that is not the case, enrollment is terminated and the PUF controller responds with an error indication. The (partially) provided activation code must then be discarded.

After successful completion of the Enroll operation, the diagnostic information about the PUF quality is provided in PUF_PSR.

Note: The Enroll operation collects the same diagnostic information as the Test PUF operation.

The activation code is not sensitive (it does not contain any information on the corresponding intrinsic PUF key) and is unique for every device and every enrollment. It can be stored in non-secure memory area.

The activation code and the intrinsic PUF key are linked to a device, and cannot be used on another device. Every time an enrollment is performed, a new intrinsic PUF key is generated together with its activation code.

The intrinsic PUF key always stays inside the PUF controller and is never output to the rest of the system.

62.5.5.4. Start Operation

During the Start operation, the SRAM start-up values and the activation code that was generated during enroll are used to reconstruct the intrinsic PUF key. When the activation code of another device is used, reconstruction fails, and the PUF controller responds with an error indication.

After successful completion of the Start operation, diagnostic information about the PUF quality is provided in PUF_PSR (see PUF Diagnostics for details).

Note: The PUF scores returned after a Start (or Reconstruct) operation and Enroll (or Test PUF) operation can differ, because these operations measure PUF quality in different ways.

© 2026 Microchip Technology Inc. and its subsidiaries

Start operates in two phases (Reconstruction and Anti-aging), each requiring the activation code. Therefore the activation code must be sent twice during a Start operation.

62.5.5.5. Reconstruct Operation

The Reconstruct operation is the same as the Start operation, except that Reconstruct does not include the Anti-aging phase. This operation can be used instead of a Start operation in the following cases only:

- The PUF SRAM is powered off most of the time.
- The time from power-on or reset to key operations is time-critical.

In other cases, the Start operation must be used.

Important: If the Reconstruct operation is used and the device's PUF SRAM remains powered on for a long time, Stop and Start operations must be launched as soon as possible after the time-critical part of the application has been completed. This applies the Anti-aging procedure and improves the long-term reliability of the PUF controller.

During the Reconstruct operation, the SRAM start-up values and the activation code that was generated during enroll are used to reconstruct the intrinsic PUF key. When the activation code of another device is used, the reconstruction will fail, and the PUF controller will respond with an error indication.

After successful completion of the Reconstruct operation, diagnostic information about the PUF quality is provided in PUF_PSR (see PUF Diagnostics for details).

Note: The PUF scores returned after a Reconstruct (or Start) operation and Enroll (or Test PUF) operation can differ because these operations measure PUF quality in different ways.

62.5.5.6. Stop Operation

The Stop operation removes sensitive data from the PUF controller and the PUF SRAM, and sets the PUF controller to the Stopped state. After this command has finished, key operations can no longer be performed. This can be used when no key operations are expected for an extended period of time (e.g. when the system goes into Sleep mode), and ensures that the intrinsic PUF key is only present in the system when needed, which improves security.

If key operations need to be performed again after a Stop operation, then a Start or Reconstruct operation needs to be completed first, as explained in PUF Controller States.

62.5.5.7. Get Key Operation

The Get Key operation derives a key from the intrinsic PUF key and the provided context. The context also defines the length of the derived key. The key is provided to the defined destination interface. Depending on the state of the PUF controller, the allowed destinations may be limited as described in Context Specification for Key Operations. When an invalid destination is defined (all bits 0, or more than one bit 1), the command is rejected.

Bits 3:0 of the user_context_0 word of the context are passed to the Key Index register (PUF_KEY_INDEX). When the key is output to PUF_DOR, the value can be used to transfer the key to a specific process or function.

62.5.5.8. Wrap Generated Random Operation

The Wrap Generated Random operation wraps a random key into a key code (KC). The length, scope and user context of the random key are defined with a context as described in Context Specification for Key Operations. Key codes start with the provided context.

A key code is not sensitive (it does not reveal information on the corresponding key) and is linked to the activation code that was used during the last Enroll, Start or Reconstruct command.

© 2026 Microchip Technology Inc. and its subsidiaries

62.5.5.9.Wrap Operation

The Wrap operation wraps a user-defined key into a key code. The length, scope and user context of the key are defined with a context as described in Context Specification for Key Operations. Key codes start with the provided context.

A key code is not sensitive (it does not reveal information on the corresponding key) and is linked to the activation code that was used during the last Enroll, Start or Reconstruct command.

62.5.5.10.Unwrap Operation

The Unwrap operation unwraps the key from a previously created key code. Depending on the state of PUF and the key scope that is included in the key code, the allowed destinations may be limited as described in Context Specification for Key Operations. When an invalid destination is defined (all bits 0, or more than one bit 1), the command is rejected.

Bits 3:0 of the user_context_0 word of the context, as provided during the Wrap or Wrap Generated Random operation, are passed to PUF_KEY_INDEX.

62.5.5.11.Generate Random Operation

The Generate Random operation outputs the requested amount of random data as specified in a provided context. The context is defined in Context Specification for Generate Random Operation.

62.5.5.12.Reseed Operation

With the Reseed operation, DRBG2 is reseeded with new entropy, and its reseed counter is reset.

New entropy always comes from DRBG1. In addition, external random entropy can be provided via PUF_DIR. The Data Source register (PUF_SRC) must be configured with 0x1.

The following table shows the number of bytes that must be provided per entropy source.

Table 62.4. Number of Bytes per Entropy Source for Reseed Operation

Entropy Source	Number of Bits	Number of Bytes
DRBG1	384	48
Entropy via PUF_DIR	1024	128

62.5.5.13.Test Memory Operation

With the Test Memory operation, the PUF SRAM is tested for defects. If the test fails, an error is indicated and PUF enters the Locked state.

62.5.5.14.Test PUF Operation

With the Test PUF operation, diagnostics about the PUF quality are collected and presented in a PUF score. When the operation is successful, the result is read in PUF_PSR. Details about PUF diagnostics can be found in PUF Diagnostics.

Note: The Test PUF operation collects the same diagnostic information as the Enroll operation.

62.5.5.15.Zeroize Operation

The Zeroize operation removes all sensitive data from the PUF controller and the PUF SRAM. This disables all commands until the next power cycle. The Zeroize command can be used when a security breach is detected. When the Zeroize operation is successful, the PUF controller goes to the Zeroized state. If the operation fails, the PUF controller enters the Locked state.

As part of the Zeroize operation, the DRBG1 and DRBG2 are uninstantiated.

Zeroize operation is performed by writing PUF_CR.ZEROIZE=1.

Zeroize takes precedence over all other activities of the PUF controller, except when BIST is running. This means it can also be started during initialization, or while another operation is active. Zeroize cancels the current operation.

Note: When Zeroize occurs during an operation, any ongoing data transfers via PUF_DIR or PUF_DOR are interrupted. Software must ensure that these events can be handled.

© 2026 Microchip Technology Inc. and its subsidiaries

62.5.6. PUF Data Formats

62.5.6.1. Activation Code Format

The activation code includes a 64-bit header carrying a unique value checked by the PUF controller, a payload and a 32-bit checksum checked for transfer errors.

The overall length of the activation code is 996 bytes.

The header (big-endian format) is 0x0001_0307_2005_0500.

Note: The checksum can be used by software to check that the activation code is stored safely in the non-volatile memory area.

62.5.6.2. Key Code Format

The key code includes a 128-bit header carrying a unique value and the context provided during the wrap or Wrap Generated Random operation, a payload and a 32-bit checksum checked for transfer errors.

The header (big-endian format) is 0x37 followed by word 0 to 3 of the provided context (See Context Specification for Key Operations).

The length of the key code for the accepted key length is provided in the following table.

Table 62.5. Key Code Length Versus Key Length

Key Length (bits)	Key Code Length (bytes)
64	60
128	68
192	76
256	84
320	92
384	100
448	124
512	132
576	140
640	148
704	156
768	164
832	188
896	196
960	204
1024	212
2048	388
3072	548
4096	724

62.5.6.3. Context Specification for Key Operations

The context input for Key operations is used to specify the properties of a key, and enables the explicit differentiation of keys that have distinct purposes. Under no circumstance must the same context be used on the same device for keys with different properties or purposes.

For Get Key operations, the combination of the intrinsic PUF key and the context uniquely defines the key that is output. If the same context is used, the same key is produced.

For Wrap and Wrap Generated Random operations, the combination of the intrinsic PUF key and context uniquely determines which keys are used to protect the wrapped data. Each key code is still unique, even when the same data and context are used.

© 2026 Microchip Technology Inc. and its subsidiaries

Table 62.6. Fields in the Context for Key Operations

Word Index	Bit Range	Value	Description
0	[31:24]	0	Reserved. Must always be 0.
	[23:16]	0x10	Context for key operations
	[15:13]	0	Reserved. Must always be 0.
	[12:0]	N x 64 (with N= 1..16), 2048, 3072, 4096	Length of the key in bits. The key length is not necessarily the same as the security strength.
1	[31:16]	0	Must always be 0.
	[15:10]	0	Reserved. Must always be 0.
	[9]	0	Reserved. Must always be 0.
	[8]	0, 1	Defines the allowed key destinations, when PUF is in the Started state: 0: Key cannot be available via PUF_DOR 1: Key can be available via PUF_DOR
	[7:2]	0	Reserved. Must always be 0.
	[1]	0	Reserved. Must always be 0.
	[0]	0, 1	Defines the allowed key destinations, when PUF is in the Enrolled state: 1: Key is available via PUF_DOR
2	[31:0]	Any	User context for key derivation; available bits are restricted by the value read in PUF_HW_RUC0.
3	[31:0]	Any	User context for key derivation; available bits are restricted by the value read in PUF_HW_RUC1.

62.5.6.4. Context Specification for Generate Random Operation

The context for Generate Random operations is used for internal random generation. The following table defines the fields in the context for Generate Random.

Table 62.7. Fields in the Context for Generate Random Operations

Word Index	Bit Range	Value	Description
0	[31:24]	0	Reserved. Must always be 0.
	[23:16]	0x10	Context for Generate Random operations
	[15:13]	0	Reserved. Must always be 0.
	[12:0]	N x 64 (with N= 1..16), 2048, 3072, 4096	Length of the requested data in bits

62.5.7. PUF Operation Restrictions

The PUF Hardware Settings Register provides information on current restrictions applying to operations.

© 2026 Microchip Technology Inc. and its subsidiaries

62.5.8. PUF Error Handling

62.5.8.1. Introduction

The PUF controller generates errors and failures. Errors are events that indicate that an operation was not successful, but have no immediate impact on the secure operation of the PUF controller.

Failures are events that prevent the PUF controller from ensuring a secure continuation of operations, and put the PUF controller in Locked state.

62.5.8.2. Failures

If a failure (e.g. PUF SRAM access error) is detected, either during Initialization, Zeroization or other operations, the PUF controller reports a failure result code in the PUF Operation Result Register (PUF_ORR.RCODE > 0xFA) and enters the Locked state. When the PUF controller is in Locked state, no operations other than Zeroize can be performed. The software must determine if a Zeroize operation is required.

The following table shows the possible failure result codes for each operation type.

Table 62.8. Possible Failure Result Codes per Operation

Operation / Result Code	Description	Possible Action
All Operations		
All / FAILURE_SRAM	PUF SRAM access failed.	Try to repower the PUF or the product.
Initialization		
Initialization / FAILURE_DRBG_HEALTH	One or more of the DRNG health tests failed (hardware is out of order, or has intermittent failure).	Try to repower the PUF or the product.
Initialization / FAILURE_SETTINGS	An illegal combination of values is read in PUF_HW_SETTINGS.	None
Initialization / FAILURE_DRBG1_ENTROPY	The entropy test for DRBG 1 failed.	Try to repower the PUF or the product.
Initialization / FAILURE_DRBG2_ENTROPY	Activation of DRBG 2 failed (DRBG 1 cannot provide entropy).	Try to repower the PUF or the product.
Reseed		
Reseed / FAILURE_DRBG2_ENTROPY	Reseed of DRBG 2 failed (DRBG 1 cannot provide entropy).	Try to repower the PUF or the product.

62.5.8.3. Errors

Upon detecting an error during an operation, the PUF controller cancels the command, presents an ERROR result code (PUF_ORR.RCODE > 0 and < 0xFA) and goes back to the state it was in before the command was issued. After an error, new commands can be executed by the PUF controller.

If an error occurs, the software determines what next steps apply:

- The occurred error is acceptable—The error condition can be repaired and a retry can be done. For security reasons the number of acceptable (sequential) errors must be limited. If more than this number of errors occur, it can be considered an attack and the last error cannot be accepted.
- The occurred error is not acceptable—Depending on the type and severity of the error, multiple actions can be initiated by software, for example:
  - Send a Stop command to PUF. This removes sensitive data from PUF and software can then perform other actions (e.g. ensure that the correct activation code is available), after which a new Start or Reconstruct command can be run.
  - Zeroize PUF, send Zeroize commands to other peripherals that have such command, and zeroize parts of system memory and registers that contain sensitive data.
  - Switch off the product/device, or the parts of the device that contain sensitive data.

© 2026 Microchip Technology Inc. and its subsidiaries

– Reset the product/device and check if the error remains.

The following table shows the possible error result codes for each operation type.

Table 62.9. Possible Error Result Codes per Operation

Operations / Result Code	Description	Possible Action
Enroll		
Enroll / ERR_PUF_QUALITY	PUF-dedicated SRAM quality verification fails.	Try to repower the PUF or the product.
Start		
Start / ERR_PRODUCT	The provided activation code (AC) is invalid.	Provide an AC that was created with this product/device.
Start / ERR_TRANSFER	The provided AC is corrupted.	• Verify the AC checksum. • Try sending the AC again (it might be a transient error). • Check that the AC buffer (if used) is not overwritten by another process.
Start / ERR_AUTH	Authentication of the provided AC failed.	• Verify with the AC header that the AC was created for this device. • Check that the AC buffer (if used) is not overwritten by another process. • Try to repower the PUF or the product/device.
Start / ERR_PRODUCT_PH2	The AC in the second phase is invalid.	Provide an AC that was created with this product/device.
Start / ERR_TRANSFER_PH2	The AC in the second phase is corrupted.	• Verify the AC checksum. • Try sending the AC again (it might be a transient error). • Check that the AC buffer (if used) is not overwritten by another process.
Start / ERR_AUTH_PH2	Authentication of the provided AC failed in the second phase.	Check that the AC buffer (if used) is not overwritten by another process.
Reconstruct		
Reconstruct / ERR_PRODUCT	The provided activation code (AC) is invalid.	Provide an AC that was created with this product/device.
Reconstruct / ERR_TRANSFER	The provided AC is corrupted.	• Verify the AC checksum. • Try sending the AC again (it might be a transient error). • Check that the AC buffer (if used) is not overwritten by another process.
Reconstruct / ERR_AUTH	Authentication of the provided AC failed.	• Verify with the AC header that the AC was created for this device. • Check that the AC buffer (if used) is not overwritten by another process. • Try to repower the PUF or the product/device.
Get Key		
Get Key / ERR_CONTEXT	An incorrect or unsupported context is provided.	Provide a valid context.
Get Key / ERR_DESTINATION	A key destination that was set is not allowed by the key scope in the provided context and the current PUF.	Provide a valid context.

© 2026 Microchip Technology Inc. and its subsidiaries

Table 62.9. Possible Error Result Codes per Operation (continued)

Operations / Result Code	Description	Possible Action
Wrap Generated Random, Wrap		
Wrap Generated Random, Wrap / ERR_CONTEXT	An incorrect or unsupported context is provided.	Provide a valid context.
Unwrap		
Unwrap / ERR_PRODUCT	The provided key code (KC) is invalid.	Provide a KC with a valid context.
Unwrap / ERR_CONTEXT	The context in the key code (KC) header is incorrect.	Provide a KC with a valid context.
Unwrap / ERR_DESTINATION	A key destination that was set is not allowed by the key scope in the KC header and the current PUF state.	Provide a valid destination.
Unwrap / ERR_TRANSFER	The provided KC is corrupted.	• Verify the KC checksum. • Try sending the KC again (it might be a transient error). • Check that the KC buffer (if used) is not overwritten by another process.
Unwrap / ERR_AUTH	Authentication of the provided KC failed.	• Verify with the KC header that the AC was created for this device. • Ensure that the KC was created with the same AC as was used during the last Start or Reconstruct operation (this must be managed by the system software). • Check that the KC buffer (if used) is not overwritten by another process.
Generate Random		
Generate Random / ERR_CONTEXT	An incorrect or unsupported context is provided.	Provide a valid context.

62.5.9. PUF Diagnostics

To determine the PUF quality, the PUF controller performs a statistical analysis on various aspects of the PUF, like randomness and noise. This is done during the Test PUF, Enroll, Start and Reconstruct operations, and results in a PUF score with a value from 0 to 7 that can be read in PUF Score Register after the operation successfully completes. A lower PUF score indicates a better PUF quality.

If the operation is not successful (PUF_SR.ERROR=1), the PUF score is not presented, and the register contains 0xF instead.

The PUF scores returned after Enroll (or Test PUF) give an indication of the PUF quality, while the scores after Start (or Reconstruct) provide an indication of the PUF noise level. Therefore the scores can be different.

When a high PUF score is unexpected, the system level software must determine what actions, if any, are required.

62.5.10. PUF Built-in Tests

62.5.10.1. PUF SRAM Test

The PUF SRAM is tested using a basic non-destructive memory test that retains the SRAM PUF response. The test verifies that the SRAM can be read and written, and that the address and data buses work correctly.

The test is performed in the following cases:

© 2026 Microchip Technology Inc. and its subsidiaries

- After every power cycle
- During the Test Memory operation

62.5.10.2.PUF Quality Test

The PUF quality test is done with the Test PUF operation (see Test PUF Operation). See PUF Diagnostics for details on PUF diagnostics.

62.5.10.3.PUF Built-In Self-Test (BIST)

The PUF controller BIST is controlled by the PUF_TEST register.

The BIST is started by writing PUF_TEST.BISTEN=1. Once BIST is started, it cannot be interrupted by other commands (including Zeroize), and it runs until it is finished. The only way to stop it sooner is a PUF reset (refer to the section “Special Function Registers (SFR)”).

The BIST can only be started when PUF_TEST.BISTALLOW=1, which is the case when the PUF controller is in Initialized or Stopped state.

When BISTEN=1 while BISTALLOW=0, the BIST does not start until the BIST is allowed.

After PUF reset, the PUF_TEST.BISTOK and BISTERR flags are both cleared.

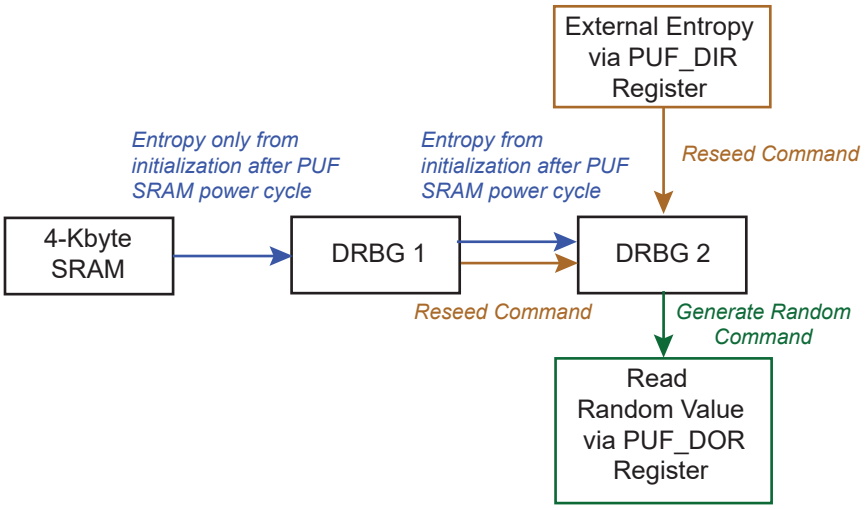
When BISTEN=1, the PUF_TEST.BISTACTIVE and BISTRUN flags go to 1 and the BISTOK and BISTERR flags go to 0. When the BIST is finished, BISTACTIVE goes to 0, and both BISTOK and BISTERR go to 1. This proves that the result signals are not stuck at 1 or 0, and that the result is reliable.

The BIST result is only shown after BISTEN=0. Either BISTOK or BISTERR goes to 0, while the other signal stays at 1, depending on the BIST result. When both signals remain at 1, it is also an indication that an error has occurred.

After the BIST is finished and the result is shown, the PUF controller resets, sets PUF_TEST.BISTRUN=0, PUF_SR.BUSY=1, runs the Initialization operation and enters Initialized state. The BIST result remains available.

In case of a BIST error, software must determine what is the next applicable action (e.g. retry BIST to check if the error was transient, zeroize, etc.).

When the BIST operation is performed, a time-out procedure must be included in the calling software. This prevents infinite waiting times in case a PUF controller hardware error prevents the BIST from finishing. At the moment the software time-out occurs, the PUF controller must be reset to stop BIST.



62.5.11. PUF Deterministic Random Number Generator (DRNG)

62.5.11.1.Introduction

The deterministic random number generator is constructed with two deterministic random bit generators (DRBG), as shown in the following figure.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 62.4. DRNG Structure

DRBG 1 uses the entropy from the PUF SRAM. This is done once per power cycle. During initialization (after every power cycle and after every reset), DRBG 2 uses entropy from DRBG 1.

During Reseed operation, DRBG 2 also uses entropy from DRBG 1 and in addition can accept entropy from external random entropy sources (1024 bits per source) via PUF_DIR. The Reseed operation can be started at any time that DRBG operations can be performed.

As defined by the NIST SP 800-90 recommendations, the maximum number of random requests between reseeds is 2^{48}. This is tracked internally with an internal reseed counter. Each DRBG has its own counter. For normal operations, DRBG 2 is used to generate random. DRBG 1 is only used during initialization.

The reseed counters track the number of executed internal (DRBG) Generate operations. Requests for random by means of the Generate Random operation can require multiple internal Generate operations.

Therefore, the reseed counter may be increased multiple times for each Generate Random operation.

Additionally, internal processes might also consume random data (e.g. to mask sensitive data or clear buffers) and thus increase the reseed counter.

The PUF controller guarantees that a started operation can always be completed without reaching the reseed counter limit. To this end, at least 256 ticks must be available on the reseed counter for any normal operation to be allowed.

If less than 256 ticks are available, i.e. the counter value is larger than 2^{48} - 257, then the flag PUF_ISR.RESEEDR=1. Only the Reseed and Zeroize operations can be performed once the counter reaches this limit and, depending on the PUF controller state, also BIST operations. Alternatively, the PUF controller or the entire device can also be reset or power-cycled to trigger a reinitialization.

Because BIST, reset and power-cycling transition the PUF controller to the Uninitialized state, DRBG 2 is reinitialized with a different value (using entropy from DRBG 1) and no reseed is required anymore. However, if external random entropy (PUF_DIR) is desired, a Reseed operation can be started after initialization has finished.

To make sure that no reseed will be required at an inconvenient moment, the PUF controller provides a warning when the internal reseed counter approaches the maximum value by 2^{32} or less.

© 2026 Microchip Technology Inc. and its subsidiaries

This is indicated with 1 on the PUF_ISR.RESEEDW flag. Although about 4 * 10^9 random requests can still be made, the Reseed command must be activated at the first convenient moment.

Table 62.10. Reseed Counter Limits

Parameter	Value	Equivalent in Years at 1 Random Request per Second
Absolute maximum number of internal random requests	2^{48} - 2	8.9 * 10^6
Maximum value of reseed counter to begin an operation	2^{48} - 257	8.9 * 10^6
Warning level for number of random requests	2^{48} - 2^{32}	8.9 * 10^6 - 136

The limit to the number of requests for DRBG 1 is also 2^{48} - 257. In the unlikely event that its reseed counter reaches this value, the PUF controller enters the Locked state. This is persistent over resets. Only the Zeroize operation can be performed, or the PUF controller or the device can be power-cycled.

62.5.11.2.DRBG Mechanism Functions

The DRBG mechanism uses the HMAC_DRBG algorithms and are available for random generation as soon as the PUF controller is out of the Uninitialized or BIST state.

Seed material for DRBG 1:

- Entropy input (2048 bytes) from PUF SRAM, first compressed to 512 bits
- Nonce input: 8192 bits (1024 bytes) from PUF SRAM, first compressed to 256 bits
- Personalization string: 256 bits, product-specific value

Seed material for DRBG 2:

- Entropy input: 256 bits (32 bytes) from DRBG 1
- Nonce input: 128 bits (16 bytes) from DRBG 1
- Personalization string: 256 bits, product-specific value

The inputs of the DRBG2 reseed mechanism (DRNG1 cannot be reseeded) are:

- 384 bits (48 bytes) from DRBG 1
- up to 1024 bits (128 bytes) via PUF_DIR (when enabled)

Zeroize operation disables the DRNGs.

© 2026 Microchip Technology Inc. and its subsidiaries

62.6. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	PUF_CR	31:24	TESTPUF	TESTMEM						
		23:16								RESEED

62.6.1. PUF Control Register

Name: PUF_CR
Offset: 0x000
Reset: 0x00000000
Property: Read/Write

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding operation.

Note: Only one command bit must be activated at a time, except ZEROIZE. Writing ZEROIZE=1 takes precedence over all other commands.

Bit	31	30	29	28	27	26	25	24
	TESTPUF	TESTMEM						
Access	R/W	R/W						
Reset	0	0						

Bit	23	22	21	20	19	18	17	16
								RESEED
Access								R/W
Reset								0

Bit	15	14	13	12	11	10	9	8
	GENRAND						WRAP	WGENRAND
Access	R/W						R/W	R/W
Reset	0						0	0

Bit	7	6	5	4	3	2	1	0

Access	R/W	R/W	R/W		R/W	R/W	R/W	R/W
Reset	0	0	0		0	0	0	0

Bit 31 – TESTPUF Test PUF Operation

Bit 30 – TESTMEM Test Memory Operation

Bit 16 – RESEED Reseed Operation

Bit 15 – GENRAND Generate Random Operation

Bit 9 – WRAP Wrap Operation

Bit 8 – WGENRAND Wrap Generated Random Operation

Bit 7 – UNWRAP Unwrap Operation

Bit 6 – GETKEY Get Key Operation

Bit 5 – STOP Stop Operation

Bit 3 – RECO Reconstruct Operation

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 2 – START Start Operation

Bit 1 – ENROLL Enroll Operation

Bit 0 – ZEROIZE Zeroize Operation

© 2026 Microchip Technology Inc. and its subsidiaries

62.6.2. PUF Operation Result Register

Name: PUF_ORR
Offset: 0x004
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	LOPNUM[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	RESEEDR	RESEEDW						
Access	R	R						
Reset	0	0						

Bit	7	6	5	4	3	2	1	0
	RCODE[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:24 – LOPNUM[7:0] Last Operation Number

Value	Name	Description
0x00	IID_PUF_LO_PROGRESS	An operation is in progress.
0x01	IID_PUF_LO_ENROLL	The last operation was ENROLL.
0x02	IID_PUF_LO_START	The last operation was START.
0x03	IID_PUF_LO_RECONSTRUCT	The last operation was RECONSTRUCT.
0x4	Reserved	Reserved
0x05	IID_PUF_LO_STOP	The last operation was STOP.
0x06	IID_PUF_LO_GET_KEY	The last operation was GET KEY.
0x07	IID_PUF_LO_UNWRAP	The last operation was UNWRAP.
0x08	IID_PUF_LO_WRAP_GEN_RND	The last operation was WRAP GENERATED RANDOM.
0x09	IID_PUF_LO_WRAP	The last operation was WRAP.
0x0A–0x0E	Reserved	Reserved
0x0F	IID_PUF_LO_GEN_RND	The last operation was GENERATED RANDOM.
0x10	IID_PUF_LO_RESEED	The last operation was RESEED.
0x11–0x1D	Reserved	Reserved
0x1E	IID_PUF_LO_TEST_MEMORY	The last operation was TESTMEMORY.
0x1F	IID_PUF_LO_TEST_PUF	The last operation was TESTPUF.
0x20	IID_PUF_LO_INITIALIZATION	The last operation was INITIALIZATION.
0x21–0x2E	Reserved	Reserved
0x2F	IID_PUF_LO_ZEROIZE	The last operation was ZEROIZE.

Bit 15 – RESEEDR Reseed Required

Value	Name	Description
0	NO_ACTION	No action required.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	REQUIRED_ACTION	The maximum number of DRBG2 requests has been done. A reseed must be performed before other operations can be done. This bit is the same as in PUF_SR.

Bit 14 – RESEEDW Reseed Warning

Value	Name	Description
0	NO_ACTION	No action required.
1	RECOMMENDED_ACTION	The DRBG reseed counter is close to its limit, it is recommended to reseed at the first suitable moment. This bit is the same as in PUF_SR.

Bits 7:0 – RCODE[7:0] Last Operation Result Code

Value	Name	Description
0x00	IID_PUF_OK	The last operation was successful or an operation is in progress.
0xF0	IID_PUF_ERR_PRODUCT	The provided activation code is not correct.
0xF1	IID_PUF_ERR_PRODUCT_PH2	The activation code in the second phase is not correct.
0xF2	IID_PUF_ERR_TRANSFER	The provided activation code is corrupted.
0xF3	IID_PUF_ERR_TRANSFER_PH2	The activation code in the second phase is corrupted.
0xF4	IID_PUF_ERR_AUTH	Authentication of the provided activation code failed.
0xF5	IID_PUF_ERR_AUTH_PH2	Authentication of the provided activation code failed in the second phase.
0xF6	IID_PUF_ERR_PUF_QUALITY	Dedicated Embedded Static RAM PUF quality verification fails.
0xF7	IID_PUF_ERR_CONTEXT	An incorrect or unsupported context is provided.
0xF8	IID_PUF_ERR_DESTINATION	A data destination that was set is not allowed according to other settings and the current PUF state.
0xF9-0xFA	Reserved	Reserved
0xFB	IID_PUF_FAILURE_DRBG2_ENTROPY	DRBG2 Reseed or Instantiation failed (DRBG1 cannot provide entropy).
0xFC	IID_PUF_FAILURE_DRBG1_ENTROPY	The entropy test for DRBG1 failed.
0xFD	IID_PUF_FAILURE_DRBG_HEALTH	One or more of the DRBG health tests failed.
0xFE	IID_PUF_FAILURE_SETTINGS	Initialization cannot finish due to illegal values in PUF_HW_SETTINGS.
0xFF	IID_PUF_FAILURE_SRAM	PUF SRAM access has failed.

Bit	7	6	5	4	3	2	1	0
		DOREQ	DIREQ	REJECTED	ZEROIZED	ERROR	OK	BUSY
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	1

Bit 30 – RESEEDR Reseed Required

Value	Name	Description
0	NO_ACTION	No action required.
1	REQUIRED_ACTION	The maximum number of DRBG2 requests has been done. A reseed must be performed before other operations can be done. This bit is the same as in PUF_ORR.

Bit 29 – RESEEDW Reseed Warning

Value	Name	Description
0	NO_ACTION	No action required.
1	RECOMMENDED_ACTION	The reseed counter of the DRBG is close to its limit, it is recommended to reseed at the first suitable moment. This bit is the same as in PUF_ORR.

Bit 6 – DOREQ Data Out Request Status

Value	Description
0	No data-out transfer is in progress.
1	A data-out transfer is in progress following a request via PUF_DOR.

Bit 5 – DIREQ Data In Request Status

Value	Description
0	No data-in transfer is in progress.
1	A data-in transfer is in progress following a request via PUF_DIR.

Bit 4 – REJECTED Last Command Rejection Status (cleared by writing a 1)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No rejection event occurred since the last clearing access.
1	A rejection event occurred when the last command has been launched. Cleared by writing a 1.

Bit 3 – ZEROIZED PUF Zeroization in Progress

Value	Description
0	No zeroization is in progress.
1	A zeroization action is in progress or the PUF is in Locked state.

Bit 2 – ERROR Last Operation Failed

Value	Description
0	The last operation completed successfully.
1	The last operation failed.

Bit 1 – OK Last Operation Successfully Achieved

Value	Description
0	ERROR bit must be checked.
1	The last operation completed successfully.

Bit 0 – BUSY Operation in Progress

Value	Description
0	No operation is in progress. A new operation can be initiated.
1	An operation is in progress. No new operation must be launched.

© 2026 Microchip Technology Inc. and its subsidiaries

62.6.4. PUF Allow Register

Name: PUF_AR
Offset: 0x00C
Reset: 0x00000000
Property: Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding action is not allowed.

1: The corresponding action is allowed.

Bit	31	30	29	28	27	26	25	24
	TESTPUF	TESTMEM						
Access	R	R						
Reset	0	0						

Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
								INTEN
Access								R/W
Reset								0

Bit 0 – INTEN Interruption Enable

Value	Description
0	Disables the interruption.
1	Enables the PUF to trigger an interruption from the sources selected in PUF_IMR.

© 2026 Microchip Technology Inc. and its subsidiaries

62.6.6. PUF Interrupt Mask Register

Name: PUF_IMR
Offset: 0x014
Reset: 0x00000000
Property: Read/Write

The following configuration values are valid for all listed bit names of this register:

0: Disables the corresponding interrupt source.

1: Enables the corresponding interrupt source.

Bit	31	30	29	28	27	26	25	24
		RESEEDR	RESEEDW					
Access		R/W	R/W					
Reset		0	0

Reset		0	0	0	0	0	0	0

Bit 30 – RESEEDR Reseed Action Required Event

Bit 29 – RESEEDW Reseed Warning Event

Bit 6 – DOREQ Data Out Request Event

Bit 5 – DIREQ Data In Request Event

Bit 4 – REJECTED Last Activation Code Rejection Event

Bit 3 – ZEROIZED Zeroized Operation Completed Event

Bit 2 – ERROR Last Operation Fail Event

Bit 1 – OK Last Operation Successful Achievement Event

Bit 0 – BUSY Operation Start Event

© 2026 Microchip Technology Inc. and its subsidiaries

62.6.7. PUF Interrupt Status Register

Name: PUF_ISR
Offset: 0x018
Reset: 0x00000000
Property: Read/Write

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt source has not triggered the interrupt line.

1: The corresponding interrupt source triggered the interrupt line.

Writing a 1 to a bit clears the corresponding bit.

Bit	31	30	29	28	27	26	25	24
		RESEEDR	RESEEDW					
Access		R/W	R/W					
Reset		0	0					

Bit	23	22	21	20	19	18	17	16
Access								
Reset

Reset		0	0	0	0	0	0	0

Bit 30 – RESEEDR Reseed Action Required (cleared by writing a 1)

Bit 29 – RESEEDW Reseed Warning (cleared by writing a 1)

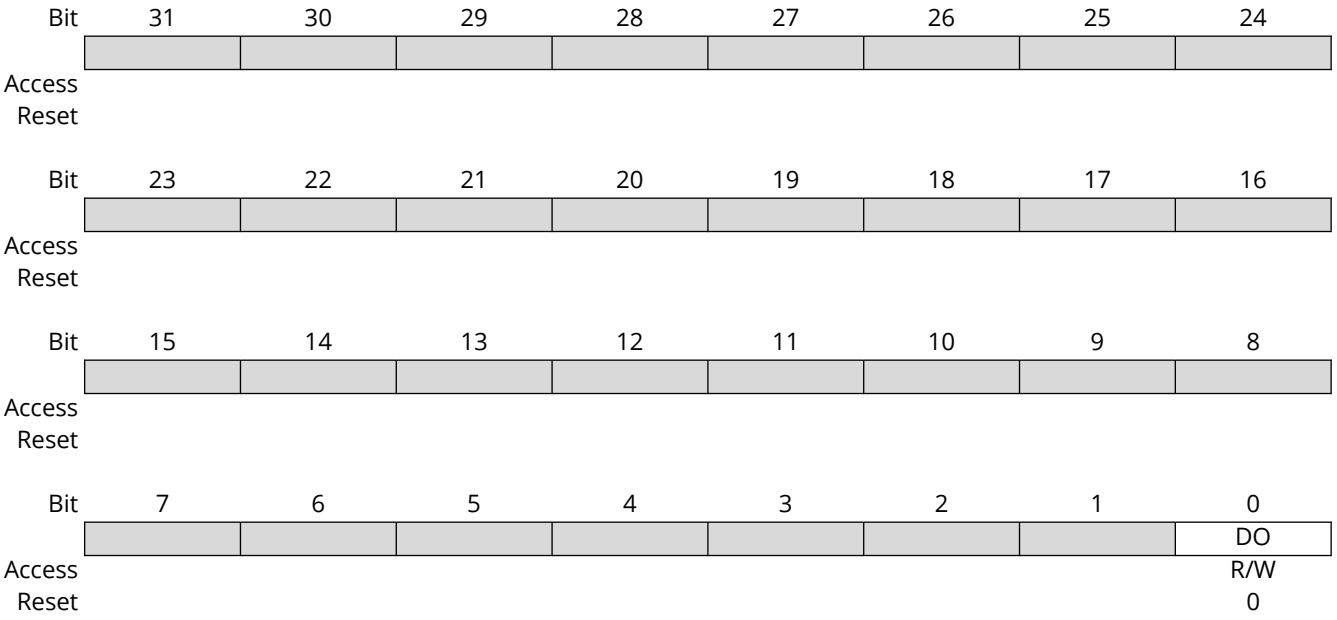
Bit 6 – DOREQ Data Out Request (cleared by writing a 1)

Bit 5 – DIREQ Data In Request (cleared by writing a 1)

Bit 4 – REJECTED Last Activation Code Rejection (cleared by writing a 1)

Bit 3 – ZEROIZED Zeroized Operation Completed (cleared by writing a 1)

Bit 2 – ERROR Last Operation Fail (cleared by writing a 1)



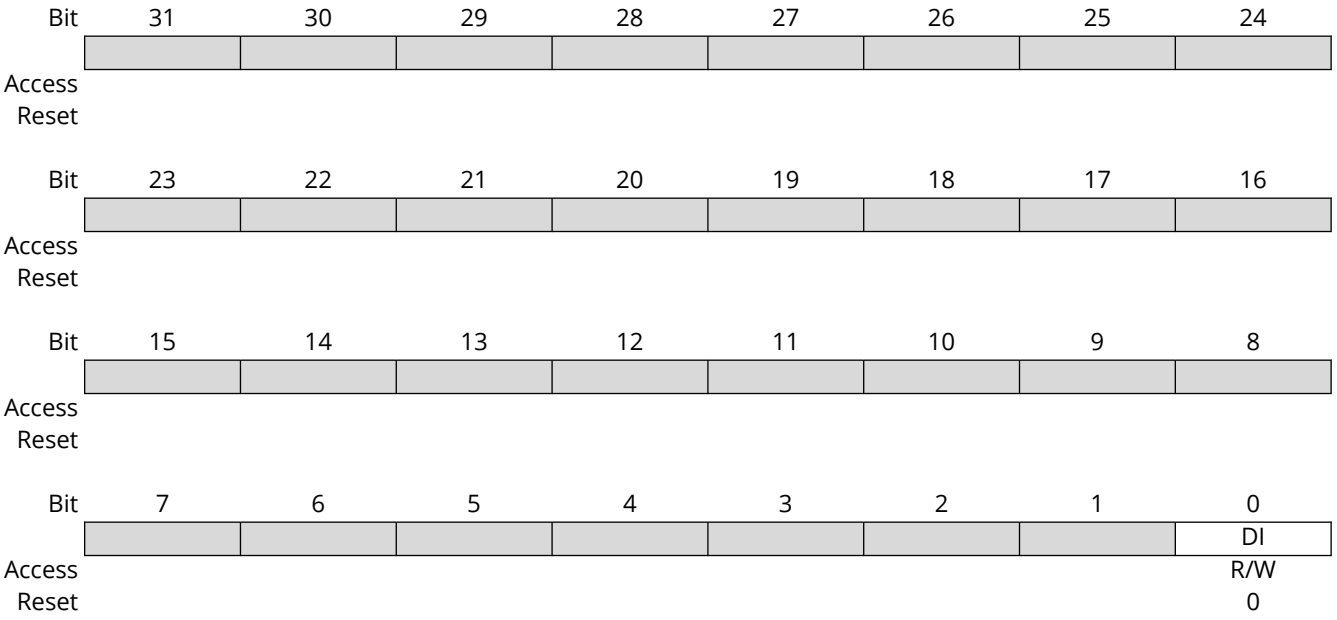
Bit 1 – OK Last Operation Achievement (cleared by writing a 1)

Bit 0 – BUSY Operation in Progress (cleared by writing a 1)

© 2026 Microchip Technology Inc. and its subsidiaries

62.6.8. PUF Data Destination Register

Name: PUF_DATA_DEST
Offset: 0x020
Reset: 0x00000000
Property: Read/Write



Bit 0 – DO Data Output on PUF_DOR

Value	Name	Description
0	DISABLED	PUF_DOR cannot be used to read data from PUF operations.
1	DO_VIA_DOR	PUF_DOR is enabled to read data from PUF operations.

© 2026 Microchip Technology Inc. and its subsidiaries

62.6.9. PUF Data Source Register

Name: PUF_DATA_SRC
Offset: 0x024
Reset: 0x00000000
Property: Read/Write

Bit 0 – DI Data Input Loaded from PUF_DIR

Value	Name	Description
0	DISABLED	PUF_DIR cannot be used to transfer data to PUF.
1	DI_VIA_DIR	PUF_DIR is enabled to load data to PUF.

© 2026 Microchip Technology Inc. and its subsidiaries

62.6.10. PUF Key Index Register

Name: PUF_KEY_INDEX
Offset: 0x028
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access

63.4. Product Dependencies

63.4.1. Clocks

All the components of this subsystem have their clocks controlled by the PMC, which is part of the system controller.

All connectivity peripherals, except the PWM controller, have a GLCK input to generate fixed baud rates, independent from the CPU frequency.

For higher timestamping accuracy, the GMAC Time Stamping Unit can be clocked from a fast generic clock (up to 400 MHz). Refer to ID67 in Peripheral Identifiers.

63.4.1.1. QSPI Features

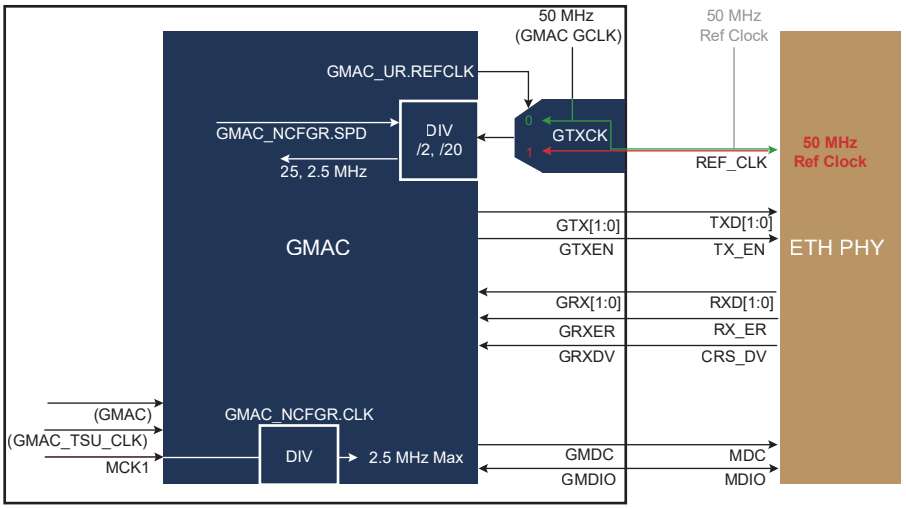
The QSPI Core peripheral is fed with the peripheral clock, or QSPI GCLK. QSPI GCLK is a 2x clock that must be programmed to twice the QSCK frequency target.

63.4.1.2. GMAC Features

- GMAC supports RGMII and RMII.
- The media interface is configured using the GMAC_UR.MIM and GMAC_NCR.MIIONRGMII bits. Each interface has a dedicated clock configuration.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 63.2. RMII MAC to PHY Connection Block Diagram



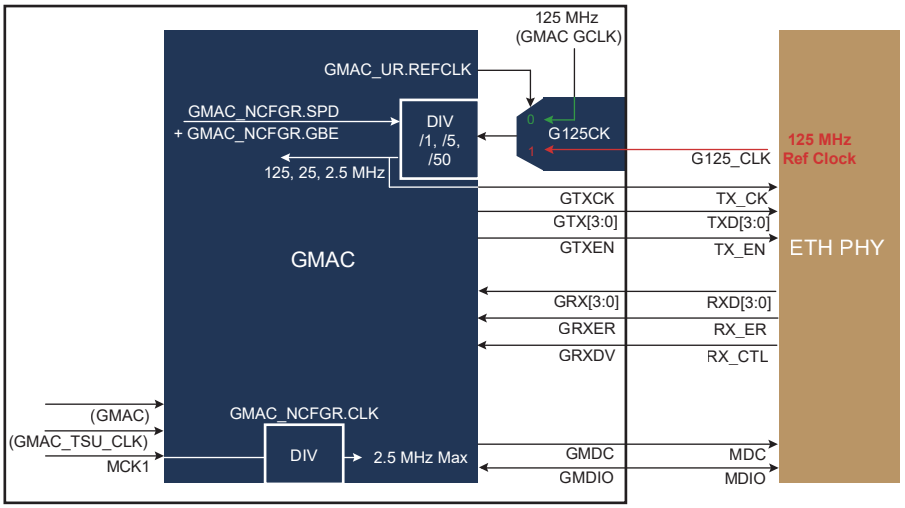


Figure 63.3. RGMII MAC to PHY Connection Block Diagram

63.4.2. Interrupts

Refer to the table Peripheral Identifiers.

63.4.3. Reset

Connectivity peripherals are connected to the processor and peripherals reset line.

63.4.4. I/Os

I/Os are multiplexed on PIOs.

For the applicable I/O type (General Purpose (GPIO) or High-Speed (HSIO)) and power supply, refer to the table Pin Description. I/O drive and slew rate configuration differs depending on the I/O type. Refer to I/O characteristics in the section Electrical Characteristics.

63.4.4.1. GMAC I/Os

For RGMII operations, G0_TXCK must be configured with the internal pull-up resistor enabled to avoid a floating line when connecting an Ethernet PHY having a high input impedance.

© 2026 Microchip Technology Inc. and its subsidiaries

The device's MAC interface complies with the RGMII v1.3 specification that requires on the TX side a typical 2 ns data-to-clock time lapse at PCB level between the transmitting port (device) and the receiving port (Ethernet PHY). In practice, it is convenient to select Ethernet PHYs that can add this 2 ns time lapse on their TXC input. As an example, Microchip KSZ9131 features an internal DLL to delay the TXC line.

63.4.4.2. QSPI I/Os

QSPI_IO2 and QSPI_IO3 have dual functions and are used as HOLD and WP in Dual and Serial I/O modes. As Quad mode is not the default mode, they need to be pulled up until Quad mode is enabled in the Configuration register. Pull-up resistors are not required for QSPI_IO0 and QSPI_IO1.

63.5. Special Functions in SFR

If a fast GMAC TSU clock is used, the GTSUCOMP pulse width can be increased using the SFR_TSU_CFG register.

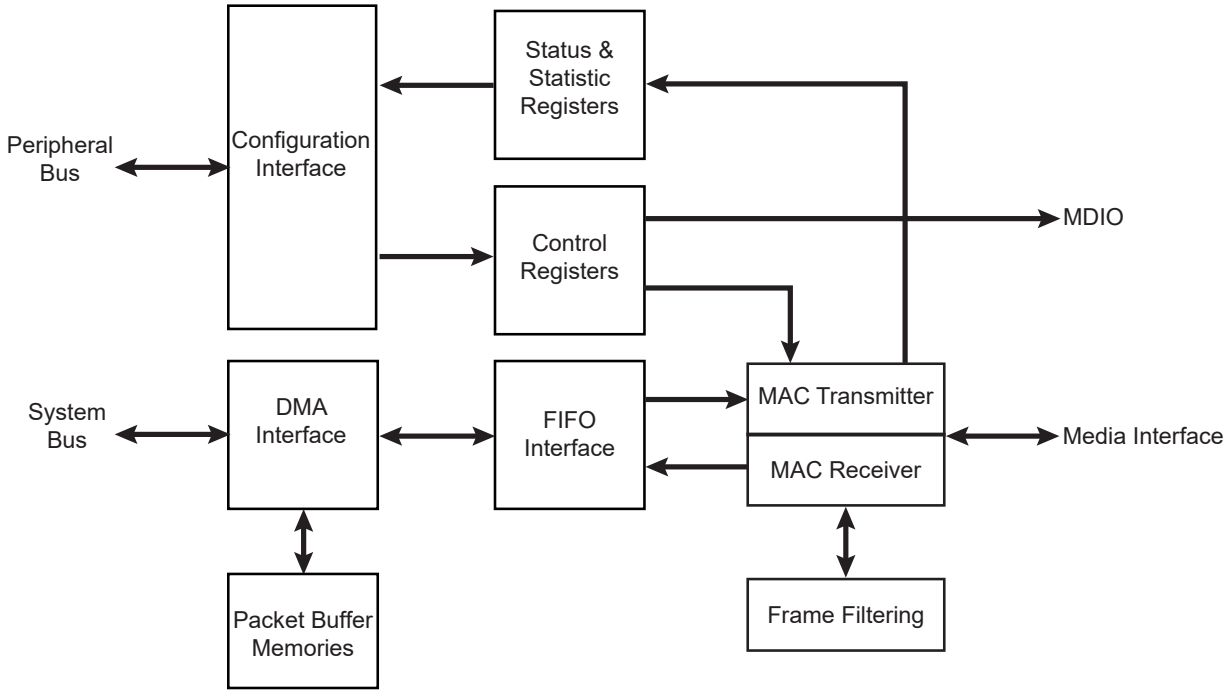
© 2026 Microchip Technology Inc. and its subsidiaries

64. Ethernet MAC (GMAC)

64.1. Description

The Gigabit Ethernet MAC (GMAC) module implements a 10/100/1000 Mbps Ethernet MAC compatible with the IEEE 802.3 standard. The GMAC can operate in either Half or Full Duplex mode at all supported speeds.

64.2. Embedded Characteristics



- Compatible with IEEE Standard 802.3
- 10, 100 and 1000 Mbps Operation
- Time-Sensitive Networking (TSN) IEEE 802.1Qbv Standard Support for Enhancement for Scheduled Traffic (EnST)
- Supports TSN IEEE 802.1CB Standard for Frame Elimination for Reliability
- Supports TSN IEEE 802.1Qci Standard for Receive (Ingress) Traffic Policy
- Supports TSN IEEE 802.3br Standard for Interspersing Express Traffic
- Supports TSN IEEE 802.1QBu Standard for Frame Preemption
- Supports 802.1Qav Traffic Shaping on Two Highest Priority Queues
- Full and Half Duplex Operation at All Supported Speeds of Operation
- Statistics Counter Registers for RMON/MIB
- RMII/RGMII Interface to the Physical Layer
- Integrated Physical Coding
- Direct Memory Access (DMA) Interface to External Memory
- Support for 6 Priority Queues
- 24 Kbytes Transmit Local Memory and 8 Kbytes Receive Local Memory (see Table 64.4 for queue-specific sizes)
- 4 Kbytes Transmit Memory and 4 Kbytes Receive Memory Dedicated to TSN Operations
- Programmable Burst Length and Endianism for DMA
- Interrupt Generation to Signal Receive and Transmit Completion, Errors or Other Events
- Automatic Pad and Cyclic Redundancy Check (CRC) Generation on Transmitted Frames
- Frame Extension and Frame Bursting at 1000 Mbps in Half Duplex Mode
- Automatic Discard of Frames Received with Errors
- Receive and Transmit IP, TCP and UDP Checksum Offload. Both IPv4 and IPv6 Packet Types Supported
- Address Checking Logic for Four Specific 48-bit Addresses, Four Type IDs, Promiscuous Mode, Hash Matching of Unicast and Multicast Destination Addresses and Wake-on-LAN
- Management Data Input/Output (MDIO) Interface for Physical Layer Management
- Support for Jumbo Frames up to 16383 Bytes
- Full Duplex Flow Control with Recognition of Incoming Pause Frames and Hardware Generation of Transmitted Pause Frames
- Half Duplex Flow Control by Forcing Collisions on Incoming Frames
- Support for 802.1Q VLAN Tagging with Recognition of Incoming VLAN and Priority Tagged Frames
- Support for 802.1Qbb Priority-based Flow Control
- Programmable Inter Packet Gap (IPG) Stretch

© 2026 Microchip Technology Inc. and its subsidiaries

- Recognition of IEEE 1588 PTP Frames
- IEEE 1588 Timestamp Unit (TSU)
- Support for 802.1AS Timing and Synchronization

64.3. Block Diagram

Figure 64.1. Block Diagram

Note: For the TSN interspersing traffic express support, see the figure Interspersing Implementation Block Diagram.

64.4. Signal Interfaces

The GMAC includes the following signal interfaces:

- Media interface supports RMII/RGMII and connects to the external PHY
- Management Data Input/Output (MDIO) connects to the external PHY for management
- Configuration interface
- System bus interface for direct memory access (DMA)
- GTSUCOMP signal for TSU timer count value comparison

Table 64.1. GMAC Connections to PHY in Different Modes

Signal Name	Function	RMII	RGMII
GTXCK	Transmit Clock or Reference Clock	REFCK	TXCK
G125CK	125 MHz Input Clock	Not Used	125 MHz Ref Clk
GTXEN	Transmit Enable	TXEN	TXCTL

Table 64.1. GMAC Connections to PHY in Different Modes (continued)

Signal Name	Function	RMII	RGMII
GRX[3:0]	Receive Data	RXD[1:0]	RXD[3:0]
GRXER	Receive Error	RXER	Not Used
GMDC	Management Data Clock	MDC	MDC
GMDIO	Management Data Input/Output	MDIO	MDIO

64.5. Product Dependencies

64.5.1. I/O Lines

The pins used for interfacing the GMAC may be multiplexed with PIO lines. The programmer must first program the PIO Controller to assign the pins to their peripheral function. If I/O lines of the GMAC are not used by the application, they can be used for other purposes by the PIO Controller.

64.5.2. Power Management

The GMAC is not continuously clocked. The user must first enable the GMAC clock in the Power Management Controller before using it.

64.5.3. Interrupt Sources

The GMAC interrupt line is connected to one of the internal sources of the interrupt controller. Using the GMAC interrupt requires prior programming of the interrupt controller.

The GMAC features 6 interrupt sources. Refer to the table “Peripheral Identifiers” in the section “Peripherals” for the interrupt numbers for GMAC priority queues.

64.6. Functional Description

64.6.1. Media Access Controller

The Media Access Controller (MAC) transmit block takes data from FIFO, adds preamble and, if necessary, pad and frame check sequence (FCS). Both Half Duplex and Full Duplex Ethernet modes of operation are supported. When operating in Half Duplex mode, the MAC transmit block generates data according to the carrier sense multiple access with collision detect (CSMA/CD) protocol. The start of transmission is deferred if carrier sense (CRS) is active. If collision (COL) becomes active during transmission, a jam sequence is asserted and the transmission is retried after a random backoff. The CRS and COL signals have no effect in Full Duplex mode. When operating in Gigabit mode half duplex, both carrier extension and frame bursting are performed in accordance with the IEEE 802.3 standard.

The MAC receive block checks for valid preamble, FCS, alignment and length, and presents received frames to the MAC address checking block and FIFO. Software can configure the GMAC to receive jumbo frames up to 16383 bytes. It can optionally strip CRC from the received frame prior to transfer to FIFO.

The address checker recognizes four specific 48-bit addresses, can recognize four different type ID values, and contains a 64-bit Hash register for matching multicast and unicast addresses as required. It can recognize the broadcast address of all ones and copy all frames. The MAC can also reject all frames that are not VLAN tagged and recognize Wake on LAN events.

The MAC receive block supports offloading of IP, TCP and UDP checksum calculations (both IPv4 and IPv6 packet types supported), and can automatically discard bad checksum frames.

The MAC replaces the timestamp field in PTP 1588 transmit sync frames to support One-Step Clock mode.

The MAC does one-step transparent clock residence time correction for PTP 1588 version 2 transmit sync frames.

© 2026 Microchip Technology Inc. and its subsidiaries

64.6.2. 1588 Timestamp Unit

The timestamp unit (TSU) consists of a timer and registers to capture the time at which PTP event frames cross the message timestamp point. An interrupt is issued when a capture register is updated.

The 1588 timestamp unit (TSU) is implemented as a 102-bit timer.

The 48 upper bits [101:54] of the timer count seconds and are accessible in the GMAC 1588 Timer Seconds High Register (GMAC_TSH) and GMAC 1588 Timer Seconds Low Register (GMAC_TSL).

The 30 lower bits [53:24] of the timer count nanoseconds and are accessible in the GMAC 1588 Timer Nanoseconds Register (GMAC_TN). The lowest 24 bits [23:0] of the timer count sub-nanoseconds and are accessible in the GMAC 1588 Timer Increment Sub-nanoseconds Register (GMAC_TISUBN).

The 54 lower bits roll over when they have counted to one second. The timer increments by a programmable period (to approximately 58.6 attoseconds resolution) with each clock period and can also be adjusted in 1 ns resolution (incremented or decremented) through APB register accesses.

The timestamp unit is clocked by GMAC_TSU_CLK. The faster this clock, the greater the timestamp accuracy.

The amount by which the timer increments each clock cycle is controlled by the Timer Increment registers (GMAC_TI).

Bits 7:0 are the default increment value in nanoseconds and an additional 24 bits of sub-nanosecond resolution are available using the Timer Increment Subnanoseconds register (GMAC_TISUBN).

If the rest of the register is written with zero, the timer increments by the value in [7:0], plus the value of GMAC_TISUBN, at each clock cycle.

GMAC_TISUBN allows a resolution of approximately 58.6 attoseconds.

Bits 15:8 of GMAC_TI is the alternative increment value in nanoseconds and bits 23:16 are the number of increments after which the alternative increment value is used. If 23:16 are zero, then the alternative increment value will never be used.

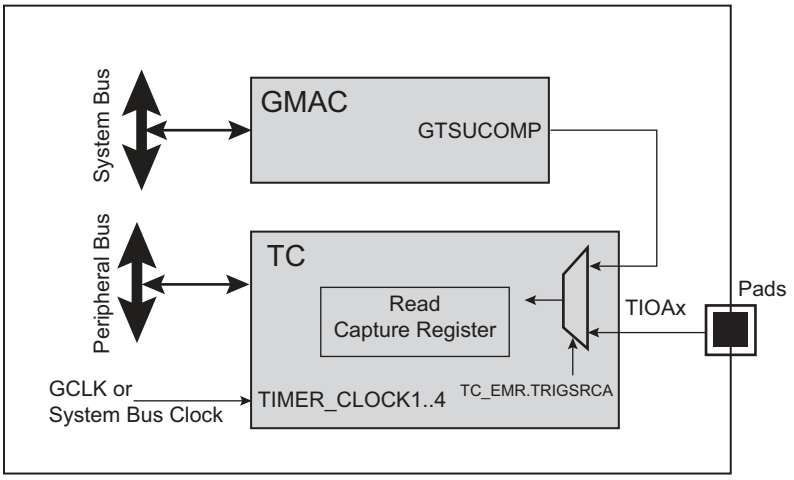
Taking the example of 10.2 MHz, there are 102 cycles every ten microseconds or 51 every five microseconds. So a timer with a 10.2 MHz clock source is constructed by incrementing by 98 ns for fifty cycles and then incrementing by 100 ns (98 × 50 + 100 = 5000). This is programmed by setting the 1588 Timer Increment register to 0x00326462.

For a 49.8 MHz clock source it would be 20 ns for 248 cycles followed by an increment of 40 ns (20 × 248 + 40 = 5000) programmed as 0x00F82814.

Having eight bits for the “number of increments” field allows frequencies up to 50 MHz to be supported with 200 kHz resolution.

Without the alternative increment field, the period of the clock would be limited to an integer number of nanoseconds, resulting in supported clock frequencies of 8, 10, 20, 25, 40, 50, 100, 125, 200 and 250 MHz.

There are additional registers that capture the time at which PTP event frames are transmitted and received. An interrupt is issued when these registers are updated. The TSU timer count value can be compared to a programmable comparison value. For the comparison, the bits of the seconds value and the upper 22 bits of the nanoseconds value are used.



An interrupt can also be generated (if enabled) when the TSU timer count value and comparison value are equal, mapped to bit 29 of the Interrupt Status register.

© 2026 Microchip Technology Inc. and its subsidiaries

A signal (GTSUCOMP) is provided to indicate when the TSU timer count value is equal to the comparison value stored in the TSU timer comparison value registers (0x0DC, 0x0E0, and 0x0E4).

The GTSUCOMP signal is internally routed to one Timer Counter. Refer to the section “Timer Counter (TC)”.

Figure 64.2. GTSUCOMP Internal Connection

64.6.3. Direct Memory Access Interface

The GMAC DMA controller is connected to the MAC FIFO interface and provides a scatter-gather type capability for packet data storage.

The DMA implements packet buffering where dual-port memories are used to buffer multiple frames.

64.6.3.1. Packet Buffer DMA

- Easier to guarantee maximum line rate due to the ability to store multiple frames in the packet buffer, where the number of frames is limited by the amount of packet buffer memory and Ethernet frame size
- Full store and forward
- Partial store and forward programmable options (partial store will cater for shorter latency requirements)
- Support for Transmit TCP/IP checksum offload
- Support for priority queuing
- When a collision on the line occurs during transmission, the packet will be automatically replayed directly from the packet buffer memory rather than having to re-fetch through the system bus (full store and forward ONLY)
- Received error packets are automatically dropped before any of the packet is presented to the system bus (full store and forward ONLY), thus reducing system bus activity
- Supports manual RX packet flush capabilities
- Optional RX packet flush when there is lack of system bus resources

64.6.3.2. Partial Store and Forward Using Packet Buffer DMA

The DMA uses local memories packet buffers, and can be programmed into a low latency mode, known as Partial Store and Forward. This allows for a reduced latency as the full packet is not buffered before forwarding. Note that this option is only available when the device is configured for full duplex operation.

© 2026 Microchip Technology Inc. and its subsidiaries

This feature is enabled via the programmable TX and RX Partial Store and Forward registers. When the transmit Partial Store and Forward mode is activated, the transmitter will only begin to forward the packet to the MAC when there is enough packet data stored in the packet buffer. Likewise, when the receive Partial Store and Forward mode is activated, the receiver will only begin to forward the packet to the system bus when enough packet data is stored in the packet buffer. The amount of packet data required to activate the forwarding process is programmable via watermark registers which are located at the same address as the partial store and forward enable bits.

Note that the minimum operational value for the TX partial store and forward watermark is 20. There is no operational limit for the RX partial store and forward watermark. Enabling partial store and forward is a useful means to reduce latency, but there are performance implications.

The GMAC DMA uses separate transmit and receive lists of buffer descriptors, with each descriptor describing a buffer area in memory. This allows Ethernet packets to be broken up and scattered around the system bus memory space.

64.6.3.3. Receive Buffers

Received frames, optionally including FCS, are written in receive buffers located in system memory. The receive buffer depth is programmable in the range of 64 bytes to 16320 bytes. If received frames are being routed to different priority queues (via the packet inspection screeners – see section Priority Queuing in the DMA), it is possible to program different receive buffer depths for each queue. For queue 0, the receive buffer depth is programmed through the DMA Configuration register (offset 0x10). For the other queues, they are programmed in the independent queue configuration registers (starting from offset 0x4a0). The default is 128 bytes.

The start location for each receive buffer is stored in system memory in a list of receive buffer descriptors at an address location pointed to by the receive buffer queue pointer. The base address for the receive buffer queue pointer is configured in software using the Receive Buffer Queue Base Address register.

The number of words in each buffer descriptor (BD) is dependent on the operating mode.

Each buffer descriptor (BD) word is defined as 32 bits.

The first two words (Word 0 and Word 1) are used for all BD modes. In Extended Buffer Descriptor modes (GMAC_DCFGR.RXDB_EXTENDED = 1), two BD words are added for 64-bit addressing mode and two BD words are added for timestamp capture.There are therefore either two, four or six BD words in each BD entry depending on the operating mode, and every BD entry has the same number of words.

To summarize:

- Every descriptor is 64 bits wide when the descriptor Timestamp Capture mode is disabled.
- Every descriptor is 128 bits wide when the descriptor Timestamp Capture mode is enabled.

The first is the address of the receive buffer and the second the receive status. If the length of a receive frame exceeds the buffer length, the status word for the used buffer is written with zeroes except for the “start of frame” bit, which is always set for the first buffer in a frame. Bit zero of the address field is written to 1 to show the buffer has been used. The receive buffer manager then reads the location of the next receive buffer and fills that with the next part of the received frame data. Receive buffers are filled until the frame is complete and the final buffer descriptor status word contains the complete frame status. See the table below for details of the receive buffer descriptor list.

Each receive buffer start location is a word address. The start of the first buffer in a frame can be offset by up to three bytes, depending on the value written to bits 14 and 15 of the Network Configuration register. If the start location of the buffer is offset, the available length of the first buffer is reduced by the corresponding number of bytes.

Table 64.2. Receive Buffer Descriptor Entry

Bit	Function
	Word 0
31:3	Address of beginning of buffer
2	Address [2] of beginning of buffer or in Extended Buffer Descriptor mode (GMAC_DCFGR.RXBD_EXTENDED = 1), indicates a valid timestamp in the BD entry.
1	Wrap—marks last descriptor in receive buffer descriptor list.
0	Ownership—needs to be zero for the GMAC to write data to the receive buffer. The GMAC sets this to one once it has successfully written a frame to memory. Software has to clear this bit before the buffer can be used again.
	Word 1
31	Global all ones broadcast address detected
30	Multicast hash match
29	Unicast hash match
28	–
27	Specific Address Register match found, bit 25 and bit 26 indicate which Specific Address Register causes the match.
26:25	Specific Address Register match. Encoded as follows: 00: Specific Address Register 1 match 01: Specific Address Register 2 match 10: Specific Address Register 3 match 11: Specific Address Register 4 match If more than one specific address is matched only one is indicated with priority 4 down to 1.
24	This bit has a different meaning depending on whether RX checksum offloading is enabled. **With RX checksum offloading disabled:** (bit 24 clear in Network Configuration Register) Type ID register match found, bit 22 and bit 23 indicate which type ID register causes the match. **With RX checksum offloading enabled:** (bit 24 set in Network Configuration Register) 0: The frame was not SNAP encoded and/or had a VLAN tag with the Canonical Format Indicator (CFI) bit set. 1: The frame was SNAP encoded and had either no VLAN tag or a VLAN tag with the CFI bit not set.
23:22	This bit has a different meaning depending on whether RX checksum offloading is enabled. **With RX checksum offloading disabled:** (bit 24 clear in Network Configuration) Type ID register match. Encoded as follows: 00: Type ID register 1 match 01: Type ID register 2 match 10: Type ID register 3 match 11: Type ID register 4 match If more than one Type ID is matched only one is indicated with priority 4 down to 1. **With RX checksum offloading enabled:** (bit 24 set in Network Configuration Register) 00: Neither the IP header checksum nor the TCP/UDP checksum was checked. 01: The IP header checksum was checked and was correct. Neither the TCP nor UDP checksum was checked. 10: Both the IP header and TCP checksum were checked and were correct. 11: Both the IP header and UDP checksum were checked and were correct.
21	VLAN tag detected—type ID of 0x8100. For packets incorporating the stacked VLAN processing feature, this bit will be set if the second VLAN tag has a type ID of 0x8100
20	Priority tag detected—type ID of 0x8100 and null VLAN identifier. For packets incorporating the stacked VLAN processing feature, this bit will be set if the second VLAN tag has a type ID of 0x8100 and a null VLAN identifier.
19:17	When bit 15 (End of frame) and bit 21 (VLAN tag) are set, these bits represent the VLAN priority. When header/data splitting is enabled (via bit 5 of the DMA configuration register, offset 0x10) bit 17 indicates this descriptor is pointing to the last buffer of the header

© 2026 Microchip Technology Inc. and its subsidiaries

Table 64.2. Receive Buffer Descriptor Entry (continued)

Bit	Function
16	This bit has a different meaning depending on the state of bit 13 (report bad FCS in bit 16 of word 1 of the receive buffer descriptor) and bit 5 (header/data splitting) of the DMA Configuration register (offset 0x10). When header/data splitting is enabled and this buffer descriptor (BD) is not the last BD of the frame (as indicated in bit 15 of this BD), this bit will indicate that the BD is pointing to a data buffer containing header bytes. When this BD is the last BD of the frame (as indicated in bit 15 of this BD), and bit 13 of the DMA configuration register is set, this bit represents FCS/CRC error. When this BD is the last BD of the frame (as indicated in bit 15 of this BD), and bit 13 of the DMA configuration register is clear, and the received frame is VLAN tagged, this bit represents the Canonical format indicator (CFI).
15	End of frame—when set the buffer contains the end of a frame. If end of frame is not set, then the only valid status bit (unless header/data splitting is enabled) is start of frame (bit 14). If header/data splitting is enabled, then bits 16 and 17 are also valid status bits when this bit is not set.
14	Start of frame—when set the buffer contains the start of a frame. If both bits 15 and 14 are set, the buffer contains a whole frame.
13	This bit has a different meaning depending on whether jumbo frames and ignore FCS modes are enabled. If neither mode is enabled this bit will be zero. **With jumbo frame mode enabled:** (bit 3 set in Network Configuration Register) Additional bit for length of frame (bit[13]), that is concatenated with bits[12:0] **With ignore FCS mode enabled and jumbo frames disabled:** (bit 26 set in Network Configuration Register and bit 3 clear in Network Configuration Register) This indicates per frame FCS status as follows: 0: Frame had good FCS 1: Frame had bad FCS, but was copied to memory as ignore FCS enabled.
12:0	When header/data splitting enabled (via bit 5 of the DMA Configuration register, offset 0x10) and bit 17 is set (last buffer of header), these bits represent the length of the header in bytes. When bit 15 (End of frame) is set, these bits represent the length of the received frame which may or may not include FCS depending on whether FCS Discard mode is enabled. **With FCS Discard mode disabled** (bit 17 clear in Network Configuration register) Least significant 12-bits for length of frame including FCS. If jumbo frames are enabled, these 12-bits are concatenated with bit[13] of the descriptor above. **With FCS Discard mode enabled:** (bit 17 set in Network Configuration register) Least significant 12-bits for length of frame excluding FCS. If jumbo frames are enabled, these 12-bits are concatenated with bit[13] of the descriptor above.
Word 2	
31:30	Timestamp seconds[1:0] (see Note)
29:0	Timestamp nanoseconds[29:0] (see Note)
Word 3	
31:10	Reserved
9:0	Timestamp seconds[11:2] (see Note)

Note: For details on how to configure Timestamp mode, see GMAC Receive Buffer Data Control Register. The timestamp bits are written back to the last buffer descriptor of a frame only.

To receive frames, the buffer descriptors must be initialized by writing an appropriate address to bits 31:2 in the first word of each list entry. Bit 0 must be written with zero. Bit 1 is the wrap bit and indicates the last entry in the buffer descriptor list.

The start location of the receive buffer descriptor list must be written with the receive buffer queue base address before reception is enabled (receive enable in the Network Control register). Once reception is enabled, any writes to the Receive Buffer Queue Base Address register are ignored. When read, it will return the current pointer position in the descriptor list, though this is only valid and stable when receive is disabled.

If the filter block indicates that a frame should be copied to memory, the receive data DMA operation starts writing data into the receive buffer. If an error occurs, the buffer is recovered.

© 2026 Microchip Technology Inc. and its subsidiaries

The receive buffer queue pointer increments by two words after each buffer has been used. It re-initializes to the receive buffer queue base address if any descriptor has its wrap bit set.

As receive buffers are used, the receive buffer manager sets bit zero of the first word of the descriptor to logic one indicating the buffer has been used.

Software should search through the “used” bits in the buffer descriptors to find out how many frames have been received, checking the start of frame and end of frame bits.

When the DMA is configured in the packet buffer Partial Store And Forward mode, received frames are written out to the system bus buffers as soon as enough frame data exists in the packet buffer. For both cases, this may mean several full system bus buffers are used before some error conditions can be detected. If a receive error is detected the receive buffer currently being written will be recovered. Previous buffers will not be recovered. As an example, when receiving frames with cyclic redundancy check (CRC) errors or excessive length, it is possible that a frame fragment might be stored in a sequence of receive buffers. Software can detect this by looking for start of frame bit set in a buffer following a buffer with no end of frame bit set.

To function properly, a 10/100/1000 Ethernet system should have no excessive length frames or frames greater than 128 bytes with CRC errors. Collision fragments will be less than 128 bytes long, therefore it will be a rare occurrence to find a frame fragment in a receive buffer, when using the default value of 128 bytes for the receive buffers size.

When in packet buffer Full Store and Forward mode, only good received frames are written out of the DMA, so no fragments will exist in the system memory buffers due to MAC receiver errors. There is still the possibility of fragments due to DMA errors, for example used bit read on the second buffer of a multi-buffer frame.

If bit zero of the receive buffer descriptor is already set when the receive buffer manager reads the location of the receive buffer, then the buffer has been already used and cannot be used again until software has processed the frame and cleared bit zero. In this case, the “buffer not available” bit in the Receive Status register is set and an interrupt triggered. The Receive Resource Error statistics register is also incremented.

When the DMA is configured in the packet buffer Full Store and Forward mode, the user can optionally select whether received frames should be automatically discarded when no system bus buffer resource is available. This feature is selected via bit 24 of the DMA Configuration register (by default, the received frames are not automatically discarded). If this feature is off, then received packets will remain to be stored in the GMAC local memory packet buffer until the system memory buffer resource next becomes available. This may lead to an eventual packet buffer overflow if packets continue to be received when bit zero (used bit) of the receive buffer descriptor remains set. Note that after a used bit has been read, the receive buffer manager will re-read the location of the receive buffer descriptor every time a new packet is received. When the DMA is not configured in the packet buffer Full Store and Forward mode and a used bit is read, the frame currently being received will be automatically discarded.

When the DMA is configured in the packet buffer Full Store and Forward mode, a receive overrun condition occurs when the receive GMAC local memory packet buffer is full, or because the system bus returns an error. In all other modes, a receive overrun condition occurs when either the system bus was not granted quickly enough, or because of a system bus error, or because a new frame has been detected by the receive block, but the status update or write back for the previous frame has not yet finished. For a receive overrun condition, the receive overrun interrupt is asserted and the buffer currently being written is recovered. The next frame that is received whose address is recognized reuses the buffer.

In any packet buffer mode, a write to bit 18 of GMAC_NCR forces a packet from the external SRAM-based receive packet buffer to be flushed. This feature is only acted upon when the DMA receive channel is not currently writing packet data out to system bus. If the DMA receive channel is active, a write to this bit is ignored.

64.6.3.4.Transmit Buffers

Frames to transmit are stored in one or more transmit buffers located in system memory. Transmit frames can be between 1 and 16384 bytes long, so it is possible to transmit frames longer than the maximum length specified in the IEEE 802.3 standard. It should be noted that zero length buffers are allowed and that the maximum number of buffers permitted for each transmit frame is 128.

The start location for each transmit buffer is stored in memory in a list of transmit buffer descriptors at a location pointed to by the transmit buffer queue pointer. The base address for this queue pointer is set in software using the Transmit Buffer Queue Base Address register.

Each list entry consists of two words.

The number of words in each buffer descriptor (BD) depends on the operating mode.

Each BD word is defined as 32 bits. The first two words (Word 0 and Word 1) are used for all BD modes.

In Extended Buffer Descriptor modes, two BD words are added for timestamp capture. Thus there are either two or four BD words in each BD entry depending on the operating mode, and every BD entry has the same number of words.

To summarize:

- Each descriptor is 64 bits wide when the descriptor timestamp Capture mode is disabled.
- Each descriptor is 128 bits wide when the descriptor timestamp Capture mode is enabled.

The first is the byte address of the transmit buffer and the second containing the transmit control and status. For the packet buffer DMA, the start location for each transmit buffer is a byte address, the bottom bits of the address being used to offset the start of the data from the data-word boundary (i.e., bits 2,1 and 0 are used to offset the address for 64-bit datapaths).

Frames can be transmitted with or without automatic CRC generation. If CRC is automatically generated, pad will also be automatically generated to take frames to a minimum length of 64 bytes. When CRC is not automatically generated (as defined in word 1 of the transmit buffer descriptor), the frame is assumed to be at least 64 bytes long and pad is not generated.

An entry in the transmit buffer descriptor list is described in the table below.

To transmit frames, the buffer descriptors must be initialized by writing an appropriate byte address to bits [31:0] in the first word of each descriptor list entry.

The second word of the transmit buffer descriptor is initialized with control information that indicates the length of the frame, whether or not the MAC is to append CRC and whether the buffer is the last buffer in the frame.

After transmission the status bits are written back to the second word of the first buffer along with the used bit. Bit 31 is the used bit which must be zero when the control word is read if transmission is to take place. It is written to one once the frame has been transmitted. Bits[29:20] indicate various transmit error conditions. Bit 30 is the wrap bit which can be set for any buffer within a frame. If no wrap bit is encountered the queue pointer continues to increment.

The Transmit Buffer Queue Base Address register can only be updated while transmission is disabled or halted; otherwise any attempted write will be ignored. When transmission is halted the transmit buffer queue pointer will maintain its value. Therefore when transmission is restarted the next descriptor read from the queue will be from immediately after the last successfully transmitted frame. while transmit is disabled (bit 3 of the Network Control register set low), the transmit buffer queue pointer resets to point to the address indicated by the Transmit Buffer Queue Base Address register. Note that disabling receive does not have the same effect on the receive buffer queue pointer.

Once the transmit queue is initialized, transmit is activated by writing to the transmit start bit (bit 9) of the Network Control register. Transmit is halted when a buffer descriptor with its used bit set is

© 2026 Microchip Technology Inc. and its subsidiaries

read, a transmit error occurs, or by writing to the transmit halt bit of the Network Control register. Transmission is suspended if a pause frame is received while the pause enable bit is set in the Network Configuration register. Rewriting the start bit while transmission is active is allowed. This is implemented with TXGO variable which is readable in the Transmit Status register at bit location 3. The TXGO variable is reset when:

- Transmit is disabled.
- A buffer descriptor with its ownership bit set is read.
- Bit 10, THALT, of the Network Control register is written.
- There is a transmit error such as too many retries, late collision (Gigabit mode only) or a transmit underrun.

To set TXGO, write TSTART to the bit 9 of the Network Control register. Transmit halt does not take effect until any ongoing transmit finishes.

If the DMA is configured for packet buffer Partial Store and Forward mode and a collision occurs during transmission of a multi-buffer frame, transmission will automatically restart from the first buffer of the frame. For packet buffer mode, the entire contents of the frame are read into the transmit packet buffer memory, so the retry attempt will be replayed directly from the packet buffer memory rather than having to re-fetch through the system bus.

If a used bit is read midway through transmission of a multi-buffer frame, this is treated as a transmit error. Transmission stops, GTXER is asserted and the FCS will be bad.

If transmission stops due to a transmit error or a used bit being read, transmission restarts from the first buffer descriptor of the frame being transmitted when the transmit start bit is rewritten.

Table 64.3. Transmit Buffer Descriptor Entry

Bit	Function
	Word 0
31:0	Byte address of buffer
	Word 1
31	Used—must be zero for the GMAC to read data to the transmit buffer. The GMAC sets this to one for the first buffer of a frame once it has been successfully transmitted. Software must clear this bit before the buffer can be used again.
30	Wrap—marks last descriptor in transmit buffer descriptor list. This can be set for any buffer within the frame.
29	Retry limit exceeded, transmit error detected
28	Reserved.
27	Transmit frame corruption due to system bus error—set if an error occurs while midway through reading transmit frame from the system bus, including system bus errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and GTXER asserted). Also set if single frame is too large for configured packet buffer memory size.
26	Late collision, transmit error detected. Late collisions only force this status bit to be set in Gigabit mode.
25:24	Reserved
23	For Extended Buffer Descriptor mode, this bit indicates a timestamp has been captured in the BD. Otherwise Reserved.

© 2026 Microchip Technology Inc. and its subsidiaries

Table 64.3. Transmit Buffer Descriptor Entry (continued)

Bit	Function
22:20	Transmit IP/TCP/UDP checksum generation offload errors: 000: No Error. 001: The Packet was identified as a VLAN type, but the header was not fully complete, or had an error in it. 010: The Packet was identified as a SNAP type, but the header was not fully complete, or had an error in it. 011: The Packet was not of an IP type, or the IP packet was invalidly short, or the IP was not of type IPv4/IPv6. 100: The Packet was not identified as VLAN, SNAP or IP. 101: Non supported packet fragmentation occurred. For IPv4 packets, the IP checksum was generated and inserted. 110: Packet type detected was not TCP or UDP. TCP/UDP checksum was therefore not generated. For IPv4 packets, the IP checksum was generated and inserted. 111: A premature end of packet was detected and the TCP/UDP checksum could not be generated.
19:17	Reserved
16	No CRC to be appended by MAC. When set, this implies that the data in the buffers already contains a valid CRC, hence no CRC or padding is to be appended to the current frame by the MAC. This control bit must be set for the first buffer in a frame and will be ignored for the subsequent buffers of a frame. Note that this bit must be clear when using the transmit IP/TCP/UDP checksum generation offload, otherwise checksum generation and substitution will not occur.
15	Last buffer, when set this bit will indicate the last buffer in the current frame has been reached.
14	Reserved
13:0	Length of buffer
	Word 2
31:30	Timestamp seconds[1:0]
29:0	Timestamp nanoseconds[29:0]
	Word 3
31:10	Reserved
9:0	Timestamp seconds[11:2]

64.6.3.5. DMA Bursting on the System Bus

When performing data transfers, the system bus burst length used can be programmed using bits 4:0 of the DMA Configuration register.

When there is enough space and enough data to be transferred, the programmed fixed length bursts will be used. If there is not enough data or space available, for example when at the beginning or the end of a buffer, single type accesses are used.

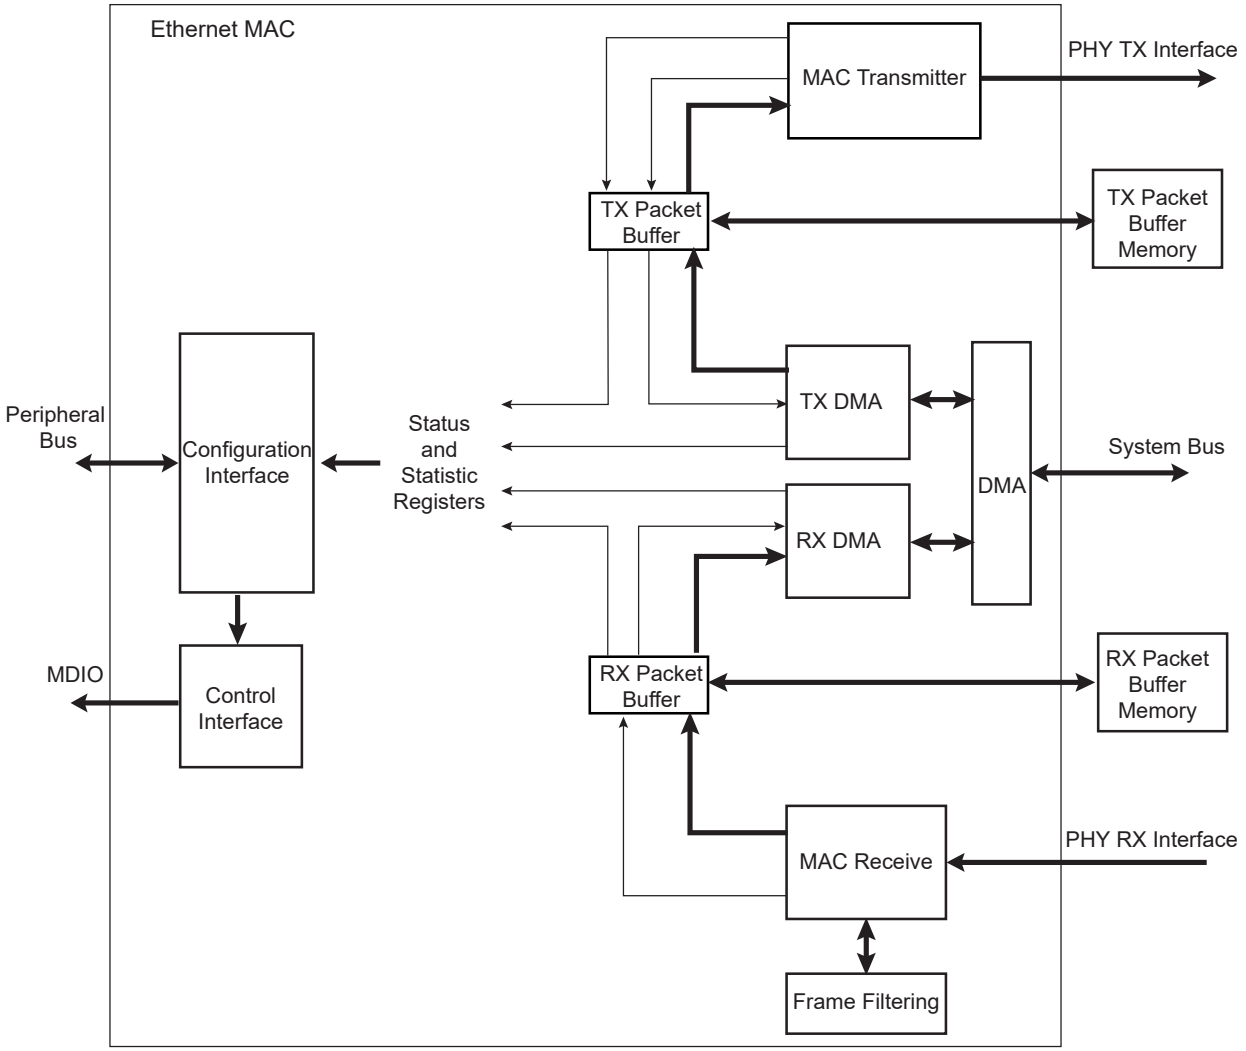
The DMA will not terminate a fixed length burst early, unless an error condition occurs on the system bus or if receive or transmit are disabled in the Network Control register.

64.6.3.6. DMA Packet Buffer

The DMA uses packet buffers for both transmit and receive paths. This mode allows multiple packets to be buffered in both transmit and receive directions. This allows the DMA to withstand far greater access latencies on the system bus and make more efficient use of the system bus bandwidth. There are two modes of operation—Full Store and Forward and Partial Store and Forward.

As described in section Partial Store and Forward Using Packet Buffer DMA, the DMA can be programmed into a low latency mode, known as Partial Store and Forward.

When the DMA is in Full Store and Forward mode, Full packet buffering provides the possibility to:



- Discard packets with error on the receive path before they are partially written out of the DMA, thus saving system bus bandwidth and driver processing overhead,,
- Retry collided transmit frames from the buffer, thus saving system bus bandwidth,

© 2026 Microchip Technology Inc. and its subsidiaries

- Implement transmit IP/TCP/UDP checksum generation offload.

With the packet buffers included, the structure of the GMAC data paths is shown in the figure below.

Figure 64.3. Data Paths with Packet Buffers Included

64.6.3.7.Transmit Packet Buffer

The transmitter packet buffer will continue attempting to fetch frame data from the system memory until the packet buffer itself is full, at which point it will attempt to maintain its full level.

To accommodate the status and statistics associated with each frame, three words per packet (or two if the GMAC is configured in 64-bit Datapath mode) are reserved at the end of the packet data. If the packet is bad and requires to be dropped, the status and statistics are the only information held on that packet. Storing the status in the packet buffer memory is required in order to decouple the DMA interface of the buffer from the MAC interface, to update the MAC status/statistics and to generate interrupts in the order in which the packets that they represent were fetched from the system memory.

If any errors occur on the system bus while reading the transmit frame, the fetching of packet data from system memory is halted. The MAC transmitter continues to fetch packet data, thereby emptying the packet buffer and allowing any good non-errored frames to be transmitted successfully. Once these have been fully transmitted, the status/statistics for the errored frame will

© 2026 Microchip Technology Inc. and its subsidiaries

be updated and software will be informed via an interrupt that a system error occurred. This way, the error is reported in the correct packet order.

The transmit packet buffer will only attempt to read more frame data from the system bus when space is available in the packet buffer memory. If space is not available it must wait until the a packet fetched by the MAC completes transmission and is subsequently removed from the packet buffer memory. Note that if Full Store and Forward mode is active and if a single frame is fetched that is too large for the packet buffer memory, the frame is flushed and the DMA halted with an error status. This is because a complete frame must be written into the packet buffer before transmission can begin, and therefore the minimum packet buffer memory size should be chosen to satisfy the maximum frame to be transmitted in the application.

In Full Store and Forward mode, once the complete transmit frame is written into the packet buffer memory, a trigger is sent across to the MAC transmitter, which will then begin reading the frame from the packet buffer memory. Since the whole frame is present and stable in the packet buffer memory, an underflow of the transmitter is not possible. The frame is kept in the packet buffer until notification is received from the MAC that the frame data has either been successfully transmitted or can no longer be retransmitted (too many retries in half duplex mode). When this notification is received, the frame is flushed from memory to make room for a new frame to be fetched from the system memory.

In Partial Store and Forward mode, a trigger is sent across to the MAC transmitter as soon as sufficient packet data is available, which will then begin fetching the frame from the packet buffer memory. If, after this point, the MAC transmitter is able to fetch data from the packet buffer faster than the DMA can fill it, an underflow of the transmitter is possible. In this case, the transmission is terminated early, and the packet buffer is completely flushed. Transmission can only be restarted by writing to the transmit START bit.

In Half Duplex mode, the frame is kept in the packet buffer until notification is received from the MAC that the frame data has either been successfully transmitted or can no longer be retransmitted (too many retries in Half Duplex mode). When this notification is received, the frame is flushed from memory to make room for a new frame to be fetched from system memory.

In Full Duplex mode, the frame is removed from the packet buffer on the fly.

Other than underflow, the only MAC related errors that can occur are due to collisions during half duplex transmissions. When a collision occurs the frame still exists in the packet buffer memory so can be retried directly from there. Only once the MAC transmitter has failed to transmit after sixteen attempts is the frame finally flushed from the packet buffer.

64.6.3.8. Receive Packet Buffer

The receive packet buffer stores frames from the MAC receiver along with their status and statistics. Frames with errors are flushed from the packet buffer memory, while good frames are pushed onto the DMA interface.

The receiver packet buffer monitors the FIFO write interface from the MAC receiver and translates the FIFO pushes into packet buffer writes. At the end of the received frame the status and statistics are buffered so that the information can be used when the frame is read out. When programmed in full store and forward mode, if the frame has an error the frame data is immediately flushed from the packet buffer memory allowing subsequent frames to utilise the freed up space. The status and statistics for bad frames are still used to update the GMAC registers.

To accommodate the status and statistics associated with each frame, three words per packet are reserved at the end of the packet data. If the packet is bad and requires to be dropped, the status and statistics are the only information held on that packet.

The receiver packet buffer will also detect a full condition so that an overflow condition can be detected. If this occurs, subsequent packets are dropped and a receive overflow interrupt is raised.

© 2026 Microchip Technology Inc. and its subsidiaries

For Full Store and Forward, the DMA only begins packet fetches once the status and statistics for a frame are available. If the frame has a bad status due to a frame error, the status and statistics are passed on to the GMAC registers. If the frame has a good status, the information is used to read the frame from the packet buffer memory and burst onto the system bus using the DMA buffer management protocol. Once the last frame data has been transferred to the packet buffer, the status and statistics are updated to the GMAC registers.

If Partial Store and Forward mode is active, the DMA begins fetching the packet data before the status is available. As soon as the status becomes available, the DMA fetches this information as soon as possible before continuing to fetch the remainder of the frame. Once the last frame data has been transferred to the packet buffer, the status and statistics are updated to the GMAC registers.

64.6.3.9. Priority Queueing in the DMA

The DMA by default uses a single transmit and receive queue. This means the list of transmit/receive buffer descriptors point to data buffers associated with a single transmit/receive data stream. The GMAC can select up to 6 priority queues. Each queue has an independent list of buffer descriptors pointing to separate data streams.

The table below shows the memory size associated with each queue:

Table 64.4. Queue Size

Queue Number	Queue Size
5 (highest priority)	4 Kb
4	4 Kb
3	4 Kb
2	4 Kb
1	4 Kb
0 (lowest priority)	4 Kb

In the transmit direction, higher priority queues are always serviced before lower priority queues, with Q0 as lowest priority and Q5 as highest priority. This strict priority scheme requires the user to ensure that high priority traffic is constrained so that lower priority traffic will have required bandwidth. The GMAC DMA will determine the next queue to service by initiating a sequence of buffer descriptor reads interrogating the ownership bits of each. The buffer descriptor corresponding to the highest priority queue is read first. As an example, if the ownership bit of this descriptor is set, then the DMA will progress to reading the 2nd highest priority queue's descriptor. If that ownership bit read of this lower priority queue is set, then the DMA will read the 3rd highest priority queue's descriptor. If all the descriptors return an ownership bit set, then a resource error has occurred, an interrupt is generated and transmission is automatically halted. Transmission can only be restarted by setting the START bit in the Network Control register. The GMAC DMA will need to identify the highest available queue to transmit from when the START bit in the Network Control register is written to and the TX is in a halted state, or when the last word of any packet has been fetched from system memory.

The GMAC transmit DMA maximizes the effectiveness of priority queuing by ensuring that high priority traffic be transmitted as early as possible after being fetched from the system bus. High priority traffic fetched from the system bus is pushed to the MAC layer, depending on traffic shaping being enabled and the associated credit value for that queue, before any lower priority traffic that may pre-exist in the transmit SRAM-based packet buffer. This is achieved by separating the transmit GMAC local memory packet buffer into regions, one region per queue. The size of each region determines the amount of memory space allocated per queue.

For each queue, there is an associated Transmit Buffer Queue Base Address register. For the lowest priority queue (or the only queue when only one queue is selected), the Transmit Buffer Queue Base

© 2026 Microchip Technology Inc. and its subsidiaries

Address is located at address 0x1C. For all other queues, the Transmit Buffer Queue Base Address registers are located at sequential addresses starting at address 0x440.

In the receive direction each packet is written to system memory data buffers in the order that it is received. For each queue, there is an independent set of receive buffers for each queue. There is therefore a separate Receive Buffer Queue Base Address register for each queue. For the lowest priority queue (or the only queue when only one queue is selected), the Receive Buffer Queue Base Address is located at address 0x18. For all other queues, the Receive Buffer Queue Base Address registers are located at sequential addresses starting at address 0x480. Every received packet will pass through a programmable screening algorithm which will allocate a particular queue to that frame. The user interface to the screeners is through two types of programmable registers:

- Screening Type 1 registers—The module features 4 Screening Type 1 registers (GMAC_ST1RPQ). Screening Type 1 registers hold values to match against specific IP and UDP fields of the received frames. The fields matched against are DS (Differentiated Services field of IPv4 frames), TC (Traffic class field of IPv6 frames) and/or the UDP destination port.
- Screening Type 2 registers—The module features 8 Screening Type 2 registers (GMAC_ST2RPQ). Screening Type 2 registers operate independently of Screening Type 1 registers and offer additional match capabilities. Screening Type 2 allows a screen to be configured that is the combination of all or any of the following comparisons:

1. An enable bit VLAN priority, VLANE. A VLAN priority match will be performed if the VLAN priority enable is set. The extracted priority field in the VLAN header is compared against VLANP in the GMAC_ST2RPQ register itself.
2. An enable bit EtherType, ETHE. The EtherType field I2ETH in GMAC_ST2RPQ maps to one of 4 EtherType match registers, GMAC_ST2ER. The extracted EtherType is compared against GMAC_ST2ER designated by this EtherType field.
3. An enable bit Compare A, COMPAE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC_ST2CW0R/1R.
4. An enable bit Compare B, COMPBE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC_ST2CW0R/1R.
5. An enable bit Compare C, COMPCE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC_ST2CW0R/1R.

Each screener type has an enable bit, a match pattern and a queue number. If a received frame matches on an enabled Screening register, then the frame will be tagged with the queue value in the associated Screening register, and forwarded onto the DMA and subsequently into the external memory associated with that queue. If two screeners are matched, then the one which resides at the lowest register address will take priority so care must be taken on the selection of the screener location.

When the priority queuing feature is enabled, the number of interrupt outputs from the GMAC core is increased to match the number of supported queues. The number of Interrupt Status registers is increased by the same number. Only DMA related events are reported using the individual interrupt outputs, as the GMAC can relate these events to specific queues. All other events generated within the GMAC are reported in the interrupt associated with the lowest priority queue. For the lowest priority queue (or the only queue when only 1 queue is selected), the Interrupt Status register is located at address 0x24. For all other queues, the Interrupt Status register is located at sequential addresses starting at address 0x400.

Note: The address matching is the first level of filtering. If there is a match, the screeners are the next level of filtering for routing the data to the appropriate queue. See MAC Filtering Block for more details.

The additional screening done by the functions Compare A, B, and C each have an enable bit and compare register field. COMPA, COMPB and COMPC in GMAC_ST2RPQ are pointers to a configured offset (OFFSVAL), value (COMPVAL), and mask (MASKVAL). If enabled, the compare is true if the

© 2026 Microchip Technology Inc. and its subsidiaries

data at the offset into the frame, ANDed with MASKVAL, is equal to the value of COMPVAL ANDed with MASKVAL. A 16-bit word comparison is done. The byte at the offset number of bytes from the index start is compared to bits 7:0 of the configured COMPVAL and MASKVAL. The byte at the offset number of bytes + 1 from the index start is compared to bits 15:8 of the configured COMPVAL and MASKVAL.

The offset value in bytes, OFFSVAL, ranges from 0 to 127 bytes from either the start of the frame, the byte after the EtherType field, the byte after the IP header (IPv4 or IPv6) or the byte after the TCP/UDP header. Note the logic to decode the IP header or the TCP/UDP header is reused from the TCP/UDP/IP checksum offload logic and therefore has the same restrictions on use (the main limitation is that IP fragmentation is not supported). Refer to the Checksum Offload for IP, TCP and UDP section of this documentation for further details.

Compare A, B, and C use a common set of 24 GMAC_ST2CW0R/1R registers, thus all COMPA, COMPB and COMPC fields in the registers GMAC_ST2RPQ point to a single pool of 24 GMAC_ST2CW0R/1R registers.

Note that Compare A, B and C together allow matching against an arbitrary 48 bits of data and so can be used to match against a MAC address.

All enabled comparisons are ANDed together to form the overall type 2 screening match.

64.6.4. MAC Transmit Block

The MAC transmitter can operate in either Half Duplex or Full Duplex mode and transmits frames in accordance with the Ethernet IEEE 802.3 standard. In Half Duplex mode, the CSMA/CD protocol of the IEEE 802.3 specification is followed.

A small input buffer receives data through the FIFO interface which will extract data in 32-bit form. All subsequent processing prior to the final output is performed in bytes.

Transmit data can be output using the RMII/RGMII interface.

Frame assembly starts by adding preamble and the start frame delimiter. Data is taken from the transmit FIFO interface a word at a time.

If necessary, padding is added to take the frame length to 60 bytes. CRC is calculated using an order 32-bit polynomial. This is inverted and appended to the end of the frame taking the frame length to a minimum of 64 bytes. If the no CRC bit is set in the second word of the last buffer descriptor of a transmit frame, neither pad nor CRC are appended. The no CRC bit can also be set through the FIFO interface.

In Full Duplex mode (at all data rates), frames are transmitted immediately. Back to back frames are transmitted at least 96 bit times apart to guarantee the interframe gap.

In Half Duplex mode, the transmitter checks carrier sense. If asserted, the transmitter waits for the signal to become inactive, and then starts transmission after the interframe gap of 96 bit times. If the collision signal is asserted during transmission, the transmitter will transmit a jam sequence of 32 bits taken from the data register and then retry transmission after the backoff time has elapsed. If the collision occurs during either the preamble or Start Frame Delimiter (SFD), then these fields will be completed prior to generation of the jam sequence.

The backoff time is based on an XOR of the 10 least significant bits of the data coming from the transmit FIFO interface and a 10-bit pseudo random number generator. The number of bits used depends on the number of collisions seen. After the first collision 1 bit is used, then the second 2 bits and so on up to the maximum of 10 bits. All 10 bits are used above ten collisions. An error will be indicated and no further attempts will be made if 16 consecutive attempts cause collision. This operation is compliant with the description in Clause 4.2.3.2.5 of the IEEE 802.3 standard which refers to the truncated binary exponential backoff algorithm.

In 10/100 mode, both collisions and late collisions are treated identically, and backoff and retry will be performed up to 16 times. When operating in Gigabit mode, late collisions are treated as

© 2026 Microchip Technology Inc. and its subsidiaries

an exception and transmission is aborted, without retry. This condition is reported in the transmit buffer descriptor word 1 (late collision, bit 26) and also in the Transmit Status register (late collision, bit 7). An interrupt can also be generated (if enabled) when this exception occurs, and bit 5 in the Interrupt Status register will be set.

When operating in Gigabit mode (half duplex) both carrier extension and frame bursting are performed in accordance with the IEEE 802.3 standard. For frames less than 512 bytes carrier extension is used to ensure the minimum slot time is not violated.

Frame bursting is used by the transmitter in Gigabit mode (half duplex) when more than one frame is queued for transmission. The first frame of a burst must be carrier extended (if necessary) to ensure the minimum slot time of 512 bytes is achieved, after which all subsequent frames within the burst must only satisfy the minimum frame length of 64 bytes or greater. Each interframe gap within the burst is filled by the transmitter with carrier extensions, thus ensuring control of the medium is not given up. Several frames may be transmitted up to the burst limit of 65,536 bytes. The transmitter relinquishes control of the medium when there are no more frames queued for transmission or the burst limit is exceeded.

In Gigabit mode any collisions occurring after the minimum slot time for the first frame within a burst are treated as a late collision. The burst is terminated upon this event.

In all modes of operation, if the transmit DMA underruns, a bad CRC is automatically appended using the same mechanism as jam insertion and the GTXER signal is asserted. For a properly configured system this should never occur ; it is also impossible if configured to use the DMA with packet buffers, as the complete frame is buffered in local packet buffer memory.

When bit 28 is set in the Network Configuration register, the Inter Packet Gap (IPG) may be stretched beyond 96 bits depending on the length of the previously transmitted frame and the value written to the IPG Stretch register (GMAC_IPGS). The least significant 8 bits of the IPG Stretch register multiply the previous frame length (including preamble). The next significant 8 bits (+1 so as not to get a divide by zero) divide the frame length to generate the IPG. IPG stretch only works in Full Duplex mode and when bit 28 is set in the Network Configuration register. The IPG Stretch register cannot be used to shrink the IPG below 96 bits.

64.6.5. Transmit Scheduling Algorithm

64.6.5.1. Introduction

The transmit scheduler is responsible for selecting the next queue to be serviced. One of the algorithms can be configured for each queue.

64.6.5.2. 802.1Qav Support - Credit-based Shaping

A credit-based shaping algorithm is available on the two highest priority queues and is defined in the standard 802.1Qav: Forwarding and Queuing Enhancements for Time-Sensitive Streams. This allows traffic on these queues to be limited and to allow other queues to transmit.

Traffic shaping is enabled via the CBS (Credit Based Shaping) Control register. This enables a counter which stores the amount of transmit 'credit', measured in bytes that a particular queue has. A queue may only transmit if it has non-negative credit. If a queue has data to send, but is held off from doing as another queue is transmitting, then credit will accumulate in the credit counter at the rate defined in the IdleSlope register (GMAC_CBSISQx) for that queue.

portTransmitRate is the transmission rate, in bits per second, that the underlying MAC service that supports transmission through the Port provides. The value of this parameter is determined by the operation of the MAC.

IdleSlope is the rate of change of increasing credit when waiting to transmit and must be less than the value of the portTransmitRate.

The max value of IdleSlope (or sendSlope) is (portTransmitRate / bits_per_MII_Clock).

In case of 100Mbps, maximum IdleSlope = (100Mbps / 4) = 0x17D7840.

© 2026 Microchip Technology Inc. and its subsidiaries

When this queue is transmitting, the credit counter is decremented at the rate of sendSlope, which is defined as (portTransmitRate - IdleSlope). A queue can accumulate negative credit when transmitting which will hold off any other transfers from that queue until credit returns to a non-negative value. No transfers are halted when a queue's credit becomes negative; it will accumulate negative credit until the transfer completes.

The highest priority queue always has priority regardless of which queue has the most credit.

64.6.5.3.Fixed Priority

Any of the active queues can be selected as fixed priority and this is the default mode of operation for all queues. The queue index is used as the priority, where a higher index will have a higher priority than a lower index. The scheduler will always attempt to transmit from fixed priority queues with the highest priority (i.e. a fixed priority queue with a high queue index will always take precedence over a priority queue with a lower index).

64.6.5.4.Deficit Weighted Round Robin (DWRR)

Any of the active queues can be selected as DWRR. If DWRR is required, then at least two of the active queues must be selected as DWRR. It must not be used in conjunction with Enhanced Transmission Selection (ETS).

A DWRR enabled queue has lower priority than a fixed priority queue with a higher index.

A DWRR enabled queue has lower priority than a CBS enabled queue.

The DWRR algorithm works by scanning all non-empty queues in sequence. Each queue is allocated a 'deficit counter' and an 8-bit weighting (or quantum) value. The value of the deficit counter is the maximum number of bytes that can be sent at the current time.

If the deficit counter of the scanned queue is greater than the length of the packet waiting for transmission, then the packet will be transmitted and the value of the deficit counter is decremented by the packet size. If it is not greater, the scheduler will skip to the next DWRR enabled queue.

If there is insufficient credit to transmit, the queue is simply skipped.

If the queue is empty, the value of the deficit counter is reset to 0.

If all queues have insufficient credit then each tx_clk cycle every queue's deficit counter is incremented by its quantum value until a queue's deficit counter obtains sufficient credit to transmit its first queued frame. The higher the quantum value chosen the quicker deficit counter will reach the required value.

If all DWRR queues have the same weighting, then all queues will be granted the same overall bandwidth. The weighting value is stored in four programmable registers starting at offset 0x590.

Note: If fixed priority queues are to be used in conjunction with DWRR, the fixed priority queues must be at a higher index value than the DWRR queues. A consequence of this is that the enabled DWRR queues must form a contiguous set of queues starting from queue 0.

If CBS is also used in conjunction with DWRR, the DWRR queues will share the remaining bandwidth after the CBS allocation has been deducted.

64.6.5.5.Enhanced Transmission Selection (ETS)

The ETS algorithm is defined in IEEE 802.1Qaz: Enhanced Transmission Selection for Bandwidth Sharing between Traffic and allows traffic on specific queues to be bandwidth-limited. Any of the active queues can be selected as ETS. If ETS is required, then at least two of the active queues should be selected as ETS. It must not be used in conjunction with DWRR.

An ETS-enabled queue has lower priority than a CBS-enabled queue or a fixed priority queue with a higher index.

For each ETS-enabled queue, the bandwidth requirement must be configured for each queue as a percentage of total bandwidth (an 8-bit register is used and the sum of values programmed

© 2026 Microchip Technology Inc. and its subsidiaries

should not exceed decimal 100). This will be the maximum bandwidth to be granted to that queue. The actual scheduling algorithm operates in a round-robin style from lowest indexed queues up to the highest indexed queue in sequence. The bandwidth allocation percentage is stored in programmable registers starting at offset 0x590 – these are the same registers used for DWRR.

If CBS is also used in conjunction with ETS, the sum of the ETS queue percentages should equal the remaining bandwidth after the CBS allocation has been deducted.

Transmit cut-thru must not be enabled if the transmit scheduler is used.

64.6.5.6. Enhancement for Scheduled Traffic (EnST)

IEEE 802.1Qbv is a TSN standard for “Enhancements for Scheduled Traffic” and specifies “time-aware queue-draining procedures” based on “timing derived from IEEE 802.1AS”. It adds transmission gates to the priority queues which allow low-priority queues to be shut down at specific times to allow higher-priority queues immediate access to the network at specific times.

For details, see Time-sensitive Networking Support (TSN).

64.6.6. MAC Receive Block

All processing within the MAC receive block is implemented using a 16-bit data path. The MAC receive block checks for valid preamble, FCS, alignment and length, presents received frames to the FIFO interface and stores the frame destination address for use by the address checking block.

If, during the frame reception, the frame is found to be too long, a bad frame indication is sent to the FIFO interface. The receiver logic ceases to send data to memory as soon as this condition occurs.

At end of frame reception the receive block indicates to the DMA block whether the frame is good or bad. The DMA block will recover the current receive buffer if the frame was bad.

Ethernet frames are normally stored in DMA memory complete with the FCS. Setting the FCS remove bit in the network configuration (bit 17) causes frames to be stored without their corresponding FCS. The reported frame length field is reduced by four bytes to reflect this operation.

The receive block signals to the register block to increment the alignment, CRC (FCS), short frame, long frame, jabber or receive symbol errors when any of these exception conditions occur.

If bit 26 is set in the network configuration, CRC errors will be ignored and CRC errored frames will not be discarded, though the Frame Check Sequence Errors statistic register will still be incremented. Additionally, if not enabled for Jumbo Frames mode, then bit 13 of the receiver descriptor word 1 will be updated to indicate the FCS validity for the particular frame. This is useful for applications such as EtherCAT, where individual frames with FCS errors must be identified.

Received frames can be checked for length field error by setting the Length Field Error Frame Discard bit of the Network Configuration register (bit 16). When this bit is set, the receiver compares a frame's measured length with the length field (bytes 13 and 14) extracted from the frame. The frame is discarded if the measured length is shorter. This checking procedure is for received frames between 64 bytes and 1518 bytes in length.

Each discarded frame is counted in the 10-bit Length Field Frame Error statistics register. Frames where the length field is greater than or equal to 0x0600 hex will not be checked.

When operating in Gigabit mode (half duplex), the receiver will discard frames which do not meet the minimal slot time of 512 bytes. If a burst is detected, the first frame is checked to ensure it meets the slot time, but all subsequent frames of the burst are checked to ensure they meet the minimum frame size of 64 bytes.

In Gigabit mode (half duplex), carrier extension errors are detected by the receiver during the minimum slot time, and the frame discarded. An error of this nature causes the Receive Symbol

© 2026 Microchip Technology Inc. and its subsidiaries

Errors statistic register to be incremented. Carrier extension errors occurring during the inter packet gap period are ignored and have no effect on the statistics.

64.6.7. Checksum Offload for IP, TCP and UDP

The GMAC can be programmed to perform IP, TCP and UDP checksum offloading in both receive and transmit directions, which is enabled by setting bit 24 in the Network Configuration register for receive and bit 11 in the DMA Configuration register for transmit.

IPv4 packets contain a 16-bit checksum field, which is the 16-bit 1's complement of the 1's complement sum of all 16-bit words in the header. TCP and UDP packets contain a 16-bit checksum field, which is the 16-bit 1's complement of the 1's complement sum of all 16-bit words in the header, the data and a conceptual IP pseudo header.

To calculate these checksums in software requires each byte of the packet to be processed. For TCP and UDP this can use a large amount of processing power. Offloading the checksum calculation to hardware can result in significant performance improvements.

For IP, TCP or UDP checksum offload to be useful, the operating system containing the protocol stack must be aware that this offload is available so that it can make use of the fact that the hardware can either generate or verify the checksum.

64.6.7.1. Receiver Checksum Offload

When receive checksum offloading is enabled in the GMAC, the IPv4 header checksum is checked as per RFC 791, where the packet meets the following criteria:

- If present, the VLAN header must be four octets long and the CFI bit must not be set.
- Encapsulation must be RFC 894 Ethernet Type Encoding or RFC 1042 SNAP Encoding.
- IPv4 packet
- IP header is of a valid length

The GMAC also checks the TCP checksum as per RFC 793, or the UDP checksum as per RFC 768, if the following criteria are met:

- IPv4 or IPv6 packet
- Good IP header checksum (if IPv4)
- No IP fragmentation
- TCP or UDP packet

When an IP, TCP or UDP frame is received, the receive buffer descriptor provides an indication if the GMAC was able to verify the checksums. There is also an indication if the frame had SNAP encapsulation. These indication bits will replace the type ID match indication bits when the receive checksum offload is enabled. For details of these indication bits, see Receive Buffer Descriptor Entry.

If any of the checksums are verified as incorrect by the GMAC, the packet is discarded and the appropriate statistics counter incremented.

64.6.7.2. Transmitter Checksum Offload

The transmitter checksum offload is only available if the full store and forward mode is enabled. This is because the complete frame to be transmitted must be read into the packet buffer memory before the checksum can be calculated and written back into the headers at the beginning of the frame.

Transmitter checksum offload is enabled by setting bit [11] in the DMA Configuration register. When enabled, it will monitor the frame as it is written into the transmitter packet buffer memory to automatically detect the protocol of the frame. Protocol support is identical to the receiver checksum offload.

For transmit checksum generation and substitution to occur, the protocol of the frame must be recognized and the frame must be provided without the FCS field, by making sure that bit [16] of

© 2026 Microchip Technology Inc. and its subsidiaries

the transmit descriptor word 1 is clear. If the frame data already had the FCS field, this would be corrupted by the substitution of the new checksum fields.

If these conditions are met, the transmit checksum offload engine will calculate the IP, TCP and UDP checksums as appropriate. Once the full packet is completely written into packet buffer memory, the checksums will be valid and the relevant memory locations will be updated for the new checksum fields as per standard IP/TCP and UDP packet structures.

If the transmitter checksum engine is prevented from generating the relevant checksums, bits [22:20] of the transmitter DMA writeback status will be updated to identify the reason for the error. Note that the frame will still be transmitted but without the checksum substitution, as typically the reason that the substitution did not occur was that the protocol was not recognized.

64.6.8. MAC Filtering Block

The filter block determines which frames should be written to the FIFO interface and on to the DMA.

Whether a frame is passed depends on what is enabled in the Network Configuration register, the contents of the specific address, type and Hash registers and the frame's destination address and type field.

If bit 25 of the Network Configuration register is not set, a frame will not be copied to memory if the GMAC is transmitting in half duplex mode at the time a destination address is received.

Ethernet frames are transmitted a byte at a time, least significant bit first. The first six bytes (48 bits) of an Ethernet frame make up the destination address. The first bit of the destination address, which is the LSB of the first byte of the frame, is the group or individual bit. This is one for multicast addresses and zero for unicast. The all ones address is the broadcast address and a special case of multicast.

The GMAC supports recognition of four specific addresses. Each specific address requires two registers, Specific Address Bottom register and Specific Address Top register. Specific Address Bottom register stores the first four bytes of the destination address and Specific Address Top register contains the last two bytes. The addresses stored can be specific, group, local or universal.

The destination address of received frames is compared against the data stored in the Specific Address registers once they have been activated. The addresses are deactivated at reset or when their corresponding Specific Address Bottom register is written. They are activated when Specific Address Top register is written. If a receive frame address matches an active address, the frame is written to the FIFO interface and on to DMA memory.

Frames may be filtered using the type ID field for matching. Four type ID registers exist in the register address space and each can be enabled for matching by writing a one to the MSB (bit 31) of the respective register. When a frame is received, the matching is implemented as an OR function of the various types of match.

The contents of each type ID register (when enabled) are compared against the length/type ID of the frame being received (e.g., bytes 13 and 14 in non-VLAN and non-SNAP encapsulated frames) and copied to memory if a match is found. The encoded type ID match bits (Word 0, Bit 22 and Bit 23) in the receive buffer descriptor status are set indicating which type ID register generated the match, if the receive checksum offload is disabled.

The reset state of the type ID registers is zero, hence each is initially disabled.

The following example illustrates the use of the address and type ID match registers for a MAC address of 21:43:65:87:A9:CB:

Preamble	55
SFD	D5
DA (Octet 0 - LSB)	21
DA (Octet 1)	43

© 2026 Microchip Technology Inc. and its subsidiaries

DA (Octet 2)	65
DA (Octet 3)	87
DA (Octet 4)	A9
DA (Octet 5 - MSB)	CB
SA (LSB)	00(1)
SA	00(1)
SA	00(1)
SA	00(1)
SA	00(1)
SA (MSB)	00(1)
Type ID (MSB)	43
Type ID (LSB)	21

Note:

1. Contains the address of the transmitting device.

The sequence above shows the beginning of an Ethernet frame. Byte order of transmission is from top to bottom as shown. For a successful match to specific address 1, the following address matching registers must be set up:

- Specific Address 1 Bottom register (GMAC_SAB1) (Address 0x088) 0x87654321
- Specific Address 1 Top register (GMAC_SAT1) (Address 0x08C) 0x0000CBA9

For a successful match to the type ID, the following Type ID Match 1 register must be set up:

- Type ID Match 1 register (GMAC_TIDM1) (Address 0x0A8) 0x80004321

64.6.9. Broadcast Address

Frames with the broadcast address of 0xFFFFFFFFFFFF are stored to memory only if the 'no broadcast' bit in the Network Configuration register is set to zero.

64.6.10. Hash Addressing

The hash address register is 64 bits long and takes up two locations in the memory map. The least significant bits are stored in Hash Register Bottom and the most significant bits in Hash Register Top.

The unicast hash enable and the multicast hash enable bits in the Network Configuration register enable the reception of hash matched frames. The destination address is reduced to a 6-bit index into the 64-bit Hash register using the following hash function: The hash function is an XOR of every sixth bit of the destination address.

```
hash_index[05] = da[05] ^ da[11] ^ da[17] ^ da[23] ^ da[29] ^ da[35] ^ da[41] ^ da[47]
hash_index[04] = da[04] ^ da[10] ^ da[16] ^ da[22] ^ da[28] ^ da[34] ^ da[40] ^ da[46]
hash_index[03] = da[03] ^ da[09] ^ da[15] ^ da[21] ^ da[27] ^ da[33] ^ da[39] ^ da[45]
hash_index[02] = da[02] ^ da[08] ^ da[14] ^ da[20] ^ da[26] ^ da[32] ^ da[38] ^ da[44]
hash_index[01] = da[01] ^ da[07] ^ da[13] ^ da[19] ^ da[25] ^ da[31] ^ da[37] ^ da[43]
hash_index[00] = da[00] ^ da[06] ^ da[12] ^ da[18] ^ da[24] ^ da[30] ^ da[36] ^ da[42]
da[0]
```

represents the least significant bit of the first byte received, that is, the multicast/unicast indicator, and `da[47]` represents the most significant bit of the last byte received.

If the hash index points to a bit that is set in the Hash register then the frame will be matched according to whether the frame is multicast or unicast.

A multicast match will be signalled if the multicast hash enable bit is set, `da[0]` is logic 1 and the hash index points to a bit set in the Hash register.

© 2026 Microchip Technology Inc. and its subsidiaries

A unicast match will be signalled if the unicast hash enable bit is set, `da[0]` is logic 0 and the hash index points to a bit set in the Hash register.

To receive all multicast frames, the Hash register should be set with all ones and the multicast hash enable bit should be set in the Network Configuration register.

64.6.11. Copy all Frames (Promiscuous Mode)

If the Copy All Frames bit is set in the Network Configuration register then all frames except those that are too long, too short, have FCS errors or have GRXER asserted during reception will be copied to memory. Frames with FCS errors will be copied if bit 26 is set in the Network Configuration register.

64.6.12. Disable Copy of Pause Frames

Pause frames can be prevented from being written to memory by setting the disable copying of pause frames control bit 23 in the Network Configuration register. When set, pause frames are not copied to memory regardless of the Copy All Frames bit, whether a hash match is found, a type ID match is identified or if a destination address match is found.

64.6.13. VLAN Support

The following table describes an Ethernet encoded 802.1Q VLAN tag.

Table 64.5. 802.1Q VLAN Tag

TPID (Tag Protocol Identifier) 16 bits	TCI (Tag Control Information) 16 bits
0x8100	First 3 bits priority, then CFI bit, last 12 bits VID

The VLAN tag is inserted at the 13th byte of the frame adding an extra four bytes to the frame. To support these extra four bytes, the GMAC can accept frame lengths up to 1536 bytes by setting bit 8 in the Network Configuration register.

If the VID (VLAN identifier) is null (0x000) this indicates a priority-tagged frame.

The following bits in the receive buffer descriptor status word provide information about VLAN tagged frames:-

- Bit 21 set if receive frame is VLAN tagged (i.e., type ID of 0x8100).
- Bit 20 set if receive frame is priority tagged (i.e., type ID of 0x8100 and null VID). (If bit 20 is set, bit 21 will be set also.)
- Bit 19, 18 and 17 set to priority if bit 21 is set.
- Bit 16 set to CFI if bit 21 is set.

The GMAC can be configured to reject all frames except VLAN tagged frames by setting the discard non-VLAN frames bit in the Network Configuration register.

64.6.14. Wake on LAN Support

The receive block supports Wake on LAN by detecting the following events on incoming receive frames:

- Magic packet
- Address Resolution Protocol (ARP) request to the device IP address
- Specific address 1 filter match
- Multicast hash filter match

These events can be individually enabled through bits [19:16] of the Wake on LAN register. Also, for Wake on LAN detection to occur, receive enable must be set in the Network Control register, however a receive buffer does not have to be available.

© 2026 Microchip Technology Inc. and its subsidiaries

In case of an ARP request, specific address 1 or multicast filter events will occur even if the frame is errored. For magic packet events, the frame must be correctly formed and error free.

A magic packet event is detected if all of the following are true:

- Magic packet events are enabled through bit 16 of the Wake on LAN register
- The frame's destination address matches specific address 1
- The frame is correctly formed with no errors
- The frame contains at least 6 bytes of 0xFF for synchronization
- There are 16 repetitions of the contents of Specific Address 1 register immediately following the synchronization

An ARP request event is detected if all of the following are true:

- ARP request events are enabled through bit 17 of the Wake on LAN register
- Broadcasts are allowed by bit 5 in the Network Configuration register
- The frame has a broadcast destination address (bytes 1 to 6)
- The frame has a type ID field of 0x0806 (bytes 13 and 14)
- The frame has an ARP operation field of 0x0001 (bytes 21 and 22)
- The least significant 16 bits of the frame's ARP target protocol address (bytes 41 and 42) match the value programmed in bits[15:0] of the Wake on LAN register

The decoding of the ARP fields adjusts automatically if a VLAN tag is detected within the frame. The reserved value of 0x0000 for the Wake on LAN target address value will not cause an ARP request event, even if matched by the frame.

A specific address 1 filter match event will occur if all of the following are true:

- Specific address 1 events are enabled through bit 18 of the Wake on LAN register
- The frame's destination address matches the value programmed in the Specific Address 1 registers

A multicast filter match event will occur if all of the following are true:

- Multicast hash events are enabled through bit 19 of the Wake on LAN register
- Multicast hash filtering is enabled through bit 6 of the Network Configuration register
- The frame destination address matches against the multicast hash filter
- The frame destination address is not a broadcast

64.6.15. IEEE 1588 Support

IEEE 1588 is a standard for precision time synchronization in local area networks. It works with the exchange of special Precision Time Protocol (PTP) frames. The PTP messages can be transported over IEEE 802.3/Ethernet, over Internet Protocol Version 4 or over Internet Protocol Version 6 as described in the annex of IEEE P1588.D2.1.

The GMAC indicates the message timestamp point (asserted on the start packet delimiter and de-asserted at end of frame) for all frames and the passage of PTP event frames (asserted when a PTP event frame is detected and de-asserted at end of frame).

IEEE 802.1AS is a subset of IEEE 1588. One difference is that IEEE 802.1AS uses the Ethernet multicast address 0180C200000E for sync frame recognition whereas IEEE 1588 does not. GMAC is designed to recognize sync frames with both IEEE 802.1AS and IEEE 1588 addresses and so can support both 1588 and 802.1AS frame recognition simultaneously.

Synchronization between host and client clocks is a two-stage process.

© 2026 Microchip Technology Inc. and its subsidiaries

First, the offset between the host and client clocks is corrected by the host sending a sync frame to the client with a follow-up frame containing the exact time the sync frame was sent. Hardware assist modules at the host and client side detect exactly when the sync frame was sent by the host and received by the client. The client then corrects its clock to match the host clock.

Second, the transmission delay between the host and client is corrected. The client sends a delay request frame to the host which sends a delay response frame in reply. Hardware assist modules at the host and client side detect exactly when the delay request frame was sent by the client and received by the host. The client now has enough information to adjust its clock to account for delay. For example, if the client was assuming zero delay, the actual delay will be half the difference between the transmit and receive time of the delay request frame (assuming equal transmit and receive times) because the client clock will be lagging the host clock by the delay time already.

The timestamp is taken when the message timestamp point passes the clock timestamp point. This can generate an interrupt if enabled (GMAC_IER). However, MAC Filtering configuration is needed to actually 'copy' the message to memory. For Ethernet, the message timestamp point is the SFD and the clock timestamp point is the MII interface. (The IEEE 1588 specification refers to sync and delay_req messages as event messages as these require timestamping. These events are captured in the registers GMAC_EFTx and GMAC_EFRx, respectively. Follow up, delay response and management messages do not require timestamping and are referred to as general messages.)

1588 version 2 defines two additional PTP event messages. These are the peer delay request (Pdelay_Req) and peer delay response (Pdelay_Resp) messages. These events are captured in the registers GMAC_PEFTx and GMAC_PEFRx, respectively. These messages are used to calculate the delay on a link. Nodes at both ends of a link send both types of frames (regardless of whether they contain a host or client clock). The Pdelay_Resp message contains the time at which a Pdelay_Req was received and is itself an event message. The time at which a Pdelay_Resp message is received is returned in a Pdelay_Resp_Follow_Up message.

1588 version 2 introduces transparent clocks of which there are two kinds, peer-to-peer (P2P) and end-to-end (E2E). Transparent clocks measure the transit time of event messages through a bridge and amend a correction field within the message to allow for the transit time. P2P transparent clocks additionally correct for the delay in the receive path of the link using the information gathered from the peer delay frames. With P2P transparent clocks delay_req messages are not used to measure link delay. This simplifies the protocol and makes larger systems more stable.

The GMAC recognizes four different encapsulations for PTP event messages:

1. 1588 version 1 (UDP/IPv4 multicast)
2. 1588 version 2 (UDP/IPv4 multicast)
3. 1588 version 2 (UDP/IPv6 multicast)
4. 1588 version 2 (Ethernet multicast)

Other stuff (Octets 75–168)	–

For 1588 version 1 messages, sync and delay request frames are indicated by the GMAC if the frame type field indicates TCP/IP, UDP protocol is indicated, the destination IP address is 224.0.1.129/130/131 or 132, the destination UDP port is 319 and the control field is correct.

The control field is 0x00 for sync frames and 0x01 for delay request frames.

For 1588 version 2 messages, the type of frame is determined by looking at the message type field in the first byte of the PTP frame. Whether a frame is version 1 or version 2 can be determined by looking at the version PTP field in the second byte of both version 1 and version 2 PTP frames.

In version 2 messages sync frames have a message type value of 0x0, delay_req have 0x1, Pdelay_Req have 0x2 and Pdelay_Resp have 0x3.

64.6.16. MAC 802.3 Pause Frame Support

Note: See Clause 31, and Annex 31A and 31B of the IEEE standard 802.3 for a full description of MAC 802.3 pause operation.

The following table shows the start of a MAC 802.3 pause frame.

Table 64.14. Start of an 802.3 Pause Frame

Address		Type (MAC Control Frame)	Pause	
Destination	Source		Opcode	Time
0x0180C2000001	6 bytes	0x8808	0x0001	2 bytes

The GMAC supports both hardware controlled pause of the transmitter, upon reception of a pause frame, and hardware generated pause frame transmission.

© 2026 Microchip Technology Inc. and its subsidiaries

64.6.16.1.802.3 Pause Frame Reception

Bit 13 of the Network Configuration register is the pause enable control for reception. If this bit is set, transmission pauses if a non zero pause quantum frame is received.

If a valid pause frame is received, then the Pause Time register is updated with the new frame's pause time, regardless of whether a previous pause frame is active or not. An interrupt (either bit 12 or bit 13 of the Interrupt Status register) is triggered when a pause frame is received, but only if the interrupt has been enabled (bit 12 and bit 13 of the Interrupt Mask register). Pause frames received with non zero quantum are indicated through the interrupt bit 12 of the Interrupt Status register. Pause frames received with zero quantum are indicated on bit 13 of the Interrupt Status register.

Once the Pause Time register is loaded and the frame currently being transmitted has been sent, no new frames are transmitted until the pause time reaches zero. The loading of a new pause time, and hence the pausing of transmission, only occurs when the GMAC is configured for full duplex operation. If the GMAC is configured for half duplex there will be no transmission pause, but the pause frame received interrupt will still be triggered. A valid pause frame is defined as having a destination address that matches either the address stored in Specific Address 1 register or if it matches the reserved address of 0x0180C2000001. It must also have the MAC control frame type ID of 0x8808 and have the pause opcode of 0x0001.

Pause frames that have frame check sequence (FCS) or other errors will be treated as invalid and will be discarded. 802.3 Pause frames that are received after Priority-based Flow Control (PFC) has been negotiated will also be discarded. Valid pause frames received will increment the Pause Frames Received statistic register.

The Pause Time register decrements every 512 bit times once transmission has stopped. For test purposes, the retry test bit can be set (bit 12 in the Network Configuration register) which causes the Pause Time register to decrement every GTXCK cycle once transmission has stopped.

The interrupt (bit 13 in the Interrupt Status register) is asserted whenever the Pause Time register decrements to zero (assuming it has been enabled by bit 13 in the Interrupt Mask register). This interrupt is also set when a zero quantum pause frame is received.

64.6.16.2.802.3 Pause Frame Transmission

Automatic transmission of pause frames is supported through the transmit pause frame bits of the Network Control register. If either bit 11 or bit 12 of the Network Control register is written with logic 1, an 802.3 pause frame will be transmitted, providing full duplex is selected in the Network Configuration register and the transmit block is enabled in the Network Control register.

Pause frame transmission will happen immediately if transmit is inactive or if transmit is active between the current frame and the next frame due to be transmitted.

Transmitted pause frames comprise the following:

- A destination address of 01-80-C2-00-00-01
- A source address taken from Specific Address 1 register
- A type ID of 88-08 (MAC control frame)
- A pause opcode of 00-01
- A Pause Quantum register
- Fill of 00 to take the frame to minimum frame length
- Valid FCS

The pause quantum used in the generated frame will depend on the trigger source for the frame as follows:

- If bit 11 is written with a one, the pause quantum will be taken from the Transmit Pause Quantum register. The Transmit Pause Quantum register resets to a value of 0xFFFF giving maximum pause quantum as default.

© 2026 Microchip Technology Inc. and its subsidiaries

- If bit 12 is written with a one, the pause quantum will be zero.

After transmission, a pause frame transmitted interrupt will be generated (bit 14 of the Interrupt Status register) and only the statistics register Pause Frames Transmitted is incremented.

Pause frames can also be transmitted by the MAC using normal frame transmission methods.

64.6.17. MAC PFC Priority-based Pause Frame Support

Note: Refer to the 802.1Qbb standard for a full description of priority-based pause operation.

The following table shows the start of a Priority-based Flow Control (PFC) pause frame.

Table 64.15. Start of a PFC Pause Frame

Address		Type (Mac Control Frame)	Pause Opcode	Priority Enable Vector	Pause Time
Destination	Source				
0x0180C2000001	6 bytes	0x8808	0x1001	2 bytes	8 × 2 bytes

The GMAC supports PFC priority-based pause transmission and reception. Before PFC pause frames can be received, bit 16 of the Network Control register must be set.

64.6.17.1. PFC Pause Frame Reception

The ability to receive and decode priority-based pause frames is enabled by setting bit 16 of the Network Control register. When this bit is set, the GMAC will match either classic 802.3 pause frames or PFC priority-based pause frames. Once a priority-based pause frame has been received and matched, then from that moment on the GMAC will only match on priority-based pause frames (this is an 802.1Qbb requirement, known as PFC negotiation). Once priority-based pause has been negotiated, any received 802.3x format pause frames will not be acted upon.

If a valid priority-based pause frame is received then the GMAC will decode the frame and determine which, if any, of the eight priorities require to be paused. Up to eight Pause Time registers are then updated with the eight pause times extracted from the frame regardless of whether a previous pause operation is active or not. An interrupt (either bit 12 or bit 13 of the Interrupt Status register) is triggered when a pause frame is received, but only if the interrupt has been enabled (bit 12 and bit 13 of the Interrupt Mask register). Pause frames received with non zero quantum are indicated through the interrupt bit 12 of the Interrupt Status register. Pause frames received with zero quantum are indicated on bit 13 of the Interrupt Status register. The loading of a new pause time only occurs when the GMAC is configured for full duplex operation. If the GMAC is configured for half duplex, the pause time counters will not be loaded, but the pause frame received interrupt will still be triggered. A valid pause frame is defined as having a destination address that matches either the address stored in Specific Address 1 register or if it matches the reserved address of 0x0180C2000001. It must also have the MAC control frame type ID of 0x8808 and have the pause opcode of 0x0101.

Pause frames that have frame check sequence (FCS) or other errors will be treated as invalid and will be discarded. Valid pause frames received will increment the Pause Frames Received Statistic register.

The Pause Time registers decrement every 512 bit times immediately following the PFC frame reception. For test purposes, the retry test bit can be set (bit 12 in the Network Configuration register) which causes the Pause Time register to decrement every GRXCK cycle once transmission has stopped.

The interrupt (bit 13 in the Interrupt Status register) is asserted whenever the Pause Time register decrements to zero (assuming it has been enabled by bit 13 in the Interrupt Mask register). This interrupt is also set when a zero quantum pause frame is received.

64.6.17.2. PFC Pause Frame Transmission

Automatic transmission of pause frames is supported through the transmit priority-based pause frame bit of the Network Control register. If bit 17 of the Network Control register is written with

© 2026 Microchip Technology Inc. and its subsidiaries

logic 1, a PFC pause frame will be transmitted providing full duplex is selected in the Network Configuration register and the transmit block is enabled in the Network Control register. When bit 17 of the Network Control register is set, the fields of the priority-based pause frame will be built using the values stored in the Transmit PFC Pause register.

Pause frame transmission will happen immediately if transmit is inactive or if transmit is active between the current frame and the next frame due to be transmitted.

Transmitted pause frames comprise the following:

- A destination address of 01-80-C2-00-00-01
- A source address taken from Specific Address 1 register
- A type ID of 88-08 (MAC control frame)
- A pause opcode of 01-01
- A priority enable vector taken from Transmit PFC Pause register
- 8 Pause Quantum registers
- Fill of 00 to take the frame to minimum frame length
- Valid FCS

The Pause Quantum registers used in the generated frame will depend on the trigger source for the frame as follows:

- If bit 17 of the Network Control register is written with a one, then the priority enable vector of the priority-based pause frame will be set equal to the value stored in the Transmit PFC Pause register [7:0]. For each entry equal to zero in the Transmit PFC Pause register [15:8], the pause quantum field of the pause frame associated with that entry will be taken from the Transmit Pause Quantum register. For each entry equal to one in the Transmit PFC Pause register [15:8], the pause quantum associated with that entry will be zero.
- The Transmit Pause Quantum register resets to a value of 0xFFFF giving maximum pause quantum as default.

After transmission, a pause frame transmitted interrupt will be generated (bit 14 of the Interrupt Status register) and the only statistics register that will be incremented will be the Pause Frames Transmitted register.

PFC Pause frames can also be transmitted by the MAC using normal frame transmission methods.

64.6.18. Energy-efficient Ethernet Support

IEEE 802.3az adds support for energy efficiency to Ethernet. These are the key features of 802.3az:

- Allows a system's transmit path to enter a Low-Power mode if there is nothing to transmit.
- Allows a PHY to detect whether its link partner's transmit path is in Low-Power mode, therefore allowing the system's receive path to enter Low-Power mode.
- Link remains up during lower power mode and no frames are dropped.
- Asymmetric, one direction can be in Low-Power mode while the other is transmitting normally.
- LPI (Low Power Idle) signaling is used to control entry and exit to and from Low-Power modes.
- LPI signaling can only take place if both sides have indicated support for it through auto-negotiation.

These are the key features of 802.3az operation:

- Low-power control is done at the MII (reconciliation sublayer).
- As an architectural convenience in writing the 802.3az it is assumed that transmission is deferred by asserting carrier sense, in practice it will not be done this way. This system will know when it has nothing to transmit and only enter Low-Power mode when it is not transmitting.

© 2026 Microchip Technology Inc. and its subsidiaries

- LPI should not be requested unless the link has been up for at least one second.
- LPI is signaled on the transmit path by asserting 0x01 on txd with tx_en low and tx_er high.
- A PHY on seeing LPI requested on the MII will send the sleep signal before going quiet. After going quiet it will periodically transmit refresh signals.
- The sleep, quiet and refresh periods are defined in Table 78-2 of 802.3az. For 1000BASE-X the sleep period is 20 microseconds, the quiet period 2.5 milliseconds and the refresh period 20 microseconds.
- 1000BASE-X is required to go quiet after sleep is signaled. The easiest way to do this is to write to a control register to disable transmit in the SerDes.
- LPI mode ends by transmitting normal idle for the wake time. There is a default time for this but it can be adjusted in software using the Link Layer Discovery Protocol (LLDP) described in Clause 79 of 802.3az.
- LPI is indicated at the receive side when sleep and refresh signaling has been detected.

64.6.19. LPI Operation in the GMAC

It is best to use firmware to control LPI. LPI operates at the system level. Firmware provides maximum control and flexibility of operation. LPI operation is straightforward and firmware should be capable of responding within the required timeframes.

Auto-negotiation:

1. Indicate EEE capability using next page auto-negotiation.

For the transmit path:

1. If the link has been up for 1 second and there is nothing being transmitted, write to the TXLPIEN bit in the Network Control register.
2. If connected to 1000BASE-T PHY using RGMII, there is nothing more to do.
3. If connected to a backplane using a 1000BASE-KX PHY, use firmware to periodically disable the SerDes transmit path. (Write to bit 1.160.0 for 1000BASE-KX.)
4. Wake up by clearing the TXLPIEN bit in the Network Control register.

For the receive path:

1. Enable RXLPISBC bit in GMAC_IER. The bit RXLPIS is set in Network Status Register triggering an interrupt.
2. Wait for an interrupt to indicate that LPI has been received.
3. Disable relevant parts of the receive path if desired but keep the PCS and SerDes active.
4. The RXLPIS bit in Network Status Register gets cleared to indicate that regular idle has been received. This triggers an interrupt.
5. Re-enable the receive path.

64.6.20. PHY Interface

Different PHY interfaces are supported by the Gigabit Ethernet MAC:

- RMII – operates at 10/100 Mbps and uses GTX[1:0] and GRX[1:0].
- RGMIIv1.3 – operates at 10/100/1000 Mbps.

64.6.21. 10/100 Operation

The Speed (SPD) bit in the Network Configuration register is used to select between 10 Mbps and 100 Mbps operation.

© 2026 Microchip Technology Inc. and its subsidiaries

64.6.22. Jumbo Frames

The Jumbo Frame Size (JFRAME) bit in the Network Configuration register allows the GMAC, in its default configuration, to receive jumbo frames up to 10240 bytes in size. This operation does not form part of the IEEE 802.3 specification and is normally disabled. When jumbo frames are enabled, frames received with a frame size greater than 10240 bytes are discarded.

The GMAC can be configured to receive jumbo frames up to 16383 bytes by writing the RX Jumbo Frame Max Length register (GMAC_RJFML).

64.6.23. Time-sensitive Networking Support (TSN)

64.6.23.1.IEEE 802.1Qbv: Enhancement for Scheduled Traffic (EnST)

IEEE 802.1Qbv is a TSN standard for “Enhancements for Scheduled Traffic” and specifies “time-aware queue-draining procedures” based on “timing derived from IEEE 802.1AS”. It adds transmission gates to the eight priority queues which allow low priority queues to be shut down at specific times to allow higher priority queues immediate access to the network at specific times.

There are two main use cases for this:

- Firstly to allow guaranteed access for high priority low latency control frames (this is similar to Time Triggered Ethernet previously specified by the SAE in 2011 - AS6802)
- Secondly to allow periodic transmission of AVB traffic such as 1722 talker class A streams which need frames to be transmitted every 125 microseconds

GMAC supports IEEE 802.1Qbv by allowing time-aware control of individual transmit queues. GMAC has the ability to enable and disable transmission on a particular queue on a periodic basis with the on/off cycling starting at a specified TSU clock time.

For each transmit queue, configured up to a maximum of eight, there is a gate on timer and a gate off timer.

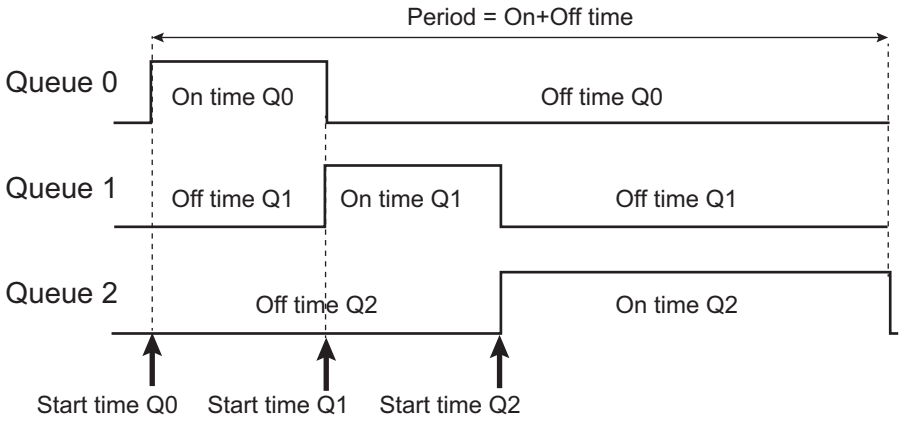
The on and off timer values are set in two 17-bit registers. These registers determine the “on” and “off” times for each queue in bytes. The actual “on” and “off” time will be a function of the number of bytes programmed in these registers and the speed of operation. 17 bits allow for a maximum value of about 1.05 milliseconds at 1G speed of operation.

For each transmit queue, configured up to a maximum of eight, there is a 32-bit register to control the start time for IEEE802.1Qbv queuing. The bottom 30 bits define the nanosecond value (as matched against the TSU timer) at which the queue will start and the top two bits the second value.

There is a 16-bit register that enables and disables IEEE 802.1Qbv traffic scheduling on each queue. The bottom 8 bits are for enabling each queue and the top 8 bits are for disabling. The disabling bits start at bit location 16. If the enable and disable bits are set simultaneously for a particular queue, the disable bit has priority. The disable bits are write-only. The enable bits are read/write with a read returning the queue’s status.

When enabled traffic scheduling starts for a particular queue at the time the TSU rolls over to the start time value in the relevant 32-bit register, the queue will then be on for the time in the “on” time register and off for the time in the “off” time register and the sequence will then repeat ignoring the time on the start time register. The functionality is similar to but not identical to the “Cycle Timer state machine” specified in the IEEE 802.1Qbv standard. The state machine in the IEEE 802.1Qbv standard allows complete freedom in setting a queue’s “on” and “off” times. The GMAC assumes that the “on” and “off” times will occur with a fixed period. If it is necessary to change the on/off sequencing, you need to write to the EnST control register to disable the queue and reprogram the “on”, “off”, and start times before restarting EnST on the queue.

When traffic scheduling is disabled, the queue will no longer be gated and will be scheduled as normal.



© 2026 Microchip Technology Inc. and its subsidiaries

If scheduling is enabled for a queue, transmission will not start if the frame to be transmitted will not complete in the remaining on-time available, that is, it is too long. If the frame is too long to ever be transmitted, then the frame will be dropped and an error indicated.

IEEE 802.1Qbv scheduling works in addition to other queue arbitration schemes such as Credit-Based Shaping (CBS) and priority queuing.

The EnST registers (GMAC_ENST_START_Q/ON_Q/OFF_Q) must be set so that the queues are not overlapping when they are open as shown in the following figure.

Figure 64.4. Example of Transmit Scheduling Configuration

To simplify implementation the on-time and the off-time are specified in bytes rather than nanoseconds.

The relation between the on-time (nanoseconds) and the on-time (bytes, the register of the module) is: on-time (bytes) = on-time (nanoseconds) divided by X, where X = 8 for 1 Gbit/s operation, 80 for 100 Mbit/s and 800 for 10 Mbits/s.

The maximum value of on-time and off-time and that can be set is 1,048,568 ns.

64.6.23.2.IEEE 802.1CB: Frame Elimination for Reliability

64.6.23.2.1.Introduction

IEEE 802.1CB “Frame Replication and Elimination for Reliability” is one of the TSN (Time Sensitive Networking) standards developed by the 802.1 working group. Using Frame Replication and Elimination for Reliability (FRER) within a network increases the probability that a given packet will be delivered using multi-paths through the network.

The GMAC supports a subset of this standard and provides the capability for stream identification and frame elimination but does not provide support for the replication of frames.

64.6.23.2.2.Stream Identification

The identification of IEEE 802.1CB streams relies on the use of the existing type 2 screener functionality. Each type 2 screener can be configured to inspect various fields of the receive frame and compared against values programmed into the type 2 screeners and compare registers.

For each implemented IEEE 802.1CB stream function, its associated control register contains the two fields ‘member_stream_1’ and ‘member_stream_2’:

- Each contains a value between 0x0 and 0xf representing the type 2 screener associated with this stream
- Each may point to the same or different type 2 screeners providing the option to eliminate packets which may have been sent across two different paths using different VLAN ID for example.

© 2026 Microchip Technology Inc. and its subsidiaries

64.6.23.2.3.Support for FRER Redundancy Tag and Sequence Number Identification

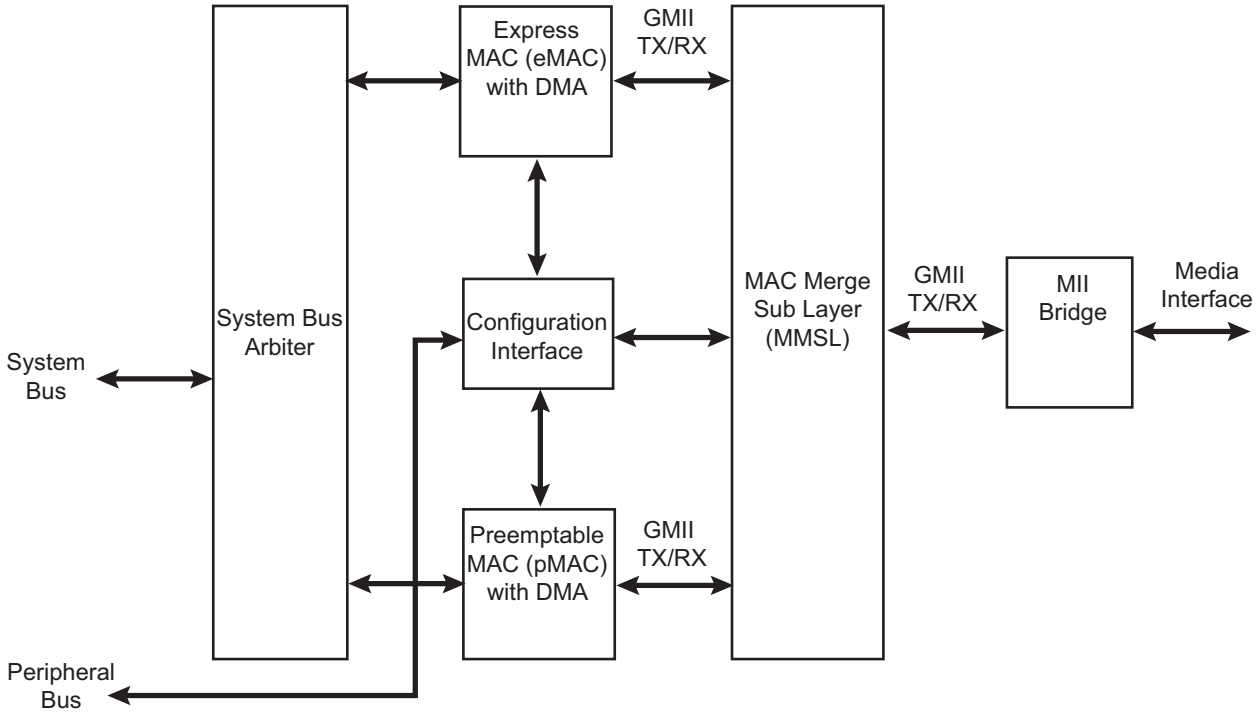
To identify duplicate frames, a sequence number must be extracted from the incoming frame.

IEEE 802.1CB defines a new optional redundancy tag field that will immediately follow either the MAC source address field or the VLAN tag fields of the frame. This redundancy tag is identified by a new Ethertype with a value of 0xF1C1.

GMAC supports Draft 2.5 of the IEEE 802.1CB standard (see sub-clause 7.8). Thus the length of the redundancy tag is 6 bytes:

- The first two bytes are for the Ethertype (F1C1)
- The second two bytes are reserved and are set to zero
- The final two bytes are the 16-bit sequence number.

64.6.23.3.IEEE 802.3br: Interspersing Express Traffic



IEEE 802.3br "Interspersing Express Traffic" is one of the TSN standards, which defines a mechanism to transmit an express frame with a minimum delay at the expense of delaying completion of normal priority frames.

This standard is implemented by instantiating two separate MAC modules with related DMA, an MMSL (MAC Merge Sub Layer) and a system bus arbiter. One MAC is termed the express or eMAC and the other is a pre-emptable or pMAC.

The eMAC is designed to carry time sensitive traffic which must be delivered within a known time.

A conceptual view of this structure is shown in the following figure.

Figure 64.5. Interspersing Implementation Block Diagram

64.6.23.3.1.Frame Types

The use of this standard introduces a new format of frame, called an M-frame. M-frames are defined in the IEEE 802.3br standard as frames that have a special type of Start Frame Delimiter (SFD), called a Start mPacket Delimiter (SMD) and have a special type of CRC, called MCRC.

© 2026 Microchip Technology Inc. and its subsidiaries

This new frame type is used by the MMSL to differentiate between the different types of traffic to determine whether:

- The frame is for the pMAC or eMAC
- An M-frame may consist of a full Ethernet frame or a fragment of an Ethernet frame

Frames to/from the eMAC are the same as regular Ethernet frames and when received will always contain a complete frame.

Frames to/from the pMAC use a different SFD and may be fragmented if a frame was required to be sent from the eMAC, in which case the pMAC frame is transmitted in between at least two pMAC frame fragments.

64.6.23.3.2.eMAC Configuration

The eMAC has a reduced set of features:

- The number of queues is 1.
- The number of stream functions is 2.
- The number of type 2 screeners and compare registers is 2 and 6 respectively.
- TSU is shared with the pMAC.
- RSC is not supported.

If the IEEE 802.3br functionality is to be used, then cut-thru and half-duplex and pause modes must not be enabled.

64.6.23.3.3.Transmit Interspersing Capability

On the transmit side, the interspersing capability is achieved by preempting M-frames from the pMAC in order to give the priority to Express frames from the eMAC.

If the pMAC is in the process of transmitting a frame and the eMAC requests to transmit, then the M-frame from the pMAC is halted with the M-frame transmission stopped and appended with a 32-bit MCRC before transmission of the express frame commences.

The additional support for IEEE 802.1Qbv also provides the capability to send time-scheduled express frames. This is supported by a set of programmable registers to define when the frame should be transmitted.

There are certain circumstances where a pMAC transmission will not be pre-empted, this is handled in accordance to the IEEE 802.3br standard as defined below:

- There are less than 64 M-frame bytes left to transmit.
- The M-frame transmission started at the moment when an Express packet requested the channel (the minimum number of bytes to be transmitted before preemption can occur is programmable in the field GMAC_MMSL_CR.ADD_FRAG_SIZE). In this case preemption will start after the minimum number of bytes of the M-frame have been transmitted.
- If the preemption function is not enabled.
- If the preemption function is enabled, the verification function is not disabled and the link partner could not complete the handshake protocol indicating that it cannot support the IEEE 802.3br standard.

64.6.23.3.4.Receive Interspersing Capability

The MMSL receiver processes the received M-frames to determine whether the frame is destined for the eMAC or the pMAC and routes them appropriately.

Frames destined for the eMAC look like standard Ethernet frames and are passed un-modified to the eMAC.

Frames destined for the pMAC contain a modified SFD and this new SFD is also used to identify frame fragments in order to reconstruct a complete Ethernet frame for the pMAC.

© 2026 Microchip Technology Inc. and its subsidiaries

If a frame for the pMAC is fragmented due to an express frame, the MMSL receiver and the pMAC receive path are halted while the express frame is routed to the eMAC. Once a continuation fragment is received, the MMSL receiver and pMAC receive path resumes operation.

64.6.23.3.5.Verification Process

The verification process is defined by the IEEE 802.3br as a mechanism to validate the support of the 802.3br standard by both ends of the link.

If the preemption capability and the verification process are enabled, after reset a “verify frame” which consists of a special type of M-frame is transmitted. This frame, when received by the link partner should cause the link partner to transmit a ‘Respond Frame’.

The proper reception of this ‘Respond Frame’ completes the verification process and enables the preemption capability.

If no ‘Respond Frame’ is received within 10ms, the process will automatically be repeated another two times before the preemption capability is disabled. If this happens, the verification process may be restarted through the programming registers.

During the time in which the core is waiting for the Respond packet, the receive traffic will be routed to either the pMAC or the eMAC depending on the value of the 802.3br configuration registers.

64.6.23.4.IEEE 802.1Qci: Receive (Ingress) Traffic Policing

The TSN standards enable provisioning the resources in a network in such a way that high priority traffic is guaranteed to get through as long as it does not exceed its frame length and flow rate allocation.

802.1Qci is a policing mechanism that discards frames on ingress (i.e. received frames) if they exceed their allocated frame length or flow rate. The receive queue flush and screener type 2 maximum rate registers are provided for this purpose.

The receive queue flush registers starting at offset 0x0b00 allow frames to be discarded on a per-queue basis when the following events occur:

- All traffic received to a particular queue
- When a receive queue’s buffer descriptor is read with the used bit set
- When a queue’s dedicated memory utilization reaches a programmable depth (specified in 128-byte chunks)
- When a frame is received above a programmable length (specified in bytes)

The screener type 2 maximum rate registers starting at 0x0b40 allow frames to be discarded that exceed a certain flow rate.

64.7. Programming Interface

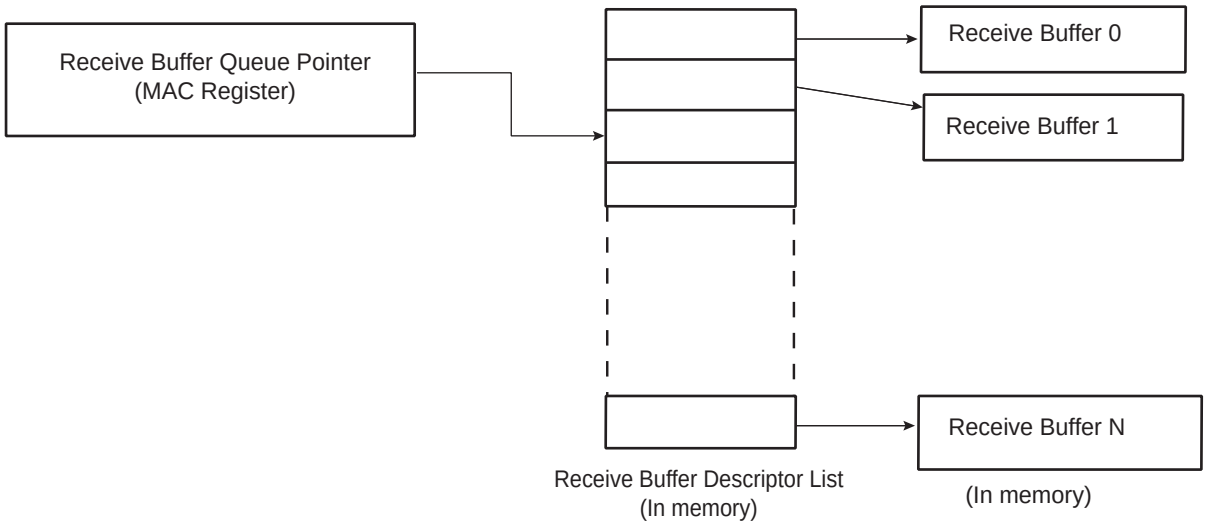
64.7.1. Initialization

64.7.1.1.Configuration

Initialization of the GMAC configuration (e.g., loop back mode, frequency ratios) must be done while the transmit and receive circuits are disabled. See the description of the Network Control register and Network Configuration register earlier in this document.

To change loop back mode, the following sequence of operations must be followed:

1. Write to Network Control register to disable transmit and receive circuits.
2. Write to Network Control register to change loop back mode.
3. Write to Network Control register to re-enable transmit or receive circuits.
   Note: These writes to the Network Control register cannot be combined in any way.



© 2026 Microchip Technology Inc. and its subsidiaries

64.7.1.2.Receive Buffer List

Receive data is written to areas of data (i.e., buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (receive buffer queue) is a sequence of descriptor entries as defined in Receive Buffer Descriptor Entry.

The Receive Buffer Queue Pointer register points to this data structure.

Figure 64.6. Receive Buffer List

To create the list of buffers:

1. Allocate a number (N) of buffers of X bytes in system memory, where X is the DMA buffer length programmed in the DMA Configuration register.
2. Allocate an area 8N bytes for the receive buffer descriptor list in system memory and create N entries in this list. Mark all entries in this list as owned by GMAC, i.e., bit 0 of word 0 set to 0.
3. Add an extra descriptor to the end of queue with its used bit set (bit 0 in word 0 set to 1). This last descriptor in the queue may also have its wrap bit set (bit 1 in word 0 set to 1) in addition to its used bit.When receive is enabled, at least one entry in the buffer descriptor ring needs its used bit set, so it is not sufficient to set the wrap bit of the last buffer in the queue without also setting its used bit. The GMAC can now prefetch receive descriptors and the used bit is used as an indication to the hardware that all available descriptors have been prefetched.
4. The GMAC can now read transmit data so fast that all data may be read in before it sets the used bit of the first buffer descriptor in the queue.
5. Write address of receive buffer descriptor list and control information to GMAC register receive buffer queue pointer
6. The receive circuits can then be enabled by writing to the address recognition registers and the Network Control register.
   Note: The queue pointers must be initialized and point to USED descriptors for all queues including those not intended for use.

64.7.1.3.Transmit Buffer List

Transmit data is read from areas of data (the buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (Transmit Buffer Queue) is a sequence of descriptor entries as defined in Transmit Buffer Descriptor Entry.

The Transmit Buffer Queue Pointer register points to this data structure.

To create this list of buffers:

© 2026 Microchip Technology Inc. and its subsidiaries

1. Allocate a number (N) of buffers of between 1 and 2047 bytes of data to be transmitted in system memory. Up to 128 buffers per frame are allowed.
2. Allocate an area 8N bytes for the transmit buffer descriptor list in system memory and create N entries in this list. Mark all entries in this list as owned by GMAC, i.e., bit 31 of word 1 set to 0.
3. Add an extra descriptor to the end of queue with its used bit set (bit 31 in word 1 set to 1). This last descriptor in the queue may also have its wrap bit set (bit 1 in word 0 set to 1) in addition to its used bit. When transmit is enabled, at least one entry in the buffer descriptor ring must have its used bit set. When the buffer descriptor ring is initialized for the first time, a used bit must be set before or at the buffer descriptor with the wrap bit. Once transmission halts due to reading a used bit, firmware can reuse the transmit buffers and clear the used bits before, including the one with the wrap bit, then restart transmission by writing TSTART in the Network Control register.
4. The GMAC can now read transmit data so fast that all data may be read in before it sets the used bit of the first buffer descriptor in the queue.
5. Write address of transmit buffer descriptor list and control information to GMAC register transmit buffer queue pointer.
6. The transmit circuits can then be enabled by writing to the Network Control register.
   Note: The queue pointers must be initialized and point to USED descriptors for all queues including those not intended for use.

64.7.1.4.Address Matching

The GMAC Hash register pair and the four Specific Address register pairs must be written with the required values. Each register pair comprises of a bottom register and top register, with the bottom register being written first. The address matching is disabled for a particular register pair after the bottom register has been written and re-enabled when the top register is written. Each register pair may be written at any time, regardless of whether the receive circuits are enabled or disabled.

As an example, to set Specific Address 1 register to recognize destination address 21:43:65:87:A9:CB, the following values are written to Specific Address 1 Bottom register and Specific Address 1 Top register:

- Specific Address 1 Bottom register bits 31:0 (0x98): 0x8765_4321.
- Specific Address 1 Top register bits 31:0 (0x9C): 0x0000_CBA9.

Note: The address matching is the first level of filtering. If there is a match, the screeners are the next level of filtering for routing the data to the appropriate queue. See Priority Queueing in the DMA for more details.

64.7.1.5.PHY Maintenance

The PHY Maintenance register is implemented as a shift register. Writing to the register starts a shift operation which is signaled as complete when bit 2 (IDLE) is set in the Network Status register (about 2000 MCK cycles later when bits 18:16 are set to '2' in the Network Configuration register). An interrupt is generated as this bit is set.

During this time, the MSB of the register is output on the GMDIO pin and the LSB updated from the GMDIO pin with each Management Data Clock (MDC) cycle. This causes the transmission of a PHY management frame on GMDIO pin. Refer to section 22.2.4.5 of the IEEE 802.3 standard.

Reading during the shift operation will return the current contents of the shift register. At the end of the management operation the bits will have shifted back to their original locations. For a read operation the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The Management Data Clock (MDC) should not toggle faster than 2.5 MHz (minimum period of 400 ns), as defined by the IEEE 802.3 standard. MDC is generated by dividing down MCK. Three bits in the Network Configuration register determine by how much MCK should be divided to produce MDC.

© 2026 Microchip Technology Inc. and its subsidiaries

64.7.1.6.Interrupts

There are multiple interrupt sources that are detected to drive multiple interrupt lines. Depending on the overall system design this may be passed through a further level of interrupt collection (interrupt controller). On receipt of the interrupt signal, the CPU enters the interrupt handler. Refer to the device interrupt controller documentation to identify that it is the GMAC that is generating the interrupt. To ascertain which interrupt, read the Interrupt Status register. Note that in the default configuration this register will clear itself after being read, though this may be configured to be write-one-to-clear if desired.

At reset all interrupts are disabled. To enable an interrupt, write to Interrupt Enable register with the pertinent interrupt bit set to 1. To disable an interrupt, write to Interrupt Disable register with the pertinent interrupt bit set to 1. To check whether an interrupt is enabled or disabled, read Interrupt Mask register. If the bit is set to 1, the interrupt is disabled.

64.7.1.7.Transmitting Frames

The procedure to set up a frame for transmission is the following:

1. Enable transmit in the Network Control register.
2. Allocate an area of system memory for transmit data. This does not have to be contiguous, varying byte lengths can be used if they conclude on byte borders.
3. Set-up the transmit buffer list by writing buffer addresses to word zero of the transmit buffer descriptor entries and control and length to word one.
4. Write data for transmission into the buffers pointed to by the descriptors.
5. Write the address of the first buffer descriptor to transmit buffer descriptor queue pointer.
6. Enable appropriate interrupts.
7. Write to the transmit start bit (TSTART) in the Network Control register.

64.7.1.8.Receiving Frames

When a frame is received and the receive circuits are enabled, the GMAC checks the address and, in the following cases, the frame is written to system memory:

- If it matches one of the four Specific Address registers.
- If it matches one of the four Type ID registers.
- If it matches the hash address function.
- If it is a broadcast address (0xFFFFFFFFFFFF) and broadcasts are allowed.
- If the GMAC is configured to “copy all frames”.

The register receive buffer queue pointer points to the next entry in the receive buffer descriptor list and the GMAC uses this as the address in system memory to write the frame to.

Once the frame has been completely and successfully received and written to system memory, the GMAC then updates the receive buffer descriptor entry (see Receive Buffer Descriptor Entry) with the reason for the address match and marks the area as being owned by software. Once this is complete, a receive complete interrupt is set. Software is then responsible for copying the data to the application area and releasing the buffer (by writing the ownership bit back to 0).

If the GMAC is unable to write the data at a rate to match the incoming frame, then a receive overrun interrupt is set. If there is no receive buffer available, i.e., the next buffer is still owned by software, a receive buffer not available interrupt is set. If the frame is not successfully received, a statistics register is incremented and the frame is discarded without informing software.

64.7.2. Statistics Registers

Statistics registers are described beginning with GMAC Octets Transmitted Low Register and ending with GMAC UDP Checksum Errors Register.

© 2026 Microchip Technology Inc. and its subsidiaries

The statistics register block begins at 0x100 and runs to 0x1B0, and comprises the registers listed below.

Octets Transmitted Low Register	Broadcast Frames Received Register
Octets Transmitted High Register	Multicast Frames Received Register
Frames Transmitted Register	Pause Frames Received Register
Broadcast Frames Transmitted Register	64 Byte Frames Received Register
Multicast Frames Transmitted Register	65 to 127 Byte Frames Received Register
Pause Frames Transmitted Register	128 to 255 Byte Frames Received Register
64 Byte Frames Transmitted Register	256 to 511 Byte Frames Received Register
65 to 127 Byte Frames Transmitted Register	512 to 1023 Byte Frames Received Register
128 to 255 Byte Frames Transmitted Register	1024 to 1518 Byte Frames Received Register
256 to 511 Byte Frames Transmitted Register	1519 to Maximum Byte Frames Received Register
512 to 1023 Byte Frames Transmitted Register	Undersize Frames Received Register
1024 to 1518 Byte Frames Transmitted Register	Oversize Frames Received Register
Greater Than 1518 Byte Frames Transmitted Register	Jabbers Received Register
Transmit Underruns Register	Frame Check Sequence Errors Register
Single Collision Frames Register	Length Field Frame Errors Register
Multiple Collision Frames Register	Receive Symbol Errors Register
Excessive Collisions Register	Alignment Errors Register
Late Collisions Register	Receive Resource Errors Register
Deferred Transmission Frames Register	Receive Overrun Register
Carrier Sense Errors Register	IP Header Checksum Errors Register
Octets Received Low Register	TCP Checksum Errors Register
Octets Received High Register	UDP Checksum Errors Register
Frames Received Register	

These registers reset to zero on a read and stick at all ones when they count to their maximum value. They should be read frequently enough to prevent loss of data.

The receive statistics registers are only incremented when the receive enable bit (RXEN) is set in the Network Control register.

Once a statistics register has been read, it is automatically cleared. When reading the Octets Transmitted and Octets Received registers, bits 31:0 should be read prior to bits 47:32 to ensure reliable operation.

	WESTAT	INCSTAT	CLRSTAT	MPE	TXEN	RXEN	LBL	
Access	R/W	W	W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	

Bit 30 – IFGQAVCRED Credit-Based Shaping Algorithm Modification

Value	Description
0	No modification of the CBS algorithm.
1	Modifies the CBS algorithm so the IFG/IPG associated with a transmit frame counts towards its 802.1Qav credit.

Bit 27 – OSSCORR OSS Correction Field
1588 One Step Correction field update. Set this bit high to update the correction field of PTP 1588 version 2 sync frames by adding current TSU timer value.

Bit 26 – EXTSELRQEN External Selection of Receive Queue Enable

Value	Description
0	Disables external selection of receive queue.
1	Enables external selection of receive queue.

Bit 25 – PFCCTL Multiple PFC Pause Quantum Enable

Value	Description
0	Disables multiple PFC pause quantums.
1	Enables multiple PFC pause quantums, one per pause priority.

Bit 24 – OSSMODE One Step Sync Mode

Value	Description
0	1588 One Step Sync mode is disabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	1588 One Step Sync mode is enabled. Replaces timestamp field in the 1588 header for TX Sync Frames with the current TSU timer value.

Bit 22 – STUDPOFFSET Store UDP Offset
Stores UDP/TCP offset to memory.

Value	Description
0	Normal operations.
1	The upper 16 bits of the CRC of every received frame are replaced with the offset from start of frame to the beginning of the UDP or TCP header. The lower 16 bits of the CRC are replaced with zero and reserved for future use. The offset is measured in units of 2 bytes.

Bit 20 – PTPUNIENA Detection of Unicast PTP Frames Enable

Value	Description
0	Disables detection of unicast PTP frames.
1	Enables detection of unicast PTP frames.

Bit 19 – TXLPIEN Enable LPI Transmission
When set, LPI (low power idle) is immediately transmitted.

Bit 18 – FNP Flush Next Packet
Flush the next packet from the external receive memory. Writing one to this bit will only have an effect if the DMA is not currently writing a packet already stored in the receive memory to system memory.

Value	Description
0	No effect.
1	Flushes the next packet from the receive memory. This will only have an effect if the DMA is not currently writing a packet already stored in the receive memory to system memory.

Bit 17 – TXPBPF Transmit PFC Priority-based Pause Frame

Value	Description
0	No effect.
1	Takes the values stored in the Transmit PFC Pause Register.

Bit 16 – ENPBPR Enable PFC Priority-based Pause Reception
Enables PFC Priority Based Pause Reception capabilities. Setting this bit enables PFC negotiation and recognition of priority-based pause frames.

Bit 15 – SRTSM Store Receive Timestamp to Memory

Value	Description
0	No effect.
1	Causes the CRC of every received frame to be replaced with the value of the nanoseconds field of the 1588 timer that was captured as the receive frame passed the message timestamp point. Note that bit RFCS in register GMAC_NCFGR may not be set to 1 when the timer should be captured.

Bit 12 – TXZQPF Transmit Zero Quantum Pause Frame

Value	Description
0	No effect.
1	Generates a pause frame with zero quantum to be transmitted.

Bit 11 – TXPF Transmit Pause Frame

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Generates a pause frame to be transmitted.

Bit 10 – THALT Transmit Halt

Value	Description
0	No effect.
1	Halts transmission as soon as any ongoing frame transmission ends.

Bit 9 – TSTART Start Transmission

Value	Description
0	No effect.
1	Starts transmission.

Bit 8 – BP Back Pressure

Value	Description
0	No effect.
1	When the MAC is set in 10M or 100M Half Duplex mode, forces collisions on all received frames. Ignored in Gigabit Half Duplex mode.

Bit 7 – WESTAT Write Enable for Statistics Registers

Value	Description
0	Forces the statistics registers to be in read-only mode for normal operation mode.
1	Makes the statistics registers writable for functional test purposes.

Bit 6 – INCSTAT Increment Statistics Registers

Bit 5 – CLRSTAT Clear Statistics Registers

Value	Description
0	No effect.
1	Clears the statistics registers.

Bit 4 – MPE Management Port Enable

Set to one to enable the management port. When zero, forces GMDIO to high impedance state and MDC low.

Value	Description
0	Forces GMDIO to high impedance state and MDC low.
1	Enables the management port.

Bit 3 – TXEN Transmit Enable

Value	Description
0	Stops transmission immediately, the transmit pipeline and control registers will be cleared and the Transmit Queue Pointer register will reset to point to the start of the transmit descriptor list.
1	Enables the GMAC transmitter to send data.

Bit 2 – RXEN Receive Enable

When set, RXEN enables the GMAC to receive data. When reset frame reception stops immediately and the receive pipeline will be cleared. The Receive Queue Pointer register is unaffected.

Value	Description
0	Stops frame reception immediately and the receive pipeline will be cleared. The Receive Queue Pointer register is unaffected.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Enables the GMAC to receive data.

Bit 1 – LBL Loop Back Local

Value	Description
0	Normal operating mode (no loop back).
1	Connects GTX to GRX, GTXEN to GRXDV and forces Full Duplex mode. GRXCK and GTXCK may malfunction as the GMAC is switched into and out of internal loop back. It is important that receive and transmit circuits have already been disabled when making the switch into and out of internal loop back.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.2. GMAC Network Configuration Register

Name: GMAC_NCFGR
Offset: 0x004
Reset: 0x00080000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
		IRXER	RXBP	IPGSEN		IRXFCS	EFRHD	RXCOEN
Access		R/W	R/W	R/W		R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	1	0	0	0

Bit	15	14	13	12	11	10	9	8
	RXBUFO[1:0]		PEN	RTY		GBE		MAXFS
Access	R/W	R/W	R/W	R/W		R/W		R/W
Reset	0	0	0	0		0		0

Bit	7	6	5	4	3	2	1	0
	UNIHEN	MTIHEN	NBC	CAF	JFRAME	DNVLAN	FD	SPD
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 30 – IRXER Ignore Receive Error from PHY
When set, GRXER has no effect on the GMAC's operation when GRXDV is low. Set this bit when using the RGMII wrapper in Half Duplex mode.

Bit 29 – RXBP Receive Bad Preamble
When set, frames with non-standard preamble are not rejected.

Bit 28 – IPGSEN IP Stretch Enable
When set, the transmit IPG can be increased above 96 bit times depending on the previous frame length using the IPG Stretch Register.

Bit 26 – IRXFCS Ignore RX FCS
When set, frames with FCS/CRC errors will not be rejected. FCS error statistics will still be collected for frames with bad FCS and FCS status will be recorded in frame's DMA descriptor. For normal operation this bit must be set to zero.

Bit 25 – EFRHD Enable Frames Received in Half Duplex
Enable frames to be received in half-duplex mode while transmitting.

Bit 24 – RXCOEN Receive Checksum Offload Enable
When set, the receive checksum engine is enabled. Frames with bad IP, TCP or UDP checksums are discarded.

Bit 23 – DCPF Disable Copy of Pause Frames
Set to one to prevent valid pause frames being copied to memory. When set, pause frames are not copied to memory regardless of the state of the Copy All Frames bit, whether a hash match is found

© 2026 Microchip Technology Inc. and its subsidiaries

or whether a type ID match is identified. If a destination address match is found, the pause frame will be copied to memory. Note that valid pause frames received will still increment pause statistics and pause the transmission of frames as required.

Bits 22:21 – DBW[1:0] Data Bus Width
Must always be written to '0'.

Bits 20:18 – CLK[2:0] MDC Clock Division
Set according to MCK speed. These three bits determine the number MCK will be divided by to generate Management Data Clock (MDC). For conformance with the 802.3 specification, MDC must not exceed 2.5 MHz (MDC is only active during MDIO read and write operations).

Value	Name	Description
0	MCK_8	MCK divided by 8 (MCK up to 20 MHz)
1	MCK_16	MCK divided by 16 (MCK up to 40 MHz)
2	MCK_32	MCK divided by 32 (MCK up to 80 MHz)
3	MCK_48	MCK divided by 48 (MCK up to 120 MHz)
4	MCK_64	MCK divided by 64 (MCK up to 160 MHz)
5	MCK_96	MCK divided by 96 (MCK up to 240 MHz)

Bit 17 – RFCS Remove FCS
Setting this bit will cause received frames to be written to memory without their frame check sequence (last 4 bytes). The frame length indicated will be reduced by four bytes in this mode.

Bit 16 – LFERD Length Field Error Frame Discard
Setting this bit causes frames with a measured length shorter than the extracted length field (as indicated by bytes 13 and 14 in a non-VLAN tagged frame) to be discarded. This only applies to frames with a length field less than 0x0600.

Bits 15:14 – RXBUFO[1:0] Receive Buffer Offset
Indicates the number of bytes by which the received data is offset from the start of the receive buffer

Bit 13 – PEN Pause Enable
When set, transmission will pause if a non-zero 802.3 classic pause frame is received and PFC has not been negotiated.

Bit 12 – RTY Retry Test
Must be set to zero for normal operation. If set to one the backoff between collisions will always be one slot time. Setting this bit to one helps test the too many retries condition. Also used in the pause frame tests to reduce the pause counter's decrement time from 512 bit times, to every GRXCK cycle.

Bit 10 – GBE Gigabit Mode Enable
Setting this bit configures the GMAC for 1000 Mbps operation.

Value	Description
0	10/100 operation.
1	Gigabit operation.

Bit 8 – MAXFS 1536 Maximum Frame Size
Setting this bit means the GMAC will accept frames up to 1536 bytes in length. Normally the GMAC would reject any frame above 1518 bytes.

Bit 7 – UNIHEN Unicast Hash Enable
When set, unicast frames will be accepted when the 6-bit hash function of the destination address points to a bit that is set in the Hash Register.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 6 – MTIHEN Multicast Hash Enable
When set, multicast frames will be accepted when the 6-bit hash function of the destination address points to a bit that is set in the Hash Register.

Bit 5 – NBC No Broadcast
When set to logic one, frames addressed to the broadcast address of all ones will not be accepted.

Bit 4 – CAF Copy All Frames
When set to logic one, all valid frames will be accepted.

Bit 3 – JFRAME Jumbo Frame Size
Set to one to enable jumbo frames up to 16383 bytes to be accepted. The default length is 10240 bytes.

Bit 2 – DNVLAN Discard Non-VLAN FRAMES
When set, only VLAN tagged frames will be passed to the address matching logic.

Bit 1 – FD Full Duplex
If set to logic one, the transmit block ignores the state of collision and carrier sense and allows receive while transmitting.

Bit 0 – SPD Speed
Set to logic one to indicate 100 Mbps operation, logic zero for 10 Mbps.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.3. GMAC Network Status Register

Name: GMAC_NSR
Offset: 0x008
Reset: see Note
Property: Read-only

Note: The register reset value is either 0x00000004 or 0x00000006 depending on the status of the GMDIO input pin.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
	RXLPIS	PFCPAUSN				IDLE	MDIO	
Access	R	R				R	R	
Reset	0	0				1	x	

Bit 7 – RXLPIS LPI Indication
Low power idle has been detected on receive. This bit is set when LPI is detected and reset when normal idle is detected. An interrupt is generated when the state of this bit changes.

Bit 6 – PFCPAUSN PFC Pause Negotiated
Set when PFC Priority-based Pause has been negotiated.

Bit 2 – IDLE PHY Management Logic Idle
The PHY management logic is idle (i.e., has completed).

Bit 1 – MDIO MDIO Input Status
Returns status of the GMDIO pin.

		HDFLCTLEN				REFCLK	MIM[1:0]	
Access		R/W				R/W	R/W	R/W
Reset		0				0	0	0

Bit 6 – HDFLCTLEN Half Duplex Flow Control Enable

Value	Description
0	Half duplex flow control is disabled.
1	Half duplex flow control is enabled.

Bit 2 – REFCLK Source for the GMAC Reference Clock

Value	Name	Description
0	INTERNAL_GCLK	Selects the GCLK from PMC.
1	EXTERNAL	Selects the clock from an IO.

Bits 1:0 – MIM[1:0] Media Interface Mode

Value	Name	Description
0	–	Reserved
1	RMII	Selects RMII mode.
2	RGMII	Selects RGMII mode.

	ESPA	ESMA		FBLDO[4:0]				
Access	R/W	R/W		R/W	R/W	R/W	R/W	R/W
Reset	0	0		0	0	0	0	0

Bit 29 – TXBD_EXTENDED Transmit Buffer Descriptor Extended Mode
See GMAC Transmit Buffer Data Control Register for a description of the features.

Value	Description
0	Disables Transmit Buffer Data Extended mode.
1	Enables Transmit Buffer Data Extended mode.

Bit 28 – RXBD_EXTENDED Receive Buffer Descriptor Extended Mode
See GMAC Receive Buffer Data Control Register for a description of the features.

Value	Description
0	Disables Receive Buffer Data Extended mode.
1	Enables Receive Buffer Data Extended mode.

Bit 26 – TXFOMAXB Force Transmit Max Burst Length
Forces the transmit DMA to always issue max length bursts on EOP (end of packet) or EOB (end of buffer) transfers as defined in FBLDO, even when there is less than max burst data bytes to read. Residual data read is ignored. Does not apply to bursts that break 1k boundary rule.

Bit 25 – RXFOMAXB Force Receive Max Burst Length
Forces the receive DMA to always issue max length bursts on EOP (end of packet) or EOB (end of buffer) transfers, even if there is less than max burst real packet data required to write. Any extra bytes of pad data is set to 0x00. Does not apply to bursts that break 1k boundary rule.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 24 – DDRP DMA Discard Receive Packets

When set, the GMAC DMA automatically discards receive packets from the receiver packet buffer memory when no system memory resource is available.
When low, the received packets remain to be stored in the GMAC local memory packet buffer until a system memory buffer resource becomes available.
A write to this bit is ignored if the DMA is not configured in the packet buffer full store and forward mode.

Bits 23:16 – DRBS[7:0] DMA Receive Buffer Size

DMA receive buffer size in system memory. The value defined by these bits determines the size of buffer to use in main system memory when writing received data.
The value is defined in multiples of 64 bytes, thus a value of 0x01 corresponds to buffers of 64 bytes, 0x02 corresponds to 128 bytes etc.
For example:
– 0x02: 128 bytes
– 0x18: 1536 bytes (1 × max length frame/buffer)
– 0xA0: 10240 bytes (1 × 10K jumbo frame/buffer)
Note that this value should never be written as zero.

Bit 13 – CRCERRREP CRC Errors Report

Value	Description
0	Bit 16 of the receive buffer descriptor represents the Canonical format indicator (CFI) bit as extracted from the receive frame (if the receive buffer descriptor is pointing to the last data buffer of the receive frame and the received frame was VLAN tagged).
1	Bit 16 of the receive buffer descriptor represents the FCS/CRC error (only if frames with FCS are copied to memory as enabled by bit 26 in the Network Configuration register).

Bit 12 – INFLASTEN Infinite Size for Last Buffer Enable

Set to one, this forces the receive DMA to consider the data buffer pointed to by the last descriptor in the descriptor list to be of definite size.

Bit 11 – TXCOEN Transmitter Checksum Generation Offload Enable

Transmitter IP, TCP and UDP checksum generation offload enable. When set, the transmitter checksum generation engine is enabled to calculate and substitute checksums for transmit frames. When clear, frame data is unaffected.

Bit 10 – TXPBMS Transmitter Packet Buffer Memory Size Select

Having this bit at zero halves the amount of memory used for the transmit packet buffer. This reduces the amount of memory used by the GMAC. It is important to set this bit to one if the full configured physical memory is available. The value in brackets below represents the size that would result for the default maximum configured memory size of 4 Kbytes.

Value	Name	Description
0	TWO_KB	Do not use top address bit (2 Kbytes).
1	FOUR_KB	Use full configured addressable space (4 Kbytes).

Bits 9:8 – RXBMS[1:0] Receiver Packet Buffer Memory Size Select

The default receive packet buffer size is 8 Kbytes. The table below shows how to configure this memory to FULL, HALF, QUARTER or EIGHTH of the default size.

Value	Name	Description
0	EIGHTH	8/8 Kbyte memory size
1	QUARTER	8/4 Kbytes memory size
2	HALF	8/2 Kbytes memory size
3	FULL	8 Kbytes memory size

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 7 – ESPA Endian Swap Mode Enable for Packet Data Accesses
When set, selects swapped endianism for system bus transfers. When clear, selects Little Endian mode.

Value	Name	Description
0	LITTLE_ENDIAN	Selects Little-endian endianism for system bus transfers.
1	BIG_ENDIAN	Selects swapped endianism for system bus transfers.

Bit 6 – ESMA Endian Swap Mode Enable for Management Descriptor Accesses
When set, selects swapped endianism for system bus transfers. When clear, selects Little Endian mode.

Value	Name	Description
0	LITTLE_ENDIAN	Selects Little-endian endianism for system bus transfers.
1	BIG_ENDIAN	Selects swapped endianism for system bus transfers.

Bits 4:0 – FBLDO[4:0] Fixed Burst Length for DMA Data Operations
Selects the burst length to attempt to use on the system bus when transferring frame data. Not used for DMA management operations and only used where space and data size allow. Otherwise system bus single type accesses are used.

Value	Name	Description
0	–	Reserved
1	SINGLE	Always use single access on system bus
2	–	Reserved
4	INCR4	Attempt to use 4-beat bursts on system bus (Default)
8	INCR8	Attempt to use 8-beat bursts on system bus bursts
16	INCR16	Attempt to use 16-beat bursts on system bus bursts

64.8.6. GMAC Transmit Status Register

Name: GMAC_TSR
Offset: 0x014
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
						TXDMALCK	TXMACLCK	HRESP
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
	LCO		TXCOMP	TFC	TXGO	RLE	COL	UBR
Access	R/W		R/W	R/W	R	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

Bit 10 – TXDMALCK Transmit DMA Lockup (Clear by Writing a 1)
Set when lockup has been detected on the DMA transmit path. Writing a one clears this bit.

Bit 9 – TXMACLCK Transmit MAC Lockup (Clear by Writing a 1)
Set when lockup has been detected on the MAC transmit path. Writing a one clears this bit.

Bit 8 – HRESP System Bus Response
Set when the DMA block sees a system bus error. Writing a one clears this bit.

Bit 7 – LCO Late Collision Occurred
Only set if the condition occurs in Gigabit mode, as retry is not attempted. Writing a one clears this bit.

Bit 5 – TXCOMP Transmit Complete
Set when a frame has been transmitted. Writing a one clears this bit.

Bit 4 – TFC Transmit Frame Corruption Due to System Bus Error
Transmit frame corruption due to system bus error. Set if an error occurs while midway through reading transmit frame from the system bus, including system bus errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and GTXER asserted).
Also set in DMA packet buffer mode if single frame is too large for configured packet buffer memory size.
Writing a one clears this bit.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 3 – TXGO Transmit Go (Read only)
When high, transmit is active. When using the DMA interface, this bit represents the TXGO variable as specified in the transmit buffer description.

Bit 2 – RLE Retry Limit Exceeded
Writing a one clears this bit.

Bit 1 – COL Collision Occurred
Set by the assertion of collision. Writing a one clears this bit. When operating in 10/100 mode, this status indicates either a collision or a late collision. In gigabit mode, this status is not set for a late collision.

Bit 0 – UBR Used Bit Read
Set when a transmit buffer descriptor is read with its used bit set. Writing a one clears this bit.

64.8.7. GMAC Receive Buffer Queue Base Address Register

Name: GMAC_RBQB
Offset: 0x018
Reset: 0x00000000
Property: Read/Write

This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the Network Control Register. Once reception is enabled, any write to the Receive Buffer Queue Base Address Register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the “used” bits.

The descriptors must be aligned at 32-bit boundaries and the descriptors are written to using two individual non sequential accesses.

Bit	31	30	29	28	27	26	25	24
	ADDR[29:22]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits 31:2 – ADDR[29:0] Receive Buffer Queue Base Address
Written with the address of the start of the receive queue.

Bit 0 – RXQDIS Receive Queue Disable

Value	Description
0	Queue is enabled.
1	Queue is disabled. Used to reduce the number of active queues and should only be changed while receive is not enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.8. GMAC Transmit Buffer Queue Base Address Register

Name: GMAC_TBQB
Offset: 0x01C
Reset: 0x00000000
Property: Read/Write

This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The Transmit Buffer Queue Base Address Register must be initialized before transmit is started through bit 9 of the Network Control Register. Once transmission has started, any write to the Transmit Buffer Queue Base Address Register is illegal and therefore ignored.

Note that due to clock boundary synchronization, it takes a maximum of four MCK cycles from the writing of the transmit start bit before the transmitter is active. Writing to the Transmit Buffer Queue Base Address Register during this time may produce unpredictable results.

Reading this register returns the location of the descriptor currently being accessed. Since the DMA handles two frames at once, this may not necessarily be pointing to the current frame being transmitted.

The descriptors must be aligned at 32-bit boundaries and the descriptors are read from memory using two individual non sequential accesses.

Bit	31	30	29	28	27	26	25	24
	ADDR[29:22]

Bits 31:2 – ADDR[29:0] Transmit Buffer Queue Base Address
Written with the address of the start of the transmit queue.

Bit 0 – TXQDIS Transmit Queue Disable

Value	Description
0	Queue is enabled.
1	Queue is disabled. Used to reduce the number of active queues and should only be changed while transmit is not enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.9. GMAC Receive Status Register

Name: GMAC_RSR
Offset: 0x020
Reset: 0x00000000
Property: Read/Write

This register, when read, provides receive status details. Once read, individual bits may be cleared by writing a one to them. It is not possible to set a bit to 1 by writing to the register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			RXDMALCK	RXMACLCK	HNO	RXOVR	REC	BNA
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 5 – RXDMALCK Receive DMA Lockup (Clear by Writing a 1)
Set when lockup has been detected on the DMA receive path. Writing a one clears this bit.

Bit 4 – RXMACLCK Receive MAC Lockup (Clear by Writing a 1)
Set when lockup has been detected on the MAC receive path. Writing a one clears this bit.

Bit 3 – HNO System Bus Error
Set when the DMA block sees a system bus error. Writing a one clears this bit.

Bit 2 – RXOVR Receive Overrun
This bit is set if the receive status was not taken at the end of the frame. This bit is also set if the packet buffer overflows. The buffer will be recovered if an overrun occurs. Writing a one clears this bit.

Bit 1 – REC Frame Received
One or more frames have been received and placed in memory. Writing a one clears this bit.

Bit 0 – BNA Buffer Not Available
An attempt was made to get a new buffer and the pointer indicated that it was owned by the processor. The DMA will re-read the pointer each time an end of frame is received until a valid pointer is found. This bit is set following each descriptor read attempt that fails, even if consecutive pointers are unsuccessful and software has in the mean time cleared the status flag. Writing a one clears this bit.

64.8.10. GMAC Interrupt Status Register

Name: GMAC_ISR
Offset: 0x024
Reset: 0x00000000
Property: Read-only

This register indicates the source of the interrupt. In order that the bits of this register read 1, the corresponding interrupt source must be enabled in the mask register. If any bit is set in this register, the GMAC interrupt signal will be asserted in the system.

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 31 – TXLCK Transmit Path Lockup Detected

Bit 30 – RXLCK Receive Path Lockup Detected

Bit 29 – TSUTIMCOMP TSU Timer Comparison (cleared on read)
Indicates when the TSU timer count value is equal to programmed value.

Bit 28 – WOL Wake On LAN
WOL interrupt. Indicates a WOL event has been received.

Bit 27 – RXLPISBC Receive LPI indication Status Bit Change (cleared on read)
Receive LPI indication status bit change.

Bit 26 – SRI TSU Seconds Register Increment (cleared on read)
Indicates the register has incremented.

Bit 25 – PDRSFT PDelay Response Frame Transmitted (cleared on read)
Indicates a PTP pdelay_resp frame has been transmitted.

Bit 24 – PDRQFT PDelay Request Frame Transmitted (cleared on read)
Indicates a PTP pdelay_req frame has been transmitted.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 23 – PDRSFR PDelay Response Frame Received (cleared on read)
Indicates a PTP pdelay_resp frame has been received.

Bit 22 – PDRQFR PDelay Request Frame Received
Indicates a PTP pdelay_req frame has been received.

Bit 21 – SFT PTP Sync Frame Transmitted (cleared on read)
Indicates a PTP sync frame has been transmitted.

Bit 20 – DRQFT PTP Delay Request Frame Transmitted (cleared on read)
Indicates a PTP delay_req frame has been transmitted. (cleared on read)

Bit 19 – SFR PTP Sync Frame Received (cleared on read)
Indicates a PTP sync frame has been received.

Bit 18 – DRQFR PTP Delay Request Frame Received (cleared on read)
Indicates a PTP delay_req frame has been received.

Bit 14 – PFTR Pause Frame Transmitted (cleared on read)
Indicates a pause frame has been successfully transmitted after being initiated from the Network Control register.

Bit 13 – PTZ Pause Time Zero (cleared on read)
Set when either the Pause Time register at address 0x38 decrements to zero, or when a valid pause frame is received with a zero pause quantum field.

Bit 12 – PFNZ Pause Frame with Non-zero Pause Quantum Received (cleared on read)
Indicates a valid pause has been received that has a non-zero pause quantum field.

Bit 11 – HRESP System Bus Error (cleared on read)
Set when the DMA block sees a system bus error.

Bit 10 – ROVR Receive Overrun (cleared on read)
Set when the receive overrun status bit is set.

Bit 7 – TCOMP Transmit Complete (cleared on read)
Set when a frame has been transmitted.

Bit 6 – TFC Transmit Frame Corruption Due to System Bus Error (cleared on read)
Set if an error occurs while midway through reading transmit frame from the system bus, including system bus error and buffers exhausted mid frame.

Bit 5 – RLEX Retry Limit Exceeded or Late Collision (cleared on read)
Transmit error. Late collision will only cause this status bit to be set in Gigabit mode, as a retry is not attempted.

Bit 4 – TUR Transmit Underrun (cleared on read)
This interrupt is set if the transmitter was forced to terminate a frame that it has already began transmitting due to further data being unavailable.
This interrupt is set if a transmitter status write back has not completed when another status write back is attempted.
This interrupt is also set when the transmit DMA has written the SOP data into the FIFO and either the system bus was not granted in time for further data, or because a system bus error response was returned, or because the used bit was read.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 3 – TXUBR TX Used Bit Read (cleared on read)
Set when a transmit buffer descriptor is read with its used bit set.

Bit 2 – RXUBR RX Used Bit Read (cleared on read)
Set when a receive buffer descriptor is read with its used bit set.

Bit 1 – RCOMP Receive Complete (cleared on read)
A frame has been stored in memory.

Bit 0 – MFS Management Frame Sent (cleared on read)
The PHY Maintenance Register has completed its operation.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.11. GMAC Interrupt Enable Register

Name: GMAC_IER
Offset: 0x028
Reset: –
Property: Write-only

This register is write-only and when read will return zero.

The following values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

64.8.13. GMAC Interrupt Mask Register

Name: GMAC_IMR
Offset: 0x030
Reset: 0x07FFFFFF
Property: Read/Write

The Interrupt Mask Register is a read-only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the Interrupt Enable Register or set individually by writing to the Interrupt Disable Register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the Interrupt Mask Register.

For test purposes there is a write-only function to this register that allows the bits in the Interrupt Status Register to be set or cleared, regardless of the state of the mask register. A write to this register directly affects the state of the corresponding bit in the Interrupt Status Register, causing an interrupt to be generated if a 1 is written.

The following values are valid for all listed bit names of this register when read:

0: The corresponding interrupt is enabled.

1: The corresponding interrupt is not enabled.

64.8.14. GMAC PHY Maintenance Register

Name: GMAC_MAN
Offset: 0x034
Reset: 0x00000000
Property: Read/Write

The PHY Maintenance Register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit 2 is set in the Network Status Register. It takes about 2000 MCK cycles to complete, when MDC is set for MCK divide by 32 in the Network Configuration Register. An interrupt is generated upon completion.

During this time, the MSB of the register is output on the GMDIO pin and the LSB updated from the GMDIO pin with each MDC cycle. This causes transmission of a PHY management frame on the GMDIO pin. See Section 22.2.4.5 of the IEEE 802.3 standard.

Reading during the shift operation returns the current contents of the shift register. At the end of management operation, the bits will have shifted back to their original locations. For a read operation, the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bit 30 should be written with a 0 rather than a 1. To write clause 45 PHYs, bits 31:28 should be written as 0x0001. See the table below.

Table 64.16. Clause 22/Clause 45 PHYs Read/Write Access Configuration (GMAC_MAN Bits 31:28)

PHY	Access	Bit Value			
		WZO	CLTTO	OP[1]	OP[0]
Clause 22	Read	0	1	1	0
	Write	0	1	0	1
Clause 45	Read	0	0	1	1
	Write	0	0	0	1
	Read + Address	0	0	1	0

For a description of MDC generation, see GMAC Network Configuration Register.

Reset	1	1	1	1	1	1	1	1

Bit 31 – TXDMA_LCKUP_EN Transmit DMA Lockup Detector Enable

Value	Description
0	Disables the monitor that detects lockups in the transmit DMA.
1	Enables the monitor that detects lockups in the transmit DMA.

Bit 30 – TXMAC_LCKUP_EN Transmit MAC Lockup Detector Enable

Value	Description
0	Disables the monitor that detects lockups in the transmit MAC.
1	Enables the monitor that detects lockups in the transmit MAC.

Bit 29 – RXDMA_LCKUP_EN Receive DMA Lockup Detector Enable

Value	Description
0	Disables the monitor that detects lockups in the receive DMA.
1	Enables the monitor that detects lockups in the receive DMA.

Bit 28 – RXMAC_LCKUP_EN Receive MAC Lockup Detector Enable

Value	Description
0	Disables the monitor that detects lockups in the receive MAC.
1	Enables the monitor that detects lockups in the receive MAC.

Bit 27 – LCKUP_REC_EN Lockup Recovery Enable

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Forces the MAC in Reset mode when a lockup is detected on the transmit or receive data paths.

Bits 26:16 – DMA_LOCKUP_TIME[10:0] Timeout Value for Receive and Transmit DMA
Defines the timeout value for receive and transmit DMA lockup detection, defined as a multiple of the prescaler value (PRESCALER). The MAC lockup time is defined in a separate configuration register (GMAC_LCKUP_TIME).

Bits 15:0 – PRESCALER[15:0] Prescaler Value for Timeout
Defines the prescaler value which is a multiple of the transmit clock.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.23. GMAC MAC Lockup Time Register

Name: GMAC_LCKUP_TIME
Offset: 0x06C
Reset: 0x07FFFFFF
Property: Read/Write

Bit	31	30	29	28	27	26	25	24

Bits 31:0 – ADDR[31:0] Hash Address
The first 32 bits of the Hash Address Register.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.27. GMAC Hash Register Top

Name: GMAC_HRT
Offset: 0x084
Reset: 0x00000000
Property: Read/Write

The unicast hash enable (UNIHEN) and the multicast hash enable (MITIHEN) bits in the GMAC Network Configuration Register enable the reception of hash matched frames. See Hash Addressing.

Bits 15:0 – FL[15:0] Frame Length

Bits 7:0 are multiplied with the previously transmitted frame length (including preamble). Bits 15:8 +1 divide the frame length. If the resulting number is greater than 96 and bit 28 is set in the Network Configuration Register then the resulting number is used for the transmit inter-packet-gap. 1 is added to bits 15:8 to prevent a divide by zero. See MAC Transmit Block.

	VLAN_TYPE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 31 – ESVLAN Enable Stacked VLAN Processing Mode

Value	Description
0	Disable the stacked VLAN processing mode
1	Enable the stacked VLAN processing mode

Bits 15:0 – VLAN_TYPE[15:0] User Defined VLAN_TYPE Field
User defined VLAN_TYPE field. When Stacked VLAN is enabled, the first VLAN tag in a received frame will only be accepted if the VLAN type field is equal to this user defined VLAN_TYPE, OR equal to the standard VLAN type (0x8100). Note that the second VLAN tag of a Stacked VLAN packet will only be matched correctly if its VLAN_TYPE field equals 0x8100.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:8 – PQ[7:0] Pause Quantum
If bit 17 of the Network Control Register is written with a one then for each entry equal to zero in the Transmit PFC Pause Register[15:8], the PFC pause frame's pause quantum field associated with that entry will be taken from the Transmit Pause Quantum Register. For each entry equal to one in the Transmit PFC Pause Register [15:8], the pause quantum associated with that entry will be zero.

Bits 7:0 – PEV[7:0] Priority Enable Vector
If bit 17 of the Network Control Register is written with a one then the priority enable vector of the PFC priority based pause frame will be set equal to the value stored in this register [7:0].

Bit	7	6	5	4	3	2	1	0
					MSBADDRMSK[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 31:28 – MSBADDR[3:0] MSB of the Receive Data Buffer Address
Values used to force bits 31:28 of the receive data buffer address to a particular value when the associated enable bits stored in this register [3:0] are set.
Any changes to this register are ignored while the DMA is processing a receive packet. It only affects the next full packet to be written to external system memory.

Bits 3:0 – MSBADDRMSK[3:0] Mask of the Receive Data Buffer Address
These bits are associated directly with bits[31:28].
When bit 0 is set, the address bit 28 used for accessing the receive data buffers will be forced to the value stored in bit 28 of this register.
When bit 1 is set, the address bit 29 used for accessing the receive data buffers will be forced to the value stored in bit 29 of this register.
When bit 2 is set, the address bit 30 used for accessing the receive data buffers will be forced to the value stored in bit 30 of this register.
When bit 3 is set, the address bit 31 used for accessing the receive data buffers will be forced to the value stored in bit 31 of this register.
When these bits are clear, the associated value stored in bits 31:28 have no effect on the address used for receive data buffer accesses.
Any changes to this registerare ignored while the DMA is processing a receive packet. It only affects the next full packet to be written to external memory.

	LCOL[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – LCOL[9:0] Late Collisions
Counts the number of late collisions occurring after the slot time (512 bits) has expired. In 10/100 mode, late collisions are counted twice i.e., both as a collision and a late collision. In Gigabit mode, a late collision causes the transmission to be aborted, thus the single and multi collision registers are not updated.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.74. GMAC Deferred Transmission Frames Register

Name: GMAC_DTF
Offset: 0x148
Reset: 0x00000000

	CSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – CSR[9:0] Carrier Sense Error

This register counts the number of frames transmitted where carrier sense was not seen during transmission or where carrier sense was deasserted after being asserted in a transmit frame without collision (no underrun). Only incremented in half duplex mode. The only effect of a carrier sense error is to increment this register. The behavior of the other statistics registers is unaffected by the detection of a carrier sense error.

Bits 31:0 – NFRX[31:0] 1519 to Maximum Byte Frames Received without Error
This register counts the number of 1519 byte or above frames successfully received without error. Maximum frame size is determined by the Network Configuration Register bit 8 (1536 maximum frame size) or bit 3 (jumbo frame size). Excludes pause frames, and is only incremented if the frame is successfully filtered and copied to memory. See GMAC Network Configuration Register.

	UFRX[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – UFRX[9:0] Undersize Frames Received
Counts the number of frames received less than 64 bytes in length (10/100 mode or Gigabit mode, full duplex) that do not have either a CRC error or an alignment error. In Gigabit mode, half duplex, this register counts either frames not conforming to the minimum slot time of 512 bytes or frames not conforming to the minimum frame size once bursting is active.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.90. GMAC Oversized Frames Received Register

Name: GMAC_OFR
Offset: 0x188
Reset: 0x00000000
Property: Read-only

Bits 9:0 – OFRX[9:0] Oversized Frames Received
This register counts the number of frames received exceeding 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register , 10240 bytes if bit 3 is set in the Network Configuration Register) in length but do not have either a CRC error, an alignment error nor a receive symbol error. See GMAC Network Configuration Register.

	FCKR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – FCKR[9:0] Frame Check Sequence Errors
The register counts frames that are an integral number of bytes, have bad CRC and are between 64 and 1518 bytes in length (1536 if bit 8 is set in Network Configuration Register, 10240 bytes if bit 3 is set in the Network Configuration Register). This register is also incremented if a symbol error is detected and the frame is of valid length and has an integral number of bytes.
This register is incremented for a frame with bad FCS, regardless of whether it is copied to memory due to ignore FCS mode being enabled in bit 26 of the Network Configuration Register. See GMAC Network Configuration Register.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.93. GMAC Length Field Frame Errors Register

Name: GMAC_LFFE

	LFER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – LFER[9:0] Length Field Frame Errors
This register counts the number of frames received that have a measured length shorter than that extracted from the length field (bytes 13 and 14). This condition is only counted if the value of the length field is less than 0x0600, the frame is not of excessive length and checking is enabled through bit 16 of the Network Configuration Register. See GMAC Network Configuration Register.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.94. GMAC Receive Symbol Errors Register

Name: GMAC_RSE
Offset: 0x198

	RXSE[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – RXSE[9:0] Receive Symbol Errors

This register counts the number of frames that had GRXER asserted during reception. For 10/100 mode symbol errors are counted regardless of frame length checks. For Gigabit mode the frame must satisfy slot time requirements in order to count a symbol error. Additionally, in Gigabit half duplex mode, carrier extension errors are also recorded. Receive symbol errors will also be counted as an FCS or alignment error if the frame is between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register, 10240 bytes if bit 3 is set in the Network Configuration Register). If the frame is larger it will be recorded as a jabber error. See GMAC Network Configuration Register.

	AER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – AER[9:0] Alignment Errors
This register counts the frames that are not an integral number of bytes long and have bad CRC when their length is truncated to an integral number of bytes and are between 64 and 1518 bytes in length (1536 if bit 8 is set in Network Configuration Register, 10240 bytes if bit 3 is set in the Network Configuration Register). This register is also incremented if a symbol error is detected and the frame is of valid length and does not have an integral number of bytes. See GMAC Network Configuration Register.

Bits 7:0 – UCKER[7:0] UDP Checksum Errors
This register counts the number of frames discarded due to an incorrect UDP checksum, but are between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register, 10240 bytes if bit 3 is set in the Network Configuration Register) and do not have a CRC error, an alignment error, nor a symbol error.

Bits 15:0 – COUNT[15:0] Flushed Received Packets Count (cleared on read)
Counts the number of frames that have been flushed from the receive packet buffer memory due to one of the following reasons:

- When partial store and forward mode is enabled and a packet is received while there is no system bus resource
- When partial store and forward mode is enabled and a system bus error is encountered while writing the packet data to system memory.
- When automatic discard of received packed during lack of resource is enabled (bit 24 of the DMA Configuration register) and a packet is received while there is no system bus resource.
- When a software flush of a packet from the head of the packet buffer queue (bit 18 of the Network Control register) is performed and the DMA is not currently busy.

Bits 31:24 – LSBTIR[7:0] Lower Significant Bits of Timer Increment Register
Lower significant bits of Timer Increment Register[15:0] giving a 24-bit timer_increment counter. These bits are the sub-ns value which the 1588 timer will be incremented each clock cycle. Bit n = $2^{(n-16)}$ nsec giving a resolution of approximately $15.2E^{-15}$ sec.

Bits 31:24 – LSBTIR[7:0] Lower Significant Bits of Timer Increment Register
Lower significant bits of Timer Increment Register[15:0] giving a 24-bit timer_increment counter. These bits are the sub-ns value which the 1588 timer will be incremented each clock cycle. Bit n = $2^{(n-16)}$ nsec providing a resolution of approximately $15.2E^{-15}$ sec.

Bits 15:0 – MSBTIR[15:0] Most Significant Bits of Timer Increment Register
Most significant bits [23:8] of the sub-nanosecond value by which the 1588 timer will be incremented each clock cycle. 24 bits of sub-nanosecond precision provides a resolution of approximately $5.86E^{-17}$ seconds.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	1	0

Bits 7:0 – RBS[7:0] Receive Buffer Size
DMA receive buffer size in system memory. The value defined by these bits determines the size of buffer to use in main system memory when writing received data.
The value is defined in multiples of 64 bytes such that a value of 0x01 corresponds to buffers of 64 bytes, 0x02 corresponds to 128 bytes etc.
For example:
0x02: 128 bytes
0x18: 1536 bytes (1 × max length frame/buffer)
0xA0: 10240 bytes (1 × 10K jumbo frame/buffer)
Note that this value should never be written as zero.

	IS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – IS[31:0] IdleSlope
IdleSlope value for queue A in bytes/second.
The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent. This must not exceed the port transmit rate which is dependent on the speed of operation, e.g., 100 Mb/second = 0x017D7840
If 50% of bandwidth was to be allocated to a particular queue in 100 Mb/second mode, then the IdleSlope value for that queue would be calculated as 0x017D7840/2.

	DSTCM[3:0]					QNB[2:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

Bit 29 – UDPE UDP Port Match Enable
When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

Bit 28 – DSTCE Differentiated Services or Traffic Class Match Enable
When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

Bits 27:12 – UDPM[15:0] UDP Port Match
When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

Bits 11:4 – DSTCM[7:0] Differentiated Services or Traffic Class Match
When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

Bits 2:0 – QNB[2:0] Queue Number (0–5)
If a match is successful, then the queue value programmed in bits 2:0 is allocated to the frame.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.132.GMAC Screening Type 2 Register x Priority Queue

Name: GMAC_ST2RPQx
Offset: 0x0540 + x*0x04 [x=0..7]
Reset: 0x00000000
Property: Read/Write

Screening type 2 registers are used to allocate up to 6 priority queues to received frames based on the VLAN priority field of received Ethernet frames.

Bit	31	30	29	28	27	26	25	24

Bit 30 – COMPCE Compare C Enable

Value	Description
0	Comparison via the register designated by index COMPC is disabled.
1	Comparison via the register designated by index COMPC is enabled.

Bits 29:25 – COMPC[4:0] Index of Screening Type 2 Compare Word 0/Word 1 register x
COMPC is a pointer to the compare registers GMAC_ST2CW0Rx and GMAC_ST2CW1Rx. When COMPCE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

Bit 24 – COMPBE Compare B Enable

Value	Description
0	Comparison via the register designated by index COMPB is disabled.
1	Comparison via the register designated by index COMPB is enabled.

Bits 23:19 – COMPB[4:0] Index of Screening Type 2 Compare Word 0/Word 1 register x
COMPB is a pointer to the compare registers GMAC_ST2CW0Rx and GMAC_ST2CW1Rx. When COMPBE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

Bit 18 – COMPAE Compare A Enable

Value	Description
0	Comparison via the register designated by index COMPA is disabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Comparison via the register designated by index COMPA is enabled.

Bits 17:13 – COMPA[4:0] Index of Screening Type 2 Compare Word 0/Word 1 register x
COMPA is a pointer to the compare registers GMAC_ST2CW0Rx and GMAC_ST2CW1Rx. When COMPAE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

Bit 12 – ETHE EtherType Enable

Value	Description
0	EtherType match with bits 15:0 in the register designated by the value of I2ETH is disabled.
1	EtherType match with bits 15:0 in the register designated by the value of I2ETH is enabled.

Bits 11:9 – I2ETH[2:0] Index of Screening Type 2 EtherType register x
When ETHE is set (bit 12), the field EtherType (last EtherType in the header if the frame is VLAN tagged) is compared with bits 15:0 in the register designated by the value of I2ETH.

Bit 8 – VLANE VLAN Enable

Value	Description
0	VLAN match is disabled.
1	VLAN match is enabled.

Bits 6:4 – VLANP[2:0] VLAN Priority
When VLAN match enable is set (bit 8), the VLAN priority field of the received frame is matched against bits 7:4 of this register.

Bits 2:0 – QNB[2:0] Queue Number (0–5)
If a match is successful, then the queue value programmed in QNB is allocated to the frame.

64.8.138.GMAC Interrupt Mask Register Priority Queue x

Name: GMAC_IMRPQx
Offset: 0x0640 + (x-1)*0x04 [x=1..5]
Reset: 0x00000000
Property: Read/Write

A read of this register returns the value of the receive complete interrupt mask.

A write to this register directly affects the state of the corresponding bit in the Interrupt Status Register, causing an interrupt to be generated if a 1 is written.

The following values are valid for all listed bit names of this register:

0: Corresponding interrupt is enabled.

1: Corresponding interrupt is disabled.

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

Bits 31:16 – COMPVAL[15:0] Compare Value
The byte stored in bits [23:16] is compared against the first byte of the 2 bytes extracted from the frame.
The byte stored in bits [31:24] is compared against the second byte of the 2 bytes extracted from the frame.

Bits 15:0 – MASKVAL[15:0] Mask Value
The value of MASKVAL ANDed with the 2 bytes extracted from the frame is compared to the value of MASKVAL ANDed with the value of COMPVAL.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.141.GMAC Screening Type 2 Compare Word 1 Register x

Name: GMAC_ST2CW1Rx
Offset: 0x0704 + x*0x08 [x=0..23]
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 9 – DISMASK Disable Mask
Controls whether GMAC_ST2CW0R contains a 2-byte compare value with a 2-byte mask value or a 4-byte compare value.

Value	Description
0	GMAC_ST2CW0Rx contains a 2-byte compare value with a 2-byte mask value.
1	GMAC_ST2CW0Rx contains a 4-byte compare value.

Bits 8:7 – OFFSSTRT[1:0] Ethernet Frame Offset Start

Value	Name	Description
0	FRAMESTART	Offset from the start of the frame
1	ETHERTYPE	Offset from the byte after the EtherType field
2	IP	Offset from the byte after the IP header field
3	TCP_UDP	Offset from the byte after the TCP/UDP header field

Bits 6:0 – OFFSVAL[6:0] Offset Value in Bytes
The value of OFFSVAL ranges from 0 to 127 bytes, and is counted from either the start of the frame, the byte after the EtherType field (last EtherType in the header if the frame is VLAN tagged), the byte after the IP header (IPv4 or IPv6) or the byte after the TCP/UDP header.

Reset	0	0	0	0	0	0	0	0

Bits 15:0 – TIMEOUT[15:0] Sequence Recovery Timer Restart Period for Credit Based Streams
Determines when the sequence recovery timers are restarted and used by all of the configured CB streams. It is programmed as a count of 8192 rx_clk periods. 8192 rx_clk periods is 65.536 microseconds at gigabit speed and 327.68 microseconds at 100M speed. This allows a max timeout value of about 4 seconds at gigabit speed.

Reset	1	1	0	0	0	0	0	1

Bit 31 – STRIP_R_TAG Stripping Redundancy Tag Enable

Value	Description
0	Disables the stripping function. When the statistics counters need to reflect the actual number of octets received, then the stripping functionality must be disabled.
1	Enables the stripping function, the receive octet counters reflect post deletion frame size so the frame elimination functionality is transparent to higher level management.

Bit 30 – SIX_BYTE_TAG Six-byte Tag Enable

Value	Description
0	Defines a four-byte tag as per 802.1CB standard revision 2.4 and earlier.
1	Enables the six-byte tag as per 802.1CB standard revision 2.4 and later.

Bits 15:0 – RED_TAG[15:0] Redundancy Tag (R-TAG)
Defines the Ethertype value used to identify the redundancy tag (R-TAG).

Bit 31 – EN_ELIMINATION 802.1CB Elimination of Received Frames Enable

Value	Description
0	Disables the elimination of received frames.
1	Enables the elimination of received frames.

Bit 30 – EN_VECTOR_REC_ALG 802.1CB Vector Recovery Algorithm Enable

Value	Description
0	Enables the match recovery algorithm.
1	Enables the vector recovery algorithm.

Bit 29 – EN_SEQRECRST_TIMER 802.1CB Sequence Recovery Reset Timer Enable

Value	Description
0	Disables the sequence recovery reset timer.
1	Enables the sequence recovery reset timer.

Bit 28 – USE_R_TAG Redundancy Tag Enable

Value	Description
0	Identifies bottom of sequence number with OFFSET_VALUE.
1	Identifies sequence number with redundancy tag.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 16:8 – OFFSET_VALUE[8:0] Offset in Bytes from Start Packet Delimiter to MSB for 802.1CB Sequence Number

Defines the offset value in bytes from the start packet delimiter to the most significant byte of the 802.1CB sequence number. 9-bit width allows a TCP sequence number to be used with IPv6. This value must only be changed when EN_ELIMINATION=0.

Bits 7:4 – MEMBER_STREAM_2[3:0] Pointer to Screener Type 2 Register

Used for member stream identification. The member stream 1 and 2 values can be programmed to identical values.

Bits 3:0 – MEMBER_STREAM_1[3:0] Pointer to Screener Type 2 Register

Used for member stream identification. The member stream 1 and 2 values can be programmed to identical values.

			SEQ_REC_WINDOW[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 12:8 – SEQ_NUM_LENGTH[4:0] Number of Significant Bits of the 802.1CB Sequence Number
Defines the number of LSBs to consider in the 802.1CB sequence number.
The vector recovery algorithm does not work for values lower than 4. The value 0 and values greater than 16 are equivalent to 16.

Bits 5:0 – SEQ_REC_WINDOW[5:0] Vector Recovery Window
Defines the window size used by the vector recovery algorithm to determine whether to reject a packet. A value of zero means the entire history vector is used.

	LATENT_ERRS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 25:16 – VEC_REC_ROGUE[9:0] Number of Dropped Frames (Clear on read)
Returns the number of frames dropped by the vector recovery algorithm for being out of range.

Bits 9:0 – LATENT_ERRS[9:0] Number of Sequence Numbers Seen Without a Duplicate (Clear on read)
Returns the number of sequence numbers seen without a duplicate.
The count is updated when a frame is dropped from the history vector. So the update only happens after a new frame is received.

Reset	0	0	0	0	0	0	0	0

Bits 23:16 – SEQRST_COUNT[7:0] Number of Times the Sequence Recovery Reset Timer Decrements to Zero (Clear on read)
Returns the number of times the sequence recovery reset timer decrements to zero.

Bits 9:0 – OUT_OF_ORDER[9:0] Out of Order Sequence Numbers Received (Clear on read)
Returns of out of order sequence numbers received. Incremented when a frame is accepted but the sequence number is not +1 of the highest stored value.

64.8.152.GMAC Receive Queue Flush Register x

Name: GMAC_RX_FLUSH_Qx
Offset: 0x0B00 + x*0x04 [x=0..5]
Reset: 0x00000000
Property: R/W

This register defines the traffic policing mode of operation. Each mode can be set simultaneously with the exception of bits 2 and 3, which are exclusive. If bits 2 and 3 are both set, then only bit 3 is treated as active

Bit	31	30	29	28	27	26	25	24
	MAX_VAL[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	7	6	5	4	3	2	1	0
					LIMIT_FRAME_SIZE	LIMIT_NUM_BYTES	DROP_ON_RESRC_ERR	DROP_ALL
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 31:16 – MAX_VAL[15:0] Maximum Value for the Received Frame Size or Number of 128-Byte Chunk
Defines the maximum value for the received frame size when the bit LIMIT_FRAME_SIZE=1 or the number of 128 byte chunks of data received for this queue and already stored in the memory of the queue awaiting DMA memory writes when LIMIT_NUM_BYTES=1 and LIMIT_FRAME_SIZE=0.

Bit 3 – LIMIT_FRAME_SIZE Maximum Frame Length Received

Value	Name	Description
0	DISABLED	No effect.
1	ENABLED	When set, MAX_VAL indicates the maximum frame length in bytes that may be received. Frames exceeding this length will be dropped. This traffic policing function is relevant to the 802.1Qci standard which specifies stream filtering based on a maximum service data unit (SDU) size.

Bit 2 – LIMIT_NUM_BYTES Limitation of the Number of 128-Byte Chunk of Data Stored in the Memory of this Queue

Value	Name	Description
0	DISABLED	No effect.
1	ENABLED	Limits the number of 128-byte chunks of data received for this queue and already stored in the memory of the queue awaiting DMA memory writes to the value defined in the field MAX_VAL.

Bit 1 – DROP_ON_RESRC_ERR Drop on Resource Error

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	DISABLED	No effect.
1	ENABLED	If a free DMA descriptor for this queue cannot be obtained (also referred to as lack of descriptor resource and occurs when the software either cannot free up descriptors quickly enough to meet the receive traffic rate or has deliberately decided not to free any descriptors), all new frames received on this queue will be automatically discarded.

Bit 0 – DROP_ALL Drop All Frames

Value	Name	Description
0	DISABLED	No effect.
1	ENABLED	Drops all frames of this queue.

64.8.153.GMAC Screening Type 2 Rate Limit Register x

Name: GMAC_SCR2_RATE_LIMITx
Offset: 0x0B40 + x*0x04 [x=0..7]
Reset: 0x00000000
Property: R/W

This register manages the traffic policing function relevant to the 802.1Qci standard and associated to type 2 screener.

Bit	31	30	29	28	27	26	25	24
	MAX_RATE_VAL[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	MAX_RATE_VAL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	INTERVAL_TIME[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	INTERVAL_TIME[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:16 – MAX_RATE_VAL[15:0] Maximum Rate Value for the Interval Time
Defines the maximum number of bytes the type 2 screener is permitted to match in the programmed interval time.

Bits 15:0 – INTERVAL_TIME[15:0] Interval Time for Maximum Rate Checking
Defines the period for which the total number of bytes of received frames matched by the screener are accumulated and compared with the value configured in MAX_RATE_VAL. When the value exceeds MAX_RATE_VAL, then the current frame and frames subsequently matched will dropped until an interval time passes where MAX_RATE_VAL is not exceeded. When MAX_RATE_VAL=0, then no rate limiting will be performed. The interval time is specified in units of 64 receive clock periods.

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 0, 1, 2, 3, 4, 5, 6, 7 – EXCESS_RATE_Rx Excessive Screener Rate Register x

Value	Description
0	No excessive rate in screener since the last read of GMAC_SCR2_RATE_STATUS.
1	A screener rate limiting mechanism has been triggered since the last read of GMAC_SCR2_RATE_STATUS.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.155.GMAC MMSL Control Register

Name: GMAC_MMSL_CR
Offset: 0xF00
Reset: 0x00000020
Property: Read/Write

This register contains the control bits for the 802.3br MAC Merge Sublayer (MMSL).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			ROUTE_RX_TO_PMAC	RESTART_VER	PRE_ENABLE	VERIFY_DISABLE	ADD_FRAG_SIZE[1:0]	
Access			R/W	W	R/W	R/W	R/W	R/W
Reset			1	0	0	0	0	0

Bit 5 – ROUTE_RX_TO_PMAC Route Received Frames to Preemptive MAC

Value	Description
0	Routes all received frames to express MAC (eMAC).
1	Routes all received frames to preemptive MAC (pMAC).

Bit 4 – RESTART_VER Restart the Verification Procedure (Write-only)

Value	Description
0	No effect.
1	Restarts the verification procedure. Writing a one to this bit has no effect if any of the following are true: PRE_ENABLE=0, VERIFY_DISABLE=1 or the verification procedure is already in progress. When preemption is active, ROUTE_RX_TO_PMAC must be set to zero before writing to the RESTART_VER bit. This bit always returns zero when read.

Bit 3 – PRE_ENABLE Preemption Operation Enable

Value	Description
0	Disables the preemption operation and verifies mpackets will not be responded to or sent. If a preemption is in progress, the current preemption will complete and no further preemption will occur.
1	Enables the preemption by starting the verification procedure when VERIFY_DISABLE=0. Preemption can occur only once the verification process completes. If VERIFY_DISABLE=1, preemption can occur immediately.

Bit 2 – VERIFY_DISABLE 802.3br Support Check for the Link Partner

Value	Description
0	Enables the 802.3br support check for the link partner.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Disables the 802.3br support check for the link partner and preemption is enabled as soon as PRE_ENABLE=1.

Bits 1:0 – ADD_FRAG_SIZE[1:0] PMAC Minimum Number of Bytes before Preemption

Value	Name	Description
0	64_BYTES	A minimum of 64 bytes can be sent by pMAC before any preemption. The value can be changed only when PRE_ENABLE is cleared.
1	128_BYTES	A minimum of 128 bytes can be sent by pMAC before any preemption. The value can be changed only when PRE_ENABLE is cleared.
2	192_BYTES	A minimum of 192 bytes can be sent by pMAC before any preemption. The value can be changed only when PRE_ENABLE is cleared.
3	256_BYTES	A minimum of 256 bytes can be sent by pMAC before any preemption. The value can be changed only when PRE_ENABLE is cleared.

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 10 – SMD_ERR Illegal Start Mpacket Delimiter Received (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.
1	An illegal SMD (different from Express, Verify, Response, Start Preemptible or Continuation Preemptible SMD) has been received since the last read of GMAC_MMSL_SR.

Bit 9 – FRER_COUNT_ERR Frame Counter Error (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.
1	A frame counter error occurred since the last read of GMAC_MMSL_SR. A frame counter error occurs when the SMD-C received indicates a different frame count than expected (i.e. the fragment belongs to another frame and not to the Start packet already received before this) or when a fragment error occurred, which means the field following the SMD-C received was encoding a different fragment count than it was supposed to be.

Bit 8 – SMDC_ERR SMD-C Received When Waiting an SMD-S (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.
1	An SMD-C has been received when an SMD-S was expected, since the last read of GMAC_MMSL_SR.

Bit 7 – SMDS_ERR SMD-S Received When Waiting an SMD-C (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	An SMD-S has been received when an SMD-C was expected, since the last read of GMAC_MMSL_SR.

Bit 6 – RCV_V_ERR Incorrect Verification Mpacket Received (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.
1	An incorrect verification mPacket has been received since the last read of GMAC_MMSL_SR.

Bit 5 – RCV_R_ERR Incorrect Response Mpacket Received (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.
1	An incorrect response mPacket has been received since the last read of GMAC_MMSL_SR.

Bits 4:2 – VERIFY_STATUS[2:0] Verification Status

Value	Name	Description
0	INIT_VERIFICATION	Initialization
1	VERIFICATION_IDLE	Idle
2	SEND_VERIFY	Sending a verify command
3	WAIT_FOR_RESPONSE	Waiting for a response
4	VERIFIED	Verified
5	VERIFY_FAIL	Failure during the verify operation

Bit 1 – RESPOND_STATUS Response Status

Value	Name	Description
0	R_IDLE	Idle
1	SEND_RESPOND	Sending

Bit 0 – PRE_ACTIVE Preemption Status

Value	Description
0	Preemption is inactive.
1	Preemption is active when the verification process is completed or when GMAC_MMSL_CR.VERIFY_DISABLE=1 and GMAC_MMSL_CR.PRE_ACTIVE=1.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.157.GMAC MMSL Error Statistics Register

Name: GMAC_MMSL_ESR
Offset: 0xF08
Reset: 0x00000000
Property: Read-only

Reset	0	0	0	0	0	0	0	0

Bits 23:16 – SMD_ERROR_COUNT[7:0] Number of Rejected Frames or Fragments due to unknown SMD (Clear on read)

Returns the number of received MAC frames or fragments rejected due to unknown SMD value or arriving with an SMD-C when no frame is in progress, since the last read of the GMAC_MMSL_ESR.

Bits 7:0 – ASS_ERROR_COUNT[7:0] Number of Frames with Reassembly Errors (Clear on read)

Returns the number of frames with reassembly errors. The counter is incremented every time the ASSEMBLY_ERROR state in the receive processing state diagram is entered, since the last read of the GMAC_MMSL_ESR.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.158.GMAC MMSL Frame Re-Assembled OK Register

Name: GMAC_MMSL_ASS_OK

Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 5 – SMD_ERR Illegal SMD Received (Clear on read)

Value	Description
0	No illegal SMD received since the last read of GMAC_MMSL_ISR.
1	Illegal SMD received (different from Express, Verify, Response, Start Preemptible or Continuation Preemptible) since the last read of GMAC_MMSL_ISR

Bit 4 – FR_COUNT_ERR Illegal SMD Received (Clear on read)

Value	Description
0	No frame count error detected since the last read of GMAC_MMSL_ISR.
1	The SMD-C received since the last read of GMAC_MMSL_ISR indicates a different frame count than expected (i.e. the fragment belongs to another frame and not to the Start packet already received before this) or that a fragment error hoccurred, meaning that the field following the SMD-C received was encoding a different fragment count than it was supposed to be.

Bit 3 – SMDC_ERR SMD-C Received When Waiting an SMD-S (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.
1	An SMD-C has been received when an SMD-S was expected since the last read of GMAC_MMSL_SR.

Bit 2 – SMDS_ERR SMD-S Received When Waiting an SMD-C (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.
1	An SMD-S has been received when an SMD-C was expected since the last read of GMAC_MMSL_SR.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 1 – RCV_V_ERR Incorrect Verification Mpacket Received (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.
1	An incorrect verification mPacket has been received since the last read of GMAC_MMSL_SR.

Bit 0 – RCV_R_ERR Incorrect Response Mpacket Received (Clear on read)

Value	Description
0	No error since the last read of GMAC_MMSL_SR.
1	An incorrect response mPacket has been received since the last read of GMAC_MMSL_SR.

Bit 30 – IFGQAVCRED Credit-Based Shaping Algorithm Modification

Value	Description
0	No modification of the CBS algorithm.
1	Modifies the CBS algorithm so the IFG/IPG associated with a transmit frame counts towards its 802.1Qav credit.

Bit 27 – OSSCORR 1588 One Step Sync Mode Correction Field

Value	Description
0	Disables updating the correction field of PTP 1588 version 2 sync frames by adding current TSU timer value.
1	Enables updating the correction field of PTP 1588 version 2 sync frames by adding current TSU timer value.

Bit 26 – EXTSELRQEN External Selection of Receive Queue Enable

Value	Description
0	Disables external selection of receive queue.
1	Enables external selection of receive queue.

Bit 25 – PFCCTL Multiple PFC Pause Quantum Enable

Value	Description
0	Disables multiple PFC pause quantums.
1	Enables multiple PFC pause quantums, one per pause priority.

Bit 24 – OSSMODE One Step Sync Mode

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	1588 One Step Sync mode is disabled.
1	1588 One Step Sync mode is enabled. Replaces timestamp field in the 1588 header for TX Sync Frames with the current TSU timer value.

Bit 22 – STUDPOFFSET Store UDP Offset
Stores UDP/TCP offset to memory.

Value	Description
0	Normal operations.
1	The upper 16 bits of the CRC of every received frame are replaced with the offset from start of frame to the beginning of the UDP or TCP header. The lower 16 bits of the CRC are replaced with zero and reserved for future use. The offset is measured in units of 2 bytes.

Bit 20 – PTPUNIENA Detection of Unicast PTP Frames Enable

Value	Description
0	Disables detection of unicast PTP frames.
1	Enables detection of unicast PTP frames.

Bit 19 – TXLPIEN Enable LPI Transmission
When set, LPI (low power idle) is immediately transmitted.

Bit 18 – FNP Flush Next Packet (Write-only)

Value	Description
0	No effect.
1	Flushes the next packet from the receive memory. This will only have an effect if the DMA is not currently writing a packet already stored in the receive memory to system memory.

Bit 17 – TXPBPF Transmit PFC Priority-based Pause Frame (Write-only)

Value	Description
0	No effect.
1	Takes the values stored in the Transmit PFC Pause register.

Bit 16 – ENPBPR Enable PFC Priority-based Pause Reception

Value	Description
0	Disables PFC Priority Based Pause Reception capabilities.
1	Enables PFC Priority Based Pause Reception capabilities by enabling the PFC negotiation and recognition of priority-based pause frames.

Bit 15 – SRTSM Store Receive Timestamp to Memory

Value	Description
0	Normal operation.
1	Causes the CRC of every received frame to be replaced with the value of the nanoseconds field of the 1588 timer that was captured as the receive frame passed the message timestamp point. Note that bit RFCS in register GMAC_NCFGR may not be set to 1 when the timer should be captured.

Bit 12 – TXZQPF Transmit Zero Quantum Pause Frame (Write-only)

Value	Description
0	No effect.
1	Generates a pause frame with zero quantum to be transmitted.

Bit 11 – TXPF Transmit Pause Frame (Write-only)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Generates a pause frame to be transmitted.

Bit 10 – THALT Transmit Halt (Write-only)

Value	Description
0	No effect.
1	Halts transmission as soon as any ongoing frame transmission ends.

Bit 9 – TSTART Start Transmission (Write-only)

Value	Description
0	No effect.
1	Starts transmission.

Bit 8 – BP Back Pressure

Value	Description
0	No effect
1	When the MAC is set in 10M or 100M Half Duplex mode, forces collisions on all received frames. Ignored in Gigabit Half Duplex mode.

Bit 7 – WESTAT Write Enable for Statistics Registers

Value	Description
0	Forces the statistics registers to be in read-only mode for normal operation mode.
1	Makes the statistics registers writable for functional test purposes.

Bit 6 – INCSTAT Increment Statistics Registers (Write-only)
Writing a one increments all the statistics registers by one for test purposes.

Bit 5 – CLRSTAT Clear Statistics Registers (Write-only)

Value	Description
0	No effect.
1	Clears the statistics registers.

Bit 4 – MPE Management Port Enable

Value	Description
0	Forces GMDIO to high impedance state and MDC low.
1	Enables the management port.

Bit 3 – TXEN Transmit Enable

Value	Description
0	Stops transmission immediately, the transmit pipeline and control registers will be cleared and the Transmit Queue Pointer register will reset to point to the start of the transmit descriptor list.
1	Enables the GMAC transmitter to send data.

Bit 2 – RXEN Receive Enable

Value	Description
0	Stops frame reception immediately and the receive pipeline will be cleared. The Receive Queue Pointer register is unaffected.
1	Enables the GMAC to receive data.

Bit 1 – LBL Loopback Local

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Normal operating mode (no loopback).
1	Connects GTX to GRX, GTXEN to GRXDV and forces Full Duplex mode. GRXCK and GTXCK may malfunction as the GMAC is switched into and out of internal loopback. It is important that receive and transmit circuits have already been disabled when making the switch into and out of internal loopback.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.166.GMAC Express MAC Network Configuration Register

Name: GMAC_EMAC_NCFGR
Offset: 0x1004
Reset: 0x00080000

	RXBUFO[1:0]		PEN	RTY		GBE		MAXFS
Access	R/W	R/W	R/W	R/W		R/W		R/W
Reset	0	0	0	0		0		0

Bit	7	6	5	4	3	2	1	0
	UNIHEN	MTIHEN	NBC	CAF	JFRAME	DNVLAN	FD	SPD
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 30 – IRXER Ignore Receive Error from PHY

Value	Description
0	
1	GRXER has no effect on the GMAC's operation when GRXDV is low. Set this bit when using the RGMII wrapper in Half Duplex mode.

Bit 29 – RXBP Receive Bad Preamble

Value	Description
0	Rejects frames with non-standard preamble.
1	Accepts frames with non-standard preamble.

Bit 28 – IPGSEN Inter Packet Gap Stretch Enable

Value	Description
0	The transmit IPG cannot be increased.
1	The transmit IPG can be increased above 96 bit times depending on the previous frame length using the IPG Stretch Register.

Bit 26 – IRXFCS Ignore RX FCS

Value	Description
0	Normal operation, frames with FCS/CRC errors are rejected.
1	Frames with FCS/CRC errors are rejected. FCS error statistics are still collected for frames with bad FCS and FCS status is recorded in frame's DMA descriptor.

Bit 25 – EFRHD Enable Frames Received in Half Duplex

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Disables frames to be received in Half Duplex mode while transmitting.
1	Enables frames to be received in Half Duplex mode while transmitting.

Bit 24 – RXCOEN Receive Checksum Offload Enable

Value	Description
0	Disables the receive checksum engine. Frames with bad IP, TCP or UDP checksums are accepted.
1	Enables the receive checksum engine. Frames with bad IP, TCP or UDP checksums are discarded.

Bit 23 – DCPF Disable Copy of Pause Frames

Value	Description
0	Copies pause frames to the system memory.
1	Prevents valid pause frames being copied to memory. Pause frames are not copied to memory regardless of the state of the Copy All Frames bit, whether a hash match is found or whether a type ID match is identified. If a destination address match is found, the pause frame will be copied to memory. Note that valid pause frames received will still increment pause statistics and pause the transmission of frames as required.

Bits 22:21 – DBW[1:0] Always Written to 0
Must be always be written to '0'.

Bits 20:18 – CLK[2:0] MDC Clock Division
Set according to MCK speed. These three bits determine the number MCK will be divided by to generate Management Data Clock (MDC). For conformance with the 802.3 specification, MDC must not exceed 2.5 MHz (MDC is only active during MDIO read and write operations).

Value	Name	Description
0	MCK_8	MCK divided by 8 (MCK up to 20 MHz)
1	MCK_16	MCK divided by 16 (MCK up to 40 MHz)
2	MCK_32	MCK divided by 32 (MCK up to 80 MHz)
3	MCK_48	MCK divided by 48 (MCK up to 120 MHz)
4	MCK_64	MCK divided by 64 (MCK up to 160 MHz)
5	MCK_96	MCK divided by 96 (MCK up to 240 MHz)

Bit 17 – RFCS Remove FCS

Value	Description
0	Includes the received frame check sequence (last 4 bytes) when writing to memory.
1	Excludes the received frame check sequence (last 4 bytes) when writing to memory. The frame length indicated will be reduced by four bytes in this mode.

Bit 16 – LFERD Length Field Error Frame Discard

Value	Description
0	Accepts frames with a measured length shorter than the extracted length field
1	Discards frames with a measured length shorter than the extracted length field (as indicated by bytes 13 and 14 in a non-VLAN tagged frame). This only applies to frames with a length field less than 0x0600.

Bits 15:14 – RXBUFO[1:0] Receive Buffer Offset
Indicates the number of bytes by which the received data is offset from the start of the receive buffer

Bit 13 – PEN Pause Enable

Value	Description
0	Does not pause the transmission when a non-zero 802.3 classic pause frame is received.
1	Pauses transmission when a non-zero 802.3 classic pause frame is received and PFC has not been negotiated.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 12 – RTY Retry Test0

Value	Description
0	Normal operation.
1	The backoff between collisions will always be one slot time and helps test the too many retries condition. Also used in the pause frame tests to reduce the pause counter's decrement time from 512 bit times, to every GRXCK cycle.

Bit 10 – GBE Gigabit Mode Enable

Value	Description
0	Operates in 10/100 Mbps mode.
1	Operates in Gigabit mode.

Bit 8 – MAXFS 1536 Maximum Frame Size

Value	Description
0	Rejects frame sizes above 1518 bytes.
1	Accepts frames up to 1536 bytes in length. Normally the GMAC would reject any frame above 1518 bytes.

Bit 7 – UNIHEN Unicast Hash Enable

Value	Description
0	Rejects unicast frames.
1	Accepts unicast frames when the 6-bit hash function of the destination address points to a bit that is set in the Hash register.

Bit 6 – MTIHEN Multicast Hash Enable

Value	Description
0	Rejects multicast frames.
1	Accepts multicast frames when the 6-bit hash function of the destination address points to a bit that is set in the Hash register.

Bit 5 – NBC No Broadcast

Value	Description
0	Accepts broadcast frames.
1	Rejects frames addressed to the broadcast address of all ones.

Bit 4 – CAF Copy All Frames

Value	Description
0	Discards invalid frames.
1	Accepts all valid frames.

Bit 3 – JFRAME Jumbo Frame Size

Value	Description
0	Disables jumbo frames.
1	Enables jumbo frames up to 16383 bytes to be accepted. The default length is 10240 bytes.

Bit 2 – DNVLAN Discard Non-VLAN FRAMES

Value	Description
0	Passes all frames to address matching logic
1	Passes only VLAN tagged frames to the address matching logic.

Bit 1 – FD Full Duplex

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Half-duplex mode.
1	The transmit block ignores the state of collision and carrier sense and allows receive while transmitting.

Bit 0 – SPD Speed

Value	Description
0	MAC operates at 10 Mbps.
1	MAC operates at 100 Mbps.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.167.GMAC Express MAC Network Status Register

Name: GMAC_EMAC_NSR
Offset: 0x1008
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
	RXLPIS	PFCPAUSN				IDLE	MDIO	
Access	R	R				R	R	
Reset								

Bit 7 – RXLPIS LPI Indication
Low power idle has been detected on receive. This bit is set when LPI is detected and reset when normal idle is detected. An interrupt is generated when the state of this bit changes.

Bit 6 – PFCPAUSN PFC Pause Negotiated
Set when PFC Priority-based Pause has been negotiated.

Bit 2 – IDLE PHY Management Logic Idle
The PHY management logic is idle (i.e., has completed).

Bit 1 – MDIO MDIO Input Status
Returns status of the GMDIO pin.

© 2026 Microchip Technology Inc. and its subsidiaries

Reset	0	0		0	0	1	0	0

Bit 29 – TXBD_EXTENDED Transmit Buffer Descriptor Extended Mode
See GMAC_EMAC_TXBDCTRL for a description of the features.

Value	Description
0	Disables Transmit Buffer Data Extended mode.
1	Enables Transmit Buffer Data Extended mode.

Bit 28 – RXBD_EXTENDED Receive Buffer Descriptor Extended Mode
See GMAC_EMAC_RXBDCTRL for a description of the features.

Value	Description
0	Disables Receive Buffer Data Extended mode.
1	Enables Receive Buffer Data Extended mode.

Bit 26 – TXFOMAXB Force Transmit Max Burst Length
Forces the transmit DMA to always issue max length bursts on EOP (end of packet) or EOB (end of buffer) transfers as defined in FBLDO, even when there is less than max burst data bytes to read. Residual data read is ignored. Does not apply to bursts that break 1k boundary rule.

Bit 25 – RXFOMAXB Force Receive Max Burst Length
Forces the receive DMA to always issue max length bursts on EOP (end of packet) or EOB (end of buffer) transfers, even if there is less than max burst real packet data required to write. Any extra bytes of pad data is set to 0x00. Does not apply to bursts that break 1k boundary rule.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 24 – DDRP DMA Discard Receive Packets
When set, the GMAC DMA will automatically discard receive packets from the receiver packet buffer memory when no system memory resource is available.
When low, the received packets will remain to be stored in the GMAC local memory packet buffer until system memory buffer resource next becomes available.
A write to this bit is ignored if the DMA is not configured in the packet buffer Full Store and Forward mode.

Bits 23:16 – DRBS[7:0] DMA Receive Buffer Size
DMA receive buffer size in system memory. The value defined by these bits determines the size of buffer to use in main system memory when writing received data.
The value is defined in multiples of 64 bytes, thus a value of 0x01 corresponds to buffers of 64 bytes, 0x02 corresponds to 128 bytes etc.
For example:
0x02: 128 bytes
0x18: 1536 bytes (1 × max length frame/buffer)
0xA0: 10240 bytes (1 × 10K jumbo frame/buffer)
Note that this value should never be written as zero.

Bit 13 – CRCERRREP CRC Errors Report

Value	Description
0	Bit 16 of the receive buffer descriptor represents the Canonical format indicator (CFI) bit as extracted from the receive frame (if the receive buffer descriptor is pointing to the last data buffer of the receive frame and the received frame was VLAN tagged).
1	Bit 16 of the receive buffer descriptor represents the FCS/CRC error (only if frames with FCS are copied to memory as enabled by bit 26 in the Network Configuration register).

Bit 12 – INFLASTEN Infinite Size for Last Buffer Enable
Set to '1', this forces the receive DMA to consider the data buffer pointed to by the last descriptor in the descriptor list to be of definite size.

Bit 11 – TXCOEN Transmitter Checksum Generation Offload Enable
Transmitter IP, TCP and UDP checksum generation offload enable. When set, the transmitter checksum generation engine is enabled to calculate and substitute checksums for transmit frames. When clear, frame data is unaffected.

Bit 10 – TXPBMS Transmitter Packet Buffer Memory Size Select
This bit at zero halves the amount of memory used for the transmit packet buffer. This reduces the amount of memory used by the GMAC. It is important to set this bit to '1' if the full configured physical memory is available. The value in brackets below represents the size that would result for the default maximum configured memory size of 4 Kbytes.

Value	Name	Description
0	TWO_KB	Do not use top address bit (2 Kbytes).
1	FOUR_KB	Use full configured addressable space (4 Kbytes).

Bits 9:8 – RXBMS[1:0] Receiver Packet Buffer Memory Size Select
The default receive packet buffer size is 8 Kbytes. The table below shows how to configure this memory to FULL, HALF, QUARTER or EIGHTH of the default size.

Value	Name	Description
0	EIGHTH	8/8 Kbyte Memory Size
1	QUARTER	8/4 Kbytes Memory Size
2	HALF	8/2 Kbytes Memory Size
3	FULL	8 Kbytes Memory Size

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 7 – ESPA Endian Swap Mode Enable for Packet Data Accesses

Value	Name	Description
0	LITTLE_ENDIAN	Selects Little-endian endianism for system bus transfers.
1	BIG_ENDIAN	Selects swapped endianism for system bus transfers.

Bit 6 – ESMA Endian Swap Mode Enable for Management Descriptor Accesses

Selects the burst length to attempt to use on the system bus when transferring frame data. Not used for DMA management operations and only used where space and data size allow. Otherwise system bus single type accesses are used.

Value	Name	Description
0	LITTLE_ENDIAN	Selects Little-endian endianism for system bus transfers.
1	BIG_ENDIAN	Selects swapped endianism for system bus transfers. FBLDO: Fixed Burst Length for DMA Data Operations:

Bits 4:0 – FBLDO[4:0] Fixed Burst Length for DMA Data Operations

Value	Name	Description
0	–	Reserved
1	SINGLE	Always uses single access on system bus
2	–	Reserved
4	INCR4	Attempt to use 4-beat bursts on system bus (Default)
8	INCR8	Attempt to use 8-beat bursts on system bus bursts
16	INCR16	Attempt to use 16-beat bursts on system bus bursts 50

Bit	7	6	5	4	3	2	1	0
	LCO		TXCOMP	TFC	TXGO	RLE	COL	UBR
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

Bit 10 – TXDMALCK Transmit DMA Lockup (Clear by Writing a 1)
Set when lockup has been detected on the DMA transmit path. Writing a one clears this bit.

Bit 9 – TXMACLCK Transmit MAC Lockup (Clear by Writing a 1)
Set when lockup has been detected on the MAC transmit path. Writing a one clears this bit.

Bit 8 – HRESP System Bus Response (Clear by Writing a 1)
Set when the DMA block sees a system bus error. Writing a one clears this bit.

Bit 7 – LCO Late Collision Occurred (Clear by Writing a 1)
Only set if the condition occurs in Gigabit mode, as retry is not attempted. Writing a one clears this bit.

Bit 5 – TXCOMP Transmit Complete (Clear by Writing a 1)
Set when a frame has been transmitted. Writing a one clears this bit.

Bit 4 – TFC Transmit Frame Corruption Due to System Bus Error (Clear by Writing a 1)
Transmit frame corruption due to system bus error. Set if an error occurs while midway through reading transmit frame from the system bus, including system bus errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and GTXER asserted).
Also set in DMA packet buffer mode if a single frame is too large for the configured packet buffer memory size.
Writing a one clears this bit.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 3 – TXGO Transmit Go (Read only)
When high, transmit is active. When using the DMA interface, this bit represents the TXGO variable as specified in the transmit buffer description.

Bit 2 – RLE Retry Limit Exceeded (Clear by Writing a 1)
Writing a one clears this bit.

Bit 1 – COL Collision Occurred (Clear by Writing a 1)
Set by the assertion of collision. Writing a one clears this bit. When operating in 10/100 mode, this status indicates either a collision or a late collision. In Gigabit mode, this status is not set for a late collision.

Bit 0 – UBR Used Bit Read (Clear by Writing a 1)
Set when a transmit buffer descriptor is read with its used bit set. Writing a one clears this bit.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.170.GMAC Express EMAC Receive Buffer Queue Base Address Register

Name: GMAC_EMAC_RBQB
Offset: 0x1018
Reset: 0x00000000
Property: Read/Write

This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the Network Control register. Once reception is enabled, any write to the Receive Buffer Queue Base Address Register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the “used” bits.

The descriptors must be aligned at 32-bit boundaries and the descriptors are written to using two single accesses.

64.8.171.GMAC Express MAC Transmit Buffer Queue Base Address Register

Name: GMAC_EMAC_TBQB
Offset: 0x101C
Reset: 0x00000000
Property: Read/Write

This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The Transmit Buffer Queue Base Address register must be initialized before transmit is started through bit 9 of the Network Control register. Once transmission has started, any write to the Transmit Buffer Queue Base Address register is illegal and therefore ignored.

Note that due to clock boundary synchronization, it takes a maximum of four MCK cycles from the writing of the transmit start bit before the transmitter is active. Writing to the Transmit Buffer Queue Base Address register during this time may produce unpredictable results.

Reading this register returns the location of the descriptor currently being accessed. Since the DMA handles two frames at once, this may not necessarily be pointing to the current frame being transmitted.

The descriptors must be aligned at 32-bit boundaries and the descriptors are read from memory using two individual non sequential accesses.

64.8.172.GMAC Express EMAC Receive Status Register

Name: GMAC_EMAC_RSR
Offset: 0x1020
Reset: 0x00000000
Property: Read/Write

This register, when read, provides receive status details. Once read, individual bits may be cleared by writing a one to them. It is not possible to set a bit to 1 by writing to the register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
			RXDMALCK	RXMACLCK	HNO	RXOVR	REC	BNA
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 5 – RXDMALCK Receive DMA Lockup (Clear by Writing a 1)
Set when lockup has been detected on the DMA receive path. Writing a one clears this bit.

Bit 4 – RXMACLCK Receive MAC Lockup (Clear by Writing a 1)
Set when lockup has been detected on the MAC receive path. Writing a one clears this bit.

Bit 3 – HNO System Bus Error (Clear by Writing a 1)
Set when the DMA block sees a system bus error. Writing a one clears this bit.

Bit 2 – RXOVR Receive Overrun (Clear by Writing a 1)
This bit is set if the receive status was not taken at the end of the frame. This bit is also set if the packet buffer overflows. The buffer will be recovered if an overrun occurs. Writing a one clears this bit.

Bit 1 – REC Frame Received (Clear by Writing a 1)
One or more frames have been received and placed in memory. Writing a one clears this bit.

Bit 0 – BNA Buffer Not Available (Clear by Writing a 1)
An attempt was made to get a new buffer and the pointer indicated that it was owned by the processor. The DMA will re-read the pointer each time an end of frame is received until a valid pointer is found. This bit is set following each descriptor read attempt that fails, even if consecutive pointers are unsuccessful and software has in the mean time cleared the status flag. Writing a one clears this bit.

64.8.173.GMAC Express EMAC Interrupt Status Register

Name: GMAC_EMAC_ISR
Offset: 0x1024
Reset: 0x00000000
Property: Read-only

This register indicates the source of the interrupt. In order that the bits of this register read 1, the corresponding interrupt source must be enabled in the Mask register. If any bit is set in this register, the GMAC interrupt signal will be asserted in the system.

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 31 – TXLCK Transmit Path Locked (Cleared on read)
Set when any monitors (MAC or DMA) detect a lockup.

Bit 30 – RXLCK Receive Path Locked (Cleared on read)
Set when any monitors (MAC or DMA) detect a lockup.

Bit 29 – TSUTIMCOMP TSU Timer Comparison (Cleared on read)
Indicates when the TSU timer count value is equal to the programmed value.

Bit 28 – WOL Wake On LAN (Cleared on read)
WOL interrupt. Indicates a WOL event has been received.

Bit 27 – RXLPISBC Receive LPI indication Status Bit Change (Cleared on read)
Receive LPI indication status bit change.

Bit 26 – SRI TSU Seconds Register Increment (Cleared on read)
Indicates the register has incremented.

Bit 25 – PDRSFT PDelay Response Frame Transmitted (Cleared on read)
Indicates a PTP pdelay_resp frame has been transmitted.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 24 – PDRQFT PDelay Request Frame Transmitted (Cleared on read)
Indicates a PTP pdelay_req frame has been transmitted.

Bit 23 – PDRSFR PDelay Response Frame Received (Cleared on read)
Indicates a PTP pdelay_resp frame has been received.

Bit 22 – PDRQFR PDelay Request Frame Received (Cleared on read)
Indicates a PTP pdelay_req frame has been received.

Bit 21 – SFT PTP Sync Frame Transmitted (Cleared on read)
Indicates a PTP sync frame has been transmitted.

Bit 20 – DRQFT PTP Delay Request Frame Transmitted (Cleared on read)
Indicates a PTP delay_req frame has been transmitted.

Bit 19 – SFR PTP Sync Frame Received (Cleared on read)
Indicates a PTP sync frame has been received.

Bit 18 – DRQFR PTP Delay Request Frame Received (Cleared on read)
Indicates a PTP delay_req frame has been received.

Bit 14 – PFTR Pause Frame Transmitted (Cleared on read)
Indicates a pause frame has been successfully transmitted after being initiated from the Network Control register.

Bit 13 – PTZ Pause Time Zero (Cleared on read)
Set when either the Pause Time register at address 0x38 decrements to zero, or when a valid pause frame is received with a zero pause quantum field.

Bit 12 – PFNZ Pause Frame with Non-zero Pause Quantum Received (Cleared on read)
Indicates a valid pause has been received that has a non-zero pause quantum field.

Bit 11 – HRESP System Bus Error (Cleared on read)
Set when the DMA block sees a system bus error.

Bit 10 – ROVR Receive Overrun (Cleared on read)
Set when the receive overrun status bit is set.

Bit 7 – TCOMP Transmit Complete (Cleared on read)
Set when a frame has been transmitted.

Bit 6 – TFC Transmit Frame Corruption Due to System Bus Error (Cleared on read)
Set if an error occurs while midway through reading transmit frame from the system bus, including a system bus error and buffers exhausted mid-frame.

Bit 5 – RLEX Retry Limit Exceeded or Late Collision (Cleared on read)
Transmit error. Late collision will only cause this status bit to be set in Gigabit mode, as a retry is not attempted.

Bit 4 – TUR Transmit Underrun (Cleared on read)
This interrupt is set if the transmitter was forced to terminate a frame that it has already began transmitting due to further data being unavailable.
This interrupt is set if a transmitter status writeback has not completed when another status writeback is attempted.

© 2026 Microchip Technology Inc. and its subsidiaries

This interrupt is also set when the transmit DMA has written the SOP data into the FIFO and either the system bus was not granted in time for further data, or because a system bus error response was returned, or because the used bit was read.

Bit 3 – TXUBR TX Used Bit Read (Cleared on read)
Set when a transmit buffer descriptor is read with its used bit set.

Bit 2 – RXUBR RX Used Bit Read (Cleared on read)
Set when a receive buffer descriptor is read with its used bit set.

Bit 1 – RCOMP Receive Complete (Cleared on read)
A frame has been stored in memory. Cleared on read.

Bit 0 – MFS Management Frame Sent (Cleared on read)
The PHY Maintenance register has completed its operation.

64.8.176.GMAC Express EMAC Interrupt Mask Register

Name: GMAC_EMAC_IMR
Offset: 0x1030
Reset: 0xFFFFFFFF
Property: Read/Write

The Interrupt Mask register is a read-only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the Interrupt Enable register or set individually by writing to the Interrupt Disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the Interrupt Mask register.

For test purposes, there is a write-only function to this register that allows the bits in the Interrupt Status register to be set or cleared, regardless of the state of the Mask register. A write to this register directly affects the state of the corresponding bit in the Interrupt Status register, causing an interrupt to be generated if a '1' is written.

The following values are valid for all listed bit names of this register when read:

0: The corresponding interrupt is enabled.

1: The corresponding interrupt is not enabled.

Bit	31	30	29	28	27	26	25	24

Value	Name	Description
0	AW2W	Operates the AW2W_MAX_PIPELINE field between AW to W channel.
1	AW2B	Operates the AW2W_MAX_PIPELINE field between AW to B channel.

Bits 15:8 – AW2W_MAX_PIPELINE[7:0] Address Write Bus to Write Data Bus Maximum Pipeline
Defines the maximum number of outstanding write requests that can be issued by the DMA via the AW channel. This is effectively the write issuing capability.

Bits 7:0 – AR2R_MAX_PIPELINE[7:0] Address Read Bus to Read Data Bus Maximum Pipeline
Defines the maximum number of outstanding read requests that can be issued by the DMA via the AR channel. This is effectively the read issuing capability.

64.8.183.GMAC Express MAC Interrupt Moderation Register

Name: GMAC_EMAC_INTM
Offset: 0x105C
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	TXINTMOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	RXINTMOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:16 – TXINTMOD[7:0] Transmit Interrupt Moderation
Count of 800 ns periods before bit 7 is set in GMAC_EMAC_ISR.TCOMP. A non-zero value indicates transmit interrupt moderation will be performed.

Bits 7:0 – RXINTMOD[7:0] Receive Interrupt Moderation
Count of 800 ns periods before bit 1 is set in GMAC_EMAC_ISR.RCOMP. A non-zero value indicates receive interrupt moderation will be performed.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit 31 – TXDMA_LCKUP_EN Transmit DMA Lockup Detector Enable

Value	Description
0	Disables the monitor that detects lockups in the transmit DMA.
1	Enables the monitor that detects lockups in the transmit DMA.

Bit 30 – TXMAC_LCKUP_EN Transmit MAC Lockup Detector Enable

Value	Description
0	Disables the monitor that detects lockups in the transmit MAC.
1	Enables the monitor that detects lockups in the transmit MAC.

Bit 29 – RXDMA_LCKUP_EN Receive DMA Lockup Detector Enable

Value	Description
0	Disables the monitor that detects lockups in the receive DMA.
1	Enables the monitor that detects lockups in the receive DMA.

Bit 28 – RXMAC_LCKUP_EN Receive MAC Lockup Detector Enable

Value	Description
0	Disables the monitor that detects lockups in the receive MAC.
1	Enables the monitor that detects lockups in the receive MAC.

Bit 27 – LCKUP_REC_EN Lockup Recovery Enable

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Forces the EMAC in Reset mode when a lockup.is detected on the transmit or receive data paths.

Bits 26:16 – DMA_LOCKUP_TIME[10:0] Timeout Value for Receive and Transmit DMA
Defines the timeout value for receive and transmit DMA lockup detection defined as a multiple of the prescaler value (PRESCALER). The MAC lockup time is defined in a separate configuration register (GMAC_LCKUP_TIME).

Bits 15:0 – PRESCALER[15:0] Prescaler Value for Timeout
Defines the prescaler value which is a multiple of the transmit clock.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.186.GMAC Express MAC Lockup Time Register

Name: GMAC_EMAC_LCKUP_TIME
Offset: 0x106C
Reset: 0x07FFFFFF
Property: Read/Write

Bit	31	30	29	28	27	26	25	24

Reset			1	1	1	1	1	1

Bits 0, 1, 2, 3, 4, 5 – LCKUP_EN_Qx Transmit DMA Lockup Detector Enable for Queue x

Value	Description
0	Disables the transmit DMA lockup timer for queue x. The number of outstanding packets are still counted but the actual timer does not run.
1	Enables the transmit DMA lockup timer for queue x.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.188.GMAC Express MAC Receive Watermark Register

Name: GMAC_EMAC_RX_WATERMARK
Offset: 0x107C
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:16 – RX_LOW_WATERMARK[15:0] Receive Watermark Low Threshold
Defines the low threshold of the receive memory for which a zero length pause frame is transmitted when the memory fill level falls below the threshold (the action is performed only if the last pause frame transmitted was non-zero).

Bits 15:0 – RX_HIGH_WATERMARK[15:0] Receive Watermark High Threshold
Defines the high threshold of the receive memory for which a zero length pause frame is transmitted when the memory fill level exceeds the threshold.

Value	Name	Description
0x1	BIT1	Controls whether the first byte has been received.
0x2	BIT2	Controls whether the second byte has been received.
0x4	BIT3	Controls whether the third byte has been received.
0x8	BIT4	Controls whether the fourth byte has been received.
0x10	BIT5	Controls whether the fifth byte has been received.
0x20	BIT6	Controls whether the sixth byte has been received

Bit 16 – FILTSORD Filter Source or Destination MAC Address
Selects whether this filter should be comparing the MAC source address or the MAC destination address of the received Ethernet frame.

Value	Description
0	The filter is a destination address filter.
1	The filter is a source address filter.

Bits 15:0 – ADDR[15:0] Specific Address
The most significant bits of the destination address, that is, bits 47:32.

Bits 15:0 – FL[15:0] Frame Length

Bits 7:0 are multiplied with the previously transmitted frame length (including preamble). Bits 15:8 +1 divide the frame length. If the resulting number is greater than 96 and bit 28 is set in the Network Configuration register then the resulting number is used for the transmit interpacket gap. 1 is added to bits 15:8 to prevent a divide by zero. See MAC Transmit Block.

	VLAN_TYPE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 31 – ESVLAN Enable Stacked VLAN Processing Mode

Value	Description
0	Disable the stacked VLAN Processing mode
1	Enable the stacked VLAN Processing mode

Bits 15:0 – VLAN_TYPE[15:0] User Defined VLAN_TYPE Field
User defined VLAN_TYPE field. When Stacked VLAN is enabled, the first VLAN tag in a received frame will only be accepted if the VLAN type field is equal to this user defined VLAN_TYPE, OR equal to the standard VLAN type (0x8100). Note that the second VLAN tag of a Stacked VLAN packet will only be matched correctly if its VLAN_TYPE field equals 0x8100.

	PEV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:8 – PQ[7:0] Pause Quantum

If bit 17 of the Network Control register is written with a ‘1’ then for each entry equal to zero in the Transmit PFC Pause register[15:8], the PFC pause frame's pause quantum field associated with that entry will be taken from the Transmit Pause Quantum register. For each entry equal to one in the Transmit PFC Pause register [15:8], the pause quantum associated with that entry will be zero.

Bits 7:0 – PEV[7:0] Priority Enable Vector

If bit 17 of the Network Control register is written with a ‘1’ then the priority enable vector of the PFC priority based pause frame will be set equal to the value stored in this register [7:0].

Bit	7	6	5	4	3	2	1	0
					MSBADDRMSK[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 31:28 – MSBADDR[3:0] MSB of the Receive Data Buffer Address
Values used to force bits 31:28 of the receive data buffer address to a particular value when the associated enable bits stored in this register [3:0] are set.
Any changes to this register will be ignored while the DMA is currently processing a receive packet. It will only affect the next full packet to be written to external system memory.

Bits 3:0 – MSBADDRMSK[3:0] Mask of the Receive Data Buffer Address
These bits are associated directly with bits[31:28].
When bit 0 is set, the address bit 28 used for accessing the receive data buffers will be forced to the value stored in bit 28 of this register.
When bit 1 is set, the address bit 29 used for accessing the receive data buffers will be forced to the value stored in bit 29 of this register.
When bit 2 is set, the address bit 30 used for accessing the receive data buffers will be forced to the value stored in bit 30 of this register.
When bit 3 is set, the address bit 31 used for accessing the receive data buffers will be forced to the value stored in bit 31 of this register.
When these bits are cleared, the associated value stored in bits 31:28 have no effect on the address used for receive data buffer accesses.
Any changes to this register will be ignored while the DMA is currently processing a receive packet. It will only affect the next full packet to be written to external memory.

	LCOL[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – LCOL[9:0] Late Collisions

Counts the number of late collisions occurring after the slot time (512 bits) has expired. In 10/100 mode, late collisions are counted twice i.e., both as a collision and a late collision. In Gigabit mode, a late collision causes the transmission to be aborted, thus the single and multi collision registers are not updated.

	CSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – CSR[9:0] Carrier Sense Error

Counts the number of frames transmitted where carrier sense was not seen during transmission or where carrier sense was deasserted after being asserted in a transmit frame without collision (no underrun). Only incremented in Half Duplex mode. The only effect of a carrier sense error is to increment this register. The behavior of the other statistics registers is unaffected by the detection of a carrier sense error.

Bits 31:0 – NFRX[31:0] 1519 to Maximum Byte Frames Received without Error
Counts the number of 1519 byte or above frames successfully received without error. Maximum frame size is determined by the Network Configuration register bit 8 (1536 maximum frame size) or bit 3 (jumbo frame size). Excludes pause frames, and is only incremented if the frame is successfully filtered and copied to memory. SeeGMAC_NCFGR.

Bits 9:0 – UFRX[9:0] Undersize Frames Received
Counts the number of frames received less than 64 bytes in length (10/100 mode or Gigabit mode, full duplex) that do not have either a CRC error or an alignment error. In Gigabit mode, half duplex, counts either frames not conforming to the minimum slot time of 512 bytes or frames not conforming to the minimum frame size once bursting is active.

	FCKR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – FCKR[9:0] Frame Check Sequence Errors
Counts frames that are an integral number of bytes, have bad CRC and are between 64 and 1518 bytes in length (1536 if bit 8 is set in Network Configuration register, 10240 bytes if bit 3 is set in the Network Configuration register). This register is also incremented if a symbol error is detected and the frame is of valid length and has an integral number of bytes.
This register is incremented for a frame with bad FCS, regardless of whether it is copied to memory due to ignore FCS mode being enabled in bit 26 of the Network Configuration register.

	LFER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – LFER[9:0] Length Field Frame Errors
Counts the number of frames received that have a measured length shorter than that extracted from the length field (bytes 13 and 14). This condition is only counted if the value of the length field is less than 0x0600, the frame is not of excessive length and checking is enabled through bit 16 of the Network Configuration register.

	RXSE[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 9:0 – RXSE[9:0] Receive Symbol Errors
Counts the number of frames that had GRXER asserted during reception. For 10/100 mode symbol errors are counted regardless of frame length checks. For Gigabit mode, the frame must satisfy slot time requirements in order to count a symbol error. Additionally, in Gigabit Half Duplex mode, carrier extension errors are also recorded. Receive symbol errors will also be counted as an FCS or alignment error if the frame is between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration register, 10240 bytes if bit 3 is set in the Network Configuration register). If the frame is larger it will be recorded as a jabber error.

Bits 15:0 – COUNT[15:0] Flushed Received Packets Count (cleared on read)
Counts the number of frames that have been flushed from the receive packet buffer memory due to one of the following reasons:
When partial store and forward mode is enabled and a packet is received while there is no system bus resource.
When partial store and forward mode is enabled and a system bus error is encountered while writing the packet data to system memory.
When automatic discard of received packed during lack of resource is enabled (bit 24 of the DMA Configuration register) and a packet is received while there is no system bus resource.
When a software flush of a packet from the head of the packet buffer queue (bit 18 of the Network Control register) is performed and the DMA is not currently busy.

Reset	0	0	0	0	0	0	0	0

Bits 31:24 – LSBTIR[7:0] Lower Significant Bits of Timer Increment Register
Lower significant bits of Timer Increment Register[15:0] giving a 24-bit timer_increment counter. These bits are the sub-ns value which the 1588 timer will be incremented each clock cycle. Bit n = $2^{(n-16)}$ nsec providing a resolution of approximately 15.2E^{-15} sec.

Bits 15:0 – MSBTIR[15:0] Most Significant Bits of Timer Increment Register
Most significant bits [23:8] of the sub-nanosecond value by which the 1588 timer will be incremented each clock cycle. 24 bits of sub-nanosecond precision provides a resolution of approximately 5.86E-17 seconds.

Bits 29:24 – FILTBMASK[5:0] Filter Bytes Mask

Value	Name	Description
0x1	BIT1	Controls whether the first byte has been received.
0x2	BIT2	Controls whether the second byte has been received.
0x4	BIT3	Controls whether the third byte has been received.
0x8	BIT4	Controls whether the fourth byte has been received.
0x10	BIT5	Controls whether the fifth byte has been received.
0x20	BIT6	Controls whether the sixth byte has been received

Bit 16 – FILTSORD Filter Source or Destination MAC Address
Selects whether this filter should be comparing the MAC source address or the MAC destination address of the received Ethernet frame.

Value	Description
0	The filter is a destination address filter.
1	The filter is a source address filter.

Bits 15:0 – ADDR[15:0] Specific Address
The most significant bits of the destination address, that is, bits 47:32.

Reset	0	0	0	0	0	0	0	0

Bits 31:0 – IS[31:0] IdleSlope
IdleSlope value for queue A in bytes/second.
The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent. This must not exceed the port transmit rate which is dependent on the speed of operation, e.g., 100 Mb/second = 0x017D7840
If 50% of bandwidth was to be allocated to a particular queue in 100 Mb/second mode, then the IdleSlope value for that queue would be calculated as 0x017D7840 / 2.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.290.GMAC Express MAC Screening Type 1 Register

Name: GMAC_EMAC_ST1R
Offset: 0x1500
Reset: 0x00000000
Property: Read/Write

Screening Type 1 registers are used to allocate up to 6 priority queues to received frames based on certain IP or UDP fields of incoming frames.

Bit	31	30	29	28	27	26	25	24
			UDPE	DSTCE	UDPM[15:12]			
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

	UDPM[3:0]				DSTCM[7:4]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	DSTCM[3:0]					QNB[2:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

Bit 29 – UDPE UDP Port Match Enable
When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

Bit 28 – DSTCE Differentiated Services or Traffic Class Match Enable
When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

Bits 27:12 – UDPM[15:0] UDP Port Match
When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

Bits 11:4 – DSTCM[7:0] Differentiated Services or Traffic Class Match
When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

Bits 2:0 – QNB[2:0] Queue Number (0–5)
If a match is successful, then the queue value programmed in bits 2:0 is allocated to the frame.

64.8.291.GMAC Express MAC Screening Type 2 Register x

Name: GMAC_EMAC_ST2Rx
Offset: 0x1540 + x*0x04 [x=0..1]
Reset: 0x00000000
Property: Read/Write

Screening type 2 registers are used to allocate up to 6 priority queues to received frames based on the VLAN priority field of received ethernet frames.

Bit	31	30	29	28	27	26	25	24
		COMPCE	COMPC[4:0]					COMPBE
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0

Bit 30 – COMPCE Compare C Enable

Value	Description
0	Comparison via the register designated by index COMPC is disabled.
1	Comparison via the register designated by index COMPC is enabled.

Bits 29:25 – COMPC[4:0] Index of Screening Type 2 Compare Word 0/Word 1 register x
COMPC is a pointer to the compare registers GMAC_EMAC_ST2CW0R and GMAC_EMAC_ST2CW1R. When COMPCE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

Bit 24 – COMPBE Compare B Enable

Value	Description
0	Comparison via the register designated by index COMPB is disabled.
1	Comparison via the register designated by index COMPB is enabled.

Bits 23:19 – COMPB[4:0] Index of Screening Type 2 Compare Word 0/Word 1 register x
COMPB is a pointer to the compare registers GMAC_EMAC_ST2CW0R and GMAC_EMAC_ST2CW1R. When COMPBE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

Bit 18 – COMPAE Compare A Enable

Value	Description
0	Comparison via the register designated by index COMPA is disabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Comparison via the register designated by index COMPA is enabled.

Bits 17:13 – COMPA[4:0] Index of Screening Type 2 Compare Word 0/Word 1 register x
COMPA is a pointer to the compare registers GMAC_EMAC_ST2CW0R and GMAC_EMAC_ST2CW1R. When COMPAE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

Bit 12 – ETHE EtherType Enable

Value	Description
0	EtherType match with bits 15:0 in the register designated by the value of I2ETH is disabled.
1	EtherType match with bits 15:0 in the register designated by the value of I2ETH is enabled.

Bits 11:9 – I2ETH[2:0] Index of Screening Type 2 EtherType register x
When ETHE is set (bit 12), the field EtherType (last EtherType in the header if the frame is VLAN tagged) is compared with bits 15:0 in the register designated by the value of I2ETH.

Bit 8 – VLANE VLAN Enable

Value	Description
0	VLAN match is disabled.
1	VLAN match is enabled.

Bits 6:4 – VLANP[2:0] VLAN Priority
When VLAN match enable is set (bit 8), the VLAN priority field of the received frame is matched against bits 7:4 of this register.

Bits 2:0 – QNB[2:0] Queue Number (0–5)
If a match is successful, then the queue value programmed in QNB is allocated to the frame.

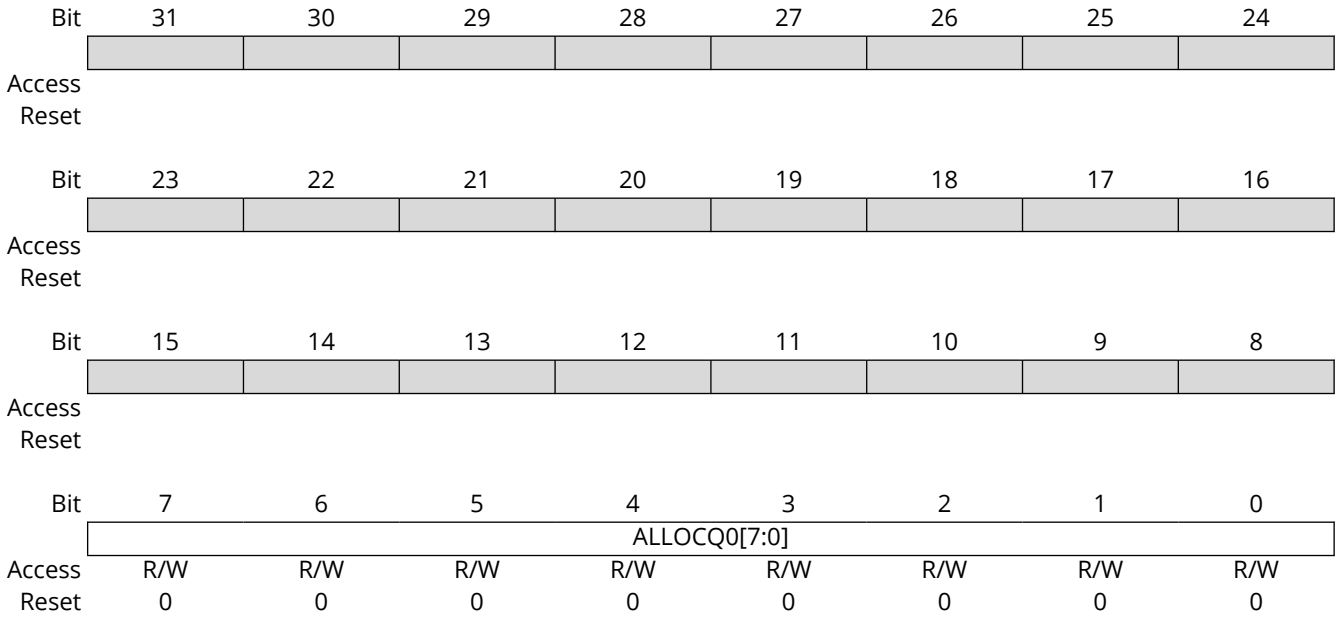
							TXSQ[1:0]	
Access							R/W	R/W
Reset							0	0



Bits 1:0 – TXSQ[1:0] Transmit Schedule for Q0

Value	Name	Description
0	FP	Fixed Priority.
1	CBS	CBS Enabled only valid if CBS capability selected.
2	DWRR	DWRR enabled.
3	ETS	ETS enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.293.GMAC Express MAC Transmit Queue Bandwidth Rate Limit Register

Name: GMAC_EMAC_TQBWRL
Offset: 0x1590
Reset: 0
Property: R/W

Bits 7:0 – ALLOCQ0[7:0] DWRR Weighting or ETS Bandwidth Allocation for EMAC
Defines the value of Deficit Weighted Round Robin (DWRR) or Enhanced Transmission Selection (ETS - 802.1Qaz).

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.294.GMAC Express MAC Transmit Queue Segment Allocation Register

Name: GMAC_EMAC_TQSA
Offset: 0x15A0
Reset: 0x00000000
Property: Read/Write

Reset	0	0	0	0	0	0	0	0

Bits 31:16 – COMPVAL[15:0] Compare Value
The byte stored in bits [23:16] is compared against the first byte of the 2 bytes extracted from the frame.
The byte stored in bits [31:24] is compared against the second byte of the 2 bytes extracted from the frame.

Bits 15:0 – MASKVAL[15:0] Mask Value
The value of MASKVAL ANDed with the 2 bytes extracted from the frame is compared to the value of MASKVAL ANDed with the value of COMPVAL.

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.296.GMAC Express MAC Screening Type 2 Compare Word 1 Register x

Name: GMAC_EMAC_ST2CW1Rx
Offset: 0x1704 + x*0x08 [x=0..5]
Reset: 0x00000000
Property: Read/Write

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 9 – DISMASK Disable Mask
Controls whether GMAC_EMAC_ST2CW0R contains a 2-byte compare value with a 2-byte mask value or a 4-byte compare value.

Value	Description
0	GMAC_EMAC_ST2CW0R contains a 2-byte compare value with a 2-byte mask value.
1	GMAC_EMAC_ST2CW0R contains a 4-byte compare value.

Bits 8:7 – OFFSSTRT[1:0] Ethernet Frame Offset Start

Value	Name	Description
0	FRAMESTART	Offset from the start of the frame
1	ETHERTYPE	Offset from the byte after the EtherType field
2	IP	Offset from the byte after the IP header field
3	TCP_UDP	Offset from the byte after the TCP/UDP header field

Bits 6:0 – OFFSVAL[6:0] Offset Value in Bytes
The value of OFFSVAL ranges from 0 to 127 bytes, and is counted from either the start of the frame, the byte after the EtherType field (last EtherType in the header if the frame is VLAN tagged), the byte after the IP header (IPv4 or IPv6) or the byte after the TCP/UDP header.

Reset	0	0	0	0	0	0	0	0

Bits 15:0 – TIMEOUT[15:0] Sequence Recovery Timer Restart Period for Credit Based Streams
Determines when the sequence recovery timers are restarted and used by all of the configured CB streams. It is programmed as a count of 8192 rx_clk periods. 8192 rx_clk periods is 65.536 microseconds at gigabit speed and 327.68 microseconds at 100M speed, this allows a max timeout value of about 4 seconds at gigabit speed.

Reset	1	1	0	0	0	0	0	1

Bit 31 – STRIP_R_TAG Stripping Redundancy Tag Enable

Value	Description
0	Disables the stripping function. When the statistics counters need to reflect the actual number of octets received, then the stripping functionality must be disabled.
1	Enables the stripping function, the receive octet counters reflect post deletion frame size so the frame elimination functionality is transparent to higher level management.

Bit 30 – SIX_BYTE_TAG Six-byte Tag Enable

Value	Description
0	Defines a four-byte tag as per 802.1CB standard revision 2.4 and earlier.
1	Enables the six-byte tag as per 802.1CB standard revision 2.4 and later.

Bits 15:0 – RED_TAG[15:0] Redundancy Tag (R-TAG)
Defines the Ethertype value used to identify the redundancy tag (R-TAG).

© 2026 Microchip Technology Inc. and its subsidiaries

64.8.303.GMAC Express MAC Frame Elimination Control1 A Register

Name: GMAC_EMAC_FRER_CTRL1_A

Bit 31 – EN_ELIMINATION 802.1CB Elimination of Received Frames Enable

Value	Description
0	Disables the elimination of received frames.
1	Enables the elimination of received frames.

Bit 30 – EN_VECTOR_REC_ALG 802.1CB Vector Recovery Algorithm Enable

Value	Description
0	Enables the match recovery algorithm.
1	Enables the vector recovery algorithm.

Bit 29 – EN_SEQRECRST_TIMER 802.1CB Sequence Recovery Reset Timer Enable

Value	Description
0	Disables the sequence recovery reset timer.
1	Enables the sequence recovery reset timer.

Bit 28 – USE_R_TAG Redundancy Tag Enable

Value	Description
0	Identifies bottom of sequence number with OFFSET_VALUE.
1	Identifies sequence number with redundancy tag.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 16:8 – OFFSET_VALUE[8:0] Offset in Bytes from Start Packet Delimiter to MSB for 802.1CB Sequence Number

Defines the offset value in bytes from the start packet delimiter to the most significant byte of the 802.1CB sequence number. 9-bit width allows a TCP sequence number to be used with IPv6. This value must only be changed when EN_ELIMINATION=0.

Bits 7:4 – MEMBER_STREAM_2[3:0] Pointer to Screener Type 2 Register

Used for member stream identification. The member stream 1 and 2 values can be programmed to identical values.

Bits 3:0 – MEMBER_STREAM_1[3:0] Pointer to Screener Type 2 Register

Used for member stream identification. The member stream 1 and 2 values can be programmed to identical values.

			SEQ_REC_WINDOW[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 12:8 – SEQ_NUM_LENGTH[4:0] Number of Significant Bits of the 802.1CB Sequence Number
Defines the number of LSBs to consider in the 802.1CB sequence number.
The vector recovery algorithm does not work for values lower than 4. The value 0 and values greater than 16 are equivalent to 16.

Bits 5:0 – SEQ_REC_WINDOW[5:0] Vector Recovery Window
Defines the window size used by the vector recovery algorithm to determine whether to reject a packet. A value of zero means the entire history vector is used.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 25:16 – VEC_REC_ROGUE[9:0] Number of Dropped Frames (Clear on read)
Returns the number of frames dropped by the vector recovery algorithm for being out of range.

Bits 9:0 – LATENT_ERRS[9:0] Number of Sequence Numbers Seen Without a Duplicate (Clear on read)
Returns the number of sequence numbers seen without a duplicate.
The count is updated when a frame is dropped from the history vector. So the update only happens after a new frame is received.

Bit 31 – EN_ELIMINATION 802.1CB Elimination of Received Frames Enable

Value	Description
0	Disables the elimination of received frames.
1	Enables the elimination of received frames.

Bit 30 – EN_VECTOR_REC_ALG 802.1CB Vector Recovery Algorithm Enable

Value	Description
0	Enables the match recovery algorithm.
1	Enables the vector recovery algorithm.

Bit 29 – EN_SEQRECRST_TIMER 802.1CB Sequence Recovery Reset Timer Enable

Value	Description
0	Disables the sequence recovery reset timer.
1	Enables the sequence recovery reset timer.

Bit 28 – USE_R_TAG Redundancy Tag Enable

Value	Description
0	Identifies bottom of sequence number with OFFSET_VALUE.
1	Identifies sequence number with redundancy tag.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 16:8 – OFFSET_VALUE[8:0] Offset in Bytes from Start Packet Delimiter to MSB for 802.1CB Sequence Number

Defines the offset value in bytes from the start packet delimiter to the most significant byte of the 802.1CB sequence number. 9-bit width allows a TCP sequence number to be used with IPv6. This value must only be changed when EN_ELIMINATION=0.

Bits 7:4 – MEMBER_STREAM_2[3:0] Pointer to Screener Type 2 Register

Used for member stream identification. The member stream 1 and 2 values can be programmed to identical values.

Bits 3:0 – MEMBER_STREAM_1[3:0] Pointer to Screener Type 2 Register

Used for member stream identification. The member stream 1 and 2 values can be programmed to identical values.

			SEQ_REC_WINDOW[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 12:8 – SEQ_NUM_LENGTH[4:0] Number of Significant Bits of the 802.1CB Sequence Number
Defines the number of LSBs to consider in the 802.1CB sequence number.
The vector recovery algorithm does not work for values lower than 4. The value 0 and values greater than 16 are equivalent to 16.

Bits 5:0 – SEQ_REC_WINDOW[5:0] Vector Recovery Window
Defines the window size used by the vector recovery algorithm to determine whether to reject a packet. A value of zero means the entire history vector is used.

Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					LIMIT_FRAME_SIZE	LIMIT_NUM_BYTES	DROP_ON_RESRC_ERR	DROP_ALL
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 31:16 – MAX_VAL[15:0] Maximum Value for the Received Frame Size or Number of 128-Byte Chunk
Defines the maximum value for the received frame size when the bit LIMIT_FRAME_SIZE=1 or the number of 128 byte chunks of data received for this queue and already stored in the memory of the queue awaiting DMA memory writes when LIMIT_NUM_BYTES=1 and LIMIT_FRAME_SIZE=0.

Bit 3 – LIMIT_FRAME_SIZE Maximum Frame-length Received

Value	Name	Description
0	DISABLED	No effect.
1	ENABLED	When set, MAX_VAL indicates the maximum frame-length in bytes that may be received. Frames exceeding this length will be dropped. This traffic policing function is relevant to the 802.1Qci standard which specifies stream filtering based on a maximum service data unit (SDU) size.

Bit 2 – LIMIT_NUM_BYTES Limitation of the Number of 128-Byte Chunk of Data Stored in the Memory of this Queue

Value	Name	Description
0	DISABLED	No effect.
1	ENABLED	Limits the number of 128 byte chunks of data received for this queue and already stored in the memory of the queue awaiting DMA memory writes to the value defined in the field MAX_VAL.

Bit 1 – DROP_ON_RESRC_ERR Drop on Resource Error

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	DISABLED	No effect.
1	ENABLED	If a free DMA descriptor for this queue cannot be obtained (also referred to as lack of descriptor resource and occurs when the software either cannot free up descriptors quickly enough to meet the receive traffic rate or has deliberately decided not to free any descriptors), all new frames received on this queue will be automatically discarded.

Bit 0 – DROP_ALL Drop All Frames

Value	Name	Description
0	DISABLED	No effect.
1	ENABLED	Drops all frames of this queue.

Bit	7	6	5	4	3	2	1	0
	INTERVAL_TIME[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:16 – MAX_RATE_VAL[15:0] Maximum Rate Value for the Interval Time
Defines the maximum number of bytes the type 2 screener is permitted to match in the programmed interval time.

Bits 15:0 – INTERVAL_TIME[15:0] Interval Time for Maximum Rate Checking
Defines the period for which the total number of bytes of received frames matched by the screener are accumulated and compared with the value configured in MAX_RATE_VAL. When the value exceeds MAX_RATE_VAL, then the current frame and frames subsequently matched will dropped until an interval time passes where MAX_RATE_VAL is not exceeded. When MAX_RATE_VAL=0, then no rate limiting will be performed. The interval time is specified in units of 64 receive clock periods.

65. Flexible Serial Communication Controller (FLEXCOM)

65.1. Description

The Flexible Serial Communication Controller (FLEXCOM) offers several serial communication protocols that are managed by the three submodules USART, SPI, and TWI (I^2C).

The Universal Synchronous Asynchronous Receiver Transceiver (USART) provides one full-duplex universal synchronous asynchronous serial link. Data frame format is widely programmable (data length, parity, number of stop bits) to support a maximum of standards. The receiver implements parity error, framing error and overrun error detection. The receiver timeout enables handling variable-length frames and the transmitter timeguard facilitates communications with slow remote devices. Multidrop communications are also supported through address bit handling in reception and transmission.

The USART features three test modes: Remote Loopback, Local Loopback and Automatic Echo.

The USART supports specific operating modes providing interfaces on RS485, LIN, LON, , with ISO7816 T = 0 or T = 1 smart card slots, and infrared transceivers. The hardware handshaking feature enables an out-of-band flow control by automatic management of the pins RTS and CTS.

The USART supports the connection to the DMA Controller, which enables data transfers to the transmitter and from the receiver. The DMAC provides chained buffer management without any intervention of the processor.

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Host or Client mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “host” which controls the data flow, while the other devices act as “clients” which have data shifted into and out by the host. Different CPUs can take turn being hosts (multiple host protocol, contrary to single host protocol where one CPU is always the host while all of the others are always clients). One host can simultaneously shift data into multiple clients. However, only one client can drive its output to write data back to the host at any given time.

A client device is selected when the host asserts its NSS signal. If multiple client devices exist, the host generates a separate client select signal for each client (NPCS).

The SPI provides an additional logic for CRC calculation and checking and an optimized interface to get an easy link with Two-Pin mode devices such as 24-bit ADC MCP3910.

The SPI system consists of two data lines and two control lines:

- Host Out Client In (MOSI)—This data line supplies the output data from the host shifted into the input(s) of the client(s).
- Host In Client Out (MISO)—This data line supplies the output data from a client to the input of the host. There may be no more than one client transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the host and regulates the flow of the data bits. The host can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Client Select (NSS)—This control line allows clients to be turned on and off by hardware.

The Two-wire Interface (TWI) interconnects components on a unique two-wire bus, made up of one clock line and one data line based on a byte-oriented transfer format. It can be used with any Two-wire Interface bus Serial EEPROM and I2C-compatible devices, such as a Real-Time Clock (RTC), Dot Matrix/Graphic LCD Controller and temperature sensor. The TWI is programmable as a host or a client with sequential or single-byte access. Multiple host capability is supported.

© 2026 Microchip Technology Inc. and its subsidiaries

Arbitration of the bus is performed internally and puts the TWI in Client mode automatically if the bus arbitration is lost.

A configurable baud rate generator permits the output data rate to be adapted to a wide range of core clock frequencies.

The following table lists the compatibility level of any TWI in Host mode and a full I2C compatible device.

Table 65.1. TWI Compatibility with I2C Standard

I2C Standard	TWI
Standard mode speed (100 kHz)	Host, Multi-Host, Client supported
Fast mode speed (400 kHz)	Host, Multi-Host, Client supported
Fast mode Plus speed (1 MHz)	Host, Multi-Host, Client supported
High-speed mode (3.4 MHz)	Host, Client supported
7- or 10-bit(1) Client addressing	Supported
Repeated Start (Sr) condition	Supported
ACK and NACK management	Supported
Input filtering	Supported
Slope control	Not supported
Clock stretching	Supported

Note:

1. 10-bit support in Host mode only.

65.2. Embedded Characteristics

65.2.1. USART/UART Characteristics

- 16-data Transmit and Receive FIFOs
- Programmable Baud Rate Generator
- Baud Rate can be Independent of the Processor/Peripheral Clock
- Comparison Function on Received Character
- 5-bit to 9-bit Full-duplex Synchronous or Asynchronous Serial Communications
  - 1, 1.5, or 2 stop bits in Asynchronous mode or 1 or 2 stop bits in Synchronous mode
  - Parity generation and error detection
  - Framing error detection, overrun error detection
  - Digital filter on receive line
  - MSB-first or LSB-first
  - Optional break generation and detection
  - By 8 or by 16 oversampling receiver frequency
  - Optional hardware handshaking RTS-CTS
  - Receiver timeout and transmitter timeguard
  - Optional Multidrop mode with address generation and detection
- RS485 with Driver Control Signal
- ISO7816, T = 0 or T = 1 Protocols for Interfacing with Smart Cards
  - NACK handling, error counter with repetition and iteration limit
- IrDA Modulation and Demodulation
  - Communication at up to 115.2 kbit/s

© 2026 Microchip Technology Inc. and its subsidiaries

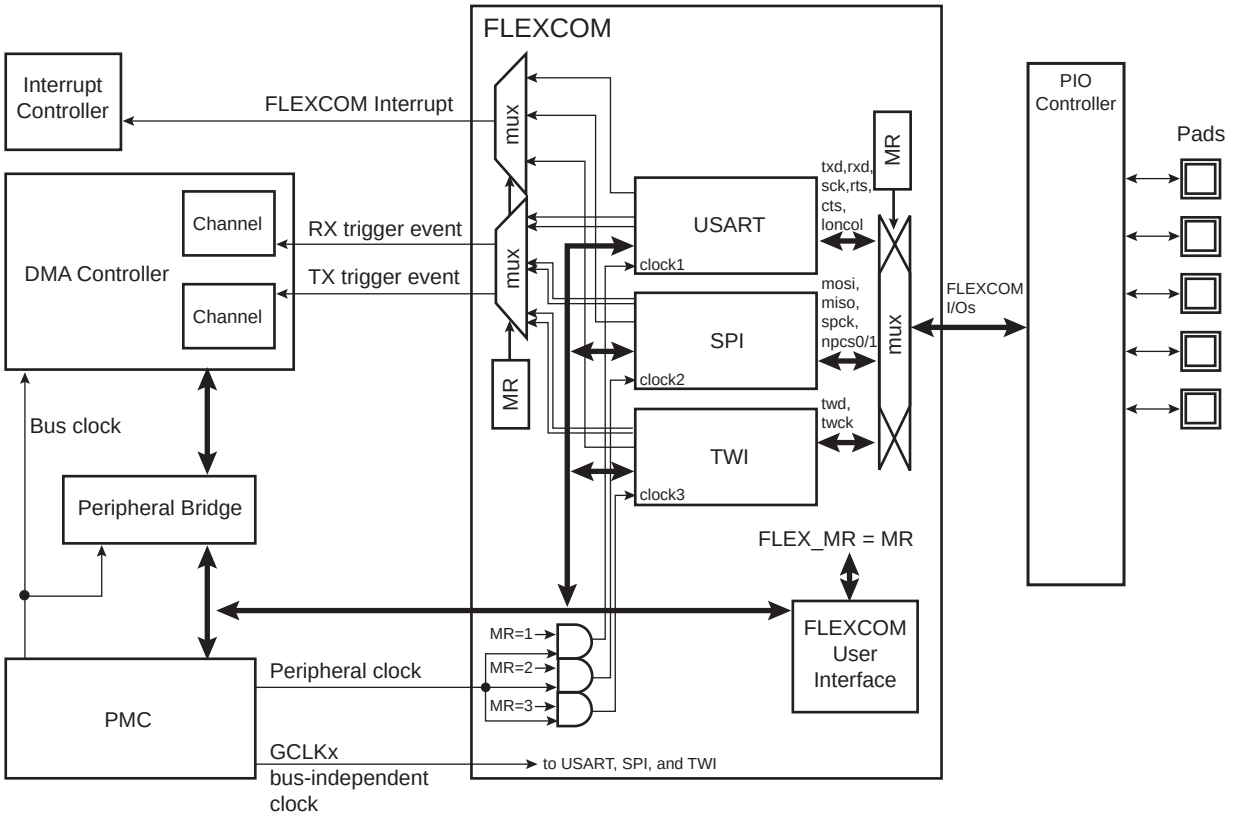
- Up to 16-bit data, Manchester-encoded Frame Support
- LIN Mode
  - Compliant with LIN 1.3 and LIN 2.0 specifications
  - Host or client
  - Processing of frames with up to 256 data bytes
  - Response data length can be configurable or defined automatically by the identifier
  - Self-synchronization in client node configuration
  - Automatic processing and verification of the “synch break” and the “synch field”
  - “Synch break” detection even when partially superimposed with a data byte
  - Automatic identifier parity calculation/sending and verification
  - Parity sending and verification can be disabled
  - Automatic checksum calculation/sending and verification
  - Checksum sending and verification can be disabled
  - Support both “classic” and “enhanced” checksum types
  - Full LIN error checking and reporting
  - Frame Slot mode: host allocates slots to the scheduled frames automatically
  - Generation of the wakeup signal
- LON Mode
  - Compliant with CEA-709 specification
  - Full-layer 2 implementation
  - Differential Manchester encoding/decoding (CDP)
  - Preamble generation including bit- and byte-sync fields
  - LON timings handling (beta1, beta2, IDT, etc.)
  - CRC generation and checking
  - Automated random number generation
  - Backlog calculation and update
  - Collision detection support
  - Supports both comm_type = 1 and comm_type = 2 modes
  - Clock drift tolerance up to 16%
  - Optimal for node-to-node communication (no embedded digital line filter)
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo
- Supports Connection of:
  - Two DMA Controller (DMAC) channels
  - Offers buffer transfer without processor intervention
- Functional Safety: Protection, Monitors and Reports
  - Register Write protection
  - Reports any write-protected access

65.2.2. SPI Characteristics

- 16-data Transmit and Receive FIFOs
- Host or Client Serial Peripheral Bus Interface

© 2026 Microchip Technology Inc. and its subsidiaries

  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
- Selectable Mode Fault Detection
- Host Mode Can Drive SPCK up to Peripheral Clock
- Host Mode Bit Rate Can Be Independent of the Processor/Peripheral Clock
- Client Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Four Chip Selects with External Decoder Support Allow Communication with up to 15Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors
- Connection to DMA Channels Optimizes Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- CRC Generation and Checking
- Two-Pin Mode for Easy Link with MCP3910 ADC
- Functional Safety: Protection, Monitors and Reports
  - Register Write protection
  - Reports any write-protected access



65.2.3. TWI/SMBus Characteristics

- 16-byte Transmit and Receive FIFOs
- Bit Rate can be Independent of the Processor/Peripheral Clock
- SMBus Support
- Compatible with I^2C Compatible Devices (see Note 1)
- One, Two or Three Bytes for Client Address
- Sequential Read/Write Operations
- General Call Supported in Client Mode
- Connection to DMA Controller Channels Optimizes Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Functional Safety: Protection, Monitors, and Reports
  - Register Write protection
  - Reports any write-protected access
- **Note:**

65.5. Product Dependencies

65.5.1. I/O Lines

The pins used for interfacing the FLEXCOM are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the desired FLEXCOM pins to their peripheral function. If I/O lines of the FLEXCOM are not used by the application, they can be used for other purposes by the PIO Controller.

© 2026 Microchip Technology Inc. and its subsidiaries

65.5.2. Power Management

The peripheral clock is not continuously provided to the FLEXCOM. The programmer must first enable the FLEXCOM Clock in the Power Management Controller (PMC) before using the USART or SPI or TWI.

65.5.3. Interrupt Sources

The FLEXCOM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the FLEXCOM interrupt requires the Interrupt Controller to be programmed first.

65.6. Register Accesses

Register accesses support 8-bit, 16-bit and 32-bit access, allowing, for example, an 8-bit part of a 32-bit register to be written in one access. To do so, the access must be done with the right size at the right address.

8-bit, 16-bit and 32-bit accesses are supported for register accesses. However, a field in a register cannot be partially written (for example, if a field is bigger than 8 bits, the whole field must be written).

This feature avoids a read-modify-write process if only a small part of the register is to be modified.

65.7. USART Functional Description

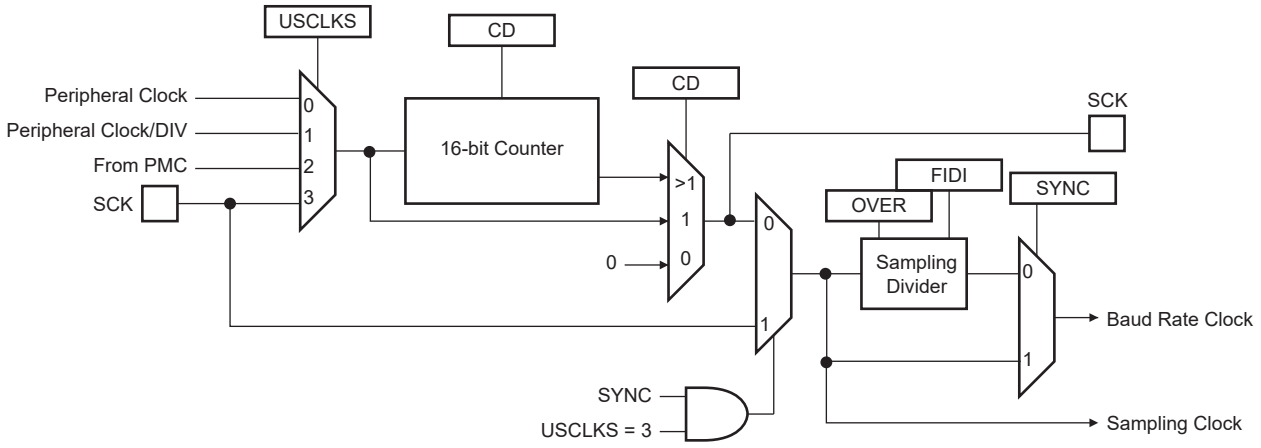
65.7.1. Baud Rate Generator

The baud rate generator provides the bit period clock named “baud rate clock” to both the receiver and the transmitter.

Configuring the USCLKS field in FLEX_US_MR selects the baud rate generator clock from one of the following sources:

- the peripheral clock
- a division of the peripheral clock, the divider being product dependent, but generally set to 8
- a fully programmable generic clock (GCLK) provided by PMC and independent of processor/peripheral clock
- the external clock, available on the SCK pin

The baud rate generator is based upon a 16-bit divider, which is programmed with the CD field of the Baud Rate Generator register (FLEX_US_BRGR). If a zero is written to CD, the baud rate generator does not generate any clock. If a one is written to CD, the divider is bypassed and becomes inactive.



If the external SCK clock is selected, the duration of the low and high levels of the signal provided on the SCK pin must be longer than a peripheral clock period. The frequency of the signal provided on SCK must follow constraints depending on the operating mode (see Baud Rate in Synchronous Mode).

If GCLK is selected, the baud rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the USART transfer. The GCLK frequency must be at least three times lower than peripheral clock frequency.

If GCLK is selected (USCLKS = 2) and the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.

Figure 65.2. Baud Rate Generator

65.7.1.1.Baud Rate in Asynchronous Mode

If the USART is programmed to operate in Asynchronous mode, the selected clock is first divided by CD, which is field-programmed in FLEX_US_BRGR. The resulting clock is provided to the receiver as a sampling clock and then divided by 16 or 8, depending on the programming of FLEX_US_MR.OVER.

If OVER is set, the receiver sampling is eight times higher than the baud rate clock. If OVER is cleared, the sampling is performed at 16 times the baud rate clock.

The baud rate is calculated as per the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{(8(2 - \text{OVER})\text{CD})}$$

This gives a maximum baud rate of peripheral clock divided by 8, assuming that peripheral clock is the highest possible clock and that the OVER bit is set.

65.7.1.1.1.Baud Rate Calculation Example

The following table shows calculations of CD to obtain a baud rate at 38,400 bit/s for different source clock frequencies. It also shows the actual resulting baud rate and the error.

Table 65.3. Baud Rate Example (OVER = 0)

Source Clock (MHz)	Expected Baud Rate (bit/s)	Calculation Result	CD	Actual Baud Rate (bit/s)	Error
3,686,400	38,400	6.00	6	38,400.00	0.00%
4,915,200	38,400	8.00	8	38,400.00	0.00%
5,000,000	38,400	8.14	8	39,062.50	1.70%
7,372,800	38,400	12.00	12	38,400.00	0.00%
8,000,000	38,400	13.02	13	38,461.54	0.16%
12,000,000	38,400	19.53	20	37,500.00	2.40%
12,288,000	38,400	20.00	20	38,400.00	0.00%
14,318,180	38,400	23.30	23	38,908.10	1.31%
14,745,600	38,400	24.00	24	38,400.00	0.00%
18,432,000	38,400	30.00	30	38,400.00	0.00%
24,000,000	38,400	39.06	39	38,461.54	0.16%
24,576,000	38,400	40.00	40	38,400.00	0.00%
25,000,000	38,400	40.69	40	38,109.76	0.76%
32,000,000	38,400	52.08	52	38,461.54	0.16%
32,768,000	38,400	53.33	53	38,641.51	0.63%

© 2026 Microchip Technology Inc. and its subsidiaries

Table 65.3. Baud Rate Example (OVER = 0) (continued)

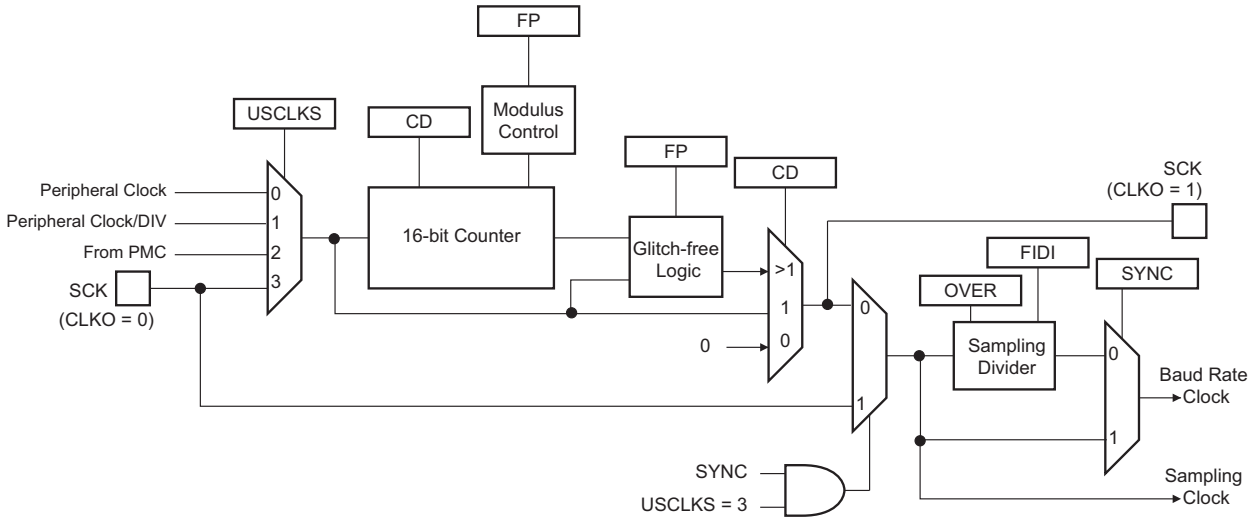
Source Clock (MHz)	Expected Baud Rate (bit/s)	Calculation Result	CD	Actual Baud Rate (bit/s)	Error
33,000,000	38,400	53.71	54	38,194.44	0.54%
40,000,000	38,400	65.10	65	38,461.54	0.16%
50,000,000	38,400	81.38	81	38,580.25	0.47%

The baud rate is calculated with the following formula:

Baud rate = MCK / CD × 16

The baud rate error is calculated with the following formula. It is not recommended to work with an error higher than 5%.

$$\text{Error} = 1 - \left(\frac{\text{Expected Baud Rate}}{\text{Actual Baud Rate}}\right)$$



65.7.1.2. Fractional Baud Rate in Asynchronous Mode

The baud rate generator previously defined is subject to the following limitation: the output frequency changes by only integer multiples of the reference frequency. An approach to this problem is to integrate a fractional N clock generator that has a high resolution. The generator architecture is modified to obtain baud rate changes by a fraction of the reference source clock. This fractional part is programmed with the FP field in FLEX_US_BRGR. If FP is not 0, the fractional part is activated. The resolution is one eighth of the clock divider. The fractional baud rate is calculated using the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\left(8(2 - \text{OVER})\left(\text{CD} + \frac{\text{FP}}{8}\right)\right)}$$

The modified architecture is presented in the following figure.

Figure 65.3. Fractional Baud Rate Generator

WARNING When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by "selected clock" period from time to time. The duty cycle depends on the value of the CD field.

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.1.3. Baud Rate in Synchronous Mode

If the USART is programmed to operate in Synchronous mode, the selected clock is simply divided by the CD field in FLEX_US_BRGR:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\text{CD}}$$

In Synchronous mode, if the external clock is selected (USCLKS = 3) and CLKO = 0 (Client mode), the clock is provided directly by the signal on the USART SCK pin. No division is active. The value written in FLEX_US_BRGR has no effect. When operating in asynchronous modes and the SCK pin is selected for baud rate generation, the external clock frequency must be at least three times lower than the system clock.

In Synchronous mode, SCK must be lower than $f_{\text{peripheral clock}}/6$.

Note: In Transmit only Synchronous mode (FLEX_US_CR.TXEN=1, FLEX_US_CR.RXDIS=1, FLEX_US_MR.SYNC=1, USCLKS=3), the transmit path (TXD) can be operated at $f_{\text{peripheral clock}}/3$.

When either the external clock SCK or the internal clock divided (peripheral clock/DIV or GCLK) is selected and if the user has to ensure a 50:50 mark/space ratio on the SCK pin, the value programmed in CD must be even. If the peripheral clock is selected and if the value programmed in CD is odd, the baud rate generator ensures a 50:50 duty cycle on the SCK pin.

65.7.1.4. Baud Rate in ISO 7816 Mode

The ISO7816 specification defines the bit rate with the following formula:

$$B = \frac{\text{Di}}{\text{Fi}} \times f$$

where:

- B is the bit rate
- Di is the bit rate adjustment factor
- Fi is the clock frequency division factor
- f is the ISO7816 clock frequency (Hz)

Di is a binary value encoded on a 4-bit field, named DI, as represented in the following table.

Table 65.4. Binary and Decimal Values for Di

DI field	0001	0010	0011	0100	0101	0110	1000	1001
Di (decimal)	1	2	4	8	16	32	12	20

Fi is a binary value encoded on a 4-bit field, named FI, as represented in the following table.

Table 65.5. Binary and Decimal Values for Fi

FI field	0000	0001	0010	0011	0100	0101	0110	1001	1010	1011	1100	1101
Fi (decimal)	372	372	558	744	1116	1488	1860	512	768	1024	1536	2048

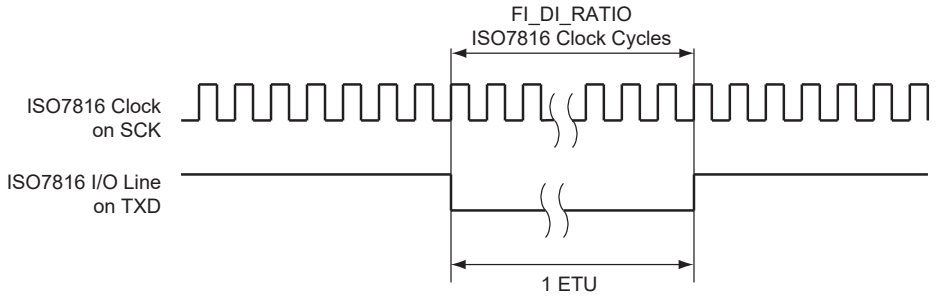
The following table shows the resulting Fi/Di Ratio, which is the ratio between the ISO7816 clock and the baud rate clock.

Table 65.6. Possible Values for the Fi/Di Ratio

Fi/Di	372	558	744	1116	1488	1806	512	768	1024	1536	2048
1	372	558	744	1116	1488	1860	512	768	1024	1536	2048
2	186	279	372	558	744	930	256	384	512	768	1024
4	93	139.5	186	279	372	465	128	192	256	384	512
8	46.5	69.75	93	139.5	186	232.5	64	96	128	192	256
16	23.25	34.87	46.5	69.75	93	116.2	32	48	64	96	128

© 2026 Microchip Technology Inc. and its subsidiaries

32	11.62	17.43	23.25	34.87	46.5	58.13	16	24	32	48	64
12	31	46.5	62	93	124	155	42.66	64	85.33	128	170.6
20	18.6	27.9	37.2	55.8	74.4	93	25.6	38.4	51.2	76.8	102.4



If the USART is configured in ISO7816 mode, the clock selected by the USCLKS field in FLEX_US_MR is first divided by the value programmed in field CD field in FLEX_US_BRGR. The resulting clock can be provided to the SCK pin to feed the smart card clock inputs. This means that FLEX_US_MR.CLKO can be set.

This clock is then divided by the value programmed in the FI_DI_RATIO field in the FI DI Ratio register (FLEX_US_FIDI). This is performed by the Sampling Divider, which performs a division by up to 65535 in ISO7816 mode. The noninteger values of the Fi/Di Ratio are not supported and the user must program the FI_DI_RATIO field to a value as close as possible to the expected value.

The FI_DI_RATIO field resets to the value 0x174 (372 in decimal) and is the most common divider between the ISO7816 clock and the bit rate (Fi = 372, Di = 1).

The following figure shows the relation between the Elementary Time Unit, corresponding to a bit time, and the ISO7816 clock.

Figure 65.4. Elementary Time Unit (ETU)

65.7.2. Receiver and Transmitter Control

After reset, the receiver is disabled. The user must enable the receiver by setting the RXEN bit in the USART Control register (FLEX_US_CR). However, the receiver registers can be programmed before the receiver clock is enabled.

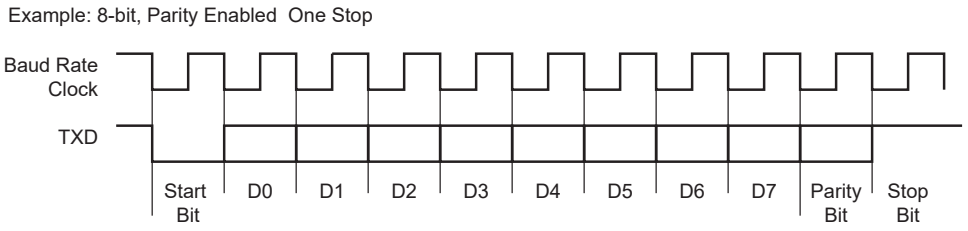
After reset, the transmitter is disabled. The user must enable it by setting the TXEN bit in FLEX_US_CR. However, the transmitter registers can be programmed before being enabled.

The receiver and the transmitter can be enabled together or independently.

At any time, the software can perform a reset on the receiver or the transmitter of the USART by setting the corresponding bit, RSTRX and RSTTX respectively, in FLEX_US_CR. The software resets clear the status flag and reset internal state machines but the user interface configuration registers hold the value configured prior to software reset. Regardless of what the receiver or the transmitter is performing, the communication is immediately stopped.

The user can also independently disable the receiver or the transmitter by setting RXDIS and TXDIS respectively in FLEX_US_CR. If the receiver is disabled during a character reception, the USART waits until the end of reception of the current character, then the reception is stopped. If the transmitter is disabled while it is operating, the USART waits the end of transmission of both the current character and character being stored in the USART Transmit Holding register (FLEX_US_THR). If a timeguard is programmed, it is handled normally.

© 2026 Microchip Technology Inc. and its subsidiaries



65.7.3. Synchronous and Asynchronous Modes

65.7.3.1. Transmitter Operations

The transmitter performs the same in both Synchronous and Asynchronous operating modes (SYNC = 0 or SYNC = 1). One start bit, up to 9 data bits, 1 optional parity bit and up to 2 stop bits are successively shifted out on the TXD pin at each falling edge of the programmed serial clock.

The number of data bits is selected by the CHRL field and the MODE9 bit in FLEX_US_MR. Nine bits are selected by setting the MODE9 bit regardless of the CHRL field. The parity bit is set according to the PAR field in FLEX_US_MR. The even, odd, space, marked or none parity bit can be configured. The MSBF bit in FLEX_US_MR configures which data bit is sent first. If written to 1, the most significant bit is sent first. If written to 0, the less significant bit is sent first. The number of stop bits is selected by the NBSTOP field in FLEX_US_MR. The 1.5 stop bit is supported in Asynchronous mode only.

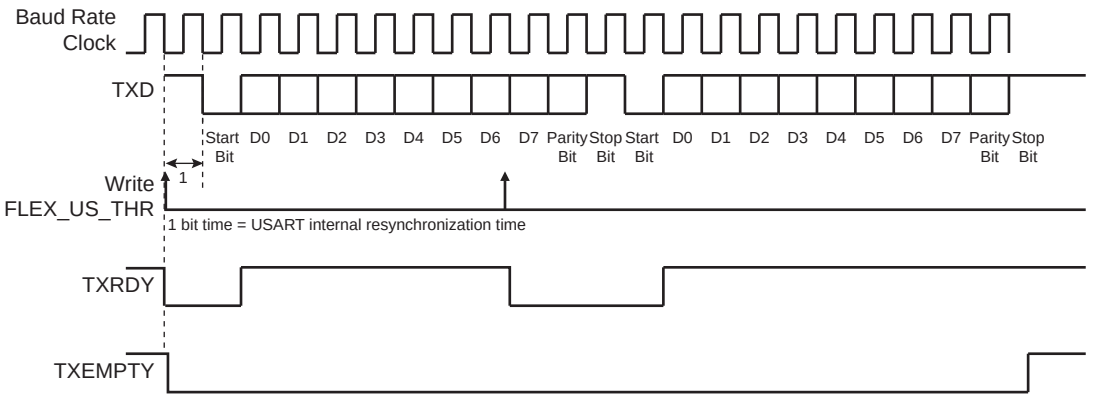


Figure 65.5. Character Transmit

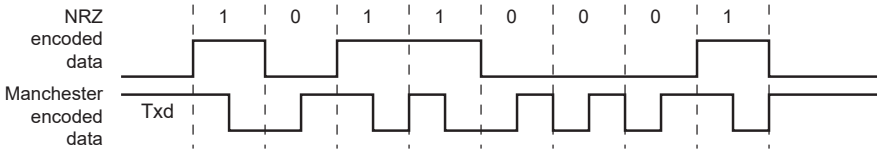
The characters are sent by writing in FLEX_US_THR. The transmitter reports two status bits in the USART Channel Status register (FLEX_US_CSR): TXRDY (Transmitter Ready), which indicates that FLEX_US_THR is empty and TXEMPTY, which indicates that all the characters written in FLEX_US_THR have been processed. When the current character processing is completed, the last character written in FLEX_US_THR is transferred into the shift register of the transmitter and FLEX_US_THR is emptied, thus TXRDY rises.

Both TXRDY and TXEMPTY bits are low when the transmitter is disabled. Writing a character in FLEX_US_THR while TXRDY is low has no effect and the written character is lost.

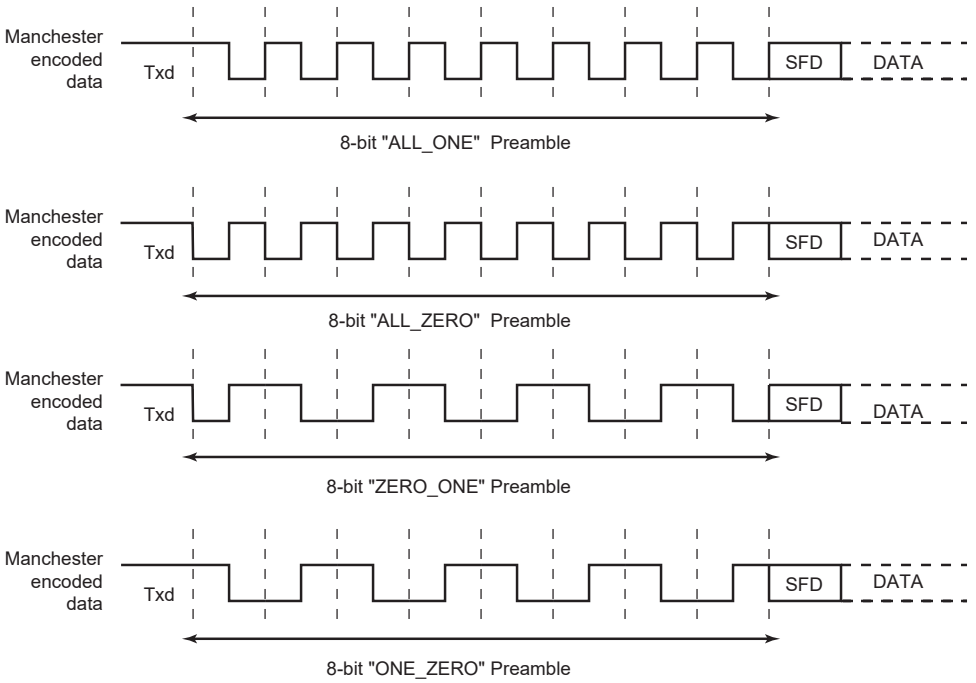
Figure 65.6. Transmitter Status



65.7.3.2. Manchester Encoder

When the Manchester encoder is in use, characters transmitted through the USART are encoded based on biphase Manchester II format. To enable this mode, set the FLEX_US_MR.MAN bit to 1. Depending on polarity configuration, a logic level (zero or one), is transmitted as a coded signal one-to-zero or zero-to-one. Thus, a transition always occurs at the midpoint of each bit time. It consumes more bandwidth than the original NRZ signal (2x) but the receiver has more error control since the expected input must show a change at the center of a bit cell. An example of Manchester

© 2026 Microchip Technology Inc. and its subsidiaries

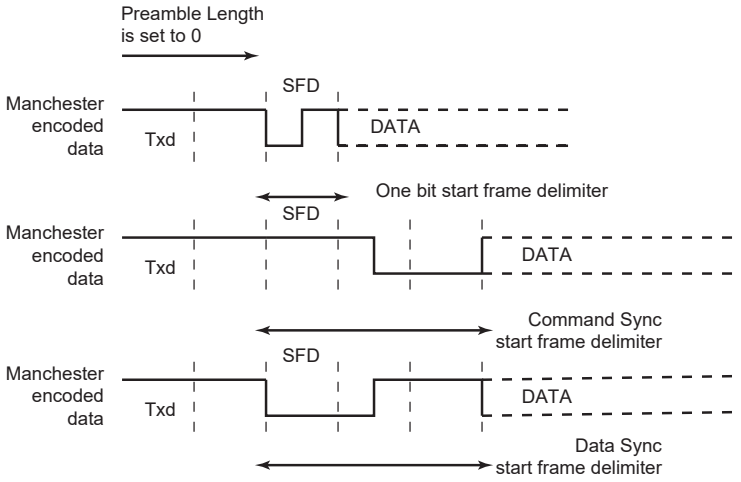


encoded sequence is: the byte 0xB1 or 10110001 encodes to 10 01 10 10 01 01 01 10, assuming the default polarity of the encoder. The following figure illustrates this coding scheme.

Figure 65.7. NRZ to Manchester Encoding

The Manchester encoded character can also be encapsulated by adding both a configurable preamble and a start frame delimiter pattern. Depending on the configuration, the preamble is a training sequence, composed of a predefined pattern with a programmable length from 1 to 15 bit times. If the preamble length is set to 0, the preamble waveform is not generated prior to any character. The preamble pattern is chosen among the following sequences: ALL_ONE, ALL_ZERO, ONE_ZERO or ZERO_ONE, writing the FLEX_US_MAN.TX_PP field. The TX_PL field is used to configure the preamble length. The following figure illustrates and defines the valid patterns. To improve flexibility, the encoding scheme can be configured using the FLEX_US_MAN.TX_MPOL bit. If the TX_MPOL bit is set to zero (default), a logic zero is encoded with a zero-to-one transition and a logic one is encoded with a one-to-zero transition. If the TX_MPOL bit is set to one, a logic one is encoded with a one-to-zero transition and a logic zero is encoded with a zero-to-one transition.

Figure 65.8. Preamble Patterns, Default Polarity Assumed



A start frame delimiter is to be configured using the FLEX_US_MR.ONEBIT bit. It consists of a user-defined pattern that indicates the beginning of a valid data. The following figure illustrates these patterns. If the start frame delimiter, also known as the start bit, is one bit, (ONEBIT = 1), a logic zero is Manchester encoded and indicates that a new character is being sent serially on the line. If the start frame delimiter is a synchronization pattern also referred to as sync (ONEBIT = 0), a sequence of three bit times is sent serially on the line to indicate the start of a new character. The sync waveform is in itself an invalid Manchester waveform as the transition occurs at the middle of the second bit time. Two distinct sync patterns are used: the command sync and the data sync. The command sync has a logic one level for one and a half bit times, then a transition to logic zero for

© 2026 Microchip Technology Inc. and its subsidiaries

the second one and a half bit times. If the FLEX_US_MR.MODSYNC bit is set to 1, the next character is a command. If it is set to 0, the next character is a data. When direct memory access is used, the MODSYNC bit can be immediately updated with a modified character located in memory. To enable this mode, the FLEX_US_MR.VAR_SYNC bit must be set. In this case, the FLEX_US_MR.MODSYNC bit is bypassed and the sync configuration is held in the FLEX_US_THR.TXSYNH bit. The USART character format is modified and includes sync information.

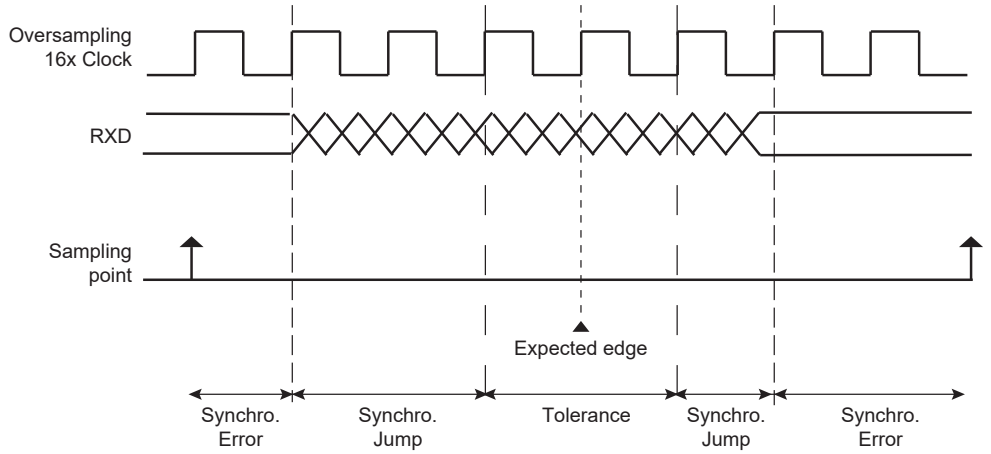


Figure 65.9. Start Frame Delimiter

65.7.3.2.1.Drift Compensation

Drift compensation is available only in 16X Oversampling mode. An hardware recovery system allows a larger clock drift. To enable the hardware system, the bit in the FLEX_US_MAN register must be set. If the RXD edge is one 16X clock cycle from the expected edge, this is considered as normal jitter and no corrective actions is taken. If the RXD event is between 4 and 2 clock cycles before the expected edge, then the current period is shortened by one clock cycle. If the RXD event is between 2 and 3 clock cycles after the expected edge, then the current period is lengthened by one clock cycle. These intervals are considered to be drift and so corrective actions are automatically taken.

Figure 65.10. Bit Resynchronization

65.7.3.3.Asynchronous Receiver

If the USART is programmed in Asynchronous operating mode (SYNC = 0), the receiver oversamples the RXD input line. The oversampling is either 16 or 8 times the baud rate clock, depending on the FLEX_US_MR.OVER bit.

© 2026 Microchip Technology Inc. and its subsidiaries

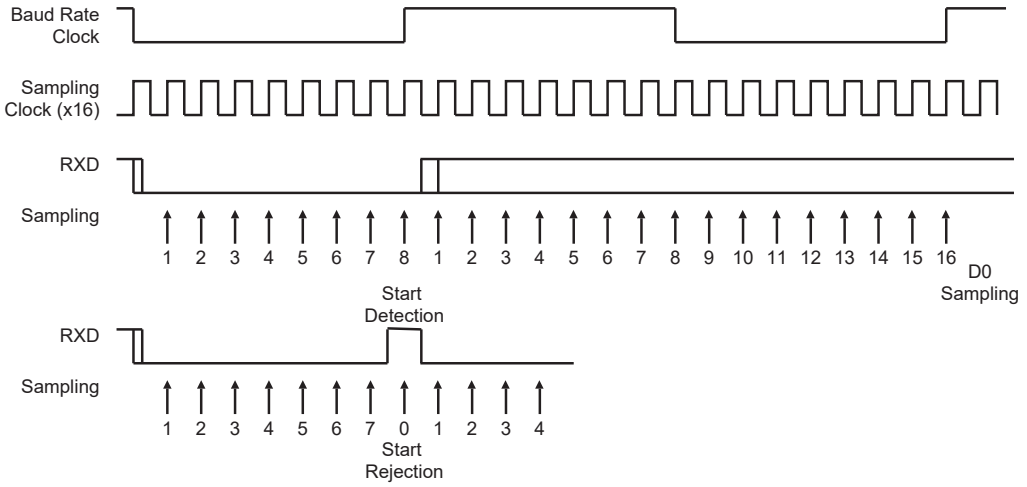
The receiver samples the RXD line. If the line is sampled during one half of a bit time to 0, a start bit is detected and data, parity and stop bits are successively sampled on the bit rate clock.

If the oversampling is 16 (OVER = 0), a start is detected at the eighth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 16 oversampling clock cycles. If the oversampling is 8 (OVER = 1), a start bit is detected at the fourth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 8 oversampling clock cycles.

The number of data bits, first bit sent and Parity mode are selected by the same fields and bits as the transmitter, i.e., respectively CHRL, MODE9, MSBF and PAR. For the synchronization mechanism only, the number of stop bits has no effect on the receiver as it considers only one stop bit, regardless of the NBSTOP field, so that resynchronization between the receiver and the transmitter can occur. Moreover, as soon as the stop bit is sampled, the receiver starts looking for a new start bit so that resynchronization can also be accomplished when the transmitter is operating with one stop bit.

The following figures illustrate start detection and character reception when USART operates in Asynchronous mode.

Figure 65.11. Asynchronous Start Detection



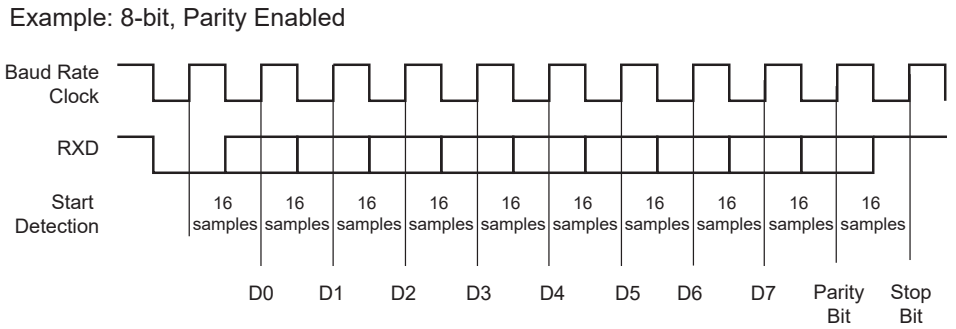


Figure 65.12. Asynchronous Character Reception

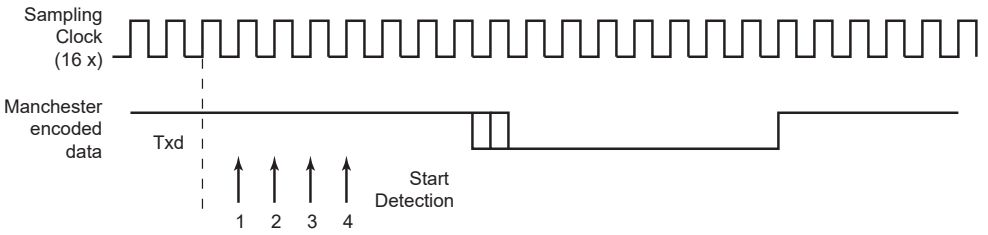
65.7.3.4. Manchester Decoder

When the FLEX_US_MR.MAN bit is set, the Manchester decoder is enabled. The decoder performs both preamble and start frame delimiter detection. One input line is dedicated to Manchester encoded input data.

An optional preamble sequence can be defined. Its length is user-defined and totally independent of the transmitter side. Use the FLEX_US_MAN.RX_PL field to configure the length of the preamble



© 2026 Microchip Technology Inc. and its subsidiaries

sequence. If the length is set to 0, no preamble is detected and the function is disabled. In addition, the polarity of the input stream is programmable with the FLEX_US_MAN.RX_MPOL bit. Depending on the desired application, the preamble pattern matching is to be defined via the FLEX_US_MAN.RX_PP field. See figure Preamble Patterns, Default Polarity Assumed for available preamble patterns.

Unlike preamble, the start frame delimiter is shared between Manchester Encoder and Decoder. So, if ONEBIT bit = 1, only a zero encoded Manchester can be detected as a valid start frame delimiter. If ONEBIT = 0, only a sync pattern is detected as a valid start frame delimiter. Decoder operates by detecting transition on incoming stream. If RXD is sampled during one quarter of a bit time to zero, a start bit is detected. See the following figure. The sample pulse rejection mechanism applies.

The FLEX_US_MAN.RXIDLEV bit informs the USART of the receiver line idle state value (receiver line inactive). The user must define RXIDLEV to ensure reliable synchronization. By default, RXIDLEV is set to one (receiver line is at level 1 when there is no activity).

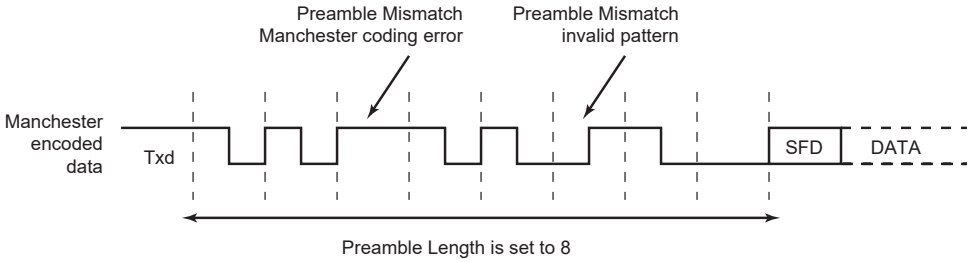


Figure 65.13. Asynchronous Start Bit Detection

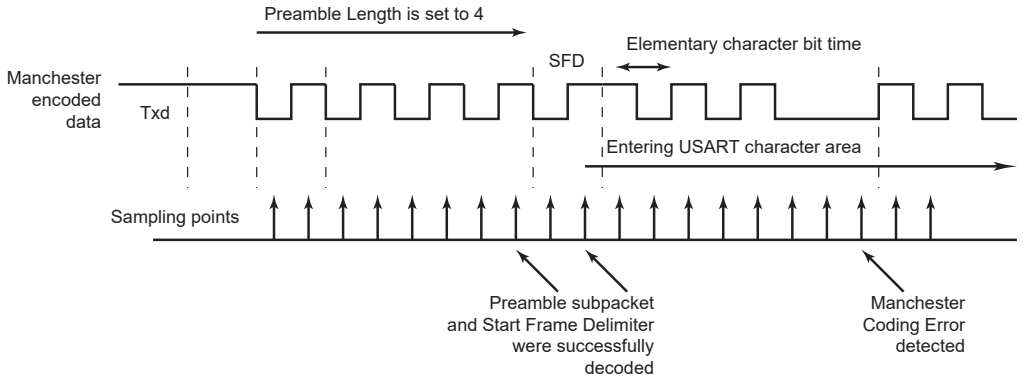
The receiver is activated and starts preamble and frame delimiter detection, sampling the data at one quarter and then three quarters. If a valid preamble pattern or start frame delimiter is detected, the receiver continues decoding with the same synchronization. If the stream does not match a valid pattern or a valid start frame delimiter, the receiver resynchronizes on the next valid edge.The minimum time threshold to estimate the bit value is three quarters of a bit time.



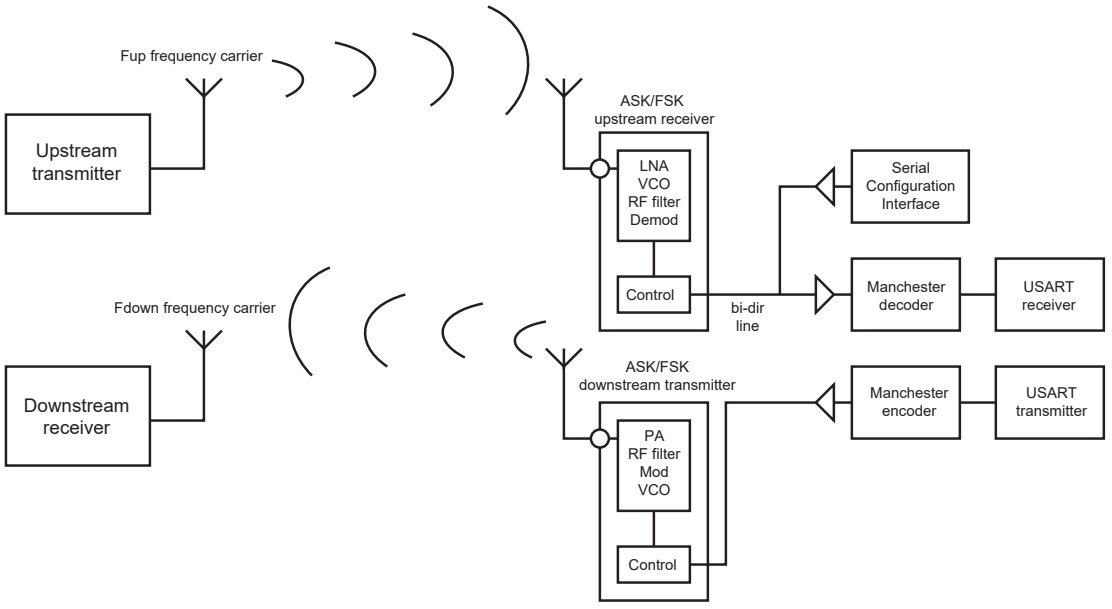
If a valid preamble (if used) followed with a valid start frame delimiter is detected, the incoming stream is decoded into NRZ data and passed to USART for processing. The following figure illustrates Manchester pattern mismatch. When incoming data stream is passed to the USART, the receiver is also able to detect Manchester code violation. A code violation is a lack of transition in the middle of a bit cell. In this case, the MANE flag in FLEX_US_CSR is raised. It is cleared by writing a one to FLEX_US_CR.RSTSTA. See figure "Manchester Error Flag" below for an example of Manchester error detection during the data phase.

Figure 65.14. Preamble Pattern Mismatch

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.15. Manchester Error Flag

When the start frame delimiter is a sync pattern (ONEBIT = 0), both command and data delimiter are supported. If a valid sync is detected, the received character is written as RXCHR field in the Receive Holding register (FLEX_US_RHR) and the RXSYNH is updated. RXCHR is set to 1 when the received character is a command, and it is set to 0 if the received character is a data. This mechanism alleviates and simplifies the direct memory access as the character contains its own sync field in the same register.



As the decoder is setup to be used in Unipolar mode, the first bit of the frame has to be a zero-to-one transition.

65.7.3.5. Radio Interface: Manchester Encoded USART Application

This section describes low data rate RF transmission systems and their integration with a Manchester encoded USART. These systems are based on transmitter and receiver ICs that support ASK and FSK modulation schemes.

The goal is to perform full-duplex radio transmission of characters using two different frequency carriers. See configuration in the following figure.

Figure 65.16. Manchester Encoded Characters RF Transmission

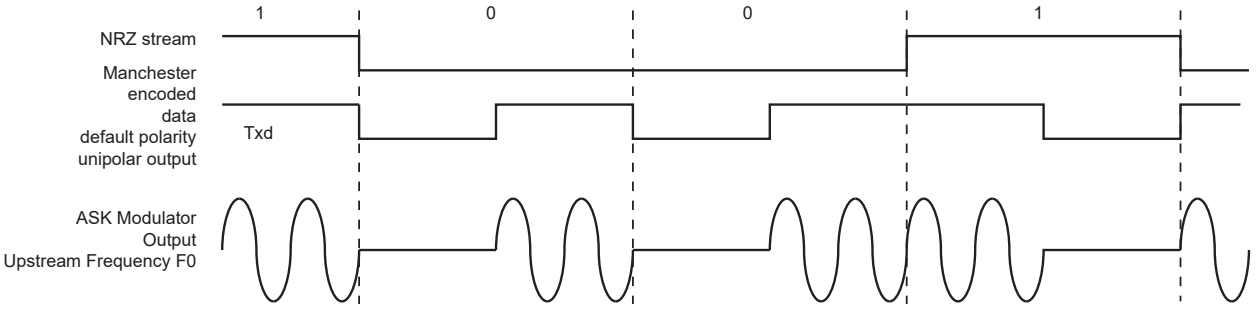
The USART peripheral is configured as a Manchester encoder/decoder. Looking at the downstream communication channel, Manchester encoded characters are serially sent to the RF transmitter. This may also include a user defined preamble and a start frame delimiter. Mostly, preamble is used in

© 2026 Microchip Technology Inc. and its subsidiaries

the RF receiver to distinguish between a valid data from a transmitter and signals due to noise. The Manchester stream is then modulated. See the following figure for an example of ASK modulation scheme. When a logic one is sent to the ASK modulator, the power amplifier, referred to as PA, is enabled and transmits an RF signal at downstream frequency. When a logic zero is transmitted, the RF signal is turned off. If the FSK modulator is activated, two different frequencies are used to transmit data. When a logic 1 is sent, the modulator outputs an RF signal at frequency F0 and switches to F1 if the data sent is a 0. See figure "FSK Modulator Output" below.

From the receiver side, another carrier frequency is used. The RF receiver performs a bit check operation examining demodulated data stream. If a valid pattern is detected, the receiver switches to Receiving mode. The demodulated stream is sent to the Manchester decoder. Because of bit checking inside RF IC, the data transferred to the microcontroller is reduced by a user-defined number of bits. The Manchester preamble length is to be defined in accordance with the RF IC configuration.

Figure 65.17. ASK Modulator Output



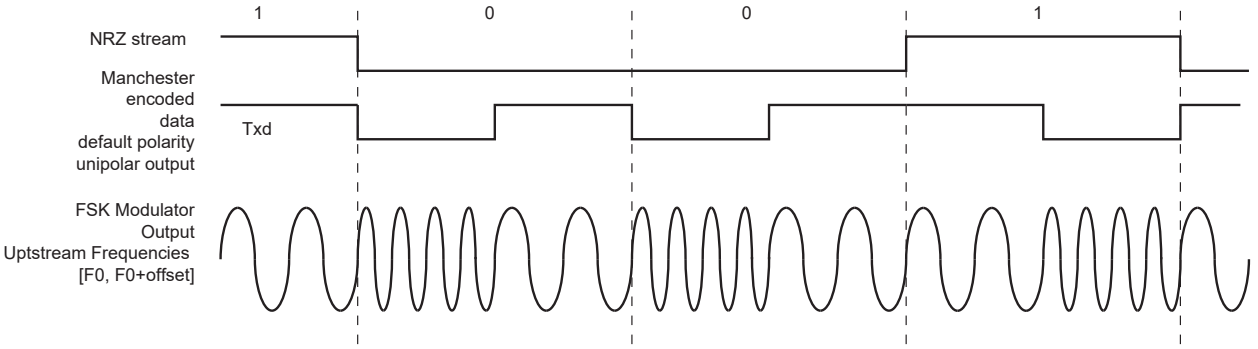


Figure 65.18. FSK Modulator Output

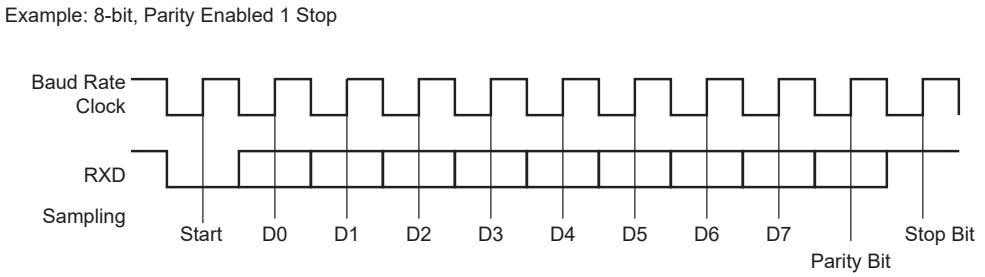
65.7.3.6.Synchronous Receiver



In Synchronous mode (SYNC = 1), the receiver samples the RXD signal on each rising edge of the baud rate clock. If a low level is detected, it is considered as a start. All data bits, the parity bit and the stop bits are sampled and the receiver waits for the next start bit. Synchronous mode operations provide a high-speed transfer capability.

Configuration fields and bits are the same as in Asynchronous mode.

The following figure illustrates a character reception in Synchronous mode.

© 2026 Microchip Technology Inc. and its subsidiaries

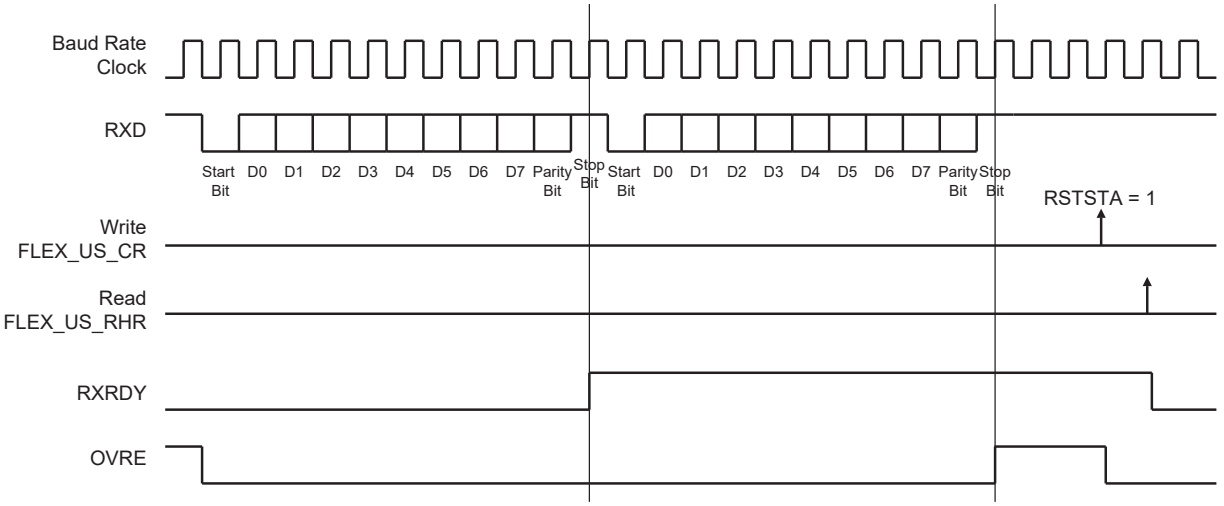


Figure 65.19. Synchronous Mode Character Reception

65.7.3.7.Receiver Operations

When a character reception is completed, it is transferred to the Receive Holding register (FLEX_US_RHR) and the FLEX_US_CSR.RXRDY bit is raised. If a character is completed while the RXRDY is set, the Overrun Error (OVRE) bit is set. The last character is transferred into FLEX_US_RHR and overwrites the previous one. The OVRE bit is cleared by writing a one to Reset Status bit FLEX_US_CR.RSTSTA.

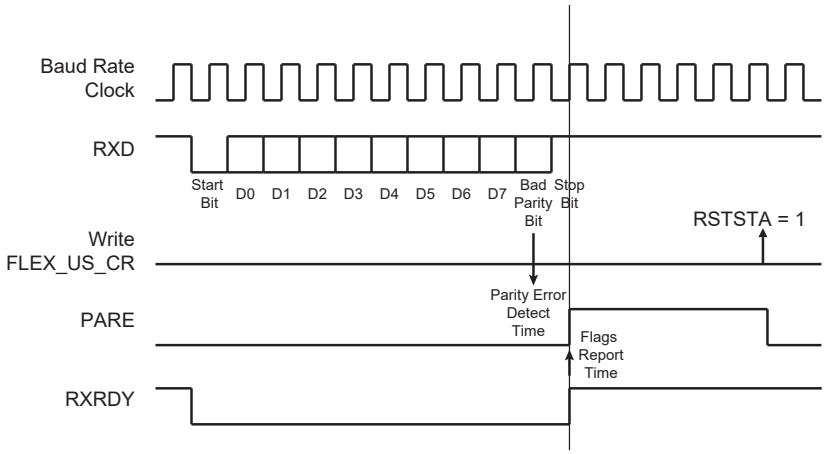
Figure 65.20. Receiver Status

65.7.3.8.Parity

The USART supports five parity modes that are selected by writing to the FLEX_US_MR.PAR field. The PAR field also enables the Multidrop mode (see Multidrop Mode). Even and odd parity bit generation and error detection are supported.

If even parity is selected, the parity generator of the transmitter drives the parity bit to 0 if a number of 1s in the character data bit is even, and to 1 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If odd parity is selected, the parity generator of the transmitter drives the parity bit to 1 if a number of 1s in the character data bit is even, and to 0 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If the mark parity is used, the parity generator of the transmitter drives the parity bit to 1 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 0. If the space parity is used, the parity generator of the transmitter drives the parity bit to 0 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 1. If parity is disabled, the transmitter does not generate any parity bit and the receiver does not report any parity error.

© 2026 Microchip Technology Inc. and its subsidiaries



The following table shows an example of the parity bit for the character 0x41 (character ASCII “A”) depending on the configuration of the USART. Because there are two bits set to 1 in the character value, the parity bit is set to 1 when the parity is odd, or configured to 0 when the parity is even.

Table 65.7. Parity Bit Examples

Character	Hexadecimal	Binary	Parity Bit	Parity Mode
A	0x41	0100 0001	1	Odd
A	0x41	0100 0001	0	Even
A	0x41	0100 0001	1	Mark
A	0x41	0100 0001	0	Space
A	0x41	0100 0001	None	None

When the receiver detects a parity error, it sets the Parity Error bit FLEX_US_CSR.PARE. The PARE bit can be cleared by writing a one to the FLEX_US_CR.RSTSTA bit. The following figure illustrates the parity bit status setting and clearing.

Figure 65.21. Parity Error

65.7.3.9.Multidrop Mode

If the value 0x6 or 0x07 is written to the FLEX_US_MR.PAR field, the USART runs in Multidrop mode. This mode differentiates the data characters and the address characters. Data are transmitted with the parity bit to 0 and addresses are transmitted with the parity bit to 1.

If the USART is configured in Multidrop mode, the receiver sets the PARE parity error bit when the parity bit is high and the transmitter is able to send a character with the parity bit high when a one is written to the FLEX_US_CR.SENDA bit.

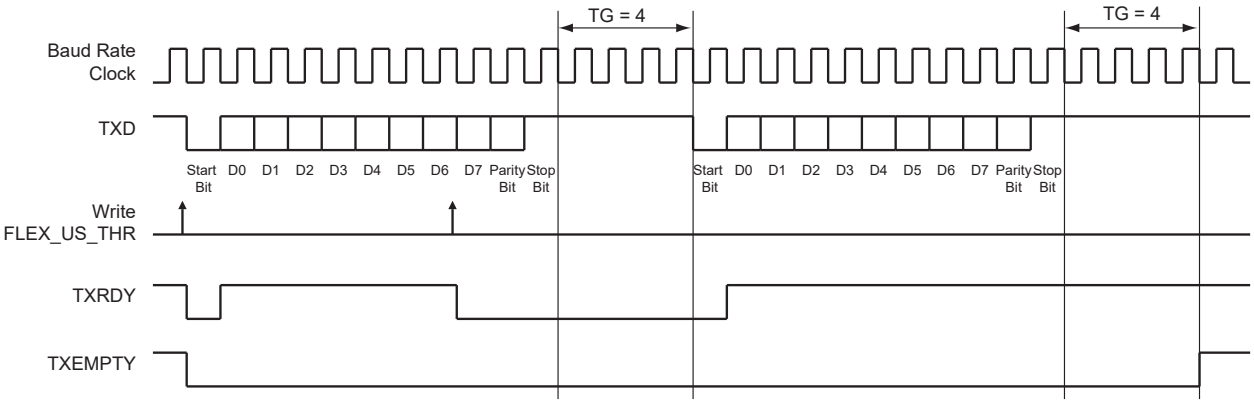
To handle parity error, the PARE bit is cleared by writing a one to the FLEX_US_CR.RSTSTA bit.

The transmitter sends an address byte (parity bit set) when the FLEX_US_CR.SENDA bit is written to 1. In this case, the next byte written to FLEX_US_THR is transmitted as an address. Any character written in FLEX_US_THR when the SENDA command is not written is transmitted normally with parity to 0.

65.7.3.10.Transmitter Timeguard

The timeguard feature enables the USART interface with slow remote devices.

The timeguard function enables the transmitter to insert an idle state on the TXD line between two characters. This idle state actually acts as a long stop bit.



The duration of the idle state is programmed in the TG field of the Transmitter Timeguard register (FLEX_US_TTGR). When this field is written to zero, no timeguard is generated. Otherwise, the

© 2026 Microchip Technology Inc. and its subsidiaries

transmitter holds a high level on TXD after each transmitted byte during the number of bit periods programmed in TG in addition to the number of stop bits.

As illustrated in the following figure, the behavior of the TXRDY and TXEMPTY status bits is modified by the programming of a timeguard. TXRDY rises only when the start bit of the next character is sent, and thus remains to 0 during the timeguard transmission if a character has been written in FLEX_US_THR. TXEMPTY remains low until the timeguard transmission is completed as the timeguard is part of the current character being transmitted.

Figure 65.22. Timeguard Operations

The following table indicates the maximum length of a timeguard period that the transmitter can handle in relation to the function of the baud rate.

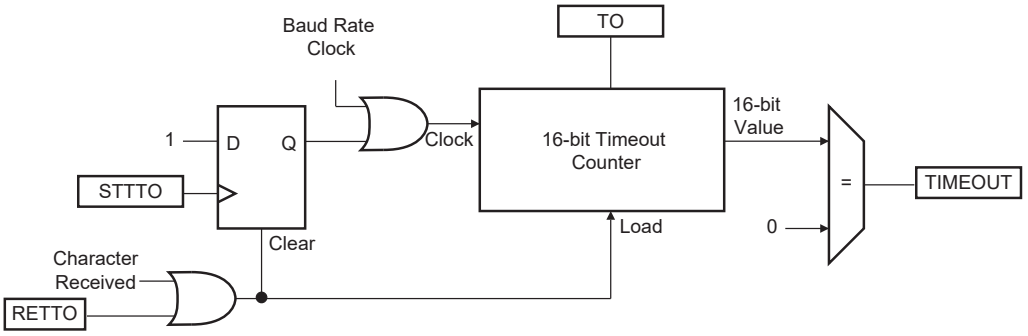
Table 65.8. Maximum Timeguard Length Depending on Baud Rate

Baud Rate (bit/s)	Bit Time (µs)	Timeguard (ms)
1,200	833	212.50
9,600	104	26.56
14,400	69.4	17.71
19,200	52.1	13.28
28,800	34.7	8.85
38,400	26	6.63
56,000	17.9	4.55
57,600	17.4	4.43
115,200	8.7	2.21

65.7.3.11.Receiver Timeout

The Receiver Timeout provides support in handling variable-length frames. This feature detects an idle condition on the RXD line. When a timeout is detected, the FLEX_US_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver an end of frame.

The timeout delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Timeout register (FLEX_US_RTOR). If the TO field is written to 0, the Receiver Timeout is disabled and no timeout is detected. The FLEX_US_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 16-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX_US_CSR.TIMEOUT bit rises. Then, the user can either:



- Stop the counter clock until a new character is received. This is performed by writing a ‘1’ to FLEX_US_CR.STTTO. In this case, the idle state on RXD before a new character is received does not provide a timeout. This prevents having to handle an interrupt before a character is received and enables waiting for the next idle state on RXD after a frame is received.

© 2026 Microchip Technology Inc. and its subsidiaries

- Obtain an interrupt while no character is received. This is performed by writing a '1' to FLEX_US_CR.RETTO. In this case, the counter starts counting down immediately from the value TO. This generates a periodic interrupt so that a user timeout can be handled, for example when no key is pressed on a keyboard.

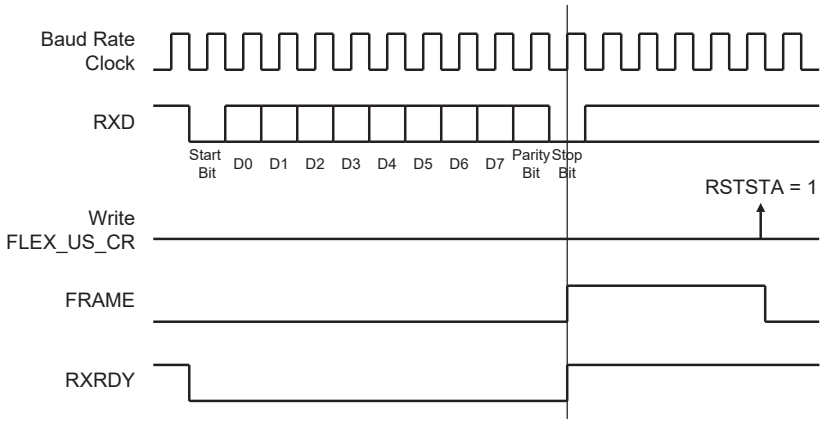
The following figure shows the block diagram of the Receiver Timeout feature.

Figure 65.23. Receiver Timeout Block Diagram

The following table gives the maximum timeout period for some standard baud rates.

Table 65.9. Maximum Timeout Period

Baud Rate (bit/s)	Bit Time (µs)	Timeout (ms)
600	1,667	109,225
1,200	833	54,613
2,400	417	27,306
4,800	208	13,653
9,600	104	6,827
14,400	69	4,551
19,200	52	3,413
28,800	35	2,276
38,400	26	1,704
56,000	18	1,170
57,600	17	1,138
200,000	5	328



65.7.3.12.Framing Error

The receiver is capable of detecting framing errors. A framing error happens when the stop bit of a received character is detected at level 0. This can occur if the receiver and the transmitter are fully desynchronized.

A framing error is reported on the FLEX_US_CSR.FRAME bit. The FRAME bit is asserted in the middle of the stop bit as soon as the framing error is detected. It is cleared by writing a one to the FLEX_US_CR.RSTSTA bit.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.24. Framing Error Status

65.7.3.13.Transmit Break

The user can request the transmitter to generate a break condition on the TXD line. A break condition drives the TXD line low during at least one complete character. It appears the same as a 0x00 character sent with the parity and the stop bits to 0. However, the transmitter holds the TXD line at least during one character until the user requests the break condition to be removed.

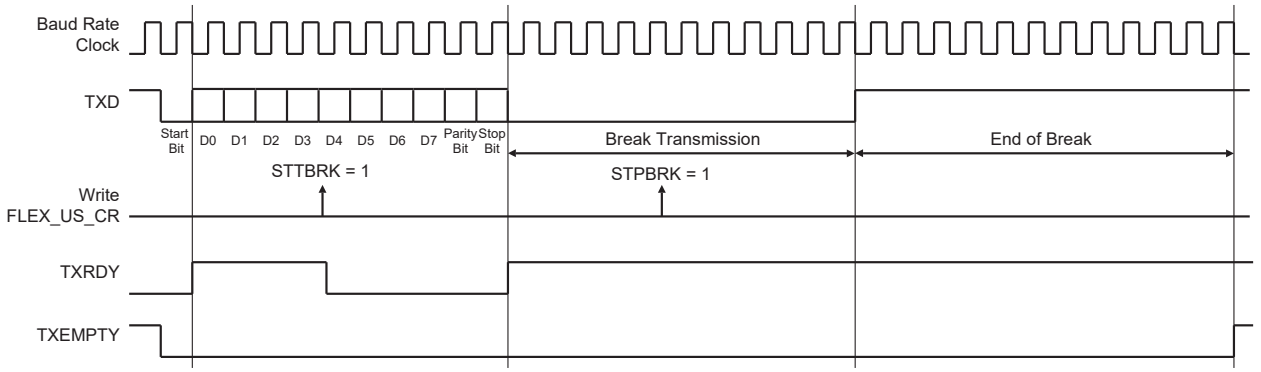
A break is transmitted by setting the FLEX_US_CR.STTBRK bit. This can be done at any time, either while the transmitter is empty (no character in either the shift register or in FLEX_US_THR) or when a character is being transmitted. If a break is requested while a character is being shifted out, the character is first completed before the TXD line is held low.

Once the Start Break command is requested, further Start Break commands are ignored until the end of the break is completed.

The break condition is removed by setting the FLEX_US_CR.STPBRK bit. If the Stop Break command is requested before the end of the minimum break duration (one character, including start, data, parity and stop bits), the transmitter ensures that the break condition completes.

The transmitter considers the break as though it is a character, i.e., the Start Break and Stop Break commands are processed only if the FLEX_US_CSR.TXRDY bit = 1 and the start of the break condition clears the TXRDY and TXEMPTY bits as if a character was processed.

Setting both the FLEX_US_CR.STTBRK and FLEX_US_CR.STPBRK bits can lead to an unpredictable result. All Stop Break commands requested without a previous Start Break command are ignored. A byte written into the Transmit Holding register while a break is pending, but not started, is ignored.



After the break condition, the transmitter returns the TXD line to 1 for a minimum of 12 bit times. Thus, the transmitter ensures that the remote receiver detects correctly the end of break and the start of the next character. If the timeguard is programmed with a value higher than 12, the TXD line is held high for the timeguard period.

After holding the TXD line for this period, the transmitter resumes normal operations.

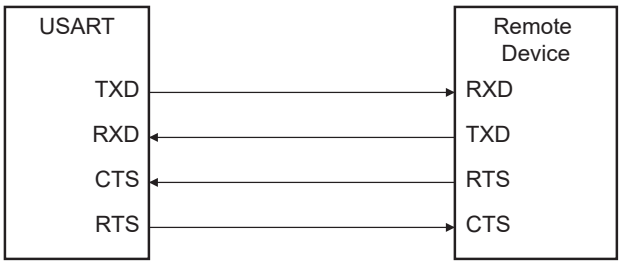
The following figure illustrates the effect of both the Start Break (STTBRK) and Stop Break (STPBRK) commands on the TXD line.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.25. Break Transmission

65.7.3.14.Receive Break

The receiver detects a break condition when all data, parity and stop bits are low. This corresponds to detecting a framing error with data to 0x00, but FRAME remains low.



When the low stop bit is detected, the receiver asserts the FLEX_US_CSR.RXBRK bit. FLEX_US_CSR.RXBRK may be cleared by setting the FLEX_US_CR.RSTSTA bit.

An end of receive break is detected by a high level for at least 2/16ths of a bit period in Asynchronous operating mode or one sample at high level in Synchronous operating mode. The end of break detection also asserts the RXBRK bit.

65.7.3.15.Hardware Handshaking

The USART features a hardware handshaking out-of-band flow control. The RTS and CTS pins are used to connect with the remote device, as shown in the following figure.

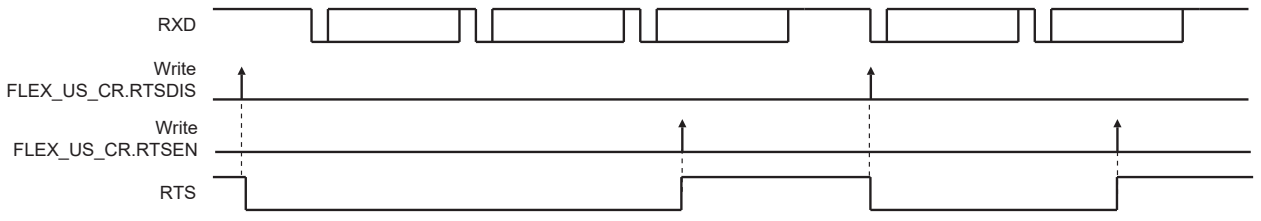


Figure 65.26. Connection with a Remote Device for Hardware Handshaking

Setting the USART to operate with hardware handshaking is performed by writing the FLEX_US_MR.USART_MODE field to the value 0x2.

The USART behavior when hardware handshaking is enabled is the same as the behavior in standard Synchronous or Asynchronous mode, except that the receiver drives the RTS pin as described below and the level on the CTS pin modifies the behavior of the transmitter as described below. Using this mode requires using the DMAC channel for reception. The transmitter can handle hardware handshaking in any case.

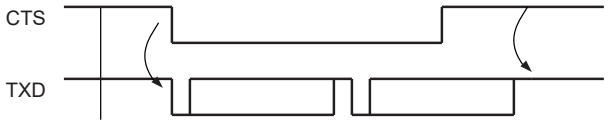

Figure 65.27. RTS Line Software Control when FLEX_US_MR.USART_MODE = 2

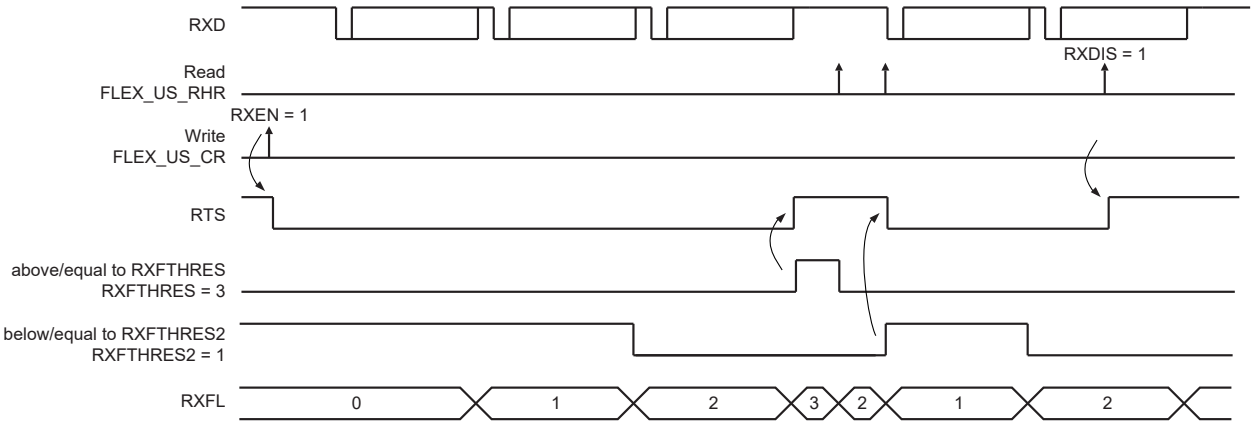
© 2026 Microchip Technology Inc. and its subsidiaries



The following figure shows how the transmitter operates if hardware handshaking is enabled. The CTS pin disables the transmitter. If a character is being processed, the transmitter is disabled only after the completion of the current character and transmission of the next character happens as soon as the pin CTS falls.

Figure 65.28. Transmitter Behavior when Operating with Hardware Handshaking

If USART FIFOs are enabled (bit FLEX_US_CR.FIFOEN), the RTS pin can be controlled by the USART Receive FIFO thresholds. The RTS pin control through Receive FIFO thresholds can be activated with the FLEX_US_FMR.FRTSC bit. Once activated, the RTS pin will be controlled by Receive FIFO thresholds, set to level 1 each time RXFTHRES is reached and set to level '0' each time RXFTHRES2 is reached (and RXFTHRES is not reached).

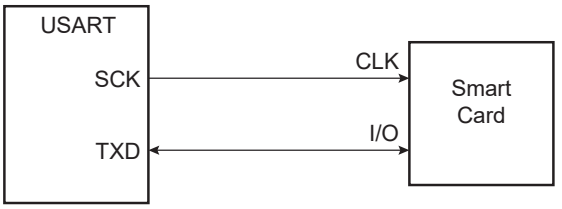
Figure 65.29. Receiver Behavior When FIFO Enabled and FRTSC Set to '1'

Note: In this mode, RXFTHRES must be > RXFTHRES2.

65.7.4. ISO7816 Mode

The USART features an ISO7816-compatible operating mode. This mode permits interfacing with smart cards and Security Access Modules (SAM) communicating through an ISO7816 link. Both T = 0 and T = 1 protocols defined by the ISO7816 specification are supported.

Setting the USART in ISO7816 mode is performed by writing the FLEX_US_MR.USART_MODE field to the value 0x4 for protocol T = 0 and to the value 0x6 for protocol T = 1.



65.7.4.1. ISO7816 Mode Overview

The ISO7816 is a half-duplex communication on only one bidirectional line. The baud rate is determined by a division of the clock provided to the remote device (see figure in section Baud Rate Generator).

The USART connects to a smart card as shown in the following figure. The TXD line becomes bidirectional and the baud rate generator feeds the ISO7816 clock on the SCK pin. As the TXD pin becomes bidirectional, its output remains driven by the output of the transmitter but only when the transmitter is active while its input is directed to the input of the receiver. The USART is considered as the host of the communication as it generates the clock.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.30. Connection of a Smart Card to the USART

When operating in ISO7816, either in T = 0 or T = 1 modes, the character format is partially predefined. The configuration is forced to 8 data bits, and 1 or 2 stop bits, regardless of the values programmed in the CHRL, MODE9 and CHMODE fields. MSBF can be used to transmit LSB or MSB first. The bit INVDATA can be used to transmit in Normal or Inverse mode.

The USART cannot operate concurrently in both Receiver and Transmitter modes as the communication is unidirectional at a time. It has to be configured according to the required mode by enabling or disabling either the receiver or the transmitter as desired. Enabling both the receiver and the transmitter at the same time in ISO7816 mode may lead to unpredictable results.

The ISO7816 specification defines an inverse transmission format. Data bits of the character must be transmitted on the I/O line at their negative value.

65.7.4.2. Protocol T = 0

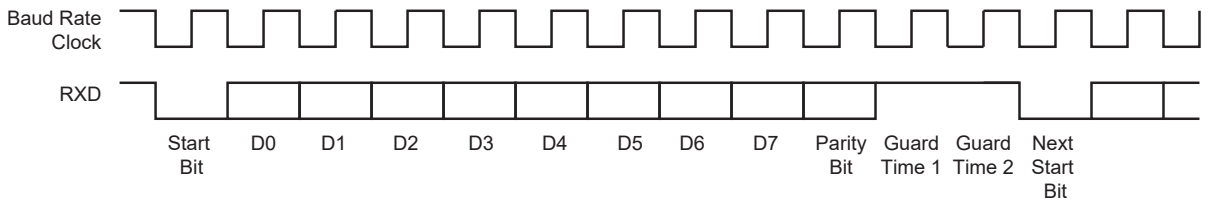
In T = 0 protocol, a character is made up of 1 start bit, 8 data bits, 1 parity bit and 1 guard time, which lasts two bit times. The transmitter shifts out the bits and does not drive the I/O line during the guard time.

If no parity error is detected, the I/O line remains at 1 during the guard time and the transmitter can continue with the transmission of the next character, as shown in the following figure.

If a parity error is detected by the receiver, it drives the I/O line to 0 during the guard time, as shown in figure "T = 0 Protocol with Parity Error" below. This error bit is also named NACK, for Non Acknowledge. In this case, the character lasts 1 bit time more, as the guard time length is the same and is added to the error bit time which lasts 1 bit time.

When the USART is the receiver and it detects an error, it does not load the erroneous character in the Receive Holding register (FLEX_US_RHR). It appropriately sets the PARE bit in the Status register (FLEX_US_CSR) so that the software can handle the error.

Figure 65.31. T = 0 Protocol without Parity Error



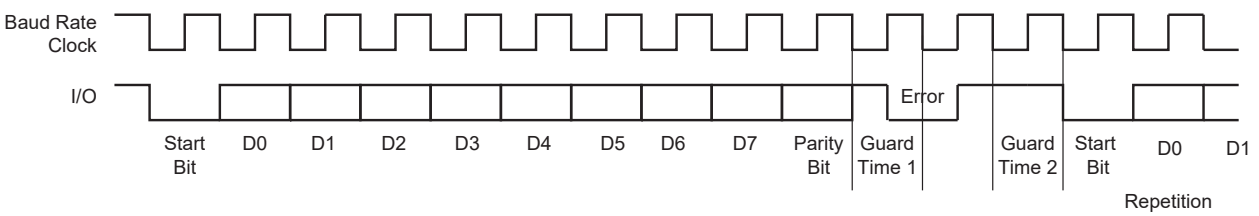


Figure 65.32. T = 0 Protocol with Parity Error

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.4.2.1.Receive Error Counter

The USART receiver also records the total number of errors. This can be read in the Number of Error (FLEX_US_NER) register. The NB_ERRORS field can record up to 255 errors. Reading FLEX_US_NER automatically clears the NB_ERRORS field.

65.7.4.2.2.Receive NACK Inhibit

The USART can be configured to inhibit an error. This is done by writing a '1' to FLEX_US_MR.INACK. In this case, no error signal is driven on the I/O line even if a parity bit is detected.

Moreover, if INACK = 1, the erroneous received character is stored in the Receive Holding register as if no error occurred, and the RXRDY bit rises.

65.7.4.2.3.Transmit Character Repetition

When the USART is transmitting a character and gets a NACK, it can automatically repeat the character before moving on to the next one. Repetition is enabled by writing the FLEX_US_MR.MAX_ITERATION field at a value higher than 0. Each character can be transmitted up to eight times: the first transmission plus seven repetitions.

If MAX_ITERATION does not equal zero, the USART repeats the character as many times as the value loaded in MAX_ITERATION.

When the USART repetition number reaches MAX_ITERATION, and the last repeated character is not acknowledged, the FLEX_US_CSR.ITER bit is set. If the repetition of the character is acknowledged by the receiver, the repetitions are stopped and the iteration counter is cleared.

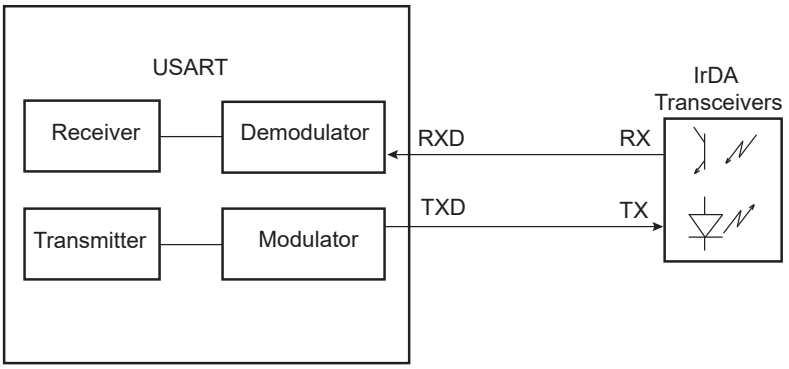
The FLEX_US_CSR.ITER bit can be cleared by writing the FLEX_US_CR.RSTIT bit to 1.

65.7.4.2.4.Disable Successive Receive NACK

The receiver can limit the number of successive NACKs sent back to the remote transmitter. This is programmed by setting the FLEX_US_MR.DSNACK bit. The maximum number of NACKs transmitted is programmed in the MAX_ITERATION field. As soon as MAX_ITERATION is reached, no error signal is driven on the I/O line and the FLEX_US_CSR.ITER bit is set.

65.7.4.3.Protocol T = 1

When operating in ISO7816 protocol T = 1, the transmission is similar to an asynchronous format with only one stop bit. The parity is generated when transmitting and checked when receiving. Parity error detection sets the FLEX_US_CSR.PARE bit.



65.7.5. IrDA Mode

The USART features an IrDA mode supplying half-duplex point-to-point wireless communication. It embeds the modulator and demodulator which allows a glueless connection to the infrared transceivers, as shown in the following figure. The modulator and demodulator are compliant with the IrDA specification version 1.1 and support data transfer speeds ranging from 2.4 kbit/s to 115.2 kbit/s.

The USART IrDA mode is enabled by setting the FLEX_US_MR.USART_MODE field to the value 0x8. The IrDA Filter register (FLEX_US_IF) allows configuring the demodulator filter. The USART transmitter and receiver operate in a normal Asynchronous mode and all parameters are accessible. Note that the modulator and the demodulator are activated.

© 2026 Microchip Technology Inc. and its subsidiaries

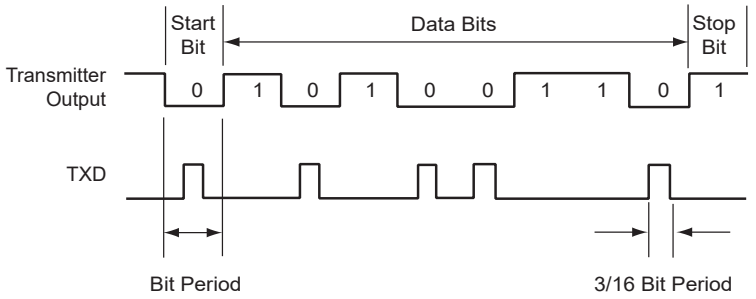
Figure 65.33. Connection to IrDA Transceivers

The receiver and the transmitter must be enabled or disabled according to the direction of the transmission to be managed.

To receive IrDA signals, the following needs to be done:

- Disable TX and Enable RX
- Configure the TXD pin as PIO and set it as an output to 0 (to avoid LED transmission). Disable the internal pullup (better for power consumption).
- Receive data

65.7.5.1. IrDA Modulation



For baud rates up to and including 115.2 kbit/s, the RZI modulation scheme is used. “0” is represented by a light pulse of 3/16th of a bit time. Some examples of signal pulse duration are shown in the following table.

Table 65.10. IrDA Pulse Duration

Baud Rate	Pulse Duration (3/16)
2.4 kbit/s	78.13 µs
9.6 kbit/s	19.53 µs
19.2 kbit/s	9.77 µs
38.4 kbit/s	4.88 µs
57.6 kbit/s	3.26 µs
115.2 kbit/s	1.63 µs

The following figure shows an example of character transmission.

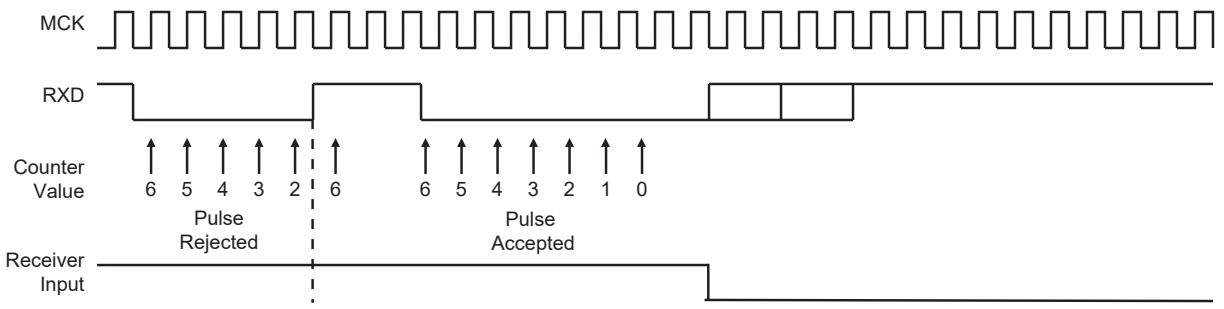
Figure 65.34. IrDA Modulation

65.7.5.2. IrDA Baud Rate

The following table gives some examples of CD values, baud rate error and pulse duration. Note that the requirement on the maximum acceptable error of ±1.87% must be met.

© 2026 Microchip Technology Inc. and its subsidiaries

Table 65.11. IrDA Baud Rate Error



Peripheral Clock	Baud Rate (bit/s)	CD	Baud Rate Error	Pulse Time (µs)
3,686,400	115,200	2	0.00%	1.63
20,000,000	115,200	11	1.38%	1.63
32,768,000	115,200	18	1.25%	1.63
40,000,000	115,200	22	1.38%	1.63
3,686,400	57,600	4	0.00%	3.26
20,000,000	57,600	22	1.38%	3.26
32,768,000	57,600	36	1.25%	3.26
40,000,000	57,600	43	0.93%	3.26
3,686,400	38,400	6	0.00%	4.88
20,000,000	38,400	33	1.38%	4.88
32,768,000	38,400	53	0.63%	4.88
40,000,000	38,400	65	0.16%	4.88
3,686,400	19,200	12	0.00%	9.77
20,000,000	19,200	65	0.16%	9.77
32,768,000	19,200	107	0.31%	9.77
40,000,000	19,200	130	0.16%	9.77
3,686,400	9,600	24	0.00%	19.53
20,000,000	9,600	130	0.16%	19.53
32,768,000	9,600	213	0.16%	19.53
40,000,000	9,600	260	0.16%	19.53
3,686,400	2,400	96	0.00%	78.13
20,000,000	2,400	521	0.03%	78.13
32,768,000	2,400	853	0.04%	78.13

65.7.5.3. IrDA Demodulator

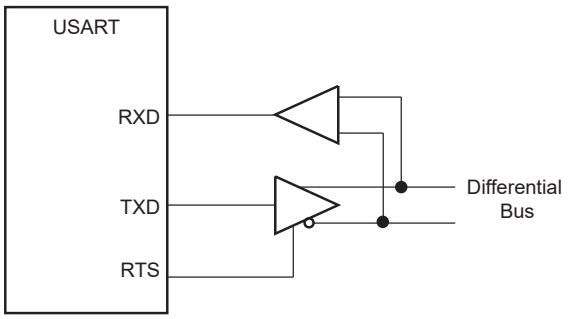
The demodulator is based on the IrDA Receive filter comprised of an 8-bit down counter which is loaded with the value programmed in FLEX_US_IF. When a falling edge is detected on the RXD pin, the Filter Counter starts counting down at the peripheral clock speed. If a rising edge is detected on the RXD pin, the counter stops and is reloaded with FLEX_US_IF. If no rising edge is detected when the counter reaches 0, the input of the receiver is driven low during one bit time.

The following figure illustrates the operations of the IrDA demodulator.

Figure 65.35. IrDA Demodulator Operations

The programmed value in the FLEX_US_IF register must always meet the following criteria:

$t_{peripheral\ clock} \times (IRDA_FILTER + 3) < 1.41\ \mu s$



As the IrDA mode uses the same logic as the ISO7816, note that the FLEX_US_FIDI.FI_DI_RATIO field must be set to a value higher than 0 to make sure IrDA communications operate correctly.

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.6. RS485 Mode

The USART features the RS485 mode to enable line driver control. While operating in RS485 mode, the USART behaves as though in Asynchronous or Synchronous mode and configuration of all the parameters is possible. The difference is that the RTS pin is driven high when the transmitter is operating. The behavior of the RTS pin is controlled by the TXEMPTY bit. A typical connection of the USART to an RS485 bus is shown in the following figure.

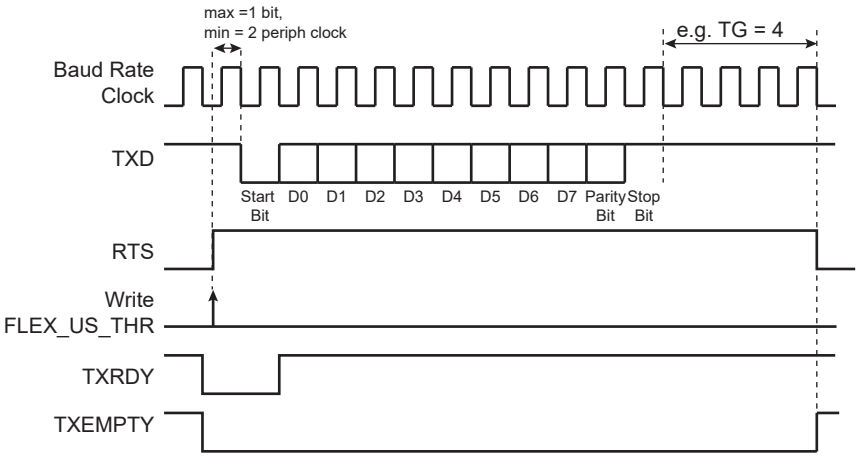


Figure 65.36. Typical Connection to an RS485 Bus

The USART is set to RS485 mode by writing the value 0x1 to the FLEX_US_MR.USART_MODE field.

The RTS pin is at a level inverse to the TXEMPTY bit. Significantly, the RTS pin remains high when a timeguard is programmed, so that the line can remain driven after the last character completion. The following figure gives an example of the RTS waveform during a character transmission when the timeguard is enabled.

Figure 65.37. Example of RTS Drive with Timeguard

Note: In case the minimum period between RTS rising edge and START bit falling edge is not suitable for the application, it is possible to drive the RTS signal by software when FLEX_US_MR.USART_MODE= 0 or 2. FLEX_US_CR.RTSEN/RTSDIS can be configured to manage RTS.

65.7.7. USART Comparison Function on Received Character

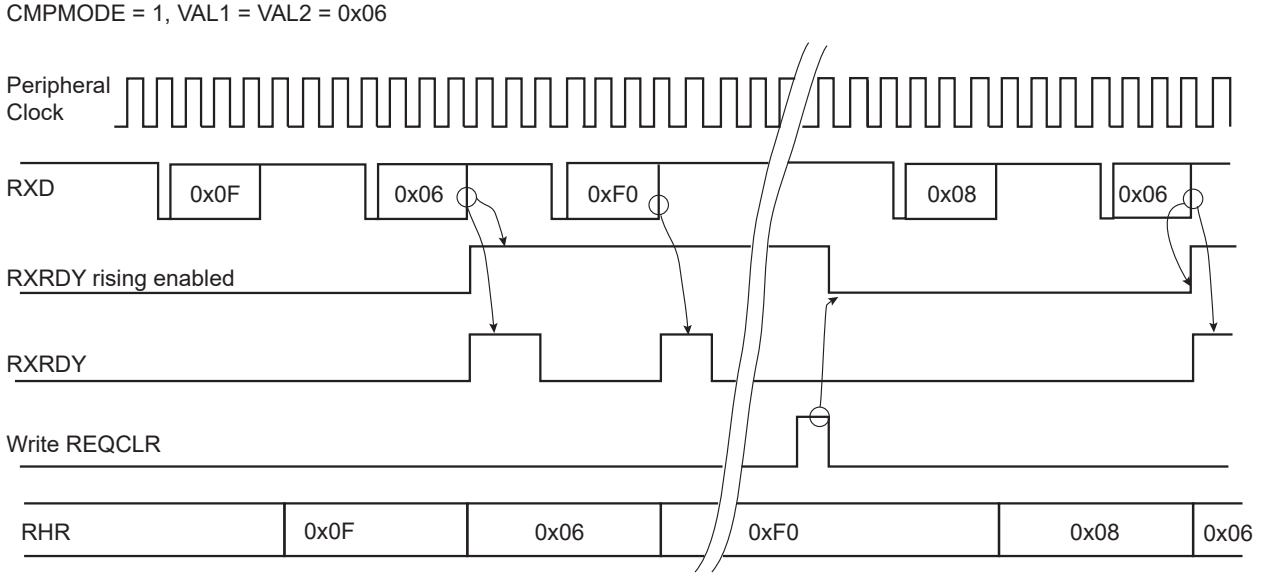
The CMP flag in FLEX_US_CSR is set when the received character matches the conditions programmed in FLEX_US_CMPR. The CMP flag is set as soon as FLEX_US_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to FLEX_US_CR.RSTSTA.

FLEX_US_CMPR can be programmed to provide different comparison methods:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.

© 2026 Microchip Technology Inc. and its subsidiaries

- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.



When the FLEX_US_CMPR.CMPMODE bit is set to FLAG_ONLY (value 0), all received data are loaded in FLEX_US_RHR and the CMP flag provides the status of the comparison result.

By programming the START_CONDITION.CMPMODE bit (value 1), the comparison function result triggers the start of the loading of FLEX_US_RHR (see the following figure). The trigger condition exists as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in FLEX_US_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX_US_CR.REQCLR bit.

By setting the CMPMODE bit to FILTER (value 2), the comparison result triggers the start of the US_RHR loading. The trigger condition exists as soon as the received address byte value matches the conditions defined by VAL1, VAL2 in US_CMPR. The comparison trigger event is restarted automatically after the reception of the data byte. This comparison mode is only available when FLEX_US_MR.USART_MODE is set).

The value programmed in the VAL1 and VAL2 fields must not exceed the maximum value of the received character (see CHRL field in FLEX_US_MR).

Figure 65.38. Receive Holding Register Management

65.7.8. LIN Mode

The LIN mode provides host node and client node connectivity on a LIN bus.

The LIN (Local Interconnect Network) is a serial communication protocol which efficiently supports the control of mechatronic nodes in distributed automotive applications.

The main properties of the LIN bus are:

- Single host/multiple clients concept
- Low-cost silicon implementation based on common UART/SCI interface hardware, an equivalent in software, or as a pure state machine.
- Self synchronization without quartz or ceramic resonator in the client nodes
- Deterministic signal transmission
- Low cost single-wire implementation

© 2026 Microchip Technology Inc. and its subsidiaries

- Speed up to 20 kbit/s

LIN provides cost efficient bus communication where the bandwidth and versatility of CAN are not required.

The LIN mode enables processing LIN frames with a minimum of action from the microprocessor.

65.7.8.1. Modes of Operation

The USART can act either as a LIN host node or as a LIN client node.

The node configuration is chosen by setting the USART_MODE field in the USART Mode register (FLEX_US_MR):

- LIN host node (USART_MODE = 0xA)
- LIN client node (USART_MODE = 0xB)

In order to avoid unpredictable behavior, any change of the LIN node configuration must be followed by a software reset of the transmitter and of the receiver (except the initial node configuration after a hardware reset). See Receiver and Transmitter Control.

65.7.8.2. Baud Rate Configuration

See Baud Rate in Asynchronous Mode.

- LIN host node: The baud rate is configured in FLEX_US_BRGR.
- LIN client node: The initial baud rate is configured in FLEX_US_BRGR. This configuration is automatically copied in the LIN Baud Rate register (FLEX_US_LINBRR) when writing FLEX_US_BRGR. After the synchronization procedure, the baud rate is updated in FLEX_US_LINBRR.

65.7.8.3. Receiver and Transmitter Control

See Receiver and Transmitter Control.

65.7.8.4. Character Transmission

See Transmitter Operations.

65.7.8.5. Character Reception

See Receiver Operations.

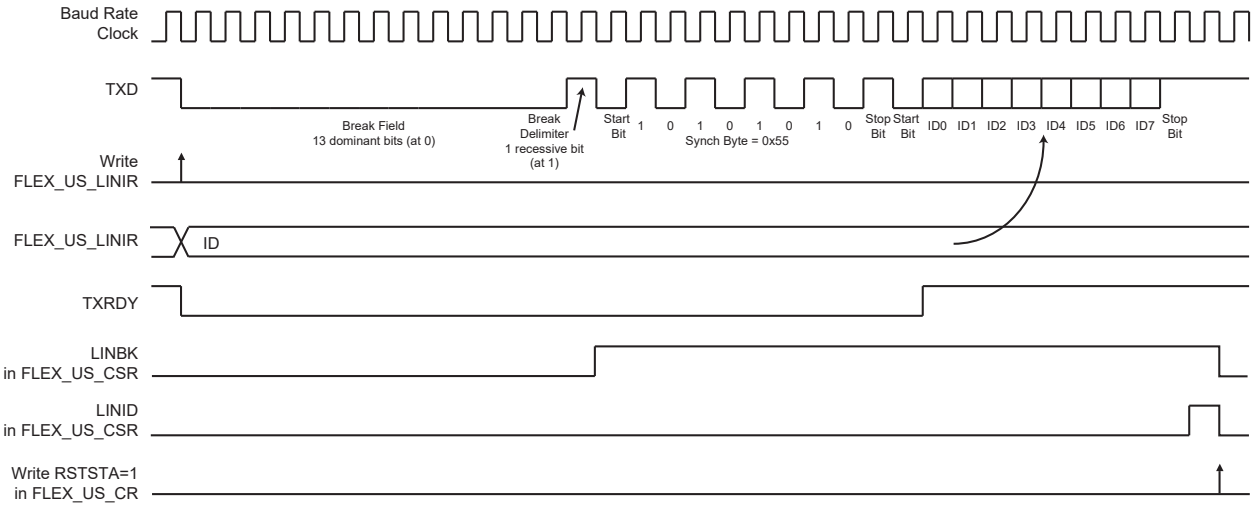
65.7.8.6. Header Transmission (Host Node Configuration)

All LIN frames start with a header sent by the host node and consisting of a Synch Break Field, a Synch Field and an Identifier Field.

So in host node configuration, the frame handling starts with the sending of the header.

The header is transmitted as soon as the identifier is written in the LIN Identifier register (FLEX_US_LINIR). At this moment, the flag TXRDY falls.

The Break Field, the Synch Field and the Identifier Field are sent automatically one after the other.



The Break Field consists of 13 dominant bits and 1 recessive bit, the Synch Field is the character 0x55 and the Identifier corresponds to the character written in the LIN Identifier register (FLEX_US_LINIR). The Identifier parity bits can be automatically computed and sent (see Identifier Parity).

The flag TXRDY rises when the identifier character is transferred into the shift register of the transmitter.

As soon as the Synch Break Field is transmitted, the FLEX_US_CSR.LINBK flag bit is set. Likewise, as soon as the Identifier Field is sent, the FLEX_US_CSR.LINID flag bit is set. These flags are reset by writing a one to the FLEX_US_CR.RSTSTA bit.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.39. Header Transmission

65.7.8.7.Header Reception (Client Node Configuration)

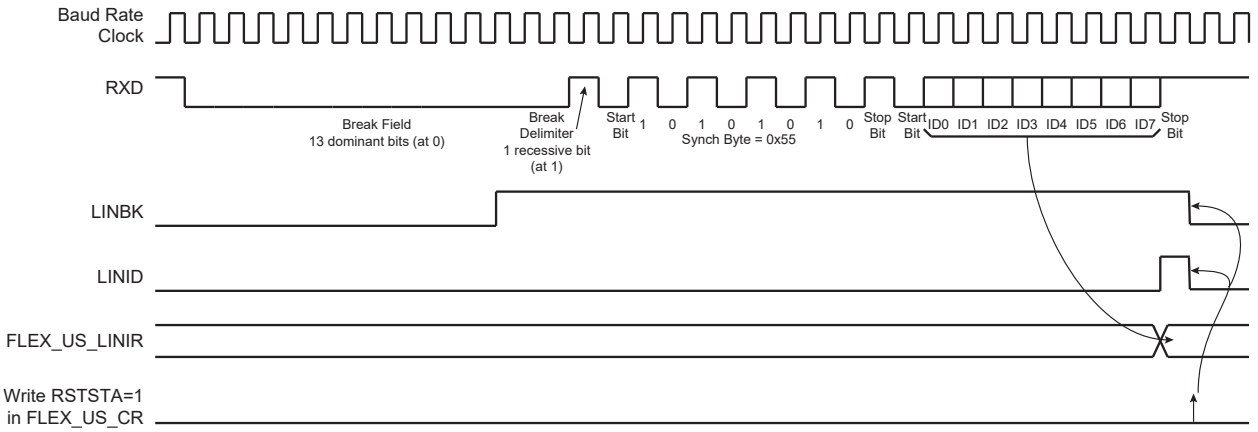
All the LIN frames start with a header which is sent by the host node and consists of a Synch Break Field, Synch Field and Identifier Field.

In client node configuration, the frame handling starts with the reception of the header.

The USART uses a break detection threshold of 11 nominal bit times at the actual baud rate. At any time, if 11 consecutive recessive bits are detected on the bus, the USART detects a Break Field. As long as a Break Field has not been detected, the USART stays idle and the received data are not taken in account.

When a Break Field has been detected, the FLEX_US_CSR.LINBK flag is set and the USART expects the Synch Field character to be 0x55. This field is used to update the actual baud rate in order to remain synchronized (see Client Node Synchronization). If the received Synch character is not 0x55, an Inconsistent Synch Field error is generated (see LIN Errors).

After receiving the Synch Field, the USART expects to receive the Identifier Field.



When the Identifier Field has been received, the FLEX_US_CSR.LINID flag bit is set. At this moment, the IDCHR field in the LIN Identifier register (FLEX_US_LINIR) is updated with the received character. The Identifier parity bits can be automatically computed and checked (see Identifier Parity).

If the header is not entirely received within the time given by the maximum length of the header $t_{Header_Maximum}$, the FLEX_US_CSR.LINHTE error flag bit is set.

The flag bits LINID, LINBK and LINHTE are reset by writing a one to the FLEX_US_CR.RSTSTA bit.

© 2026 Microchip Technology Inc. and its subsidiaries

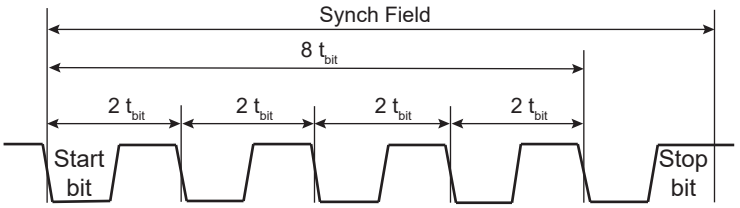


Figure 65.40. Header Reception

65.7.8.8. Client Node Synchronization

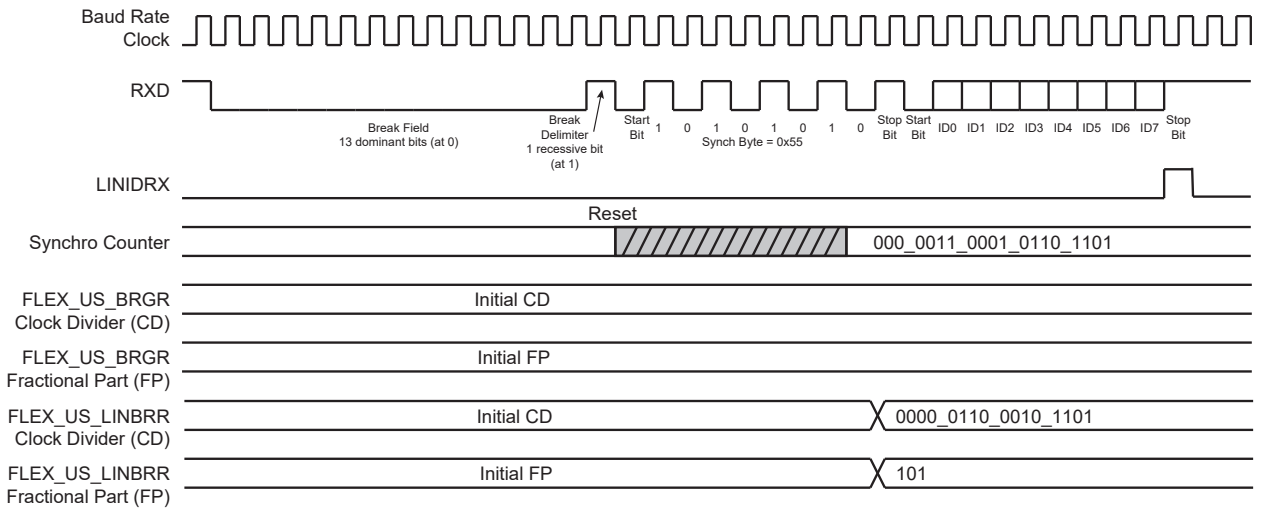
The synchronization is done only in client node configuration. The procedure is based on time measurement between the falling edges of the Synch Field. The falling edges are available in distances of 2, 4, 6 and 8 bit times.

Figure 65.41. Synch Field

The time measurement is made by a 19-bit counter driven by the sampling clock (see Baud Rate Generator).

When the start bit of the Synch Field is detected, the counter is reset. Then during the next eight t_{bit} of the Synch Field, the counter is incremented. At the end of these eight t_{bit}, the counter is stopped. At this moment, the 16 most significant bits of the counter (value divided by 8) give the new clock divider (LINCD) and the 3 least significant bits of this value (the remainder) give the new fractional part (LINFP).

Once the Synch Field has been entirely received, the clock divider (LINCD) and the fractional part (LINFP) are updated in the LIN Baud Rate register (FLEX_US_LINBRR) with the computed values, if the Synchronization is not disabled by the SYNCDIS bit in the LIN Mode register (FLEX_US_LINMR).



After reception of the Synch Field:

- If it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance FTol_Unsynch (±15%), then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX_US_CSR.LINSTE error flag bit is set.
- If it appears that the sampled Synch character is not equal to 0x55, then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX_US_CSR.LINISFE error flag bit is set.

Flags LINSTE and LINISFE are reset by writing a one to the FLEX_US_CR.RSTSTA bit.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.42. Client Node Synchronization

The synchronization accuracy depends on several parameters:

- The nominal clock frequency (f_{Nom}) (the theoretical client node clock frequency)
- The baud rate
- The oversampling (OVER = 0 => 16X or OVER = 1 => 8X)

The following formula is used to compute the deviation of the client bit rate relative to the host bit rate after synchronization (f_{CLIENT} is the real client node clock frequency).

$$\text{Baud rate deviation} = \left(100 \times \frac{[\alpha \times 8 \times (2 - \text{Over}) + \beta] \times \text{Baud rate}}{8 \times f_{CLIENT}}\right)\%$$

$$\text{Baud rate deviation} = \left(100 \times \frac{[\alpha \times 8 \times (2 - \text{Over}) + \beta] \times \text{Baud rate}}{8 \times \left(\frac{f_{TOL_UNSYNCH}}{100}\right) \times f_{Nom}}\right)\%$$

$-0.5 \leq \alpha \leq +0.5 \quad -1 < \beta < +1$

$f_{TOL_UNSYNCH}$ is the deviation of the real client node clock from the nominal clock frequency. The LIN Standard imposes that it must not exceed ±15%. The LIN Standard imposes also that for communication between two nodes, their bit rate must not differ by more than ±2%. This means that the baud rate deviation must not exceed ±1%.

Therefore, a minimum value for the nominal clock frequency can be computed as follows:

$$f_{Nom}(\text{min}) = \left(100 \times \frac{[0.5 \times 8 \times (2 - \text{Over}) + 1] \times \text{Baud rate}}{8 \times \left(\frac{-15}{100} + 1\right) \times 1\%}\right)\text{Hz}$$

Examples:

- Baud rate = 20 kbit/s, OVER = 0 (Oversampling 16X) => f_{Nom}(min) = 2.64 MHz
- Baud rate = 20 kbit/s, OVER = 1 (Oversampling 8X) => f_{Nom}(min) = 1.47 MHz
- Baud rate = 1 kbit/s, OVER = 0 (Oversampling 16X) => f_{Nom}(min) = 132 kHz

© 2026 Microchip Technology Inc. and its subsidiaries

- Baud rate = 1 kbit/s, OVER = 1 (Oversampling 8X) => f_{Nom}(min) = 74 kHz

65.7.8.9.Identifier Parity

A protected identifier consists of two subfields: the identifier and the identifier parity. Bits 0 to 5 are assigned to the identifier, and bits 6 and 7 are assigned to the parity.

The USART interface can generate/check these parity bits, but this feature can also be disabled. The user can choose between two modes via the FLEX_US_LINMR.PARDIS bit:

- PARDIS = 0:
  - During header transmission, the parity bits are computed and sent with the six least significant bits of the IDCHR field of the LIN Identifier register (FLEX_US_LINIR). Bits 6 and 7 of this register are discarded.
  - During header reception, the parity bits of the identifier are checked. If the parity bits are wrong, an Identifier Parity error occurs (see Parity). Only the six least significant bits of the IDCHR field are updated with the received Identifier. Bits 6 and 7 are stuck to 0.
- PARDIS = 1:
  - During header transmission, all the bits of the IDCHR field of the LIN Identifier register (FLEX_US_LINIR) are sent on the bus.
  - During header reception, all the bits of the IDCHR field are updated with the received Identifier.

65.7.8.10.Node Action

Depending on the identifier, the node is affected—or not—by the LIN response. Consequently, after sending or receiving the identifier, the USART must be configured. There are three possible configurations:

- PUBLISH: the node sends the response.
- SUBSCRIBE: the node receives the response.
- IGNORE: the node is not concerned by the response, it does not send and does not receive the response.

This configuration is made by the LIN Node Action (NACT) field in USART LIN Mode Register (FLEX_US_LINMR).

Example: a LIN cluster that contains a host and two clients:

- Data transfer from the host to client 1 and to client 2:

NACT(host) = PUBLISH

NACT(client 1) = SUBSCRIBE

NACT(client 2) = SUBSCRIBE

- Data transfer from the host to client 1 only:

NACT(host) = PUBLISH

NACT(client 1) = SUBSCRIBE

NACT(client 2) = IGNORE

- Data transfer from client 1 to the host:

NACT(host) = SUBSCRIBE

NACT(client 1) = PUBLISH

NACT(client 2) = IGNORE

- Data transfer from client 1 to client 2:

© 2026 Microchip Technology Inc. and its subsidiaries

NACT(host) = IGNORE

NACT(client 1) = PUBLISH

NACT(client 2) = SUBSCRIBE

- Data transfer from client 2 to the host and to client 1:

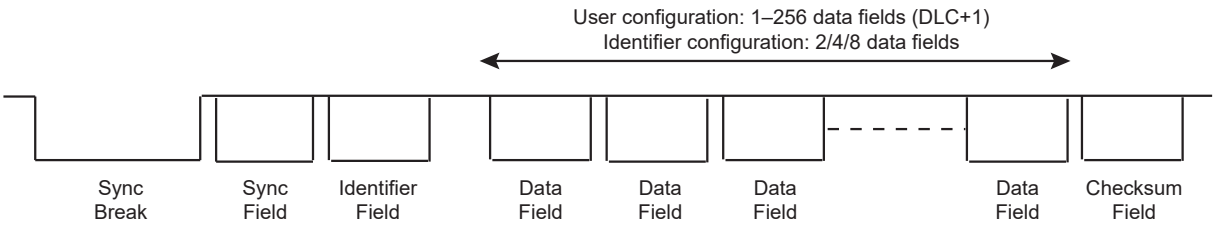
NACT(host) = SUBSCRIBE

NACT(client 1) = SUBSCRIBE

NACT(client 2) = PUBLISH

65.7.8.11.Response Data Length

The LIN response data length is the number of data fields (bytes) of the response excluding the checksum.



The response data length can either be configured by the user or be defined automatically by bits 4 and 5 of the Identifier (compatibility to LIN Specification 1.1). The user can choose between these two modes by the FLEX_US_LINMR.DLM bit:

- DLM = 0: The response data length is configured by the user via the FLEX_US_LINMR.DLC field. The response data length is equal to (DLC + 1) bytes. DLC can be programmed from 0 to 255, so the response can contain from 1 data byte up to 256 data bytes.
- DLM = 1: The response data length is defined by the Identifier (IDCHR in FLEX_US_LINIR) according to the table below. The FLEX_US_LINMR.DLC field is discarded. The response can contain 2 or 4 or 8 data bytes.

Table 65.12. Response Data Length if DLM = 1

IDCHR[5]	IDCHR[4]	Response Data Length (bytes)
0	0	2
0	1	2
1	0	4
1	1	8

Figure 65.43. Response Data Length

65.7.8.12.Checksum

The last field of a frame is the checksum. The checksum contains the inverted 8- bit sum with carry, over all data bytes or all data bytes and the protected identifier. Checksum calculation over the data bytes only is called classic checksum and it is used for communication with LIN 1.3 clients. Checksum calculation over the data bytes and the protected identifier byte is called enhanced checksum and it is used for communication with LIN 2.0 clients.

The USART can be configured to:

- Send/Check an Enhanced checksum automatically (CHKDIS = 0 & CHKTYP = 0)
- Send/Check a Classic checksum automatically (CHKDIS = 0 & CHKTYP = 1)
- Not send/check a checksum (CHKDIS = 1)

© 2026 Microchip Technology Inc. and its subsidiaries

This configuration is made by the Checksum Type (CHKTYP) and Checksum Disable (CHKDIS) bits of FLEX_US_LINMR.

If the checksum feature is disabled, the user can send it manually all the same, by considering the checksum as a normal data byte and by adding 1 to the response data length (see Response Data Length).

65.7.8.13.Frame Slot Mode

This mode is useful only for host nodes. It respects the following rule: each frame slot shall be longer than or equal to $t_{Frame_Maximum}$.

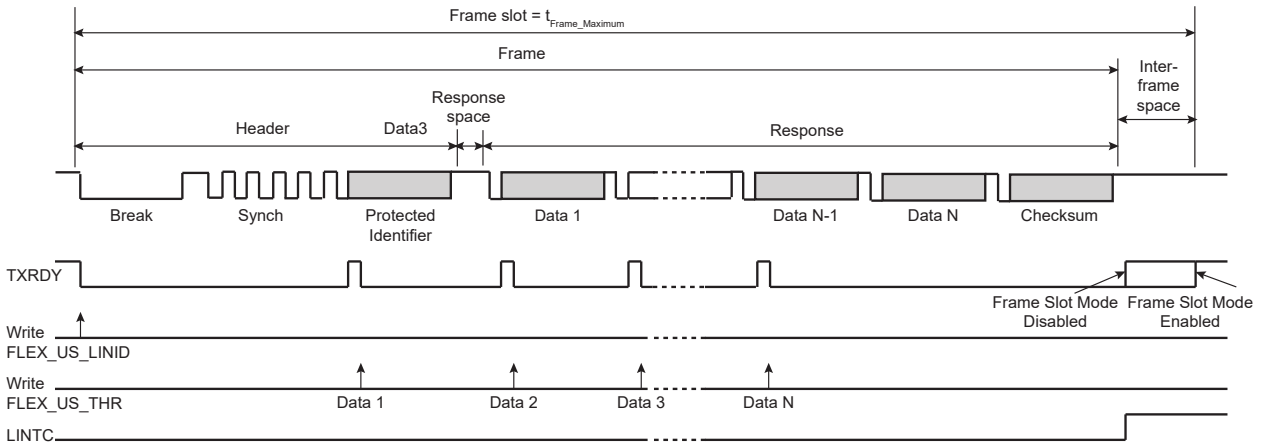
If the Frame Slot mode is enabled (FSDIS = 0) and a frame transfer has been completed, the TXRDY flag is set again only after $t_{Frame_Maximum}$ delay, from the start of frame. So the host node cannot send a new header if the frame slot duration of the previous frame is inferior to $t_{Frame_Maximum}$.

If the Frame Slot mode is disabled (FSDIS = 1) and a frame transfer has been completed, the TXRDY flag is set again immediately.

The $t_{Frame_Maximum}$ is calculated as follows:

If the Checksum is sent (CHKDIS = 0):

- $t_{Header_Nominal} = 34 \times t_{bit}$
- $t_{Response_Nominal} = 10 \times (NData + 1) \times t_{bit}$
- $t_{Frame_Maximum} = 1.4 \times (t_{Header_Nominal} + t_{Response_Nominal} + 1)$(1)
- $t_{Frame_Maximum} = 1.4 \times (34 + 10 \times (DLC + 1 + 1) + 1) \times t_{bit}$
- $t_{Frame_Maximum} = (77 + 14 \times DLC) \times t_{bit}$



If the Checksum is not sent (CHKDIS = 1):

- $t_{Header_Nominal} = 34 \times t_{bit}$
- $t_{Response_Nominal} = 10 \times NData \times t_{bit}$
- $t_{Frame_Maximum} = 1.4 \times (t_{Header_Nominal} + t_{Response_Nominal} + 1)$(1)
- $t_{Frame_Maximum} = 1.4 \times (34 + 10 \times (DLC + 1) + 1) \times t_{bit}$
- $t_{Frame_Maximum} = (63 + 14 \times DLC) \times t_{bit}$

Note:

1. The term “+1” leads to an integer result for $t_{Frame_Maximum}$ (LIN Specification 1.3).

Figure 65.44. Frame Slot Mode

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.8.14.LIN Errors

65.7.8.14.1.Bit Error

This error is generated in host or client node configuration, when the USART is transmitting and if the transmitted value on the Tx line is different from the value sampled on the Rx line. If a bit error is detected, the transmission is aborted at the next byte border.

This error is reported by the FLEX_US_CSR.LINBE flag.

65.7.8.14.2.Inconsistent Synch Field Error

This error is generated in client node configuration, if the Synch Field character received is other than 0x55.

This error is reported by the FLEX_US_CSR.LINISFE flag.

65.7.8.14.3.Identifier Parity Error

This error is generated in client node configuration, if the parity of the identifier is wrong. This error can be generated only if the parity feature is enabled (PARDIS = 0).

This error is reported by the FLEX_US_CSR.LINIPE flag.

65.7.8.14.4.Checksum Error

This error is generated in host or client node configuration, if the received checksum is wrong. This flag can be set to 1 only if the checksum feature is enabled (CHKDIS = 0).

This error is reported by the FLEX_US_CSR.LINCE flag.

65.7.8.14.5.Client Not Responding Error

This error is generated in host or client node configuration, when the USART expects a response from another node (NACT = SUBSCRIBE) but no valid message appears on the bus within the time given by the maximum length of the message frame, $t_{Frame_Maximum}$ (see Frame Slot Mode). This error is disabled if the USART does not expect any message (NACT = PUBLISH or NACT = IGNORE).

This error is reported by the FLEX_US_CSR.LINSNRE.

65.7.8.14.6.Synch Tolerance Error

This error is generated in client node configuration if, after the clock synchronization procedure, it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance FTol_Unsynch (±15%).

This error is reported by the FLEX_US_CSR.LINSTE flag.

65.7.8.14.7.Header Timeout Error

This error is generated in client node configuration, if the header is not entirely received within the time given by the maximum length of the header, $t_{Header_Maximum}$.

This error is reported by the FLEX_US_CSR.LINHTE flag.

65.7.8.15.LIN Frame Handling

65.7.8.15.1.Host Node Configuration

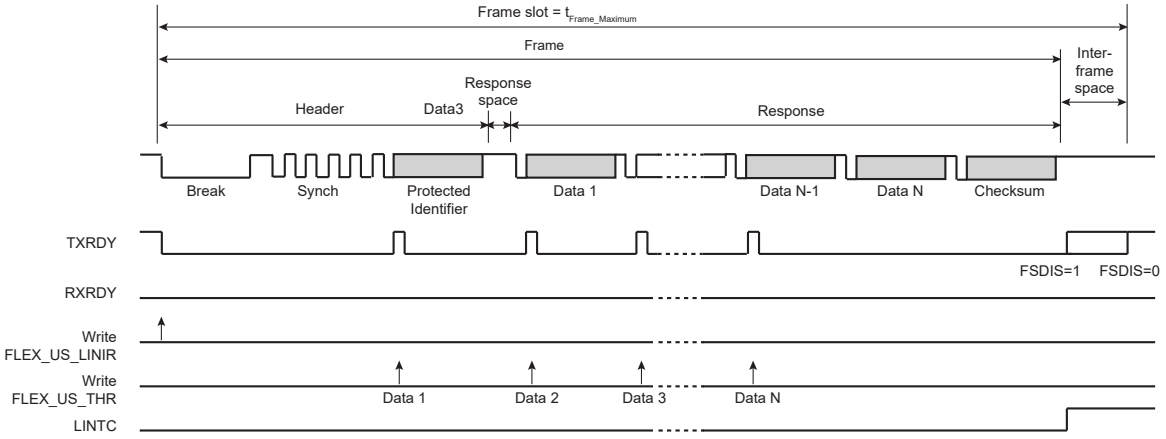
- Write FLEX_US_CR.TXEN and FLEX_US_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX_US_MR.USART_MODE to select the LIN mode and the host node configuration.
- Write FLEX_US_BRGR.CD and FLEX_US_BRGR.FP to configure the baud rate.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM, FSDIS and DLC in FLEX_US_LINMR to configure the frame transfer.
- Check that FLEX_US_CSR. TXRDY is set to 1.
- Write FLEX_US_LINIR.IDCHR to send the header.

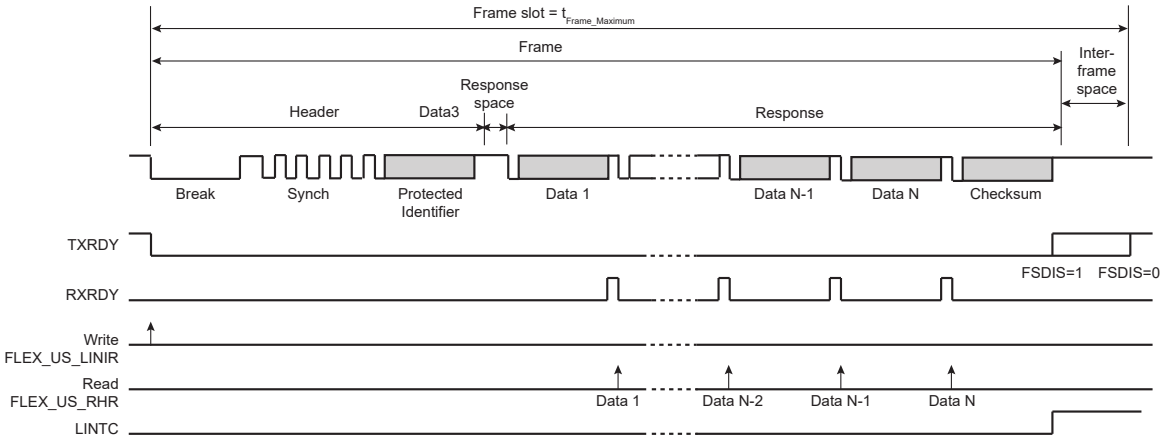
What comes next depends on the NACT configuration:

© 2026 Microchip Technology Inc. and its subsidiaries

- Case 1: NACT = PUBLISH, the USART sends the response.
  - Wait until FLEX_US_CSR. TXRDY rises.
  - Write FLEX_US_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.
- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX_US_CSR.RXRDY rises.
  - Read FLEX_US_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.

Figure 65.45. Host Node Configuration, NACT = PUBLISH





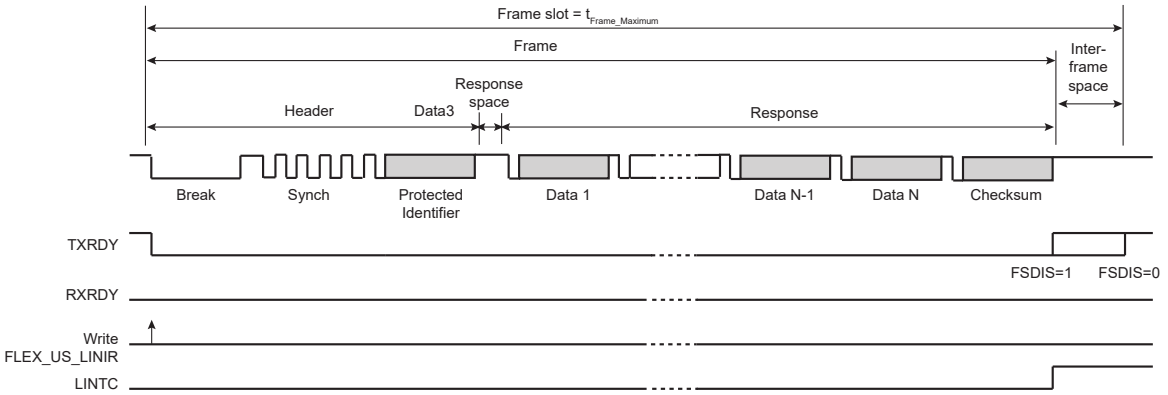


Figure 65.46. Host Node Configuration, NACT = SUBSCRIBE

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.47. Host Node Configuration, NACT = IGNORE

65.7.8.15.2.Client Node Configuration

- Write FLEX_US_CR.TXEN and FLEX_US_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX_US_MR.USART_MODE to select the LIN mode and the client node configuration.
- Write FLEX_US_BRGR.CD and FLEX_US_BRGR.FP to configure the baud rate.
- Wait until FLEX_US_CSR.LINID rises.
- Check LINISFE and LINPE errors.
- Read FLEX_US_RHR.IDCHR.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM and DLC in FLEX_US_LINMR to configure the frame transfer.

IMPORTANT: If the NACT configuration for this frame is PUBLISH, FLEX_US_LINMR must be written with NACT = PUBLISH even if this field is already correctly configured, in order to set the TXREADY flag and the corresponding write transfer request.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the LIN controller sends the response.
  - Wait until FLEX_US_CSR.TXRDY rises.
  - Write FLEX_US_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX_US_CSR. LINTC rises.
  - Check the LIN errors.
- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX_US_CSR.RXRDY rises.
  - Read FLEX_US_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.

Figure 65.48. Client Node Configuration, NACT = PUBLISH

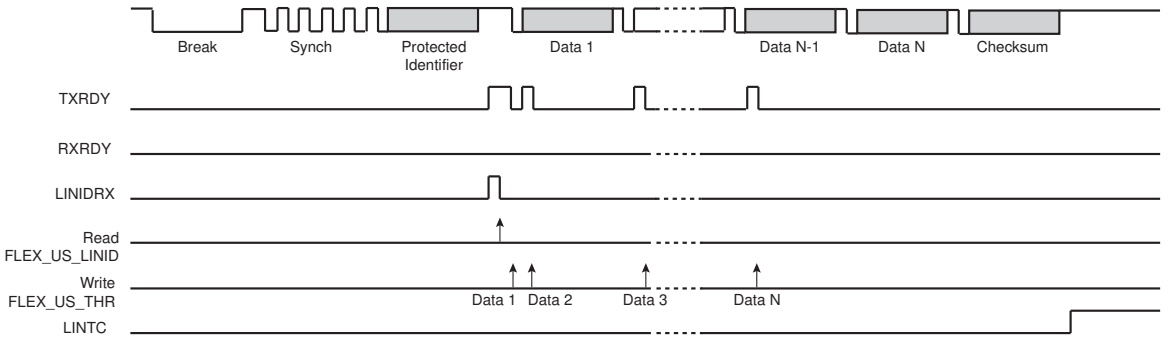

Figure 65.49. Client Node Configuration, NACT = SUBSCRIBE

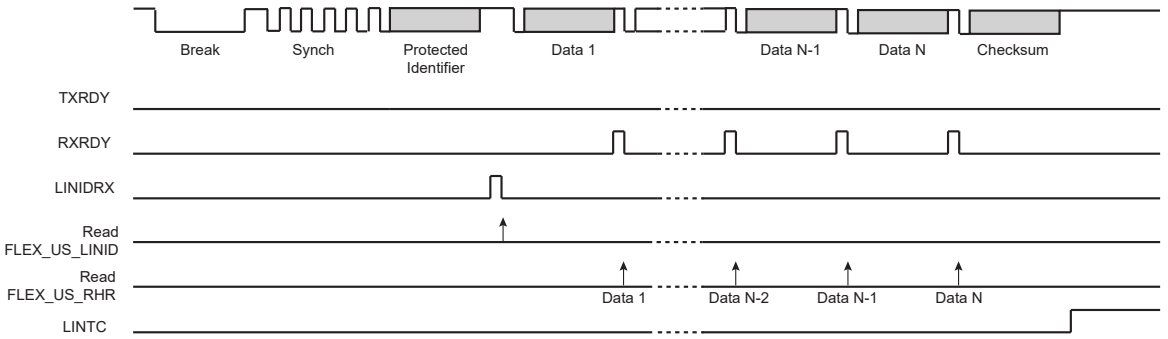

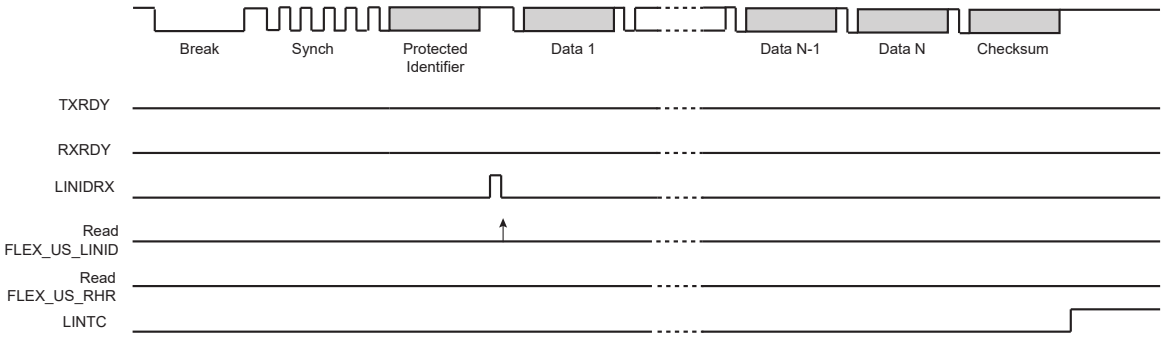

Figure 65.50. Client Node Configuration, NACT = IGNORE

65.7.8.16.LIN Frame Handling with the DMA

The USART can be used in association with the DMA in order to transfer data directly into/from the on- and off-chip memories without any processor intervention.

The DMA uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMA always writes in the Transmit Holding register (FLEX_US_THR) and it always reads in the Receive Holding register (FLEX_US_RHR). The size of the data written or read by the DMA in the USART is always a byte.

65.7.8.16.1.Host Node Configuration

The user can choose between two DMA modes by configuring the FLEX_US_LINMR.PDCM bit:

- PDCM = 1: The LIN configuration is stored in the WRITE buffer and it is written by the DMA in the Transmit Holding register FLEX_US_THR (instead of the LIN Mode register FLEX_US_LINMR). Because the DMA transfer size is limited to a byte, the transfer is split into two accesses. During the first access, the NACT, PARDIS, CHKDIS, CHKTYP, DLM and FSDIS bits are written. During the second access, the 8-bit DLC field is written.

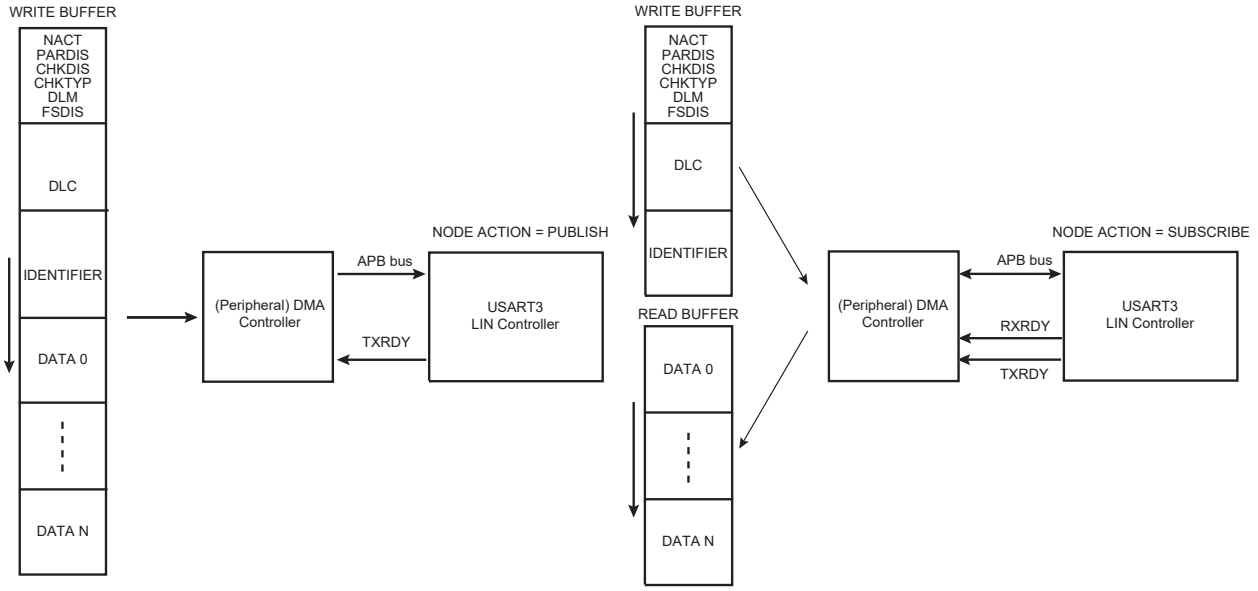
© 2026 Microchip Technology Inc. and its subsidiaries

- PDCM = 0: The LIN configuration is not stored in the WRITE buffer and it must be written by the user in FLEX_US_LINMR.

The WRITE buffer also contains the Identifier and the data, if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

Figure 65.51. Host Node with DMA (PDCM = 1)



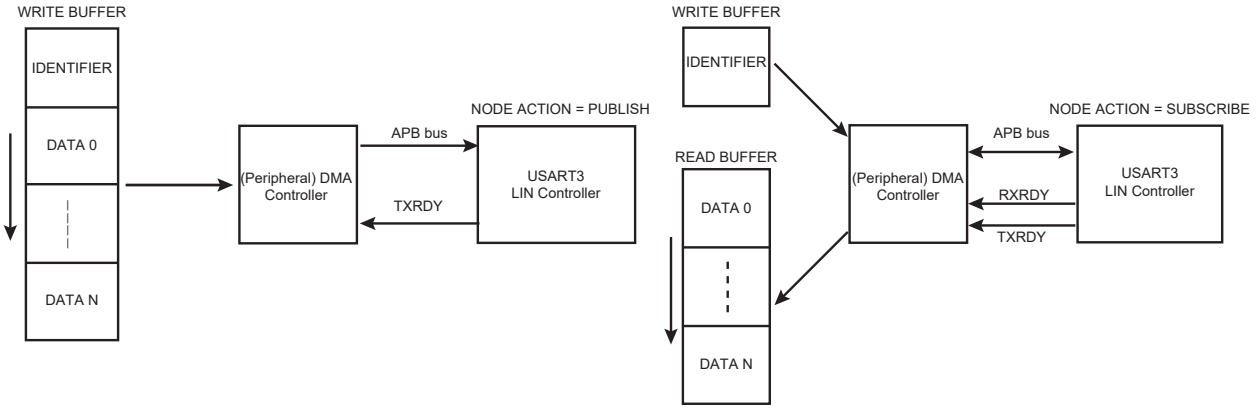


Figure 65.52. Host Node with DMA (PDCM = 0)

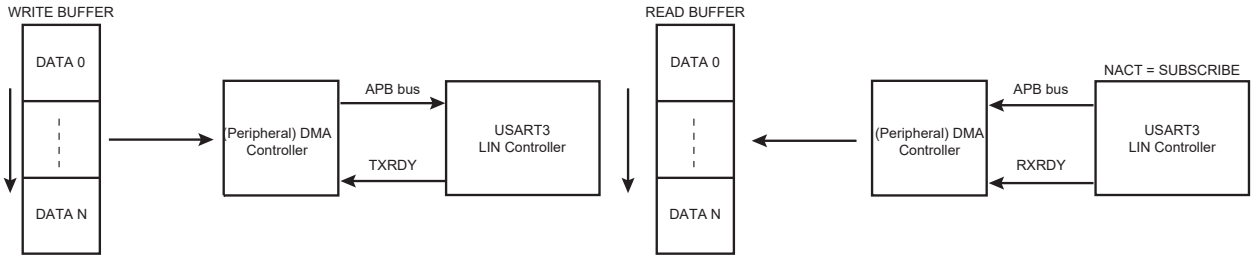
65.7.8.16.2.Client Node Configuration



In this configuration, the DMA transfers only the data. The identifier must be read by the user in the LIN Identifier register (FLEX_US_LINIR). The LIN mode must be written by the user in FLEX_US_LINMR.

The WRITE buffer contains the data if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.53. Client Node with DMA

65.7.8.17.Wakeup Request

Any node in a sleeping LIN cluster may request a wakeup.

In the LIN 2.0 specification, the wakeup request is issued by forcing the bus to the dominant state from 250 µs to 5 ms. For this, it is necessary to send the character 0xF0 in order to impose five successive dominant bits. Whatever the baud rate is, this character respects the specified timings.

- Baud rate min = 1 kbit/s -> t_{bit} = 1 ms -> 5 t_{bit} = 5 ms
- Baud rate max = 20 kbit/s -> t_{bit} = 50 µs -> 5 t_{bit} = 250 µs

In the LIN 1.3 specification, the wakeup request should be generated with the character 0x80 in order to impose eight successive dominant bits.

Using the FLEX_US_LINMR.WKUPTYP bit, the user can choose to send either a LIN 2.0 wakeup request (WKUPTYP = 0) or a LIN 1.3 wakeup request (WKUPTYP = 1).

A wakeup request is transmitted by writing the FLEX_US_CR.LINWKUP bit to 1. Once the transfer is completed, the LINTC flag is asserted in the Status register (FLEX_US_CSR). It is cleared by writing a one to the FLEX_US_CR.RSTSTA bit.

65.7.8.18.Bus Idle Timeout

If the LIN bus is inactive for a certain duration, the client nodes shall automatically enter in Sleep mode. In the LIN 2.0 specification, this timeout is defined as 4 seconds. In the LIN 1.3 specification, it is defined as 25,000 t_{bit}.

In client node configuration, the receiver timeout detects an idle condition on the RXD line. When a timeout is detected, the FLEX_US_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver to go into Sleep mode.

The timeout delay period (during which the receiver waits for a new character) is programmed in the FLEX_US_RTOR.TO field. If a zero is written to the TO field, the Receiver Timeout is disabled and no timeout is detected. The FLEX_US_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 17-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX_US_CSR.TIMEOUT bit rises.

If STTTO is performed, the counter clock is stopped until a first character is received.

If RETTO is performed, the counter starts counting down immediately from the value TO.

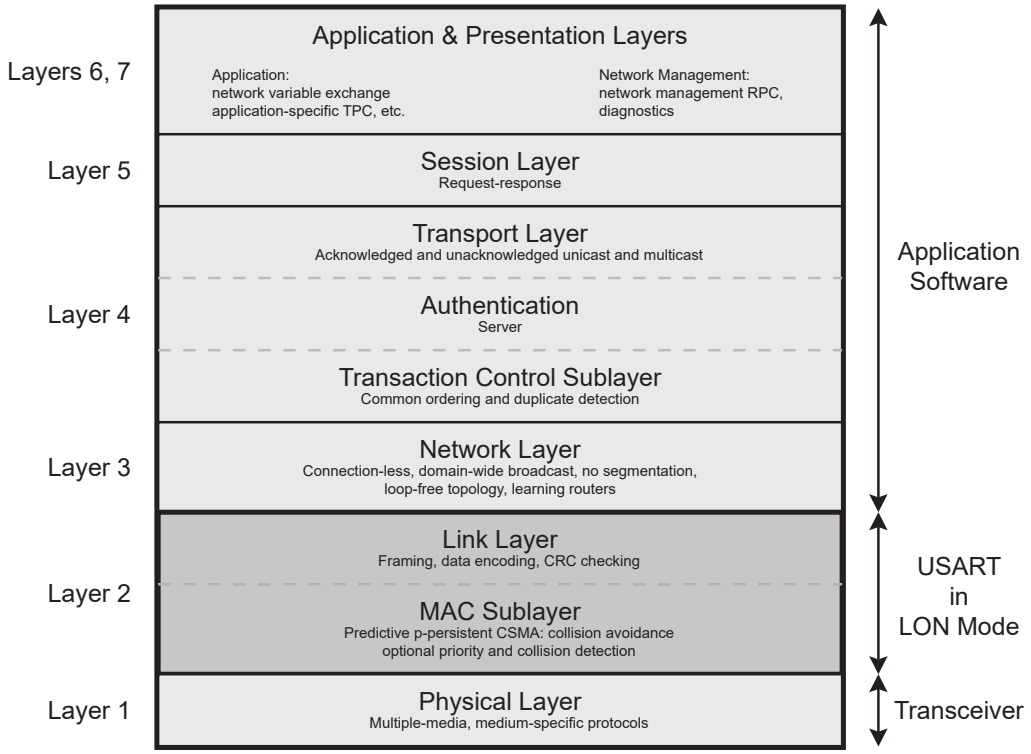
Table 65.13. Receiver Timeout Programming

LIN Specification	Baud Rate	Timeout period	TO
2.0	1,000 bit/s	4s	4,000
	2,400 bit/s		9,600
	9,600 bit/s		38,400
	19,200 bit/s		76,800
	20,000 bit/s		80,000

© 2026 Microchip Technology Inc. and its subsidiaries

Table 65.13. Receiver Timeout Programming (continued)

LIN Specification	Baud Rate	Timeout period	TO
1.3	–	25,000 t_{bit}	25,000



65.7.9. LON Mode

The LON mode provides connectivity to the local operating network (LON).

The LON standard covers all seven layers of the OSI (Open Systems Interconnect) reference model from the physical interfaces such as wired, power line, RF, and IP to the application layer and all layers in between.

The LON mode enables the transmission and reception of Physical Protocol Data Unit (PPDU) frames with minimum intervention from the microprocessor.

Figure 65.54. LON Protocol Layering

The USART configured in LON mode is a full-layer 2 implementation including standard timings handling, framing (transmit and receive PPDU frames), backlog estimation and other features. At the frame encoding/decoding level, differential Manchester encoding is used (also known as CDP). When configured in LON mode, there is no embedded digital line filter, thus the optimal usage is node-to-node communication.

65.7.9.1. Mode of Operation

To configure the USART to act as a LON node, the USART_MODE field of the USART Mode register (FLEX_US_MR) must be set to 0x9.

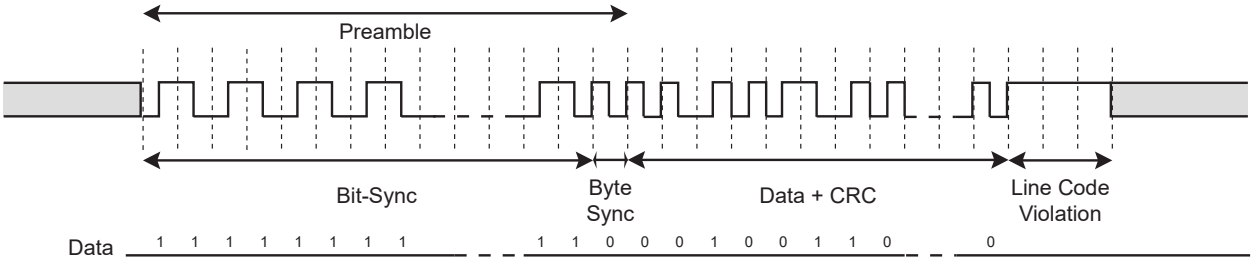
To avoid unpredictable behavior, any change of the LON node configuration must be preceded by a software reset of the transmitter and the receiver (except the initial node configuration after a hardware reset) and followed by a transmitter/receiver enable. See Receiver and Transmitter Control.

65.7.9.2. Receiver and Transmitter Control

See Receiver and Transmitter Control.

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.9.3.Character Transmission



A LON frame is made up of a preamble, a data field (up to 256 bytes) and a 16-bit CRC field. The preamble and CRC fields are automatically generated and the LON node starts the transmission algorithm on a write to LON_L2HDR. See Sending a Frame.

65.7.9.4.Character Reception

When receiving a LON frame, the Receive Holding register (FLEX_US_RHR) is updated upon completed character reception and the RXRDY bit in the Status register rises. If a character is completed while the RXRDY bit is set, the OVRE (Overrun Error) bit is set. The LON preamble field is only used for synchronization, therefore only the Data and CRC fields are transmitted to the Receive Holding register (FLEX_US_RHR). See Sending a Frame.

65.7.9.5.LON Frame

Figure 65.55. LON Framing

65.7.9.5.1.Encoding / Decoding

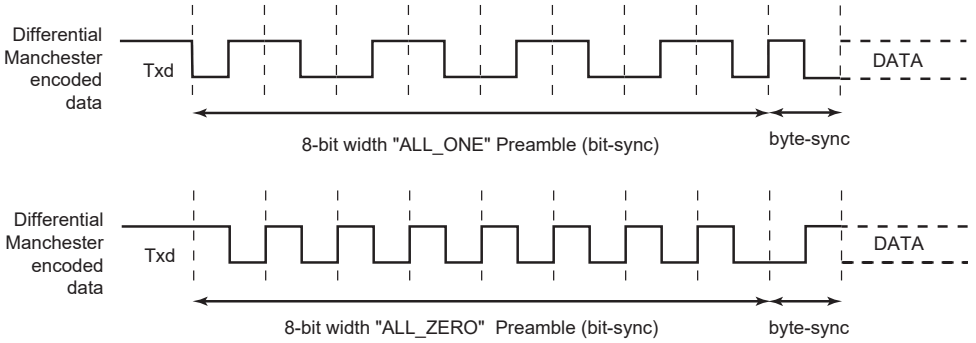
The USART configured in LON mode encodes transmitted data and decodes received data using differential Manchester encoding. In differential Manchester encoding, a '1' bit is indicated by making the first half of the signal equal to the last half of the previous bit's signal (no transition at the start of the bit-time). A '0' bit is indicated by making the first half of the signal opposite to the last half of the previous bit's signal (a zero bit is indicated by a transition at the beginning of the bit-time). As is the case with normal Manchester encoding, missing transition at the middle of bit-time represents a Manchester code violation.

The FLEX_US_MAN.RXIDLEV bit informs the USART of the receiver line idle state value (receiver line inactive) thus ensuring higher reliability of preamble synchronization. By default, RXIDLEV is set (receiver line is at level 1 when there is no activity).

Differential Manchester encoding is polarity-insensitive.

Figure 65.56. LON PPDU

65.7.9.5.2.Preamble Transmission



Each LON frame begins with a preamble of variable length which consists of a bit-sync field and a byte-sync field. The LONPL field of the USART LON Preamble register (FLEX_US_LONPR) defines the preamble length. Note that a preamble length of '0' is not allowed.

The LON implementation allows two different preamble patterns ALL_ONE and ALL_ZERO which can be configured through the TX_PL field of the USART Manchester Configuration register (FLEX_US_MAN). The following figure illustrates and defines the valid patterns.

Other preamble patterns are not supported.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.57. Preamble Patterns

65.7.9.5.3.Preamble Reception

LON received frames begin with a preamble of variable length. The receiving algorithm does not check the preamble length, although a minimum of length of 4 bits is required for the receiving algorithm to consider the received preamble as valid.

As is the case with LON preamble transmission, two preamble patterns (ALL_ONE and ALL_ZERO) are allowed and can be configured through the RX_PL field of the USART Manchester Configuration register (FLEX_US_MAN). The above figure illustrates and defines the valid patterns.

Other preamble patterns are not supported.

65.7.9.5.4.Header Transmission

Each LON frame, after sending the preamble, starts with the frame header also called L2HDR according to CEA-709 specification. This header consist of the priority bit, the alternative path bit and the backlog increment. It is the first data to be sent.

In LON mode, the transmitting algorithm starts when FLEX_US_LONL2HDR is written (it is the first data to send).

65.7.9.5.5.Header Reception

Each LON frame, after receiving the preamble, receives the frame header also called L2HDR according to CEA-709 specification. This header consists of the priority bit, the alternative path bit, and the backlog increment.

The frame header is the first received data and the RXRDY bit rises as soon as the frame header as been received and stored in the Receive Holding register (FLEX_US_RHR).

65.7.9.5.6.Data

Data are sent/received serially after the preamble transmission/reception. Data can be either sent/received MSB first or LSB first depending on the MSBF bit value in the USART Mode register (FLEX_US_MR).

65.7.9.5.7.CRC

The two last bytes of LON frames are dedicated to CRC.

When transmitting, the CRC of the frame is automatically generated and sent when expected.

When receiving frames, the CRC is automatically checked and the FLEX_US_CSR.LCRCE flag is set if the calculated CRC does not match the received one. Note that the two received CRC bytes are seen as two additional data from the user point of view.

65.7.9.5.8.End Of Frame

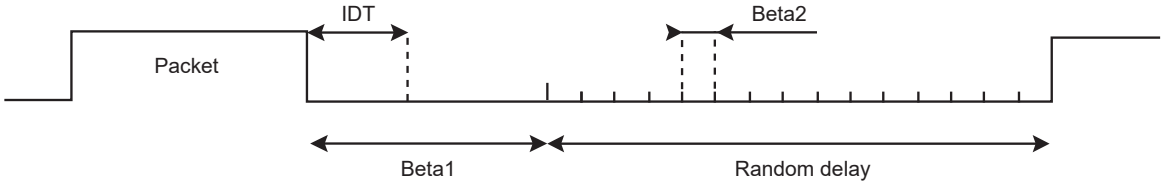
The USART configured in LON mode terminates the frame with a three t_{bit} long Manchester code violation. After sending the last CRC bit, it maintains the data transitionless during three bit periods.

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.9.6.LON Operating Modes

65.7.9.6.1.Transmitting/Receiving Modules

According to the LON node configuration and LON network state, the transmitting module is activated if a transmission request has been made and access to the LON bus granted. It returns to idle state once the transmission ends.



According to the LON node configuration and LON network state, the receiving module is activated if a valid preamble is detected and the transmitting module is not activated.

65.7.9.6.2.comm_type

In CEA-709 standard 2, communication configurations are defined and configurable through the comm_type variable. The comm_type variable value can be set in the USART LON Mode register (FLEX_US_LONMR) through the COMMT bit. The selection of the comm_type determines the MAC behavior in the following ways:

- comm_type = 1:
  - An indeterminate time is defined during the Beta 1 period in which all transitions on the channel are ignored (see figure below).
  - The MAC sublayer ignores collisions occurring during the first 25% of the transmitted preamble. Optionally (according to the FLEX_US_LONMR.CDTAIL bit), it ignores collisions reported following the transmission of the CRC but prior to the end of transmission.
  - If a collision is detected during preamble transmission, the MAC sublayer can terminate the packet if so configured according to the FLEX_US_LONMR.TCOL bit. Collisions detected after the preamble have been sent do not terminate transmission.
- comm_type = 2:
  - No indeterminate time is defined at the MAC sublayer.
  - The MAC sublayer always terminates the packet upon notification of a collision.

Figure 65.58. LON Indeterminate Time

65.7.9.6.3.Collision Detection

As an option of the CEA-709 standard collision detection is supported through an active low Collision Detect (CD) input from the transceiver.

The Collision Detection source can be either external (see I/O Lines Description) or internal. The collision detection source selection is defined through the LCDS bit in the USART LON Mode register (FLEX_US_LONMR).

The Collision Detection feature can be activated through the COLDET bit of the USART LON Mode register. If the collision detection feature is enabled and CD signal goes low for at least half t_{bit} period then a collision is detected and reported as defined in comm_type.

65.7.9.6.4.Collision Detection Mode

As defined in comm_type, if comm_type = 1 the LON node can be configured to either not terminate transmission upon collision notification during preamble transmission or terminate transmission.

The FLEX_US_LONMR.TCOL bit allows to decide whether to terminate transmission or not upon collision notification during preamble transmission.

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.9.6.5.Collision Detection after CRC

As defined in comm_type, if comm_type = 1 the LON node can be configured to ignore collisions reported after the CRC has been sent but prior to the end of the frame.

The FLEX_US_LONMR.CDTAIL bit can be used to decide whether such collision notifications must be considered or not.

65.7.9.6.6.Random Number Generation

The Predictive p-persistent CSMA algorithm defined in the CEA-709.1 Standard is based on a random number generation.

This random number is automatically generated by an internal algorithm.

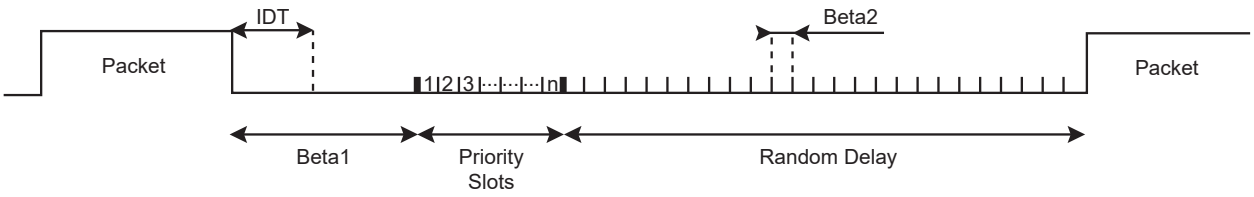
In addition, a USART IC DIFF register (FLEX_US_ICDIFF) is available to avoid that two same chips with the same software generate the same random number after reset. The value of this register is used by the internal algorithm to generate the random number. Therefore, putting a different value here for each chip ensures that the random number generated after a reset at the same time will not be the same. It is recommended to put the chip ID code here.

65.7.9.7.LON Node Backlog Estimation

As defined in CEA-709, the LON node maintains its own backlog estimation. The node backlog estimation is initially set to one, will always be greater than 1 and will never exceed 63. If the node backlog estimation exceeds the maximum backlog value, the backlog value is set to 63 and a backlog overflow error flag is set (LBLOVFE flag).

The node backlog estimation is incremented each time a frame is sent or received successfully. The increment to the backlog is encoded into the link layer header, and represents the number of messages that the packet shall cause to be generated upon reception.

The backlog decrements under one of the following conditions:



- On waiting to transmit: If Wbase randomizing slots go by without channel activity.
- On receive: If a packet is received with a backlog increment of '0'.
- On transmit: If a packet is transmitted with a backlog increment of '0'.
- On idle: If a packet cycle time expires without channel activity.

65.7.9.7.1.Optional Collision Detection Feature And Backlog Estimation

Each time a frame is transmitted and a collision occurred, the backlog is incremented by 1. In this case, the backlog increment encoded in the link layer is ignored.

65.7.9.8.LON Timings

Figure 65.59. LON Timings

65.7.9.8.1.Beta2

A node wishing to transmit generates a random delay T. This delay is an integer number of randomizing slots of duration Beta2.

The beta2 length (in t_{bit}) is configurable through FLEX_US_FIDI. Note that a length of '0' is not allowed.

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.9.8.2.Beta1 Tx/Rx

Beta1 is the period immediately following the end of a packet cycle (see the above figure). A node attempting to transmit monitors the state of the channel, and if it detects no transmission during the Beta1 period, it determines the channel to be idle.

The Beta1 value is different depending on the previous packet type (received packet or transmitted packet).

Beta1Rx and Beta1Tx length can be configured respectively through the USART LON Beta1 Rx register (FLEX_US_LONB1RX) and the USART LON Beta1 Tx register (FLEX_US_LONB1TX). Note that a length of '0' is not allowed.

65.7.9.8.3.Pcycle Timer

The packet cycle timer is reset to its initial value whenever the backlog is changed. It is started (begins counting down at its current value) whenever the MAC layer becomes idle. An idle MAC layer is defined as:

- Not receiving
- Not transmitting,
- Not waiting to transmit,
- Not timing Beta1,
- Not waiting for priority slots, and not waiting for the first Wbase randomizing window to complete.

On transition from idle to either transmit or receive, the packet cycle timer is halted.

The pcycle timer value can be configured in FLEX_US_TTGR. Note that '0' value is not allowed.

65.7.9.8.4.Wbase

The wbase timer represents the base windows size. Its duration, derived from Beta2, equals 16 Beta2 slots.

65.7.9.8.5.Priority Slots

On a channel by channel basis, the protocol supports optional priority. Priority slots, if any, follow immediately after the Beta1 period that follows the transmission of a packet (see the above figure). The number of priority slots per channel ranges from 0 to 127.

The number of priority slots in the LON network configuration is defined through the PSNB field of the USART LON Priority register (FLEX_US_LONPRIO). And the priority slot affected to the LON node, if any, is defined through the FLEX_US_LONPRIO.NPS field.

65.7.9.8.6.Indeterminate Time

See comm_type.

Like Beta1, the IDT value is different depending on whether the previous frame was transmitted or received.

IDTRx and IDTTx can be configured respectively through the USART LON IDT Rx register (FLEX_US_LONIDTRX) and the USART LON IDT Tx register (FLEX_US_LONIDTTX).

65.7.9.8.7.End of Frame Condition

The USART configured in LON mode terminates the frame with a three t_{bit} long Manchester code violation. After sending the last CRC bit, it maintains the data transitionless during three bit periods.

While receiving data, the USART configured in LON mode detects an end of frame condition after a t_{eof} transitionless Manchester code violation. The EOFS field in the USART LON Mode Register can configure t_{eof}.

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.9.9.LON Errors

All these flags can be read in the LON Channel Status register (FLEX_US_CSR) and generate interrupts if configured in the LON Interrupt Enable register (FLEX_US_IER).

These flags can be reset by writing a one to the FLEX_US_CR.RSTSTA bit.

65.7.9.9.1.Underrun Error

If the USART is in LON mode and if a character is sent while the Transmit Holding register (FLEX_US_THR) is empty, the UNRE bit flag is set.

65.7.9.9.2.Collision Detection

The LCOL flag is set whenever a valid collision has been detected and the LON node is configured to report it (see Collision Detection).

65.7.9.9.3.LON Frame Early Termination

The LFET flag is set whenever a LON frame has been terminated early due to collision detection.

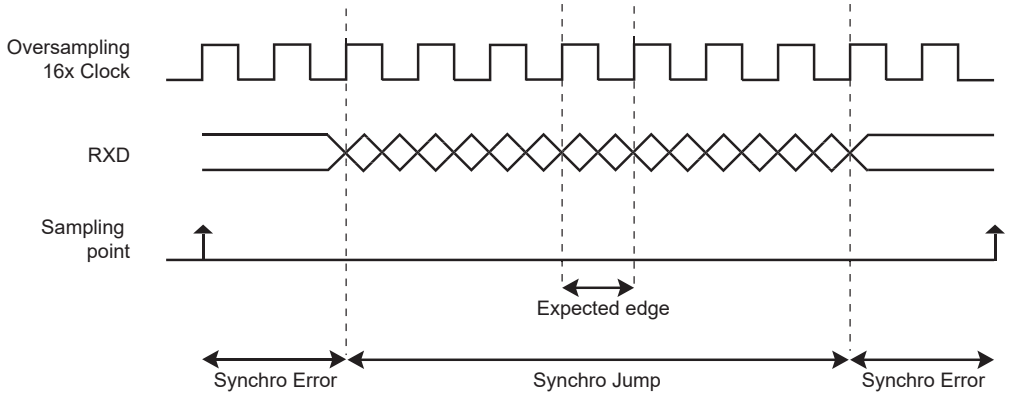
65.7.9.9.4.Reception Error

The LCRCE flag is set if the received frame has an erroneous CRC and the flag LSFE is set if the received frame is too short (LON frames must be at least 8 bytes long).

These flags can be read in FLEX_US_CSR.

65.7.9.9.5.Backlog Overflow

The LBLOVFE flag is set if the LON node backlog estimation goes over 63, which is the maximum backlog value.



65.7.9.10.Drift Compensation

It may happen that while receiving a frame, the baud rate used by the sender is not exactly the one expected, due to sender clock drifting for instance. In such case, the hardware drift compensation algorithm is used to recover up to 16% clock drift (expected baud rate ±16% is supported).

Drift compensation is available only in 16X Oversampling mode. To enable the hardware system, the DRIFT bit of the FLEX_US_MAN register must be set. If the RXD edge is between one and three 16X clock cycles away from the expected edge, then the period is shortened or lengthened accordingly to center the RXD edge.

Drift compensation hardware feature allows up to 16% clock drift to be handled, provided system clock is fast enough compared to the selected baud rate.

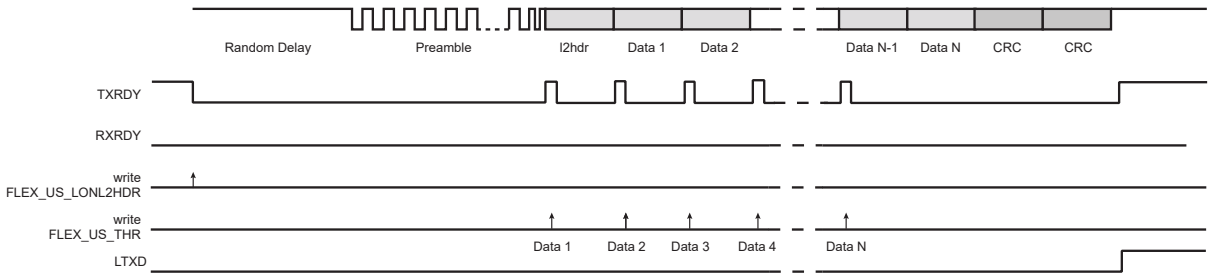
65.7.9.11.LON Frame Handling



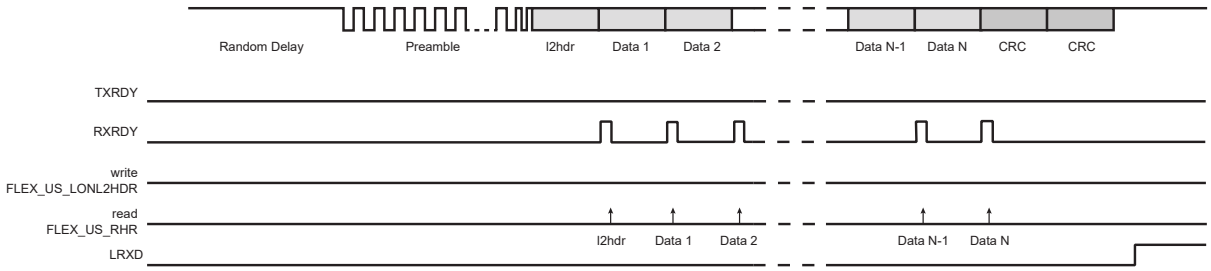
65.7.9.11.1.Sending a Frame

1. Write FLEX_US_CR.TXEN and FLEX_US_CR.RXEN to enable both the transmitter and the receiver.

© 2026 Microchip Technology Inc. and its subsidiaries

2. Write FLEX_US_MR.USART_MODE to select the LON mode configuration.
3. Write FLEX_US_BRGR.CD and FLEX_US_BRGR.FP to configure the baud rate.
4. Write COMMT, COLDET, TCOL, CDTAIL, RDMNBM and DMAM in FLEX_US_LONMR to configure the LON operating mode.
5. Write BETA2, BETA1TX, BETA1RX, PCYCLE, PSNB, NPS, IDTTX and ITDRX respectively in FLEX_US_FIDI, FLEX_US_LONB1TX, FLEX_US_LONB1RX, FLEX_US_TTGR, FLEX_US_LONPRIO, FLEX_US_LONIDTTX and FLEX_US_LONIDTRX to set the LON network configuration.
6. Write FLEX_US_MAN.TX_PL to select the preamble pattern to use.
7. Write LONPL and LONDL in FLEX_US_LONPR and FLEX_US_LONDL to set the frame transfer.
8. Check that FLEX_US_CSR.TXRDY is set to 1.
9. Write FLEX_US_LONL2HDR to send the header.
10. Wait until FLEX_US_CSR.TXRDY rises.
11. Write FLEX_US_THR.TCHR to send a byte.
12. If all the data have not been written, repeat the two previous steps.
13. Wait until FLEX_US_CSR.LTXD rises.
14. Check the LON errors.

Figure 65.61. Tx Frame



65.7.9.11.2.Receiving a Frame

1. Write FLEX_US_CR.TXEN and FLEX_US_CR.RXEN to enable both the transmitter and the receiver.
2. Write FLEX_US_MR.USART_MODE to select the LON mode configuration.
3. Write FLEX_US_BRGR.CD and FLEX_US_BRGR.FP to configure the baud rate.
4. Write COMMT, COLDET, TCOL, CDTAIL, RDMNBM and DMAM in FLEX_US_LONMR to configure the LON operating mode.
5. Write BETA2, BETA1TX, BETA1RX, PCYCLE, PSNB, NPS, IDTTX and ITDRX respectively in FLEX_US_FIDI, FLEX_US_LONB1TX, FLEX_US_LONB1RX, FLEX_US_TTGR, FLEX_US_LONPRIO, FLEX_US_LONIDTTX and FLEX_US_LONIDTRX to set the LON network configuration.
6. Write FLEX_US_MAN.RXIDLEV and FLEX_US_MAN.RX_PL to indicate the receiver line value and select the preamble pattern to use.
7. Wait until FLEX_US_CSR.RXRDY rises.
8. Read FLEX_US_RHR.RCHR.
9. If all the data and the two CRC bytes have not been read, repeat the two previous steps.
10. Wait until FLEX_US_CSR.LRXD rises.
11. Check the LON errors.

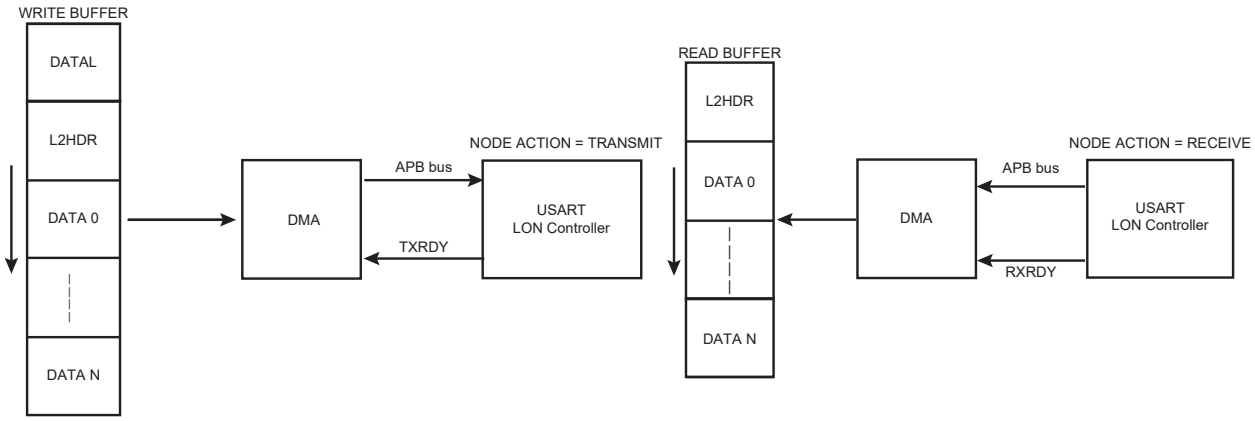
Figure 65.62. Rx Frame

65.7.9.12.LON Frame Handling with the Peripheral DMA Controller

The USART can be used in association with the DMA Controller in order to transfer data directly into/from the on- and off-chip memories without any processor intervention.

The DMA uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMA always writes in the Transmit Holding register (FLEX_US_THR) and it always reads in the Receive Holding register (FLEX_US_RHR). The size of the data written or read by the DMA in the USART is always a byte.

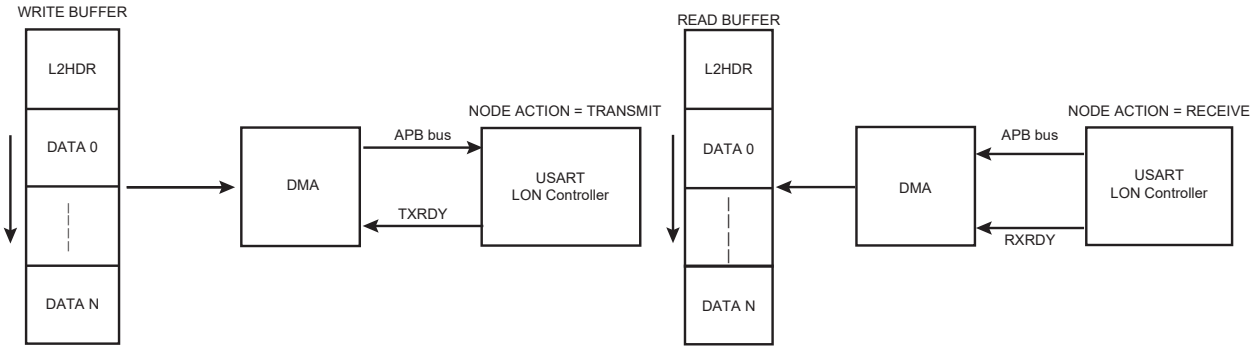
65.7.9.12.1.Configuration



The user can choose between two DMA modes by the DMAM bit in the LON Mode register

(FLEX_US_LONMR):

- DMAM = 1: The LON frame data length (DATAL) is stored in the WRITE buffer and it is written by the DMA in the Transmit Holding register FLEX_US_THR (instead of the LON Data Length register FLEX_US_LONDL).
- DMAM = 0: The LON frame data length (DATAL) is not stored in the WRITE buffer and it must be written by the user in the LON Data Length Register (FLEX_US_LONDL).

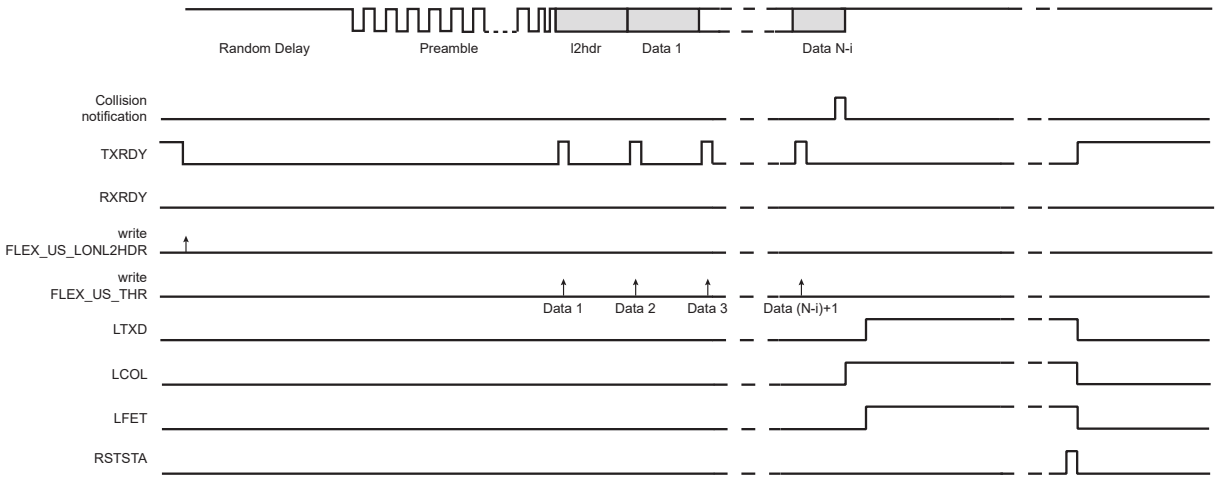


In both DMA modes, L2HDR is considered as a data and its value must be stored in the WRITE buffer as the first data to write.

Figure 65.63. DMAM = 1

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.64. DMAM = 0



65.7.9.12.2.DMA and Collision Detection

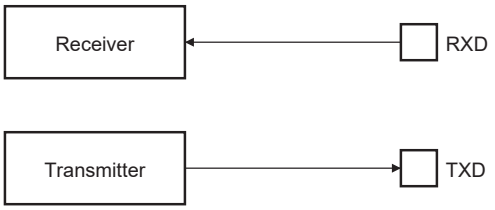
As explained in section comm_type, depending on LON configuration the transmission may be terminated early upon collision notification which means that the DMA transfer may be stopped before its end.

In case of early end of transmission due to collision detection, the USART in LON mode acts as follows:

- Send the end of frame trigger.
- Hold down TXRDY, thus avoiding any additional DMA transfer.
- Set the LTXD, LCOL and LFET flags in FLEX_US_CSR.
- Wait for the application to reconfigure the DMA.
- Wait until the LCOL and LFET flags are cleared through the FLEX_US_CR.RSTSTA bit (it will release the TXRDY signal).

Figure 65.65. DMA, Collision and Early Frame Termination

65.7.10. Test Modes



The USART can be programmed to operate in three different test modes. The internal loopback capability allows on-board diagnostics. In Loopback mode, the USART interface pins are disconnected or not and reconfigured for loopback internally or externally.

65.7.10.1.Normal Mode

Normal mode connects the RXD pin on the receiver input and the transmitter output on the TXD pin.

© 2026 Microchip Technology Inc. and its subsidiaries

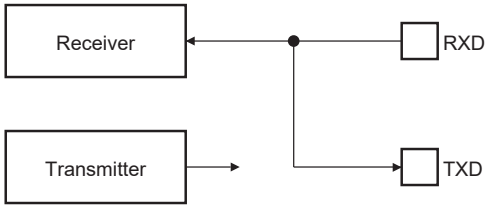


Figure 65.66. Normal Mode Configuration

65.7.10.2.Automatic Echo Mode

Automatic Echo mode allows bit-by-bit retransmission. When a bit is received on the RXD pin, it is sent to the TXD pin, as shown in the following figure. Programming the transmitter has no effect on the TXD pin. The RXD pin is still connected to the receiver input, thus the receiver remains active.

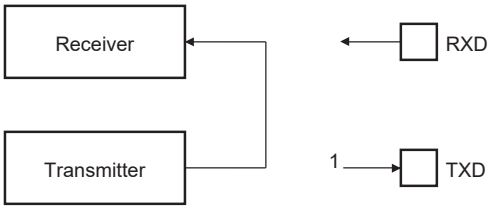

Figure 65.67. Automatic Echo Mode Configuration

65.7.10.3.Local Loopback Mode

Local Loopback mode connects the output of the transmitter directly to the input of the receiver, as shown in the following figure. The TXD and RXD pins are not used. The RXD pin has no effect on the receiver and the TXD pin is continuously driven high, as in idle state.

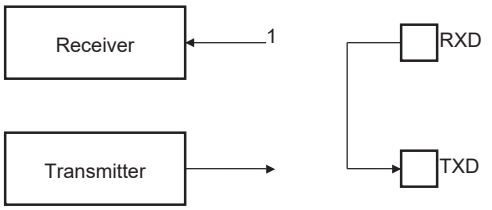

Figure 65.68. Local Loopback Mode Configuration

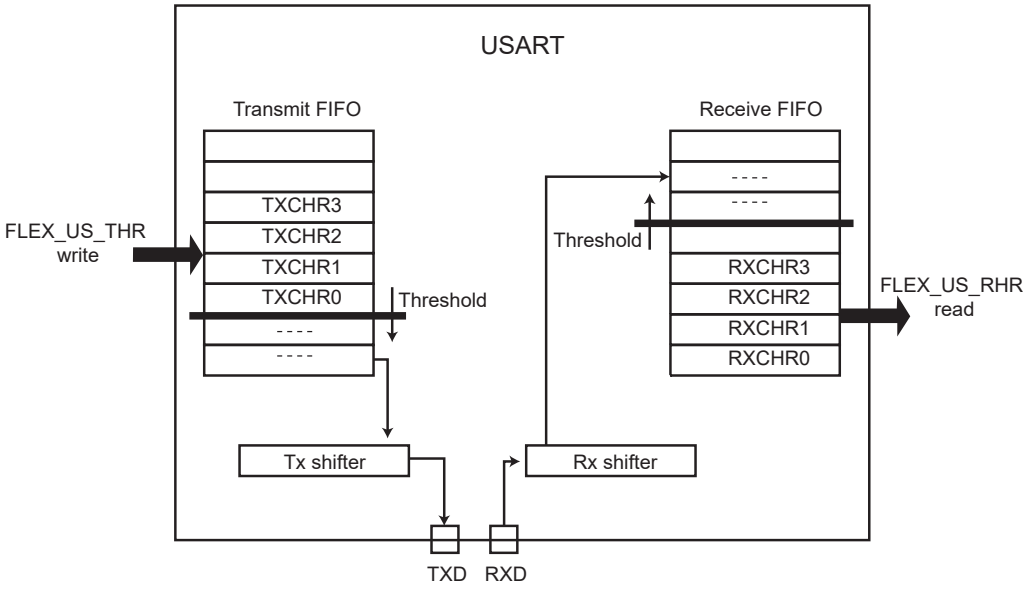
65.7.10.4.Remote Loopback Mode

Remote Loopback mode directly connects the RXD pin to the TXD pin, as shown in the following figure. The transmitter and the receiver are disabled and have no effect. This mode allows bit-by-bit retransmission.

Figure 65.69. Remote Loopback Mode Configuration

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.11. USART FIFOs



65.7.11.1.Overview

The USART includes two FIFOs which can be enabled/disabled using FLEX_US_CR.FIFOEN/FIFODIS. Both the transmitter and the receiver must be disabled before enabling or disabling the FIFOs, using the FLEX_US_CR.TXDIS/RXDIS bits.

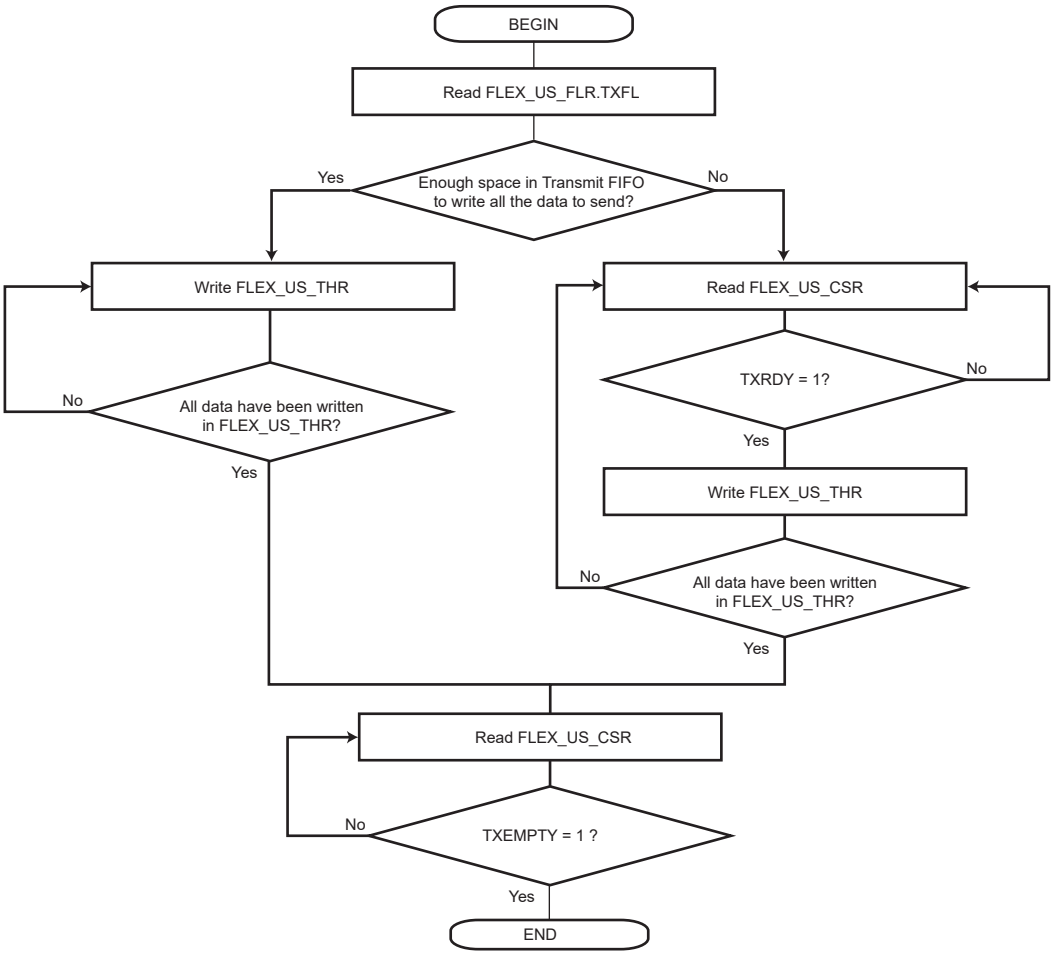
Writing FLEX_US_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

When the FIFO is enabled, it is possible to write or to read single data (5-bit to 9-bit data) or multiple data (5-bit to 8-bit data) in the same access to FLEX_US_THR/RHR. See FIFO Single Data Access and FIFO Multiple Data Access.

Figure 65.70. USART FIFOs Block Diagram

65.7.11.2.Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX_US_THR loads the Transmit FIFO.



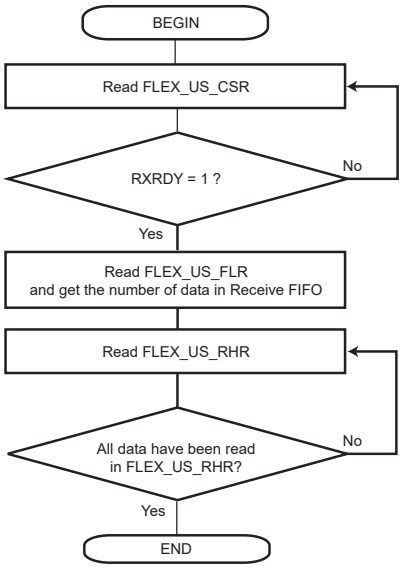
The FIFO level is provided in FLEX_US_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX_US_CSR.TXRDY and the data can be successively written in FLEX_US_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX_US_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.71. Sending Data with FIFO Enabled



65.7.11.3.Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX_US_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to ‘1’), the exact number of data can be checked with FLEX_US_FLR.RXFL. All the data can be read successively in FLEX_US_RHR without checking the RXRDY flag between each access.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.72. Receiving Data with FIFO Enabled

65.7.11.4.Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX_US_CR.TXFCLR/RXFCLR.

65.7.11.5.TXEMPTY, TXRDY and RXRDY Behavior

FLEX_US_CSR.TXEMPTY, FLEX_US_CSR.TXRDY and FLEX_US_CSR.RXRDY flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure TXRDY in Single Data Mode and TXRDYM = 0.

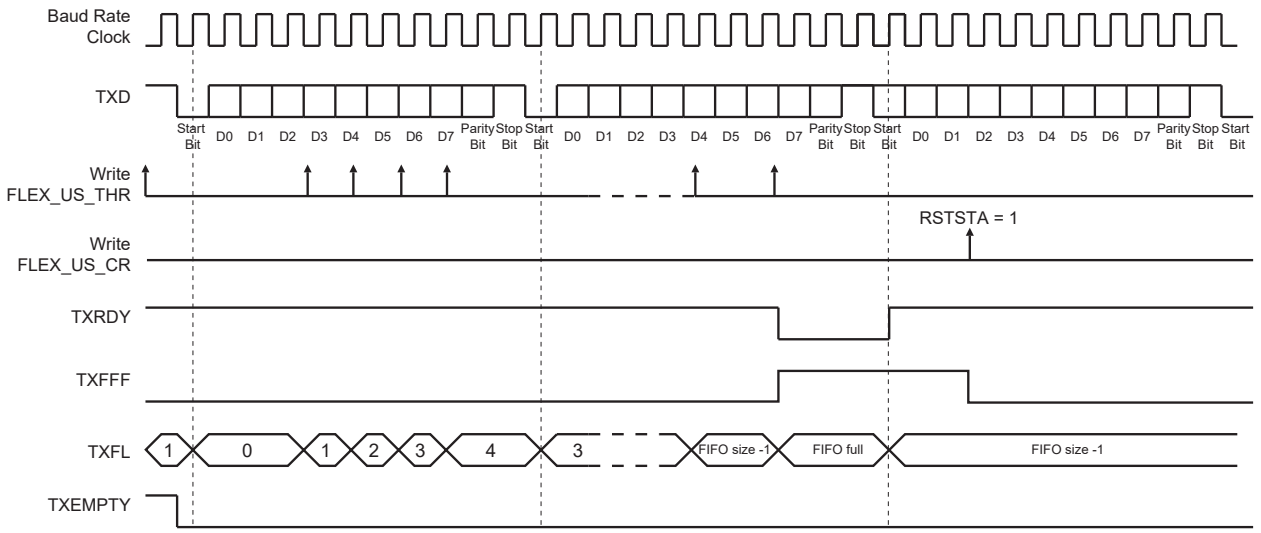
RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. See figure RXRDY in Single Data Mode and RXRDYM = 0 below.

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the USART FIFO Mode register (FLEX_US_FMR) .

See FLEX_US_FMR for the FIFO configuration.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.73. TXRDY Behavior for Single Data Access and TXRDYM = 0



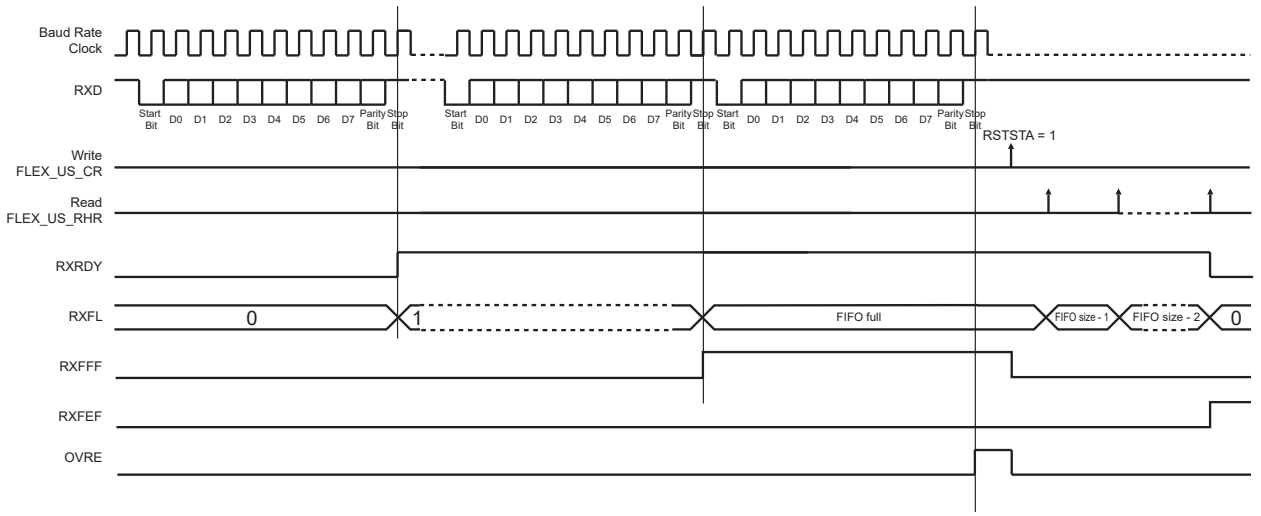


Figure 65.74. RXRDY Behavior for Single Data Access and RXRDYM = 0

65.7.11.6.FIFO Single Data Access

When FIFO is enabled and a byte access is performed in FLEX_US_THR (5-bit to 8-bit data size), a single data is written in FIFO. The similar behavior applies for FLEX_US_RHR.

If FLEX_US_MR.MODE9 is set (9-bit data), or if FLEX_US_MR.USART_MODE is configured to operate in LON mode, LIN Host mode or LIN Client mode, or if FLEX_US_MR.MAN is set, any type of access to FLEX_US_THR/RHR writes/reads a single data.

See USART Receive Holding Register (FLEX_US_RHR) and USART Transmit Holding Register (FLEX_US_THR).

However, for some configurations it is possible to write/read multiple data each time FLEX_US_THR/FLEX_US_RHR is accessed. See FIFO Multiple Data Access.

65.7.11.6.1.DMA

The DMA transfer type must be configured in bytes or halfwords when FIFOs operate in Single Data mode (the same applies when FIFOs are disabled).

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.11.7.FIFO Multiple Data Access

For some operating modes, it is possible to reduce the number of accesses to/from FLEX_US_THR/FLEX_US_RHR required to transfer an amount of data, by concatenating multiple data (5-bit to 8-bit) when FIFO is enabled (FLEX_US_CR.FIFOEN=1) and 5- to 8-bit data characters are transferred (FLEX_US_MR.MODE9=0).

Up to four data (5-bit to 8-bit) can be written/read in one FLEX_US_THR/FLEX_US_RHR access.

When the FIFO is enabled, the number of data to write/read is defined by the type of access in the holding register. If the access is a byte, only one data is written/read (single data access), if the access is a halfword or a word a multiple data access is performed. If the access is a halfword, then two data are written/read and if the access is a word, four data are written/read.

Written/read data are always right-aligned, as described in USART Receive Holding Register (FIFO Multi Data) and USART Transmit Holding Register (FIFO Multi Data).

Multiple data access cannot be used for the following configurations:

- If FLEX_US_MR.MODE9 is set
- If FLEX_US_MR.USART_MODE is configured to operated in LON mode, LIN Host mode or LIN Client mode
- FLEX_US_MR.MAN is set

As an example of multiple data access, if the Transmit FIFO is empty and there are six data to send, any of the following write accesses may be performed:

- six FLEX_US_THR-byte write accesses
- three FLEX_US_THR-halfword write accesses
- one FLEX_US_THR word write access and one FLEX_US_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX_US_RHR-byte read accesses
- three FLEX_US_RHR-halfword read accesses
- one FLEX_US_RHR-word read access and one FLEX_US_RHR-halfword read access

65.7.11.7.1.TXRDY and RXRDY Configuration

The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX_US_FMR.TXRDYM/RXRDYM.

As an example, if a word (32-bit) is written in FLEX_US_THR, the TXRDYM field must be configured so that the TXRDY flag is at '1' only when at least four data can be written in the Transmit FIFO.

In the same way, if a word (32-bit) is read in FLEX_US_RHR, the RXRDYM field must be configured so that the RXRDY flag is at '1' only when at least four unread data are in the Receive FIFO.

65.7.11.7.2.DMA

The DMA transfer type must be configured according to the FLEX_US_FMR.TXRDYM/RXRDYM settings.

As an example, FLEX_US_FMR.TXRDYM/RXRDYM=0 is not compatible with DMAC_PDC transfers in word (32-bit).

65.7.11.8.Transmit FIFO Lock

- LIN Mode:

If a frame is aborted using the Abort LIN Transmission bit (FLEX_US_CR.LINABT), a lock is set on the Transmit FIFO, preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMA channels, etc., without any risk.

© 2026 Microchip Technology Inc. and its subsidiaries

- LON Mode:

If a frame is terminated early due to collision, a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMA channels, etc., without any risk.

The TXFLOCK bit in the USART FIFO Event Status register (FLEX_US_FESR) is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX_US_CR.TXFLCLR to '1'.

65.7.11.9.FIFO Overflow/Underflow Error

If the Transmit FIFO is full and a write access is performed on FLEX_US_THR, it generates a Transmit FIFO overflow error and sets FLEX_US_FESR.TXFPTEF.

If the number of data written in FLEX_US_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO overflow error is generated and FLEX_US_FESR.TXFPTEF is set.

If the number of data read in FLEX_US_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO underflow error is generated and FLEX_US_FESR.RXFPTEF is set.

No error occurs if the FIFO state/level is checked before writing/reading in FLEX_US_THR/ FLEX_US_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When such error occurs, other FIFO flags may not behave as expected; their states must be ignored.

If a Transmit FIFO overflow error occurs, a transmitter reset must be performed using FLEX_US_CR.RSTTX. If a Receive underflow error occurs, a receiver reset must be performed using FLEX_US_CR.RSTRX.

65.7.11.10.FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX_US_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX_US_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX_US_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX_US_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The Receive FIFO threshold 2 can be set using the field FLEX_US_FMR.RXFTHRES2. Each time the Receive FIFO level goes from 'above threshold 2' to 'equal to or below threshold 2', the flag FLEX_US_FESR.RXFTHF2 is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF, RXFTHF and RXTHF2 flags can be configured to generate an interrupt using FLEX_US_FIER and FLEX_US_FIDR.

65.7.11.11.FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX_US_FIER and FLEX_US_FIDR.

FIFO flags state can be read in FLEX_US_FESR. They are cleared by writing FLEX_US_CR.RSTSTA to '1'.

© 2026 Microchip Technology Inc. and its subsidiaries

65.7.12. 16-bit Data Protocol Support

When configuring 0xC in FLEX_US_MR.USART_MODE, the transmitter sends a 16-bit data frame and the receiver expects an 8-bit data frame. The number of stop bits is defined in the field NBSTOP. The transmitter and/or receiver must operate in asynchronous mode (FLEX_US_MR.SYNC must be cleared).

When configuring 0xD in FLEX_US_MR.USART_MODE, the transmitter sends an 8-bit frame whereas the receiver expects a 16-bit frame.

The FIFO mode must be enabled by setting FLEX_US_CR.FIFOEN to '1'.

A 16-bit frame starts as soon as two 8-bit characters are written in FLEX_US_THR (assuming 0xC is written in the field USART_MODE).

Note: When FLEX_US_MR.USART_MODE =0xC or 0xD, there must be a parity bit in the frame (FLEX_US_MR.USART_MODE must not be equal to 4).

65.7.13. USART Register Write Protection

The FLEXCOM operating mode (FLEX_MR.OPMODE) must be set to FLEX_MR_OPMODE_USART to enable access to the write protection registers.

To prevent any single software error from corrupting USART behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the USART Write Protection Mode Register (FLEX_US_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the USART Write Protection Status Register (FLEX_US_WPSR) is set and the Write Protection Violation Source (WPVSRC) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX_US_WPSR.

The following registers can be write-protected when WPEN is set:

- USART Mode Register
- USART Baud Rate Generator Register
- USART Receiver Timeout Register
- USART Transmitter Timeguard Register
- USART FI DI RATIO Register
- USART IrDA FILTER Register
- USART Manchester Configuration Register
- USART LON Mode Register
- USART LON Beta1 Tx Register
- USART LON Beta1 Rx Register
- USART LON Priority Register
- USART LON IDT Tx Register
- USART LON IDT Rx Register
- USART IC DIFF Register
- USART Comparison Register

The following register(s) can be write-protected when WPITEN is set:

- USART Interrupt Enable Register

© 2026 Microchip Technology Inc. and its subsidiaries

- USART Interrupt Disable Register

The following register(s) can be write-protected when WPCREN is set:

65.8. SPI Functional Description

65.8.1. Modes of Operation

The SPI operates in Host mode or in Client mode.

- The SPI operates in Host mode by writing a 1 to the MSTR bit in the SPI Mode register (FLEX_SPI_MR):
  - The pins NPCS0 to NPCS3 are all configured as outputs.
  - The SPCK pin is driven.
  - The MISO line is wired on the receiver input.
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Client mode if the MSTR bit in FLEX_SPI_MR is written to 0:
  - The MISO line is driven by the transmitter output.
  - The MOSI line is wired on the receiver input.
  - The SPCK pin is driven by the transmitter to synchronize the receiver.
  - The NPCS0 pin becomes an input, and is used as a client select signal (NSS).
  - Pins NPCS1 to NPCS3 are not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The bit rate generator is activated only in Host mode.

65.8.2. Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select register (FLEX_SPI_CSR). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data are driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a host/client pair must use the same parameter pair values to communicate. If multiple clients are connected and require different configurations, the host must reconfigure itself each time it needs to communicate with a different client.

The following table shows the four modes and corresponding parameter settings.

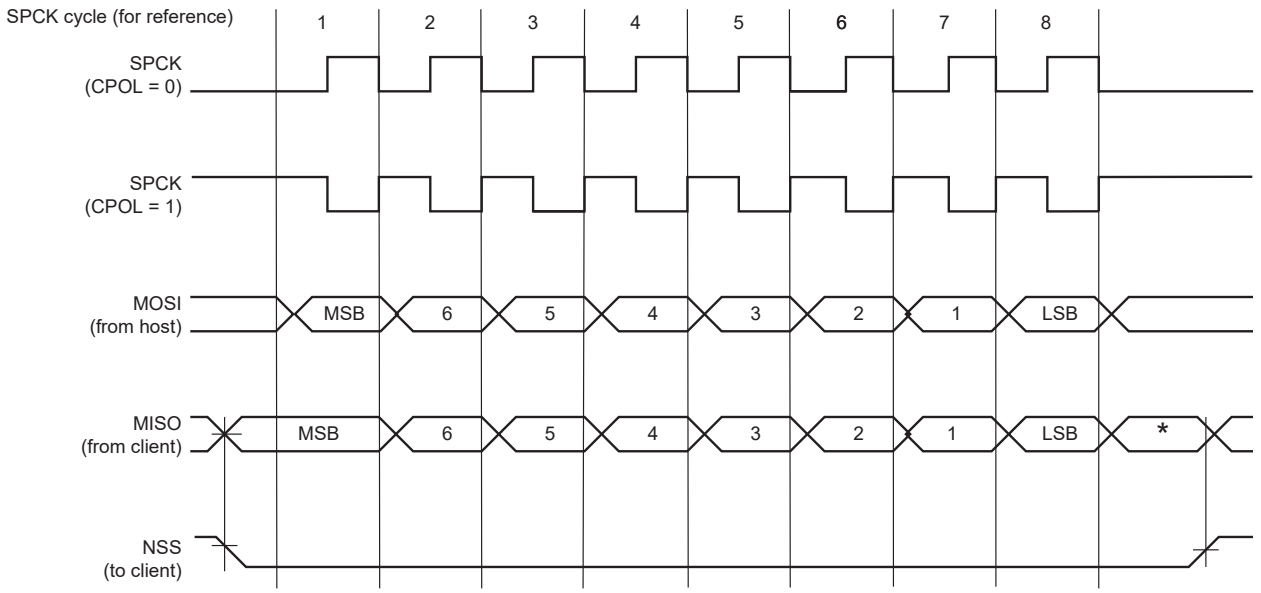

Table 65.14. SPI Bus Protocol Mode

SPI Mode	CPOL	NCPHA	Host Shift SPCK Edge	Client Capture SPCK Edge	SPCK Inactive Level
0	0	1	Falling	Rising	Low
1	0	0	Rising	Falling	Low
2	1	1	Rising	Falling	High
3	1	0	Falling	Rising	High

The following figures show examples of data transfers.

* Not defined.

65.8.3. Host Mode Operations

When configured in Host mode, the SPI operates on the clock generated by the internal programmable bit rate generator. It fully controls the data transfers to and from the client(s)

© 2026 Microchip Technology Inc. and its subsidiaries

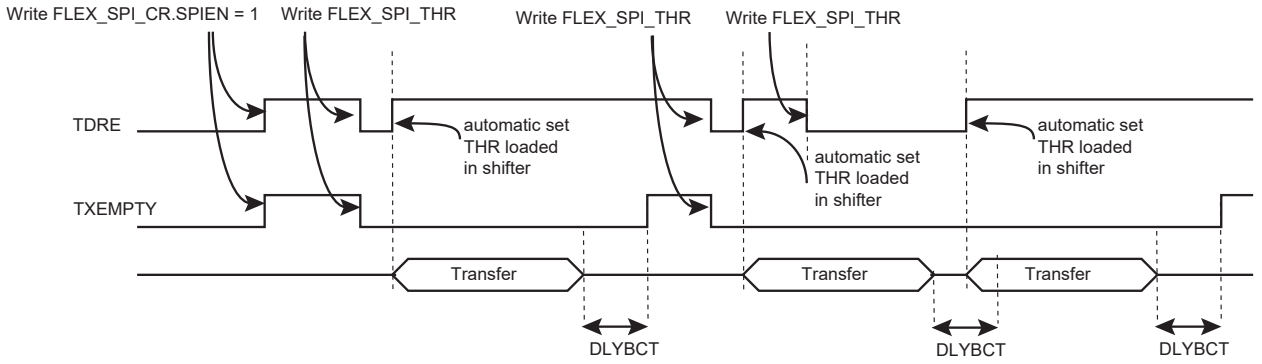
connected to the SPI bus. The SPI drives the chip select line to the client and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data register (FLEX_SPI_TDR) and the Receive Data register (FLEX_SPI_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to FLEX_SPI_TDR. The written data are immediately transferred in the shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted in the shift register. Data cannot be loaded in FLEX_SPI_RDR without transmitting data. If there is no data to transmit, a dummy data can be used (FLEX_SPI_TDR filled with ones). When the WDRBT bit is set, a new data cannot be transmitted if FLEX_SPI_RDR has not been read. If Receiving mode is not required, for example when communicating with a client receiver only (such as an LCD), the receive status flags in the SPI Status register (FLEX_SPI_SR) can be discarded.

Before writing the TDR, the FLEX_SPI_MR.PCS field must be set in order to select a client.

If new data are written in FLEX_SPI_TDR during the transfer, it is kept in FLEX_SPI_TDR until the current transfer is completed. Then, the received data are transferred from the shift register to FLEX_SPI_RDR, the data in FLEX_SPI_TDR is loaded in the shift register and a new transfer starts.



As soon as the FLEX_SPI_TDR is written, the Transmit Data Register Empty (TDRE) flag in FLEX_SPI_SR is cleared. When the data written in FLEX_SPI_TDR is loaded into the shift register, the FLEX_SPI_SR.TDRE flag is set. The TDRE bit is used to trigger the Transmit DMA channel (see figure below).

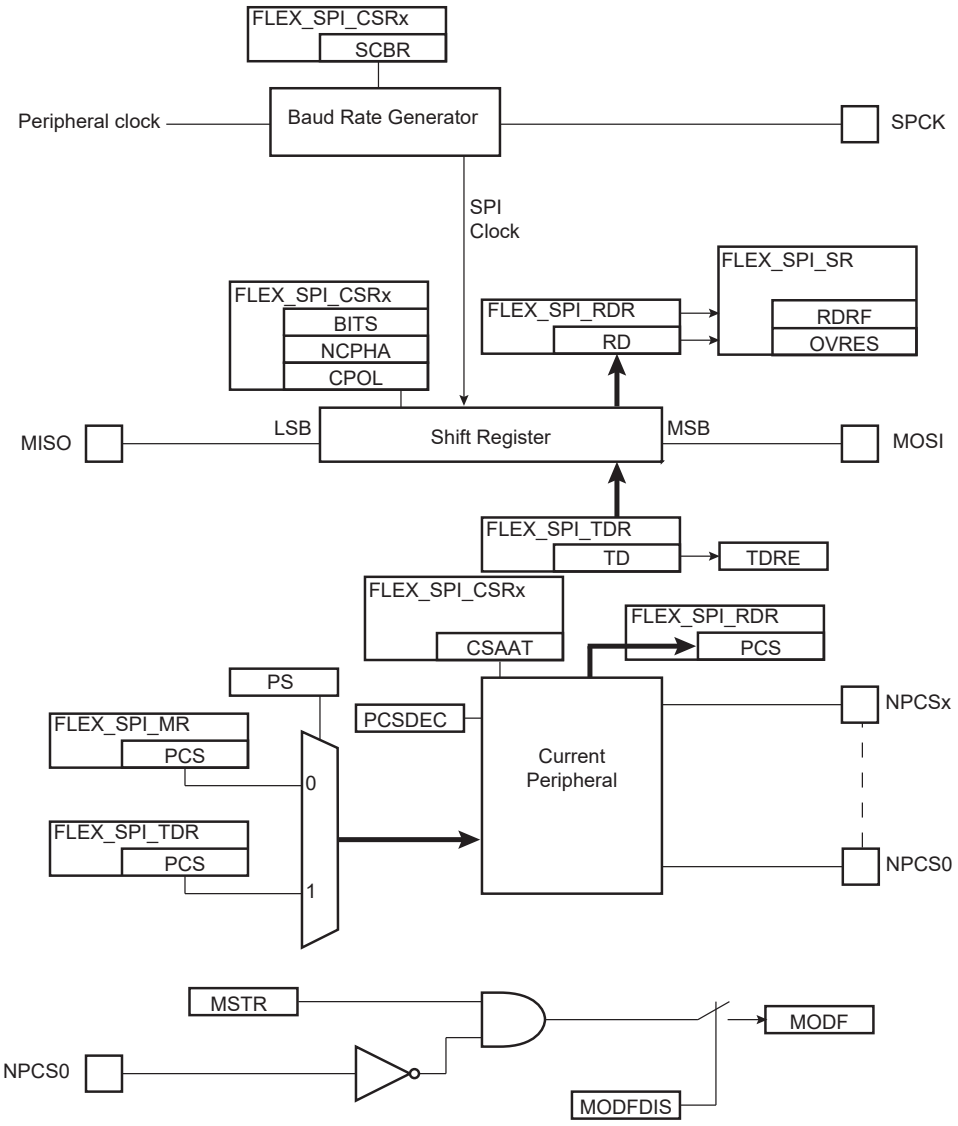
The end of transfer is indicated by FLEX_SPI_SR.TXEMPTY. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

Notes:

1. When the SPI is enabled, the TDRE and TXEMPTY flags are set.
2. The TXEMPTY flag alone cannot be used to detect the end of the buffer DMA transfer.

Figure 65.77. TDRE and TXEMPTY Flag Behavior

The transfer of received data from the shift register to FLEX_SPI_RDR is indicated by the Receive Data Register Full (RDRF) bit in FLEX_SPI_SR. When the received data are read, the RDRF bit is cleared.



If FLEX_SPI_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX_SPI_SR is set. As long as this flag is set, data are loaded in FLEX_SPI_RDR. The user has to read the status register to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Host mode and a flow chart describing how transfers are handled.

Figure 65.80. Status Register Flags Behavior

65.8.3.3.Clock Generation

The SPI bit rate clock is generated by dividing a source clock which can be the peripheral clock or a programmable clock from the GCLK. The divider can be a value between 1 and 255.

If the SCBR field is programmed to 1 and the clock source is GCLK, the operating bit rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

At reset, SCBR is 0 and the user has to program it to a valid value before performing the first transfer.

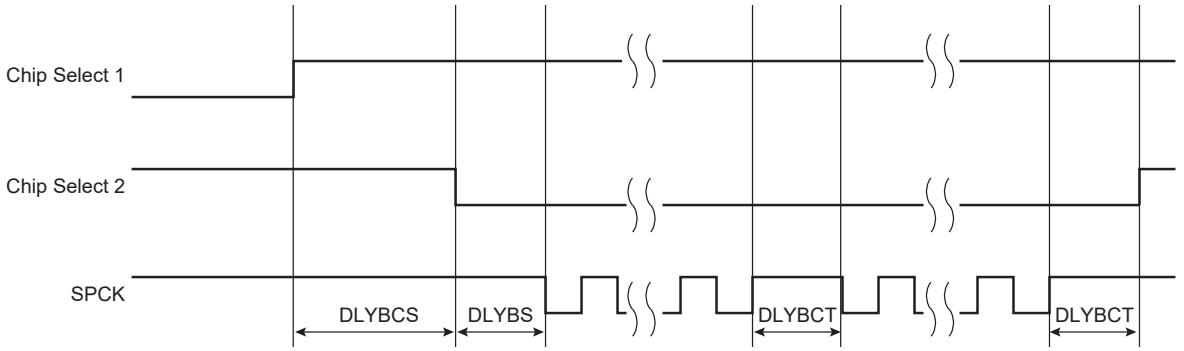
The divisor can be defined independently for each chip select, as it has to be programmed in the FLEX_SPI_CSR.SCBR field. This allows the SPI to automatically adapt the bit rate for each interfaced peripheral without reprogramming.

If GCLK is selected as source clock (FLEX_SPI_MR.BRSRCCLK = 1), the bit rate is independent of the processor/bus clock. Thus, the processor clock can be changed while SPI is enabled. The processor clock frequency changes must be performed only by programming the PMC_MCKR.PRES field (refer to the section “Power Management Controller (PMC)"). Any other method to modify the processor/bus clock frequency (PLL multiplier, etc.) is forbidden when SPI is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

65.8.3.4.Transfer Delays

The figure below shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:



- The delay between the chip selects. It is programmable only once for all chip selects by writing the FLEX_SPI_MR.DLYBCS field. The SPI client device deactivation delay is managed through DLYBCS. If there is only one SPI client device connected to the host, the DLYBCS field does not need to be configured. If several client devices are connected to a host, DLYBCS must be configured depending on the highest deactivation delay. Refer to “SPI Timings” in the section “Electrical Characteristics”.

© 2026 Microchip Technology Inc. and its subsidiaries

- The delay before SPCK, independently programmable for each chip select by writing the DLYBS field. The SPI client device activation delay is managed through DLYBS. Refer to “SPI Timings” in the section “Electrical Characteristics” to define DLYBS.
- The delay between consecutive transfers, independently programmable for each chip select by writing the DLYBCT field. The time required by the SPI client device to process received data is managed through DLYBCT. This time depends on the SPI client system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

Figure 65.81. Programmable Delays

65.8.3.5.Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS3 signals. By default, all NPCS signals are high before and after each transfer.

- Fixed Peripheral Select Mode: SPI exchanges data with only one peripheral.
  Fixed Peripheral Select mode is enabled by writing the FLEX_SPI_MR.PS bit to zero. In this case, the current peripheral is defined by the FLEX_SPI_MR.PCS field, and the FLEX_SPI_TDR. PCS field has no effect.
- Variable Peripheral Select Mode: Data can be exchanged with more than one peripheral without having to reprogram FLEX_SPI_MR.PCS.
  Variable Peripheral Select Mode is enabled by setting the FLEX_SPI_MR.PS bit to one. The FLEX_SPI_TDR.PCS field is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value must be written in a single access to FLEX_SPI_TDR in the following format:

  [xxxxxxx(7-bit) + LASTXFER(1-bit)(1)+ xxxx(4-bit) + PCS (4-bit) + TD (8 to 16-bit data)]
  with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in SPI Transmit Data Register (FLEX_SPI_TDR).
  Note: 1. Optional

  The CSAAT, LASTXFER and CSNAAT bits are discussed in Peripheral Deselection with DMA.

  If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control register (FLEX_SPI_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if the FLEX_SPI_CR.SPIEN bit has previously been written.

65.8.3.6.SPI Direct Access Memory Controller (DMAC)

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

© 2026 Microchip Technology Inc. and its subsidiaries

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, FLEX_SPI_MR must be reprogrammed.

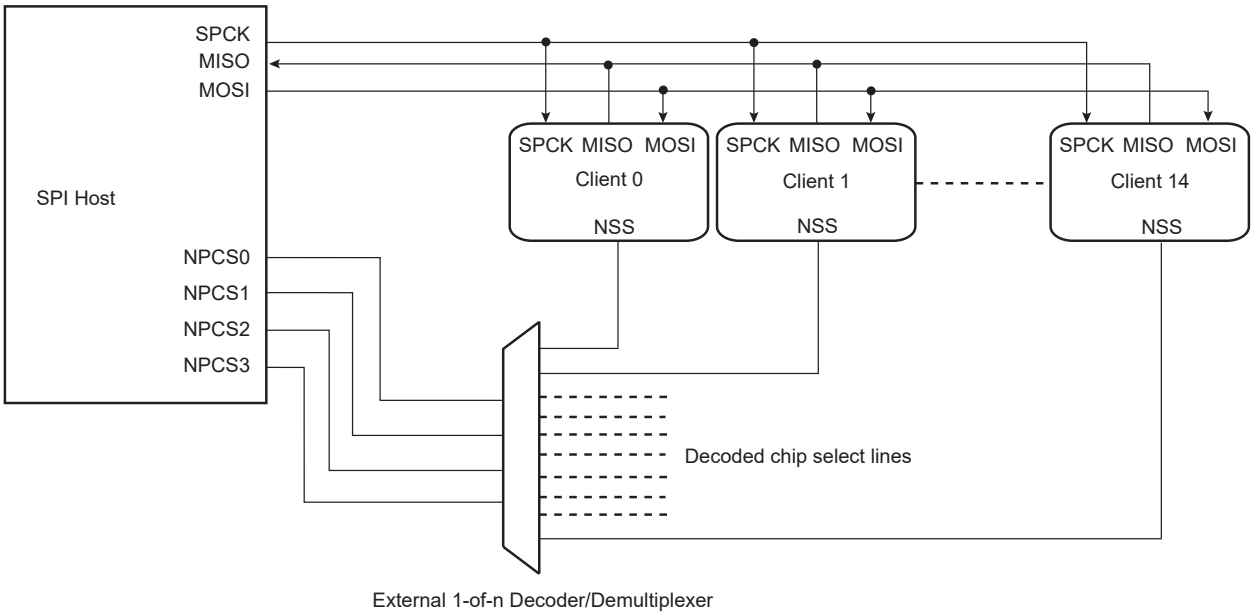
The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming FLEX_SPI_MR. Data written in FLEX_SPI_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

65.8.3.7. Peripheral Chip Select Decoding

The user can program the SPI to operate with up to 15 client peripherals by decoding the four chip select lines, NPCS0 to NPCS3 with an external decoder/demultiplexer (see the following figure). This can be enabled by setting the FLEX_SPI_MR.PCSDEC bit.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either FLEX_SPI_MR or FLEX_SPI_TDR (depending on PS).



As the SPI sets a default value of 0xF on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 15 peripherals can be decoded.

The SPI has only four Chip Select registers. As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to four peripherals. As an example, FLEX_SPI_CRS0 defines the characteristics of the externally decoded peripherals 0 to 3, corresponding to the PCS values 0x0 to 0x3. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 3, 4 to 7, 8 to 11 and 12 to 14. The following figure shows this type of implementation.

If the CSAAT bit is used, with or without the DMAC, the mode fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since mode fault detection is only on NPCS0.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.82. Chip Select Decoding Application Block Diagram: Single Host/Multiple Client Implementation

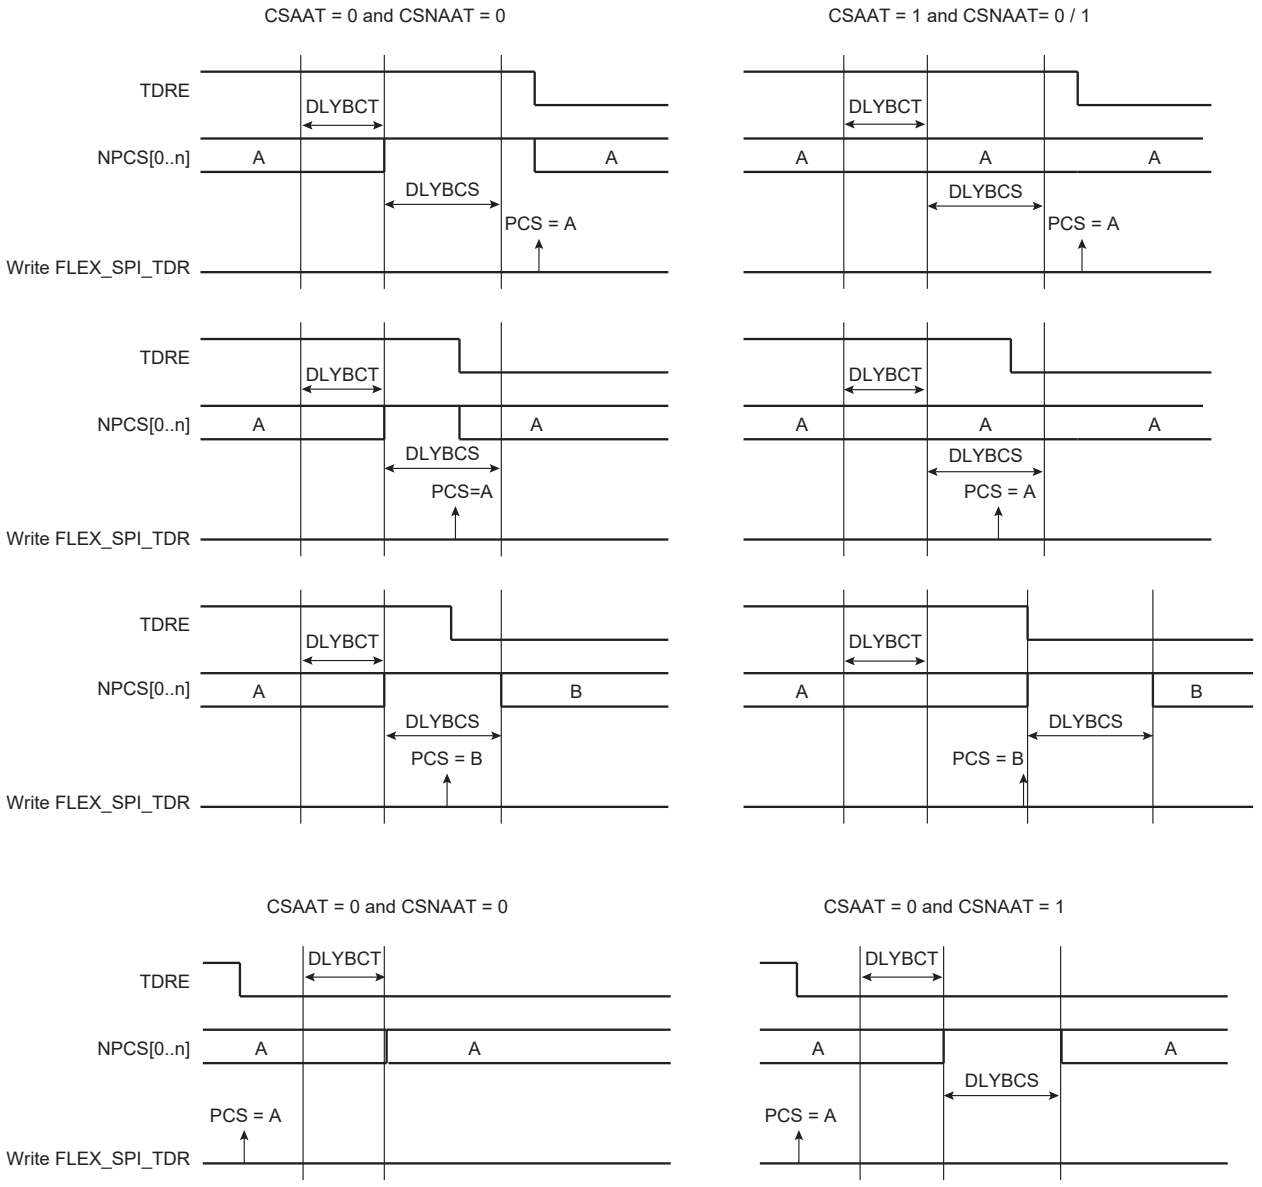
65.8.3.8. Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, FLEX_SPI_TDR is loaded by the processor, the TDRE flag rises as soon as the content of FLEX_SPI_TDR is transferred into the internal shift register. When this flag is detected high, FLEX_SPI_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload FLEX_SPI_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in FLEX_SPI_CSR, gives even less time for the processor to reload FLEX_SPI_TDR. With some SPI client peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the Chip Select registers [CSR0...CSR3] can be programmed with the Chip Select Active After Transfer (CSAAT) bit to 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if FLEX_SPI_TDR is not reloaded, the chip select remains active. To de-assert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in FLEX_SPI_CR must be set after writing the last data to transmit into FLEX_SPI_TDR.

65.8.3.9. Peripheral Deselection with DMA

DMA provides faster reloads of FLEX_SPI_TDR compared to software. However, depending on the system activity, it is never sure that FLEX_SPI_TDR is written with the next data before the end of the current transfer. Consequently, a data can be lost by the deassertion of the NPCS line for SPI client peripherals requiring the chip select line to remain active between two transfers. The only way to ensure a safe transfer in this case is the use of the CSAAT and LASTXFER bits.



When the CSAAT bit is cleared, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the TDRE flag rises as soon as the content of FLEX_SPI_TDR is transferred into the internal shift register. When this flag is detected, FLEX_SPI_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted

© 2026 Microchip Technology Inc. and its subsidiaries

between the two transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, FLEX_SPI_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit to 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is cleared for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

Figure 65.83. Peripheral Deselection

65.8.3.10.Mode Fault Detection

The SPI has the capability to operate in multi-host environment. Consequently, the NPCS0/NSS line must be monitored. If one of the hosts on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit a data. A mode fault is detected when the SPI is programmed in Host mode and a low level is driven by an external host on the NPCS0/NSS signal. In multi-host environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO

© 2026 Microchip Technology Inc. and its subsidiaries

controller). When a mode fault is detected, the FLEX_SPI_SR.MODF bit is set until FLEX_SPI_SR is read and the SPI is automatically disabled until it is re-enabled by writing the FLEX_SPI_CR.SPIEN bit to 1.

By default, the mode fault detection is enabled. The user can disable it by setting the FLEX_SPI_MR.MODFDIS bit.

65.8.4. SPI Client Mode

When operating in Client mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external host. When NSS falls, the clock is validated and the data are loaded in FLEX_SPI_RDR according to the configuration value of the FLEX_SPI_CSR0.BITS field. These bits are processed following a phase and a polarity defined respectively by the FLEX_SPI_CSR0.NCPHA and FLEX_SPI_CSR0.CPOL bits. Note that the BITS field, CPOL bit and NCPHA bit of the other Chip Select registers have no effect when the SPI is programmed in Client mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

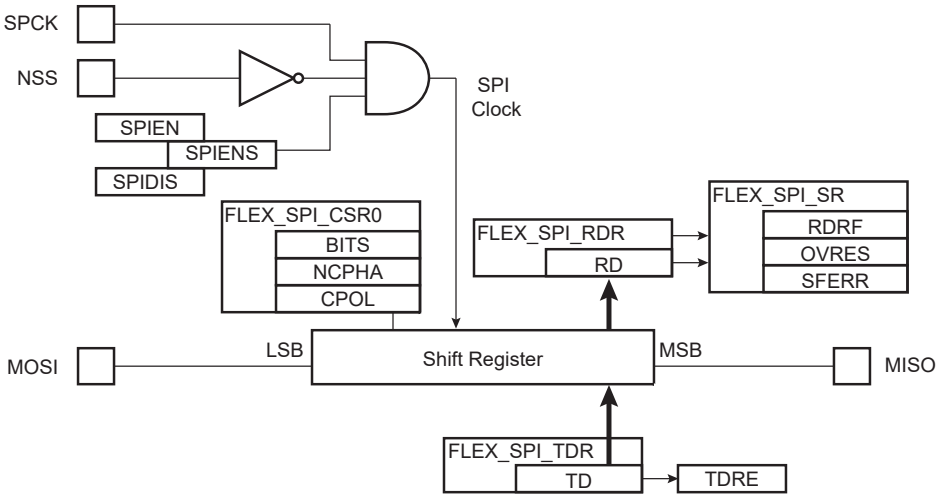
Note: For more information on the BITS field, see also the note below the FLEX_SPI_CSRx register bitmap in section SPI Chip Select Register

When all bits are processed, the received data are transferred in FLEX_SPI_RDR and the RDRF bit rises. If FLEX_SPI_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX_SPI_SR is set. As long as this flag is set, data are loaded in FLEX_SPI_RDR. The user must read FLEX_SPI_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the shift register. If no data has been written in FLEX_SPI_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the shift register resets to 0.

When a first data is written in FLEX_SPI_TDR, it is transferred immediately in the shift register and the TDRE flag rises. If new data is written, it remains in FLEX_SPI_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in FLEX_SPI_TDR is transferred in the shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, a new data is loaded in the shift register from FLEX_SPI_TDR. If no character is ready to be transmitted, i.e., no character has been written in FLEX_SPI_TDR since the last load from FLEX_SPI_TDR to the shift register, FLEX_SPI_TDR is retransmitted. In this case the Underrun Error Status flag (UNDES) is set in FLEX_SPI_SR.



If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

In Client mode, if the NSS line rises and the received character length does not match the configuration defined in FLEX_SPI_CSR0.BITS, the SFERR flag is set in FLEX_SPI_SR.

The following figure shows a block diagram of the SPI when operating in Client mode.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.84. Client Mode Functional Block Diagram

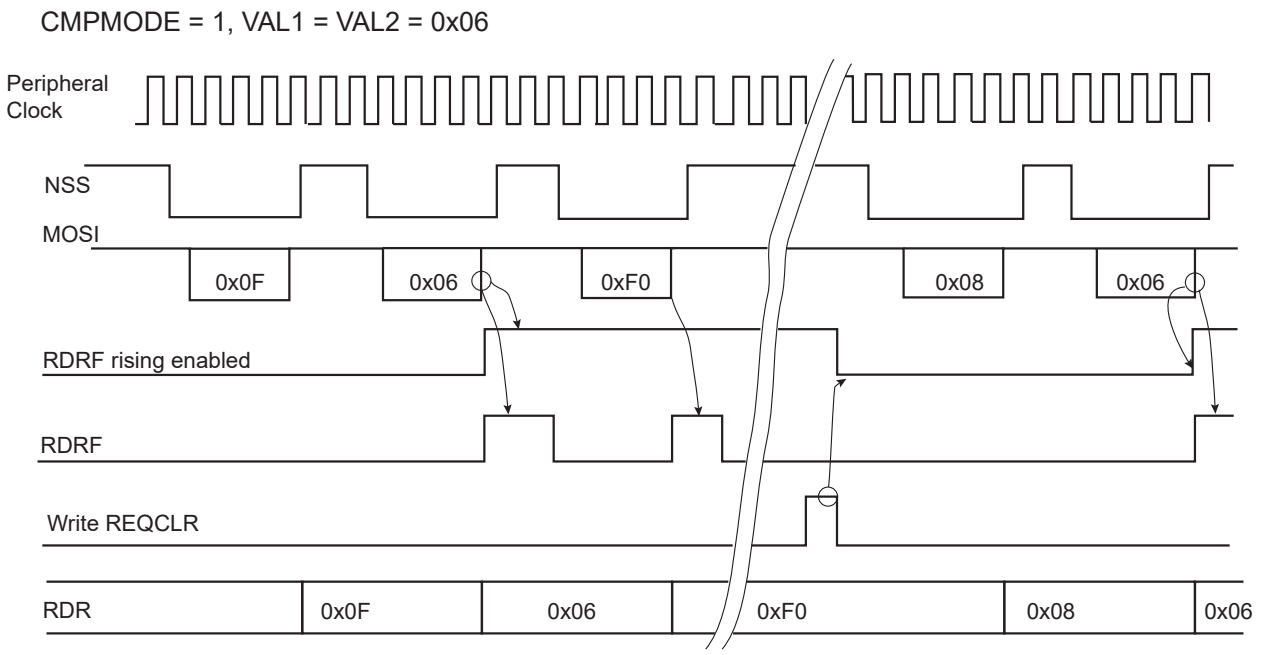
65.8.5. SPI Comparison Function on Received Character

The comparison is only relevant for SPI Client mode (MSTR = 0 in FLEX_US_MR).

In Active mode, the CMP flag in FLEX_SPI_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison register (FLEX_SPI_CMPR). The CMP flag is set as soon as FLEX_SPI_RDR is loaded with the new received character. The CMP flag is cleared by reading FLEX_SPI_SR.

The SPI Comparison register can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.



When FLEX_SPI_MR.CMPMODE is cleared, all received data is loaded in FLEX_SPI_RDR and the CMP flag provides the status of the comparison result.

By setting the CMPMODE bit, the comparison result triggers the start of FLEX_SPI_RDR loading (see the figure below). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in FLEX_SPI_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX_SPI_CR.REQCLR bit.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see BITS field in SPI Chip Select register (FLEX_SPI_CSR)).

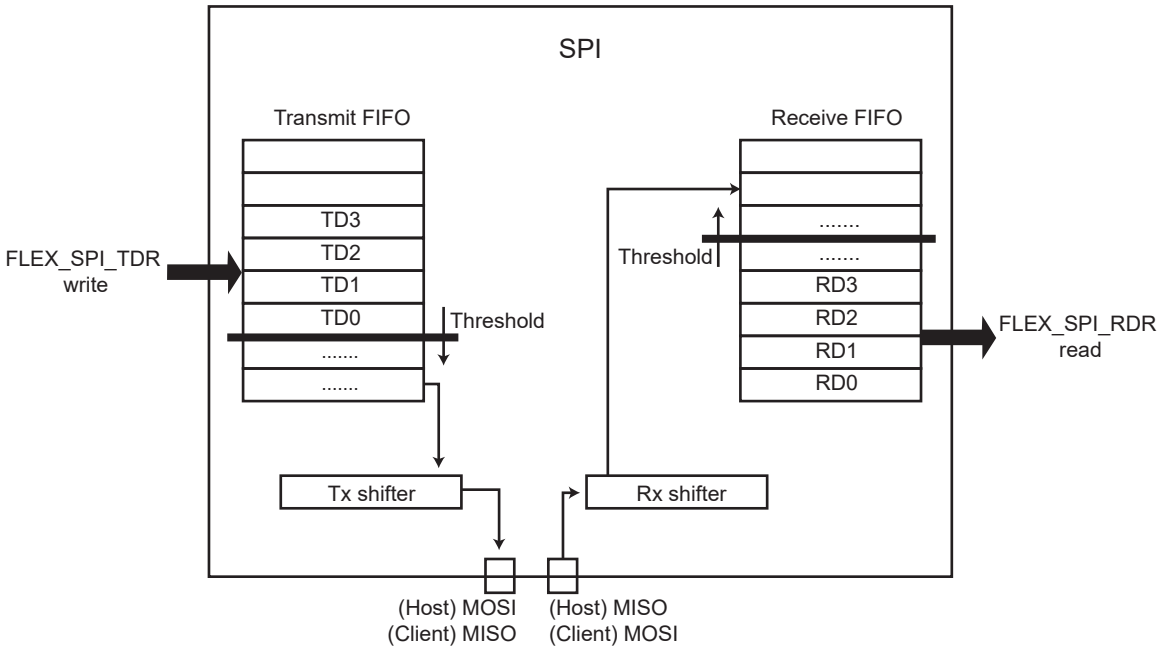
Figure 65.85. Receive Data Register Management

65.8.6. SPI FIFOs

65.8.6.1. Overview

The SPI includes two FIFOs which can be enabled/disabled using the FLEX_SPI_CR.FIFOEN/FIFODIS. The SPI module must be disabled before enabling or disabling the SPI FIFOs (FLEX_SPI_CR.SPIDIS).



Writing FLEX_SPI_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

The size of a data (8-bit to 16-bit) is determined by the value configured in FLEX_SPI_CSRx.BITS.

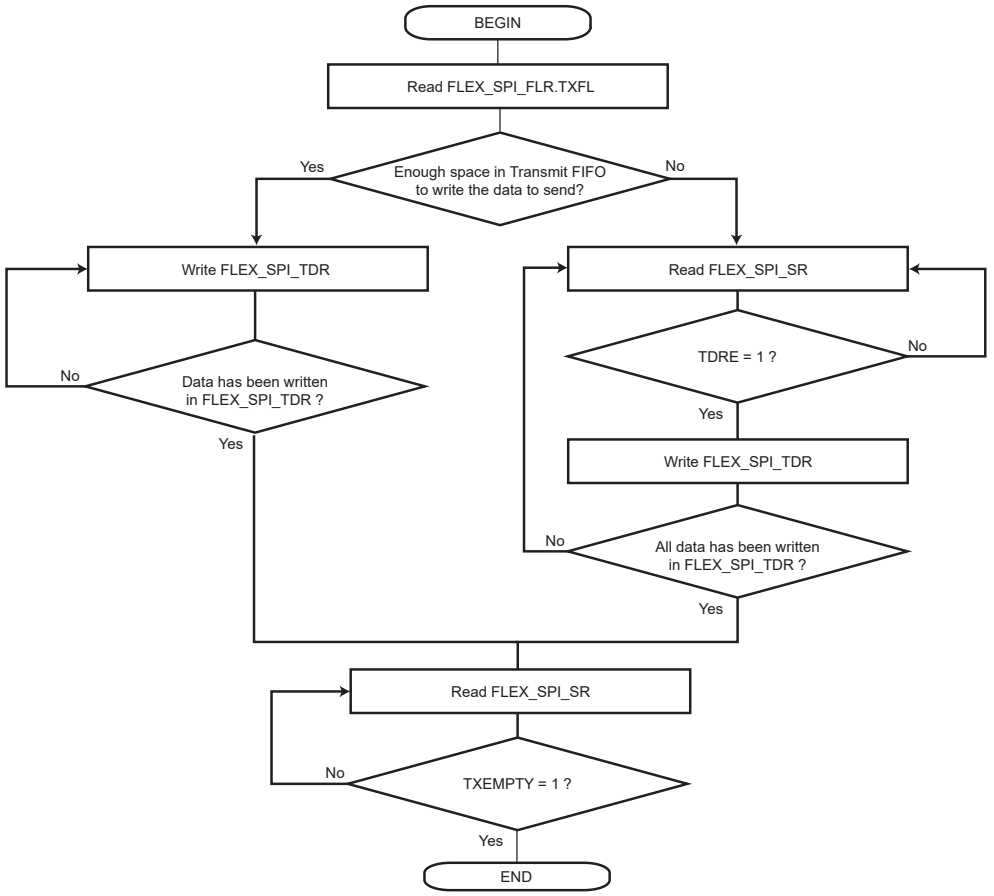
It is possible to write or to read single or multiple data in the same access to FLEX_SPI_TDR/RDR. See SPI Single Data Access and SPI Multiple Data Access.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.86. SPI FIFOs Block Diagram

65.8.6.2.Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX_SPI_TDR loads the Transmit FIFO.



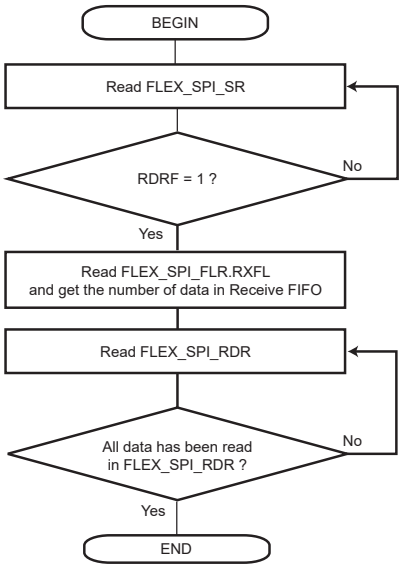
The FIFO level is provided in FLEX_SPI_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX_SPI_SR.TDRE and the data can be successively written in FLEX_SPI_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in FLEX_SPI_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.87. Sending Data with FIFO Enabled



65.8.6.3.Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX_SPI_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to ‘1’), the exact number of data can be checked with FLEX_SPI_FLR.RXFL. All the data can be read successively in FLEX_SPI_RDR without checking the RDRF flag between each access.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.88. Receiving Data with FIFO Enabled

65.8.6.4.Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX_SPI_CR.TXFCLR/RXFCLR.

65.8.6.5.TXEMPTY, TDRE and RDRF Behavior

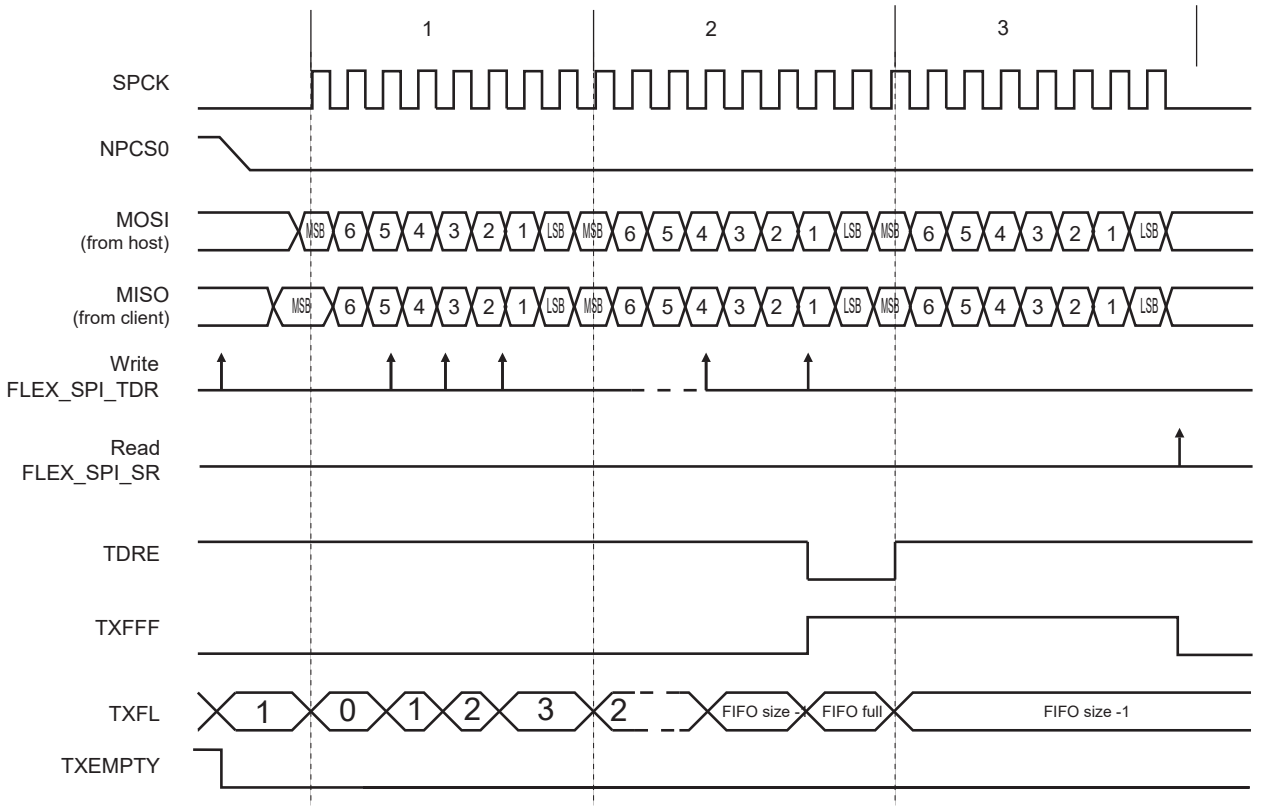
FLEX_SPI_SR.TXEMPTY, FLEX_SPI_SR.TDRE and FLEX_SPI_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. See figure TDRE Behavior for Single Data Access and TXRDYM = 0.

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. See figure RDRF Behavior in Single Data Access and RXRDYM = 0.

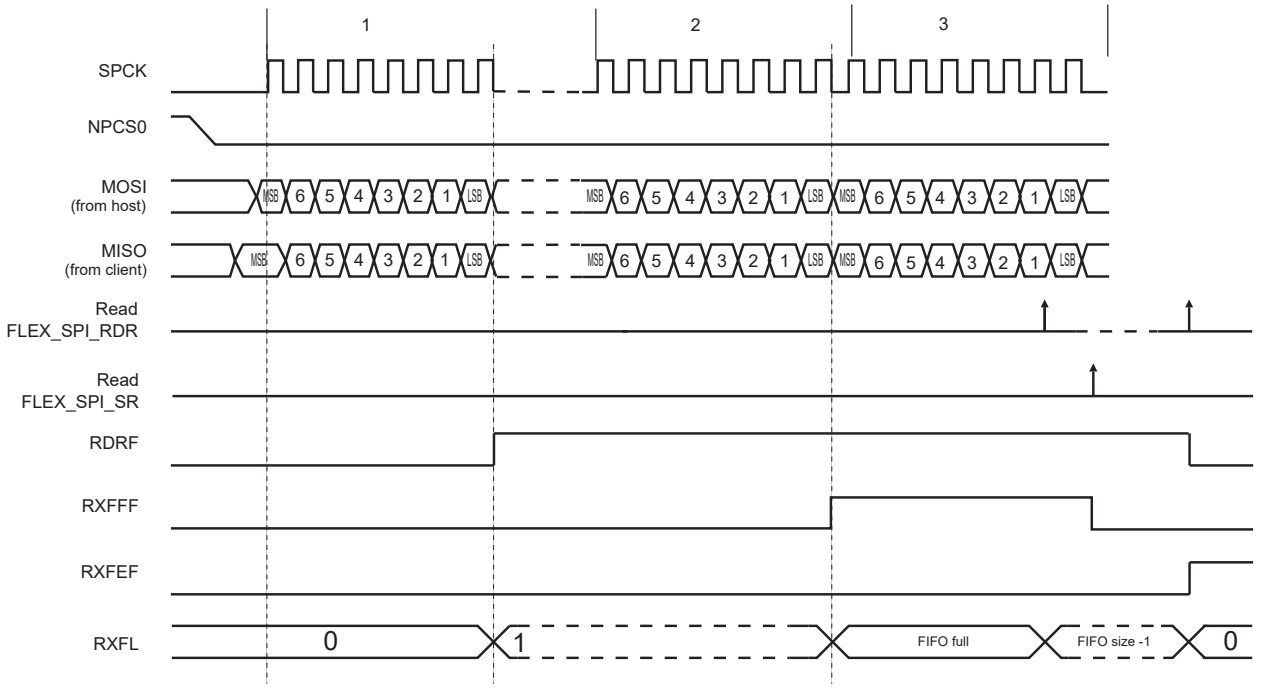
TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode register (FLEX_SPI_FMR) to reduce the number of accesses to FLEX_SPI_TDR/RDR. However, for some configurations, the following constraints apply:



- When Variable Peripheral Select mode is used (FLEX_SPI_MR.PS=1), TXRDYM/RXRDYM must be cleared.
- In Host mode (FLEX_SPI_MR.MSTR=1), RXRDYM must be cleared.

As an example, in Host mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See SPI FIFO Mode register (FLEX_SPI_FMR) for the FIFO configuration.



© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.89. TDRE Behavior for Single Data Access and TXRDYM = 0

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.90. RDRF Behavior for Single Data Access and RXRDYM = 0

65.8.6.6.SPI Single Data Access

When FIFO is enabled and a byte or a halfword access (8-bit to 16-bit data) is performed in FLEX_SPI_TDR, a single data is written in FIFO each time FLEX_SPI_TDR is accessed. The similar behavior applies for FLEX_SPI_RDR.

If Host mode is used (FLEX_SPI_MR.MSTR=1) or if Variable Peripheral Select mode is used (FLEX_SPI_MR.PS=1), each access to FLEX_SPI_RDR must be read a single data.

See SPI Transmit Data Register and SPI Receive Data Register.

However, for some configurations it is possible to write/read multiple data each time FLEX_SPI_TDR/FLEX_SPI_RDR is accessed. See SPI Multiple Data Access.

65.8.6.6.1.DMA

When FIFOs operate in Single Data mode, the DMA transfer type must be configured either in bytes, halfwords or words depending on FLEX_SPI_MR.PS bit value and FLEX_SPI_CSRx.BITS field value.

The same applies when FIFOs are disabled.

65.8.6.7.SPI Multiple Data Access

Multiple data can be read from the Receive FIFO only in Client mode (FLEX_SPI_MR.MSTR=0). When FLEX_SPI_MR.MSTR=1, FLEX_SPI_RDR (default mode) is the only way to read data.

For some operating modes, it is possible to reduce the number of accesses to FLEX_SPI_TDR/FLEX_SPI_RDR required to transfer an amount of data, by concatenating multiple data (8-bit or 9-bit to 16-bit) when the FIFO is enabled (FLEX_SPI_CR.FIFOEN=1) and fixed peripheral select is used (FLEX_SPI_MR.PS=0).

Up to two data can be written in one FLEX_SPI_TDR write access.

Up to four data can be read in one FLEX_SPI_RDR access.

© 2026 Microchip Technology Inc. and its subsidiaries

When the FIFO is enabled, the number of data written in a single access to FLEX_SPI_TDR is only defined by the type of access.

Table 65.15. Number of Data Written for Each Access to FLEX_SPI_TDR

Config/Access	Byte	Halfword	Word
8-bit to 16-bit	1	1	2

When the FIFO is enabled, the number of data read in a single access to FLEX_SPI_RDR is defined by the type of access and the configuration of FLEX_SPI_CSR0.BITS.

Table 65.16. Number of Data Read for Each Access to FLEX_SPI_RDR

Config/Access	Byte	Halfword	Word
FLEX_SPI_CSR0.BITS=0 8-bit data	1	2	4
FLEX_SPI_CSR0.BITS>0 9-bit to 16-bit data	1	1	2

The Transmit FIFO can be loaded with multiple data in the same FLEX_SPI_TDR access when FLEX_SPI_MR.PS=0.

Written/read data are always right-aligned, as described in sections SPI Receive Data Register (FIFO Multiple Data, 8-bit), SPI Receive Data Register (FIFO Multiple Data, 16-bit) and SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX_SPI_TDR-byte write accesses
- three FLEX_SPI_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX_SPI_RDR-byte read accesses
- three FLEX_SPI_RDR-halfword read accesses
- one FLEX_SPI_RDR-word read access and one FLEX_SPI_RDR-halfword read access

65.8.6.7.1.TDRE and RDRF Configuration

The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX_SPI_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX_SPI_TDR, the TXRDYM field can be configured so that the TDRE flag is at '1' only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in FLEX_SPI_RDR, the RXRDYM field can be configured so that the RDRF flag is at '1' only when at least four unread data are in the Receive FIFO.

65.8.6.7.2.DMA

It is mandatory to configure DMA channel size (byte, halfword or word) according to the FLEX_SPI_FMR.TXRDYM/RXRDYM configuration. See constraints in SPI Multiple Data Access.

As an example, when FIFO is enabled, FLEX_SPI_FMR.TXRDYM/RXRDYM=0 configuration is not compatible with DMAC_PDC transfers in word (32-bit).

65.8.6.8.FIFO Overflow/Underflow Error

If the Transmit FIFO is full and a write access is performed on FLEX_SPI_TDR, it generates a Transmit FIFO overflow error and sets FLEX_SPI_SR.TXFPTEF.

© 2026 Microchip Technology Inc. and its subsidiaries

If the number of data written in FLEX_SPI_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO overflow error is generated and FLEX_SPI_SR.TXFPTEF is set.

If the number of data read in FLEX_SPI_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO underflow error is generated and FLEX_SPI_SR.RXFPTEF is set.

No error occurs if the FIFO state/level is checked before writing/reading the required amount of data in FLEX_SPI_TDR/SPI_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When such error occurs, other FIFO flags may not behave as expected; their states must be ignored. A software reset must be performed using FLEX_SPI_CR.SWRST (configuration will be lost).

65.8.6.9. FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX_SPI_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX_SPI_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX_SPI_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX_SPI_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX_SPI_IER and FLEX_SPI_IDR.

65.8.6.10. FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX_SPI_IER and FLEX_SPI_IDR.

FIFO flags state can be read in FLEX_SPI_SR. They are cleared when FLEX_SPI_SR is read.

65.8.7. SPI CRC Generation and Checking

The SPI offers the possibility to compute and check a CRC while receiving a frame. To enable the CRC check, the CRC Enable (CRCEN) bit must be set to '1' in FLEX_SPI_MR.

The SPI CRC register (FLEX_SPI_CRCR) configures the frame length using the Frame Length (FRL) field and the CRC size using the CRC Size (CRCS) bit.

The CRC checksum uses the 16-bit CRC-16 ANSI polynomial as defined in the IEEE 802.3 standard: x16 + x15 + x2 + 1.

It is possible to define a frame header length with the Frame Header Length (FRHL) field, and a frame header can be included or excluded from CRC calculation depending on the Frame Header Excluded (FHE) bit configuration. In case of continuous read frames, the Continuous Read Mode (CRM) bit defines if the frame header is sent only at the beginning of the first frame or at every frame. The CRC Error (CRCERR) flag in FLEX_SPI_SR indicates any failed CRC check.

It is possible to configure the SPI to receive or not CRC and/or Header as a classic data by configuring FLEX_SPI_CRCR.DCRX and FLEX_SPI_CRCR.DHRX. When CRC and/or Header is configured not to be received as data, upon receiving the Header and/or CRC, the RDRF flag does not rise and the FLEX_SPI_RDR register is not updated with the received value.

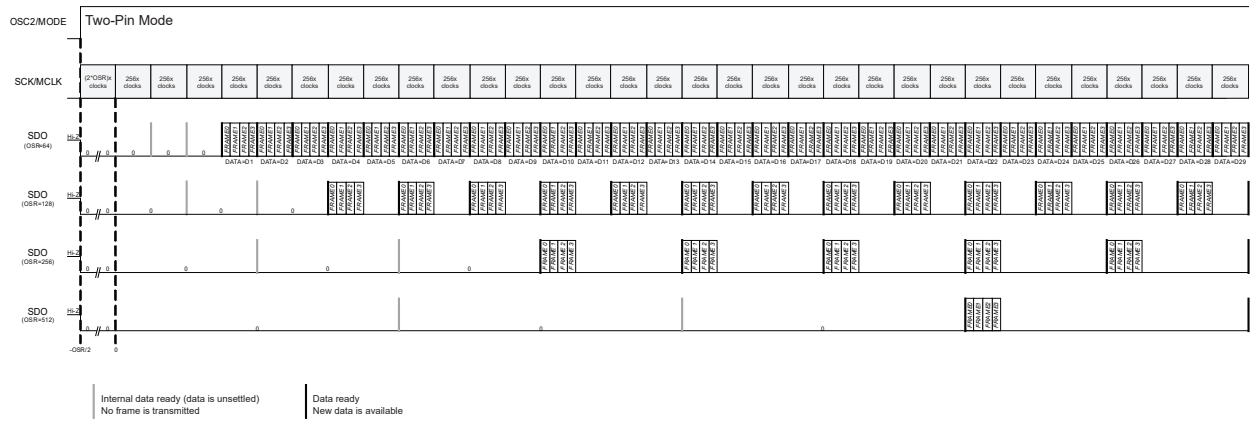
65.8.8. Two-Pin Mode

65.8.8.1. MCP3910 Protocol Overview



In Two-Pin mode, the SPI can easily interface to analog front-end ADC devices such as MCP3910. The MCP3910 device data output (SDO) is the host for the MOSI line, although the SPI generates the SPCK clock. FLEX_SPI_CSRx.SCBR defines the frequency of the SPCK output clock. The MISO line is not used.

Figure 65.91. Two-Pin MCP3910 Frame

SPI Two-Pin mode connects with up to four two-pin devices. Each MCP3910 product sends four times the same frame. See the following figure.

Figure 65.92. MCP3910 Communication Protocol

65.8.8.2. Two-Pin Mode Configuration

The Two-Pin mode is enabled when FLEX_SPI_MR.TPMEN=1 and FLEX_SPI_MR.MSTR=0.

When Two-Pin mode is enabled, SPI Mode 0 must be configured (FLEX_SPI_CSR0.CPOL=0 and FLEX_SPI_CSR0.NCPHA=0) and the data length must be 8 bits (FLEX_SPI_CSRx.BITS=0).

For proper CRC calculation and checking, FLEX_SPI_CRCR.FHE must be set to '0', FLEX_SPI_CRCR.CRM to '0', FLEX_SPI_CRCR.FRHL to '1' and FLEX_SPI_CRCR.CRCS to '0'. MCSPI_CRCR.FRL must be set according to the value used for FLEX_SPI_TPMR.OSR (refer to “Two-Wire Serial Interface Description” in the data sheet “MCP3910” available on www.microchip.com for more details on frame length and OSR).

See SPI CRC Generation and Checking for details on CRC check configuration.

© 2026 Microchip Technology Inc. and its subsidiaries

To get the synchronization on SYNC BYTE, the Comparison mode must be enabled (FLEX_SPI_MR.CMPMODE=1) and the comparison value must be configured to SYNC BYTE (FLEX_SPI_CMPR.VAL1/2= 0xA5). The clock is generated on SPCK when FLEX_SPI_CR.SPIEN is set.

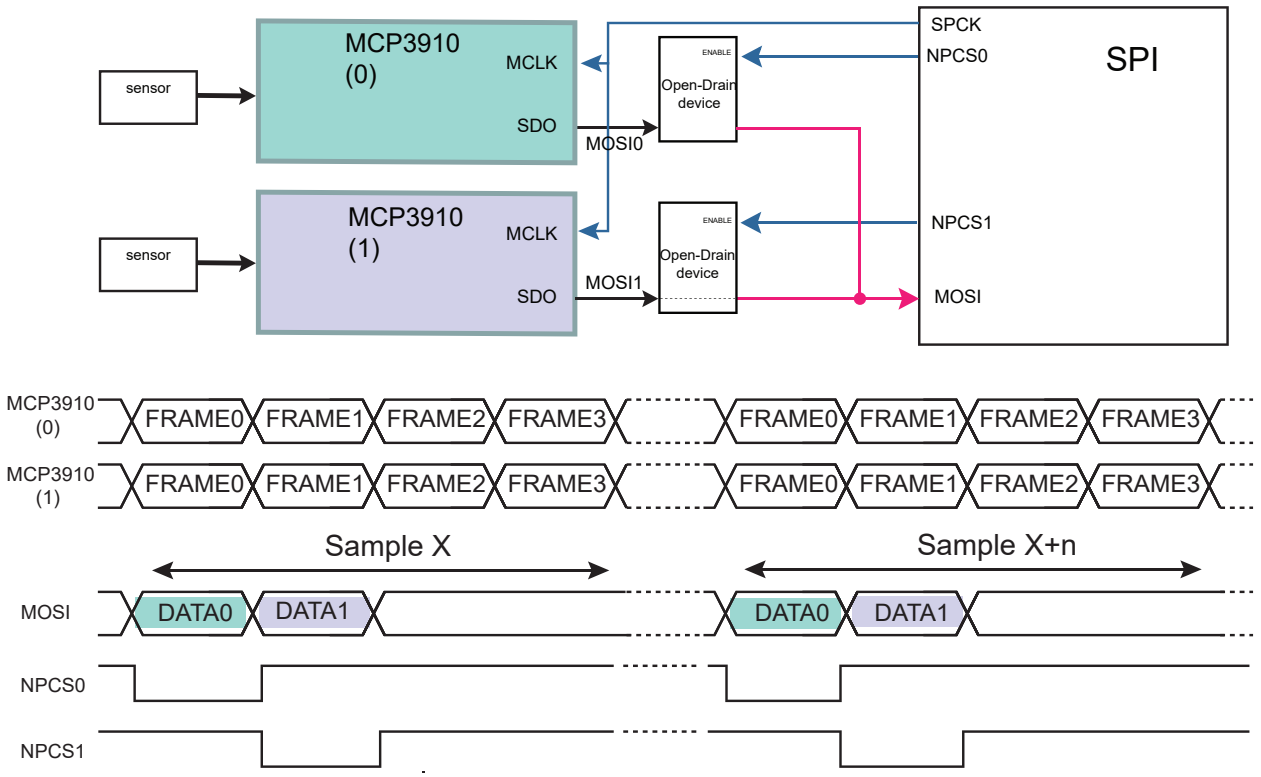
Once the SPI is configured in Two-Pin mode and Comparison mode is set, the synchronization byte (SYNC BYTE) is monitored to start receiving a frame. Upon SYNC BYTE reception, the previously received header byte is stored in the Two-Pin Header register (FLEX_SPI_TPHR) and the SYNC BYTE is stored in FLEX_SPI_RDR (the RDRF flag indicates when the data is available). Each frame byte received is written in FLEX_SPI_RDR until reception of the CRCCOM end field (CRC is received as a data).

The Oversampling Rate (OSR) field in the Two-Pin Mode register (FLEX_SPI_TPMR) defines the OSR frame configuration of the MCP3910, and thus the frame length.

Note: It is mandatory to configure FLEX_SPI_CRCR when Two-Pin mode is enabled.

65.8.8.3. Connection Example

When more than 1 MCP3910 device is connected to SPI, the SDO data lines from the MCP3910 products must be multiplexed prior to driving the SPI MOSI line.



MOSI multiplexing must be performed by successively enabling each SDO line from the MCP3910 with external discrete components. See the following figure.

In this mode, the NPCS lines are activated successively after each frame reception.

The polarity of chip select output NPCS is defined by configuring the Chip Select Inversion Enable (CSIE) bit in FLEX_SPI_MR.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.93. MCP3910 Connection Example with Two Devices

65.8.9. SPI Register Write Protection

The FLEXCOM operating mode (FLEX_MR.OPMODE) must be set to FLEX_MR_OPMODE_SPI to enable access to the write protection registers.

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the SPI Write Protection Mode Register (FLEX_SPI_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the SPI Write Protection Status Register (FLEX_SPI_WPSR) is set and the Write Protection Violation Source (WPVSRC) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX_SPI_WPSR.

The following registers can be write-protected when WPEN is set:

- SPI Mode Register
- SPI Chip Select Register
- SPI Comparison Register
- SPI CRC Register
- SPI Two-Pin Mode Register

© 2026 Microchip Technology Inc. and its subsidiaries

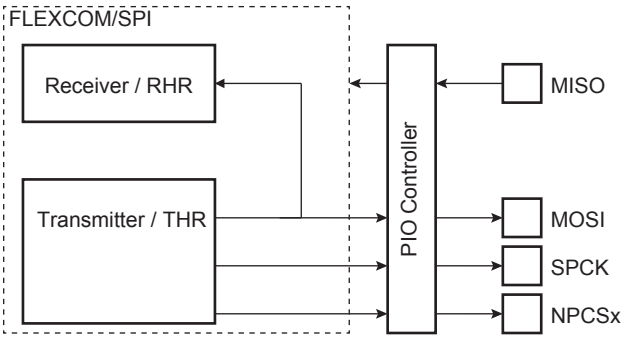
The following registers can be write-protected when WPITEN is set:

- SPI Interrupt Enable Register
- SPI Interrupt Disable Register

The following register can be write-protected when WPCREN is set:

- SPI Control Register

65.8.10. Local Loopback Test Mode



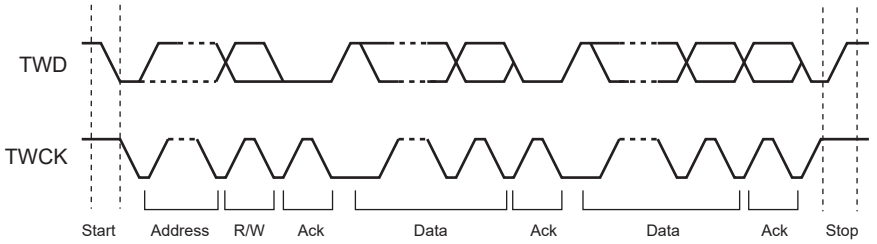
Local Loopback mode connects the output of the transmitter directly to the input of the receiver, as shown in the figure below. The MISO pin has no effect on the receiver and the MOSI pin is driven as in Normal mode.

The MOSI, SPCK and NPCSx are normally transmitted unless the PIO is configured to drive logical values to prevent the SPI external target device from starting.

Local Loopback mode and allows a quick and easy verification of the transmitter and receiver logic.

Local Loopback mode is enabled when FLEX_SPI_MR.LLB=1, FLEX_SPI_MR.MASTER=1 and the FLEX_MR.OPMODE=2.

Figure 65.94. Local Loopback Mode Configuration



© 2026 Microchip Technology Inc. and its subsidiaries

65.9. TWI Functional Description

65.9.1. Transfer Format

The data put on the TWD line must be 8 bits long. Data are transferred MSB first; each byte must be followed by an acknowledgement. The number of bytes per transfer is unlimited (see figure below).

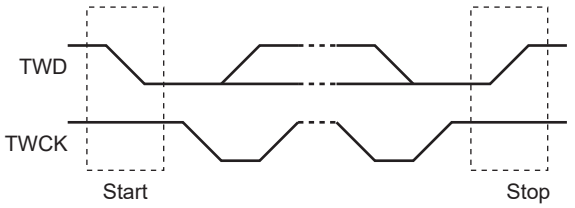


Figure 65.95. Transfer Format

Each transfer begins with a START condition and terminates with a STOP condition (see figure below).

- A high-to-low transition on the TWD line while TWCK is high defines the START condition.
- A low-to-high transition on the TWD line while TWCK is high defines a STOP condition.

Figure 65.96. START and STOP Conditions

65.9.1.1. Digital Filter

The TWI features digital filters on data and clock lines that can be configured by software via the TWI Filter register (FLEX_TWI_FILTR).

In Standard, Fast and Fast Plus modes, the digital filter must be enabled (FILT=1) and a pulse width threshold defined (THRES > 0).

The field THRES must be set according to the peripheral clock to suppress spikes below 50 ns. The recommended value is calculated using the formula:

$THRES > 50\ ns / t_{peripheral_clock(ns)}$

65.9.2. Modes of Operation

The TWI has different modes of operation:

- Host Transmitter mode
- Host Receiver mode
- Multi-host Transmitter mode
- Multi-host Receiver mode
- Client Transmitter mode

© 2026 Microchip Technology Inc. and its subsidiaries

- Client Receiver mode

These modes are described in the following sections.

65.9.3. Host Mode

65.9.3.1. Definition

The host is the device that starts a transfer, generates a clock and stops it.

65.9.3.2. Programming Host Mode

The following fields must be programmed before entering Host mode:

1. DADR (+ IADRSZ + IADR if a 10-bit device is addressed): The device address is used to access client devices in Read or Write mode.
2. CWGR + CKDIV + CHDIV + CLDIV: Clock waveform.
3. SVDIS: Disables Client mode.
4. MSEN: Enables Host mode.

Note: If the TWI is already in Host mode, the device address (DADR) can be configured without disabling Host mode.

65.9.3.3. Transfer Speed/Bit Rate

The TWI speed is defined in FLEX_TWI_CWGR. The TWI bit rate can be based either on the peripheral clock if the BRSRCCLK bit value is 0 or on a programmable clock source provided by the GCLK if the BRSRCCLK bit value is 1.

If BRSRCCLK = 1, the bit rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the TWI transfer rate.

The GCLK frequency must be at least three times lower than the peripheral clock frequency.

65.9.3.4. Host Transmitter Mode

After the host initiates a START condition when writing into the Transmit Holding register FLEX_TWI_THR, it sends a 7-bit client address, configured in the Host Mode register (DADR in FLEX_TWI_MMR), to notify the client device. The bit following the client address indicates the transfer direction, 0 in this case (FLEX_TWI_MMR.MREAD = 0).

The TWI transfers require the client to acknowledge each received byte. During the acknowledge clock pulse (ninth pulse), the host releases the data line (HIGH), enabling the client to pull it down in order to generate the acknowledge. If the client does not acknowledge the byte, then the Not Acknowledge flag (NACK) is set in the TWI Status register (FLEX_TWI_SR) of the host and a STOP condition is sent. Alternatively, if the FLEX_TWI_MMR.NOAP bit is set, no stop condition will be sent and a START or STOP condition must be triggered manually through the FLEX_TWI_CR.START or FLEX_TWI_CR.STOP bit once the software is ready for the transmission of the condition. The NACK flag must be cleared by reading the TWI Status register (FLEX_TWI_SR) before the next write into the TWI Transmit Holding register (FLEX_TWI_THR). As with the other status bits, an interrupt can be generated if enabled in the Interrupt Enable register (FLEX_TWI_IER). If the client acknowledges the byte, the data written in FLEX_TWI_THR is then shifted in the internal shifter and transferred. When an acknowledge is detected, the TXRDY bit is set until a new write in FLEX_TWI_THR.

TXRDY is used as transmit ready for the DMA transmit channel.

Note: To clear the TXRDY flag in Host mode, write the FLEX_TWI_CR.MSDIS bit to 1, then write the FLEX_TWI_CR.MSEN bit to 1.

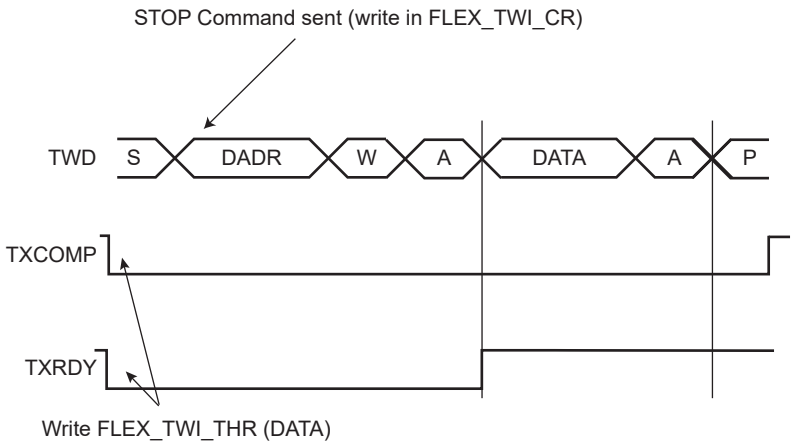
While no new data is written in FLEX_TWI_THR, the serial clock line is tied low. When new data is written in FLEX_TWI_THR, the SCL is released and the data is sent. To generate a STOP event, the STOP command must be performed by writing in the STOP field of the TWI Control register (FLEX_TWI_CR).

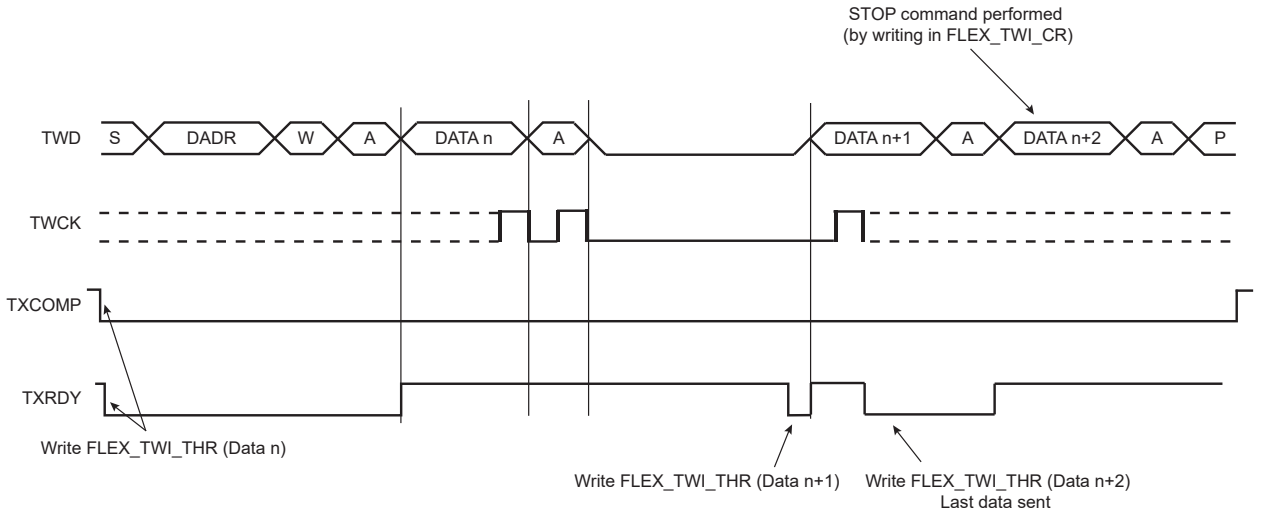
© 2026 Microchip Technology Inc. and its subsidiaries

After a host write transfer, the Serial Clock line is stretched (tied low) while no new data is written in FLEX_TWI_THR or until a STOP command is performed.

See the following figures.

Figure 65.97. Host Write with One Data Byte





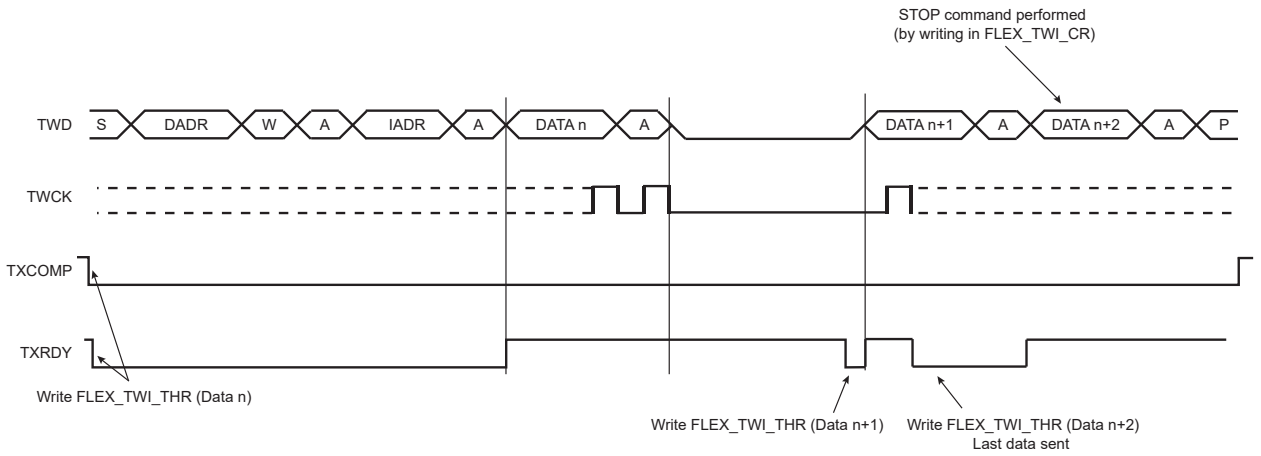


Figure 65.98. Host Write with Multiple Data Bytes

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.99. Host Write with One Byte Internal Address and Multiple Data Bytes

65.9.3.5. Host Receiver Mode

The read sequence begins by setting the START bit. After the start condition has been sent, the host sends a 7-bit client address to notify the client device. The bit following the client address indicates the transfer direction, 1 in this case (FLEX_TWI_MMR.MREAD = 1). During the acknowledge clock pulse (9th pulse), the host releases the data line (HIGH), enabling the client to pull it down in order to generate the acknowledge. The host polls the data line during this clock pulse and sets the FLEX_TWI_SR.NACK bit if the client does not acknowledge the byte.

If an acknowledge is received, the host is then ready to receive data from the client. After data has been received, the host sends an acknowledge condition to notify the client that the data has been received except for the last data (see figure "Host Read with One Data Byte" below). When the FLEX_TWI_SR.RXRDY bit is set, a character has been received in the Receive Holding register (FLEX_TWI_RHR). The RXRDY bit is reset when reading FLEX_TWI_RHR.

When a single data byte read is performed, with or without internal address (IADR), the START and STOP bits must be set at the same time. See figure "Host Read with One Data Byte" below. When a multiple data byte read is performed, with or without internal address (IADR), the STOP bit must be set after the next-to-last data received (same condition applies for START bit to generate a repeated start). See figure "Host Read with Multiple Data Bytes" below. For internal address usage, see Internal Address.

If FLEX_TWI_RHR is full (RXRDY high) and the host is receiving data, the serial clock line will be tied low before receiving the last bit of the data and until FLEX_TWI_RHR is read. Once FLEX_TWI_RHR is read, the host will stop stretching the serial clock line and end the data reception. See figure "Host Read Clock Stretching with Multiple Data Bytes" below.

⚠ WARNING When receiving multiple bytes in Host Read mode, if the next-to-last access is not read (the RXRDY flag remains high), the last access will not be completed until FLEX_TWI_RHR is read. The last access stops on the next-to-last bit (clock stretching). When FLEX_TWI_RHR is read there is only half a bit period to send the STOP bit (or START bit) command, else another read access might occur (spurious access). A possible workaround is to set the STOP bit (or START bit) before reading FLEX_TWI_RHR on the next-to-last access (within IT handler).

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.100. Host Read with One Data Byte

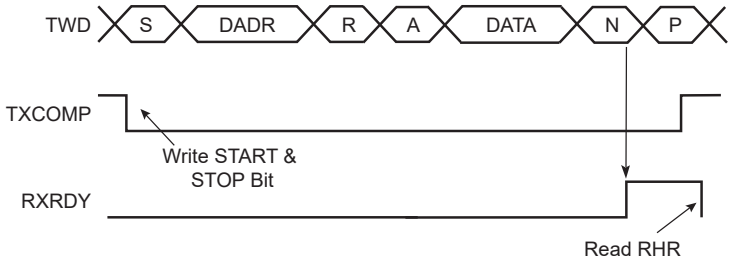

Figure 65.101. Host Read with Multiple Data Bytes

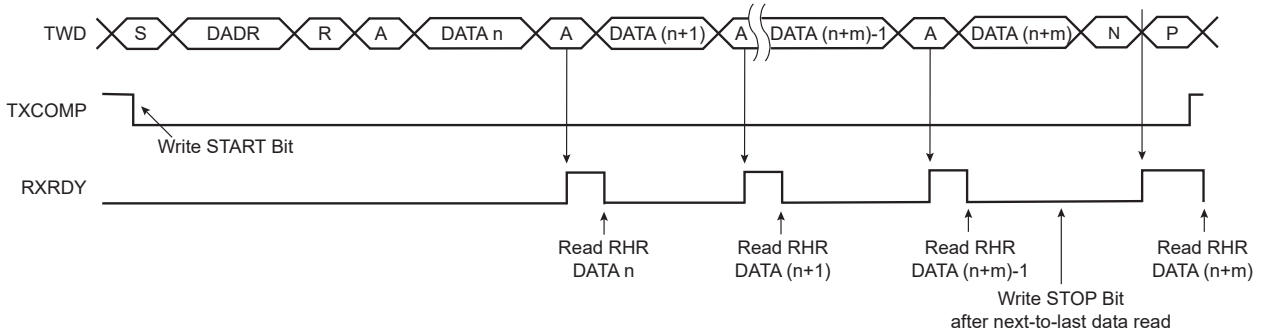

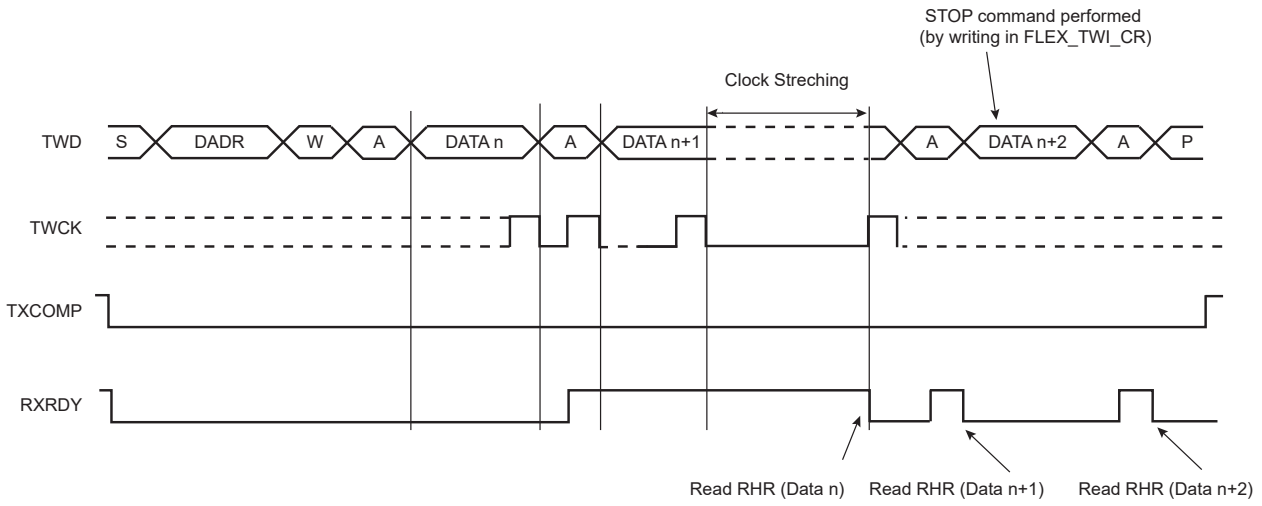

Figure 65.102. Host Read Clock Stretching with Multiple Data Bytes

RXRDY is used as receive ready trigger event for the DMA receive channel.

65.9.3.6.Internal Address

The TWI interface can perform transfers with 7-bit client address devices and with 10-bit client address devices.

65.9.3.6.1.7-bit Client Addressing

When addressing 7-bit client devices, the internal address bytes are used to perform random address (read or write) accesses to reach one or more data bytes, for example, within a memory page location in a serial memory. When performing read operations with an internal address, the TWI performs a write operation to set the internal address into the client device, and then switch to Host Receiver mode. Note that the second start condition (after sending the IADR) is sometimes called “repeated start” (Sr) in I2C fully-compatible devices. See figure Host Read with One, Two or Three Bytes Internal Address and One Data Byte.

© 2026 Microchip Technology Inc. and its subsidiaries

See figures Host Write with One, Two or Three Bytes Internal Address and One Data Byte and Internal Address Usage for the host write operation with internal address.

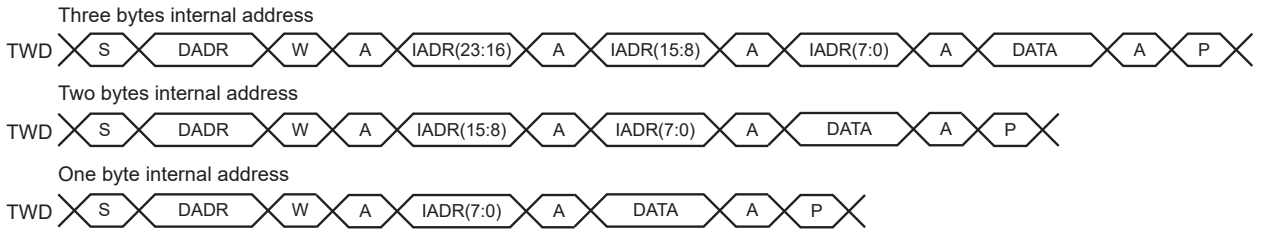
The three internal address bytes are configurable through the Host Mode register (FLEX_TWI_MMR).

If the client device supports only a 7-bit address, that is, no internal address, IADRSZ must be configured to 0.

The abbreviations listed below are used in the following figures:

S	Start
Sr	Repeated Start
P	Stop
W	Write
R	Read
A	Acknowledge
N	Not Acknowledge
DADR	Device Address
IADR	Internal Address

Figure 65.103. Host Write with One, Two or Three Bytes Internal Address and One Data Byte



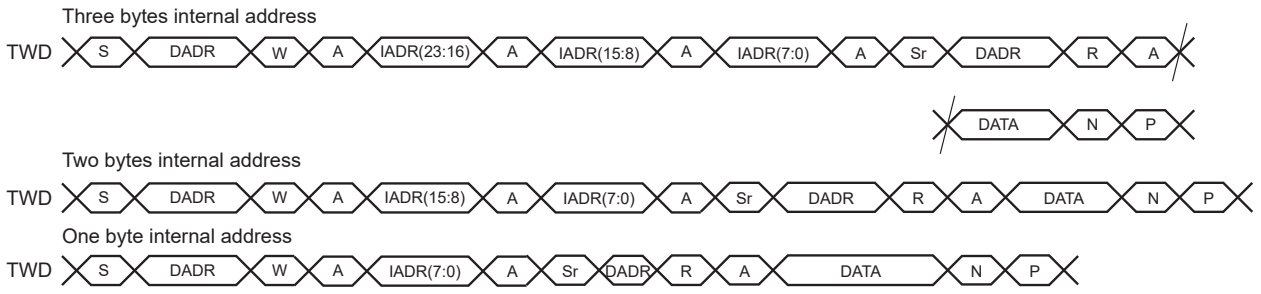


Figure 65.104. Host Read with One, Two or Three Bytes Internal Address and One Data Byte

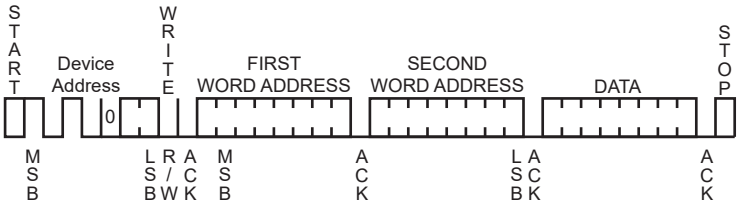
65.9.3.6.2.10-bit Client Addressing

For a client address higher than seven bits, the user must configure the address size (IADRSZ) and set the other client address bits in the Internal Address register (FLEX_TWI_IADR). The two remaining internal address bytes, IADR[15:8] and IADR[23:16], can be used the same way as in 7-bit client addressing.



Example: Address a 10-bit device (10-bit device address is b1 b2 b3 b4 b5 b6 b7 b8 b9 b10)

© 2026 Microchip Technology Inc. and its subsidiaries

1. Program IADRSZ = 1.
2. Program DADR with 1 1 1 1 0 b1 b2 (b1 is the MSB of the 10-bit address, b2, etc.).
3. Program FLEX_TWI_IADR with b3 b4 b5 b6 b7 b8 b9 b10 (b10 is the LSB of the 10-bit address).

The following figure shows a byte write to a TWI EEPROM. This demonstrates the use of internal addresses to access the device.

Figure 65.105. Internal Address Usage

65.9.3.7.Repeated Start

In addition to Internal Address mode, repeated start (Sr) can be generated manually by writing the START bit at the end of a transfer instead of the STOP bit. In such case the parameters of the next transfer (direction, SADR, etc.) will need to be set before writing the START bit at the end of the previous transfer.

See Read/Write Flowcharts.

65.9.3.8.Bus Clear Command

The TWI interface can perform a Bus Clear command:

1. Configure Host mode (DADR, CKDIV, etc).
2. Read FLEX_TWI_SR.SDA/SCL flags and check that the TWD (SDA) and TWCK (SCL) lines hold a high level.
3. Send the Bus Clear command by setting FLEX_TWI_CR.CLEAR.

Note: When TWD (SDA)=0, the Bus Clear command must be performed via the PIO. When TWCK (SCL)=0, no Bus Clear command can be issued.

Note: If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

65.9.3.9.SMBus Mode

SMBus mode is enabled when the FLEX_TWI_CR.SMBEN bit is written to one. SMBus mode operation is similar to I²C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX_TWI_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
4. A set of addresses has been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX_TWI_CR appropriately.

65.9.3.9.1.Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX_TWI_CR.PECEN bit to one enables automatic PEC handling in the current transfer. Transfers with and without PEC can freely be intermixed in the same system, since some clients may not

© 2026 Microchip Technology Inc. and its subsidiaries

support PEC. The PEC LFSR is always updated on every bit transmitted or received, so that PEC handling on combined transfers will be correct.

In Host Transmitter mode, the host calculates a PEC value and transmits it to the client after all data bytes have been transmitted. Upon reception of this PEC byte, the client will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the client will return an ACK to the host. If the PEC values differ, data was corrupted, and the client will return a NACK value. Some clients may not be able to check the received PEC in time to return a NACK if an error occurred. In this case, the client should always return an ACK after the PEC byte, and some other mechanism must be implemented to verify that the transmission was received correctly.

In Host Receiver mode, the client calculates a PEC value and transmits it to the host after all data bytes have been transmitted. Upon reception of this PEC byte, the host will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the FLEX_TWI_SR.PECERR bit is set. In Host Receiver mode, the PEC byte is always followed by a NACK transmitted by the host, since it is the last byte in the transfer.

In combined transfers, the PECRQ bit should only be set in the last of the combined transfers. If Alternative Command mode is enabled, only the NPEC bit should be set.

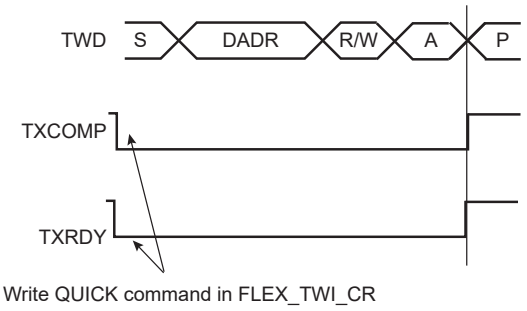
Consider the following transfer:

S, ADR+W, COMMAND_BYTE, ACK, SR, ADR+R, DATA_BYTE, ACK, PEC_BYTE, NACK, P

See Read/Write Flowcharts for detailed flowcharts.

65.9.3.9.2.Timeouts

The FLEX_TWI_SMBTR.TLOWS/TLOWM fields configure the SMBus timeout values. If a timeout occurs, the host transmits a STOP condition and leaves the bus. Furthermore, the FLEX_TWI_SR.TOUT bit is set.



65.9.3.10.SMBus Quick Command (Host Mode Only)

The TWI interface can perform a quick command:

1. Configure Host mode (DADR, CKDIV, etc).
2. Write the FLEX_TWI_MMR.MREAD bit at the value of the one-bit command to be sent.
3. Start the transfer by setting the FLEX_TWI_CR.QUICK bit.

Note: If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

Figure 65.106. SMBus Quick Command

65.9.3.11.TWI High-Speed Host

TWI High-Speed Host mode is enabled when FLEX_TWI_CR.HSEN=1 and FLEX_TWI_CR.MSEN=1. TWI High-Speed mode operation is similar to TWI operation, with the following exceptions:

1. A host code is sent first at normal speed before enabling TWI High-Speed mode.
2. Arbitration is only possible during host code transmission.

© 2026 Microchip Technology Inc. and its subsidiaries

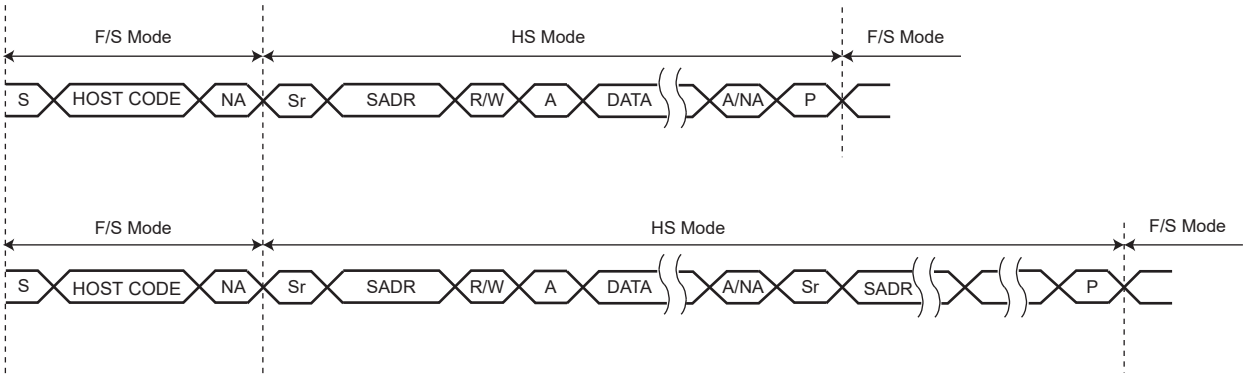
3. When TWI High-Speed mode is active, an internal mechanism is enabled to shorten the SCL signal rise time
4. When TWI High-Speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or repeated START (Sr) (as a consequence, overflow can happen).
5. When TWI High-Speed mode is active, the data transfer uses the TWI High Speed mode bit rate which can be defined in FLEX_TWI_HSCWGR.

TWI High-Speed mode allows transfers up to 3.4 Mbits/s.

65.9.3.11.1.Read-Write Operation

The TWI high-speed frame always begins with the following sequence:

1. START condition (S)
2. Host code (0000 1XXX)
3. Not-acknowledge (NACK)



Note that to enable high-speed transfer, the client must send a NACK after receiving the host code.

As described previously, this sequence is sent at normal speed, and in case of multi-host, arbitration can only happen during this sequence.

Host codes are 8-bit reserved codes with the sole purpose of enabling High-Speed mode. Each host must use a different host code, which can be set through the FLEX_TWI_HSR.MCODE field.

Once this sequence has been sent, High-Speed mode is enabled and the host sends a repeated start to begin the programmed transfer. High-Speed mode remains enabled after repeated START (Sr) and only switches back to normal speed after a STOP condition (P).

Figure 65.107. High-Speed Mode Read-Write

65.9.3.11.2.SCL Rising Time Control

In order to meet the TWI High-Speed mode SCL rise time requirements, the SCL Rise Boost feature is enabled automatically when TWI High-Speed mode is enabled.

SCLRBL bit in FLEX_TWI_MMR enables to set the number of system clock periods (MCK) during which the SCL signal will be directly driven to level '1' when the SCL rising edge is sent. This short time during which the SCL pin is directly driven to level '1' allows to increase the SCL slope as much as needed to meet the High-Speed mode rise time requirements.

The SCL Rise Boost feature can be enabled with FLEX_TWI_CR.SCLRBE and disabled with FLEX_TWI_CR.SCLRBD.

© 2026 Microchip Technology Inc. and its subsidiaries

65.9.3.11.3.TWI High-Speed Mode Usage

TWI High-Speed mode usage is the same as for standard TWI (see Read/Write Flowcharts).

65.9.3.12.Alternative Command

Another way to configure the transfer is to enable the Alternative Command mode with the ACMEN bit of the TWI Control Register.

In this mode, the transfer is configured through the TWI Alternative Command Register. It is possible to define a simple read or write transfer or a combined transfer with a repeated start.

In order to set a simple transfer, the DATAL field and the DIR field of the TWI Alternative Command Register must be filled accordingly and the NDATAL field must be cleared. To begin the transfer, either set the START bit in the TWI Control Register in case of a read transfer, or write the TWI Transmit Holding Register in case of a write transfer.

For a combined transfer linked by a repeated start, the NDATAL field must be filled with the length of the second transfer and NDIR with the corresponding direction.

The PEC and NPEC bits are used to set a PEC field. In the case of a single transfer with PEC, the PEC bit must be set. In the case of a combined transfer, the NPEC bit must be set.

Note: If the Alternative Command mode is used, the FLEX_TWI_MMR.IADRSZ field must be set to 0.

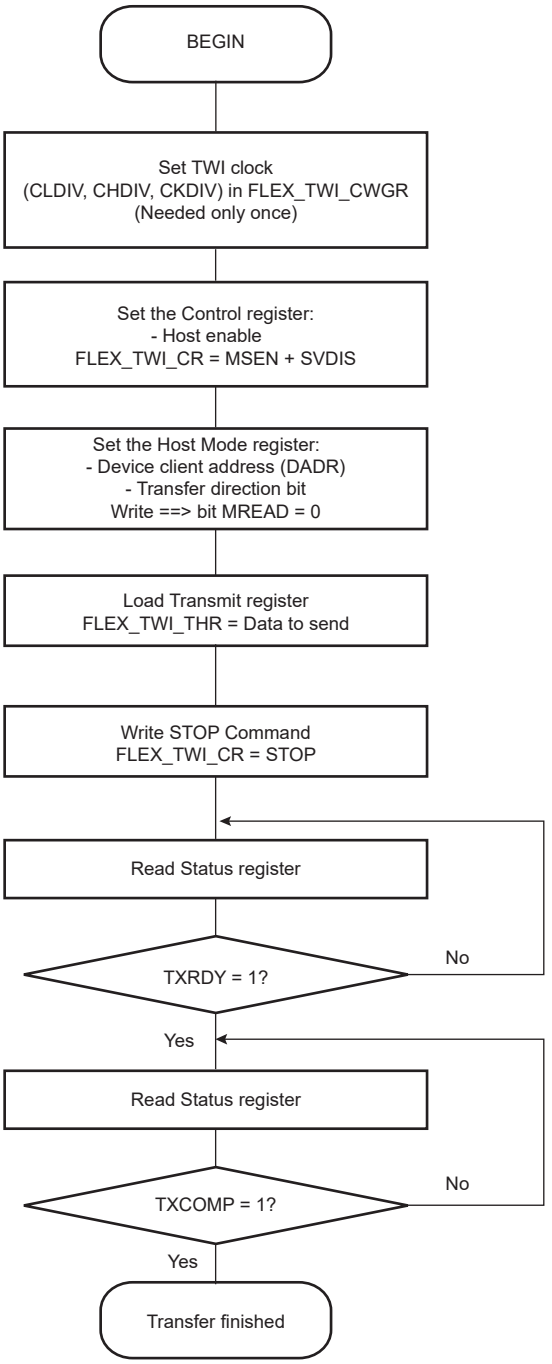
See Read/Write Flowcharts for detailed flowcharts.

65.9.3.13.Handling Errors in Alternative Command

In case of NACK generated by a client device or SMBus timeout error, the TWI stops immediately the frame, but the DMA transfer may still be active. To prevent a new frame to be restarted with the remaining DMA data (transmit), the TWI prevents any start of frame until the FLEX_TWI_SR.LOCK flag is cleared.

The FLEX_TWI_SR.LOCK bit indicates the state of the TWI (locked or not locked).

When the TWI is locked, no transfer can begin until the LOCK is cleared using the FLEX_TWI_CR.LOCKCLR bit and until the error flags are cleared reading FLEX_TWI_SR.



In case of error, FLEX_TWI_THR may have been loaded with a new data. The FLEX_TWI_CR.THRCLR bit can be used to flush FLEX_TWI_THR. If the THRCLR bit is set, the TXRDY and TXCOMP flags are set.

65.9.3.14.Read/Write Flowcharts

The flowcharts shown in this section provide examples for read and write operations. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable register (FLEX_TWI_IER) be configured first.

65.9.4. Multi-Host Mode

65.9.4.1. Definition

In Multi-Host mode, more than one host may handle the bus at the same time without data corruption by using arbitration.

Arbitration starts as soon as two or more hosts place information on the bus at the same time, and stops (arbitration is lost) for the host that intends to send a logical one while the other host sends a logical zero.

© 2026 Microchip Technology Inc. and its subsidiaries

As soon as arbitration is lost by a host, it stops sending data and listens to the bus in order to detect a STOP. When the STOP is detected, the host that has lost arbitration may put its data on the bus by respecting arbitration.

Arbitration is illustrated in figure "Arbitration Cases" below.

65.9.4.2.Different Multi-Host Modes

Two Multi-Host modes are available:

- TWI as Host Only—TWI is considered as a host only and will never be addressed.
- TWI as Host or Client—TWI may be either a host or a client and may be addressed.

Note: Arbitration in supported in both Multi-Host modes.

65.9.4.2.1.TWI as Host Only

In this mode, the TWI is considered as a host only (MSEN is always at one) and must be driven like a host with the ARBLST (ARBitration Lost) flag in addition.

If arbitration is lost (ARBLST = 1), the user must reinitiate the data transfer.

If the user starts a transfer (ex.: DADR + START + W + Write in THR) and if the bus is busy, the TWI automatically waits for a STOP condition on the bus to initiate the transfer (see figure "User Sends Data While the Bus is Busy" below).

Note: The state of the bus (busy or free) is not indicated in the user interface.

65.9.4.2.2.TWI as Host or Client

The automatic reversal from host to client is not supported in case of a lost arbitration.

Then, in the case where TWI may be either a host or a client, the user must manage the pseudo Multi-Host mode described in the steps below:

1. Program the TWI in Client mode (SADR + MSDIS + SVEN) and perform a client access (if TWI is addressed).
2. If the TWI has to be set to Host mode, wait until TXCOMP flag is at 1.
3. Program Host mode (DADR + SVDIS + MSEN) and start the transfer (ex: START + Write in THR).
4. As soon as Host mode is enabled, the TWI scans the bus in order to detect if it is busy or free. When the bus is considered as free, the TWI initiates the transfer.
5. As soon as the transfer is initiated and until a STOP condition is sent, the arbitration becomes relevant and the user must monitor the ARBLST flag.
6. If the arbitration is lost (ARBLST is = 1), the user must program the TWI in Client mode in case the host that won the arbitration needs to access the TWI.
7. If the TWI has to be set to Client mode, wait until TXCOMP flag is at 1 and then program Client mode.
   Note: In case the arbitration is lost and the TWI is addressed, the TWI will not acknowledge even if it is programmed in Client mode as soon as ARBLST = 1. Then the host must repeat SADR.

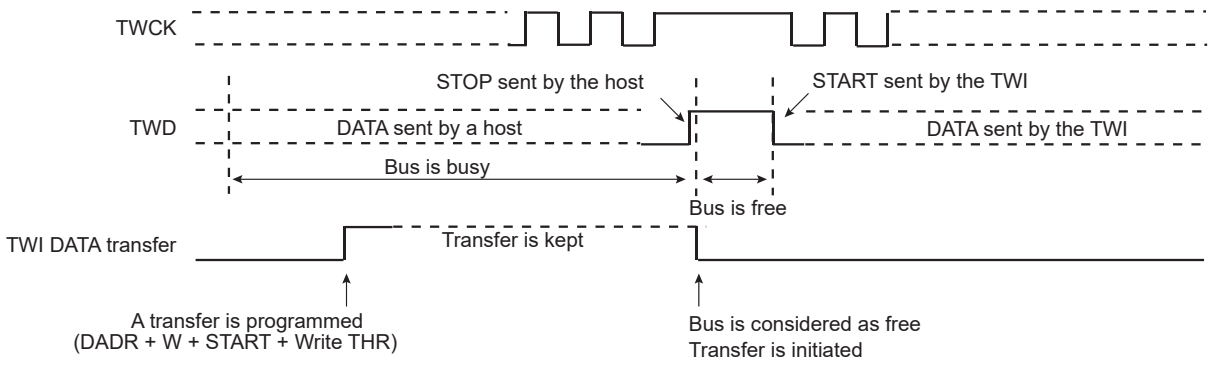
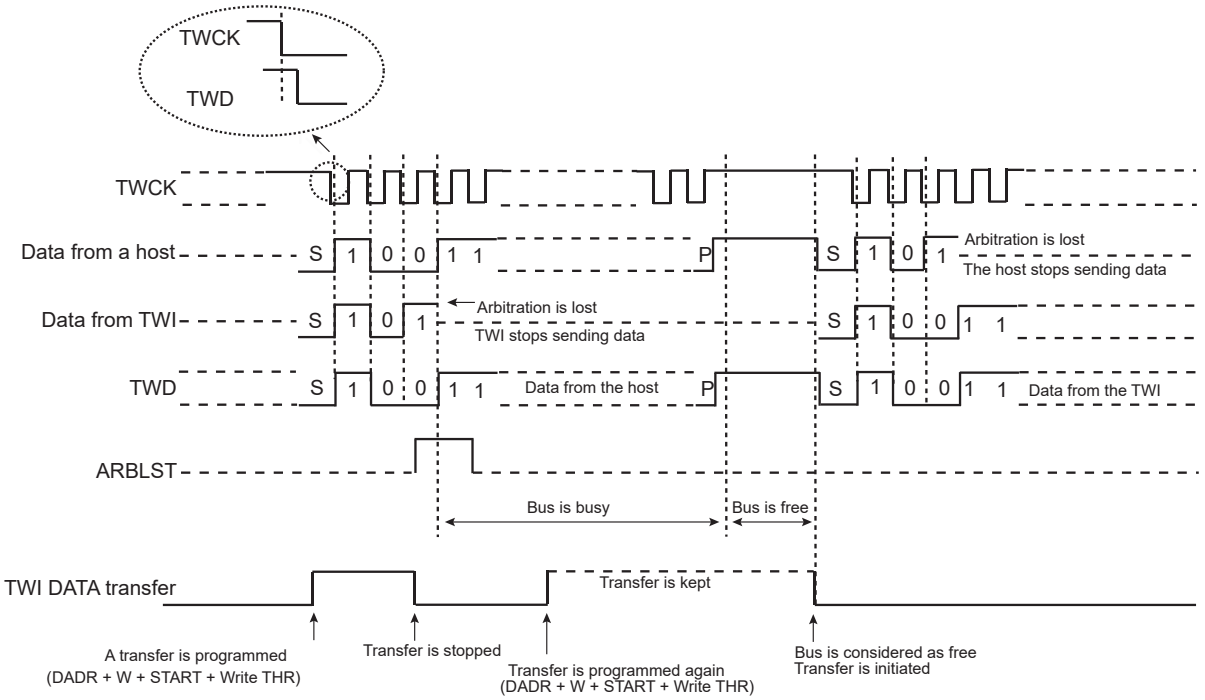
Figure 65.122. User Sends Data While the Bus is Busy





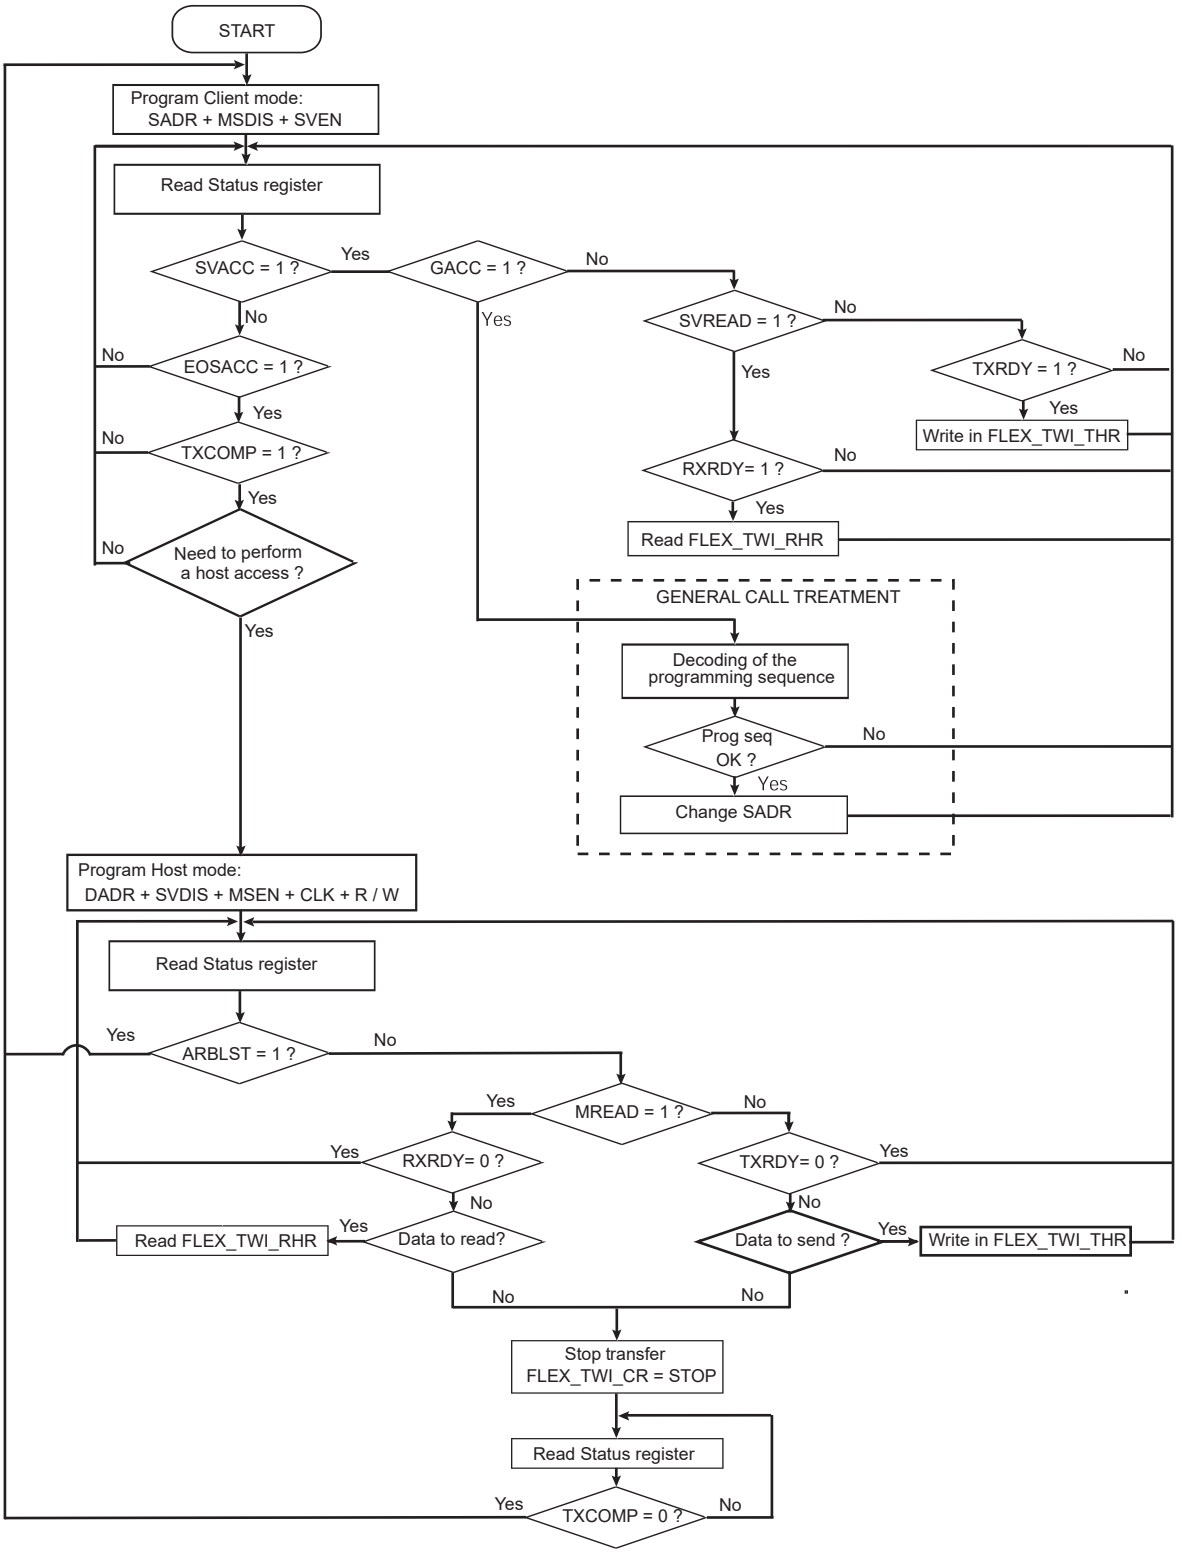


Figure 65.123. Arbitration Cases

The flowchart shown in the following figure gives an example of read and write operations in Multi-Host mode.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.124. Multi-Host Mode

© 2026 Microchip Technology Inc. and its subsidiaries

65.9.5. Client Mode

65.9.5.1. Definition

Client mode is defined as a mode where the device receives the clock and the address from another device called the host.

In this mode, the device never initiates and never completes the transmission (START, REPEATED_START and STOP conditions are always provided by the host).

65.9.5.2. Programming Client Mode

The following fields must be programmed before entering Client mode:

1. FLEX_TWI_SMR.SADR: The client device address is used in order to be accessed by host devices in Read or Write mode.
2. (Optional) FLEX_TWI_SMR.MASK can be set to mask some SADR address bits and thus allow multiple address matching.
3. FLEX_TWI_CR.MSDIS: Disables Host mode.
4. FLEX_TWI_CR.SVEN: Enables Client mode.

As the device receives the clock, values written in FLEX_TWI_CWGR are not processed.

65.9.5.3. Receiving Data

After a START or repeated START condition is detected, and if the address sent by the host matches the client address programmed in the SADR (Client Address) field, the SVACC (Client Access) flag is set and SVREAD (Client Read) indicates the direction of the transfer.

SVACC remains high until a STOP condition or a repeated START is detected. When such a condition is detected, EOSACC (End Of Client Access) flag is set.

65.9.5.3.1. Read Sequence

In the case of a read sequence (SVREAD is high), the TWI transfers data written in FLEX_TWI_THR (TWI Transmit Holding register) until a STOP condition or a REPEATED_START + an address different from SADR is detected. Note that at the end of the read sequence TXCOMP (Transmission Complete) flag is set and SVACC is reset.

As soon as data is written in FLEX_TWI_THR, the TXRDY (Transmit Holding Register Ready) flag is reset, and it is set when the internal shifter is empty and the sent data acknowledged or not. If the data is not acknowledged, the NACK flag is set.

Note that a STOP or a repeated START always follows a NACK.

See figure "Read Access Ordered by a Host" below.

Note: To clear the TXRDY flag in Client mode, write the FLEX_TWI_CR.SVDIS bit to 1, then write the FLEX_TWI_CR.SVEN bit to 1.

65.9.5.3.2. Write Sequence

In the case of a write sequence (SVREAD is low), the RXRDY (Receive Holding Register Ready) flag is set as soon as a character has been received in FLEX_TWI_RHR (TWI Receive Holding register). RXRDY is reset when reading FLEX_TWI_RHR.

TWI continues receiving data until a STOP condition or a REPEATED_START + an address different from SADR is detected. Note that at the end of the write sequence TXCOMP flag is set and SVACC reset.

See figure "Write Access Ordered by a Host" below.

65.9.5.3.3. Clock Stretching Sequence

If FLEX_TWI_THR or FLEX_TWI_RHR is not written/read in time, the TWI performs a clock stretching.

Clock stretching information is given by the SCLWS (Clock Wait State) bit.

© 2026 Microchip Technology Inc. and its subsidiaries

See figures "Clock Stretching in Read Mode" and "Clock Stretching in Write Mode" below.

Note: Clock stretching can be disabled by configuring the FLEX_TWI_SMR.SCLWSDIS bit. In that case, UNRE and OVRE flags will indicate underrun (when FLEX_TWI_THR is not filled on time) or overrun (when FLEX_TWI_RHR is not read on time).

65.9.5.3.4.General Call

In the case where a GENERAL CALL is performed, the GACC (General Call Access) flag is set.

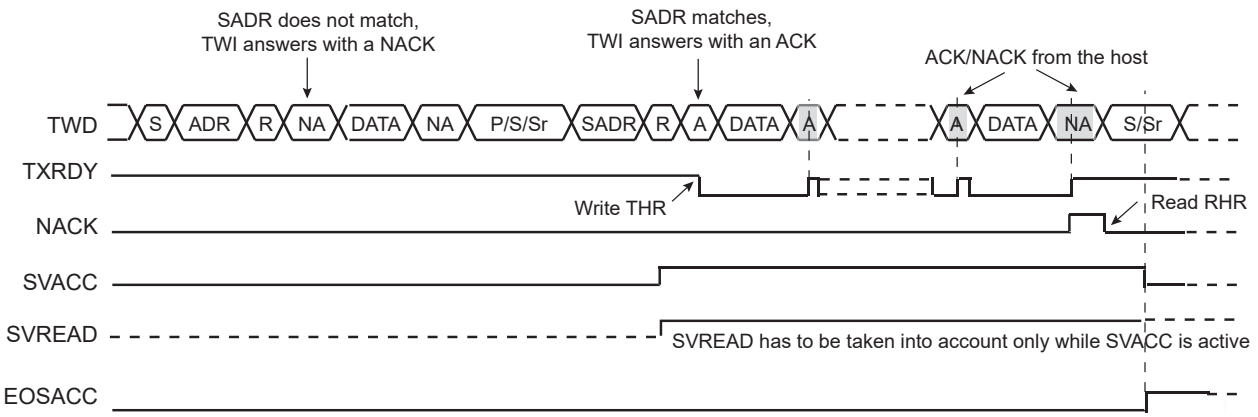
After GACC is set, it is up to the user to interpret the meaning of the GENERAL CALL and to decode the new address programming sequence.

See figure "Host Performs a General Call" below.

65.9.5.4.Data Transfer

65.9.5.4.1.Read Operation

Read mode is defined as a data requirement from the host.



After a START or a REPEATED START condition is detected, the decoding of the address starts. If the client address (SADR) is decoded, SVACC is set and SVREAD indicates the direction of the transfer.

Until a STOP or REPEATED START condition is detected, TWI continues sending data loaded in FLEX_TWI_THR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the read operation.

Figure 65.125. Read Access Ordered by a Host

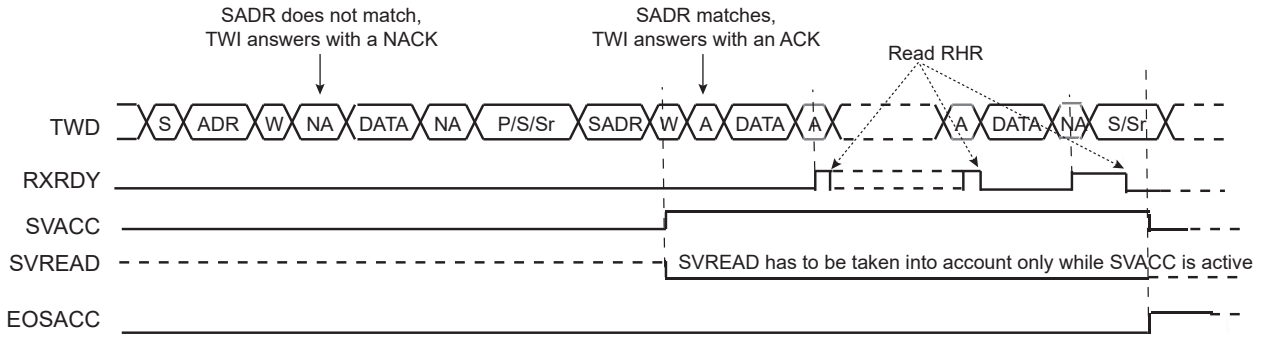
Notes:

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. TXRDY is reset when data has been transmitted from FLEX_TWI_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.

65.9.5.4.2.Write Operation

The Write mode is defined as a data transmission from the host.

After a START or a REPEATED START, the decoding of the address starts. If the client address is decoded, SVACC is set and SVREAD indicates the direction of the transfer (SVREAD is low in this case).



© 2026 Microchip Technology Inc. and its subsidiaries

Until a STOP or REPEATED START condition is detected, TWI stores the received data in FLEX_TWI_RHR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the write operation.

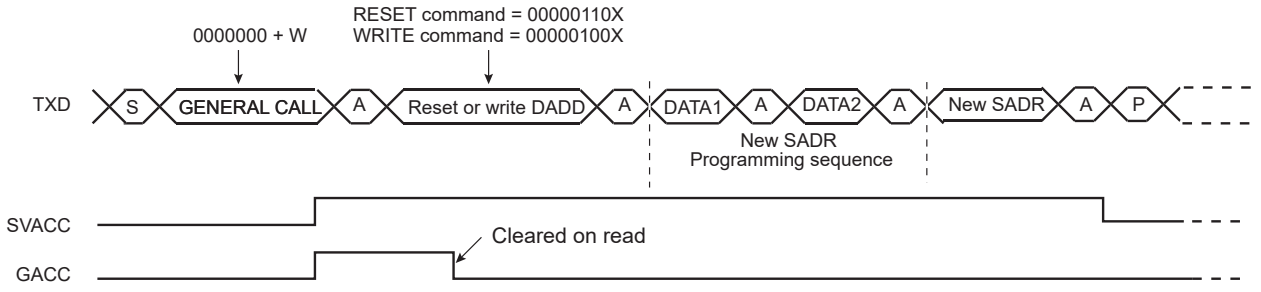
Figure 65.126. Write Access Ordered by a Host

Notes:

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. RXRDY is set when data has been transmitted from the internal shifter to FLEX_TWI_RHR, and reset when this data is read.

65.9.5.4.3.General Call

The general call is performed in order to change the address of the client.



If a GENERAL CALL is detected, GACC is set.

After the detection of general call, it is up to the user to decode the commands which follow.

In case of a WRITE command, the user has to decode the programming sequence and program a new SADR if the programming sequence matches.

The following figure describes the general call access.

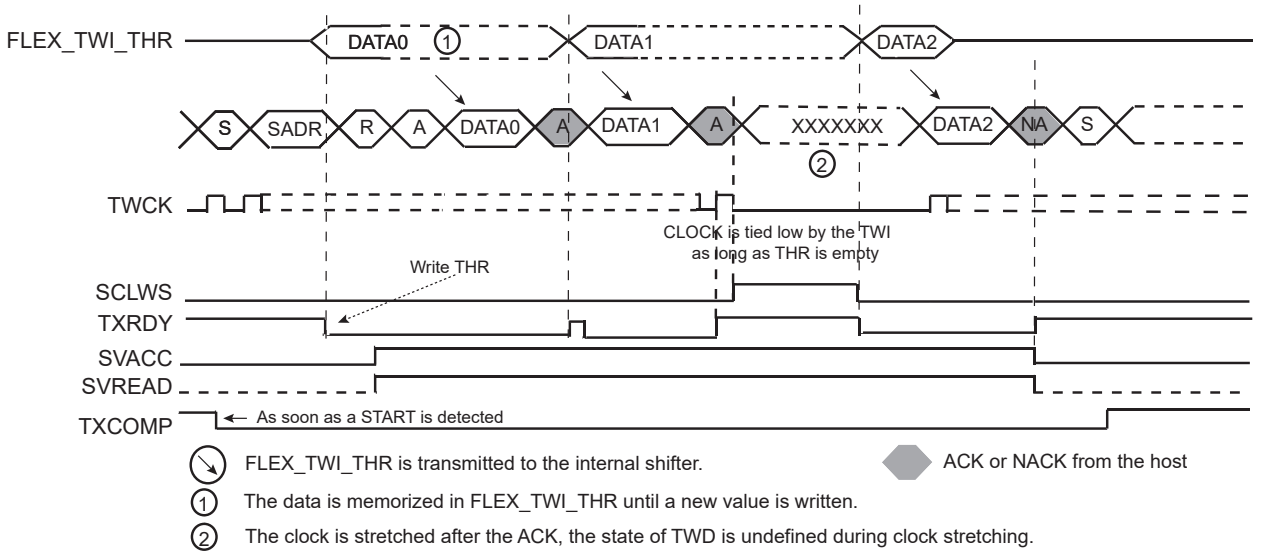
Figure 65.127. Host Performs a General Call

Note: This method enables to create a user-specific programming sequence by choosing the number of programming bytes. The programming sequence has to be provided to the host.

© 2026 Microchip Technology Inc. and its subsidiaries

65.9.5.4.4.Clock Stretching

In both Read and Write modes, it may happen that the FLEX_TWI_THR/FLEX_TWI_RHR buffer is not filled/emptied before the transmission/reception of a new character. In this case, to avoid sending/receiving undesired data, a clock stretching mechanism is implemented.



Note: Clock stretching can be disabled by setting the FLEX_TWI_SMR.SCLWSDIS bit. In that case, the UNRE and OVRE flags indicate an underrun (when FLEX_TWI_THR is not filled on time) or an overrun (when FLEX_TWI_RHR is not read on time).

— Clock Stretching in Read Mode

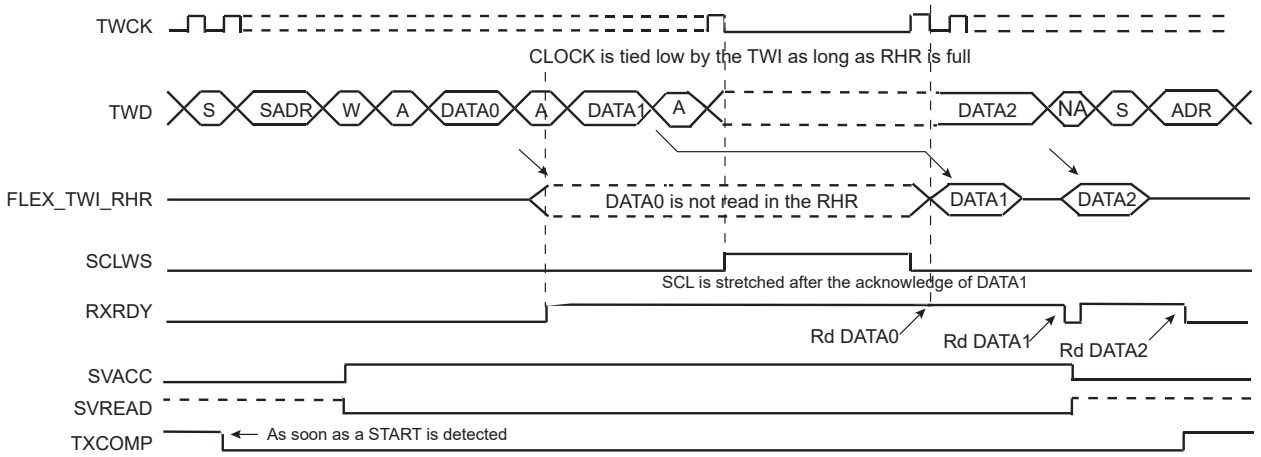
The clock is tied low if the internal shifter is empty and if a STOP or REPEATED START condition was not detected. It is tied low until the internal shifter is loaded.

The following figure describes clock stretching in Read mode.

Figure 65.128. Clock Stretching in Read Mode

Notes:

1. TXRDY is reset when data has been written in FLEX_TWI_THR to the internal shifter, and set when this data has been acknowledged or non acknowledged.
2. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED_START + an address different from SADR.
3. SCLWS is automatically set when the clock stretching mechanism is started.



— Clock Stretching in Write Mode

The clock is tied low if the internal shifter and FLEX_TWI_RHR are full. If a STOP or REPEATED_START condition was not detected, it is tied low until FLEX_TWI_RHR is read.

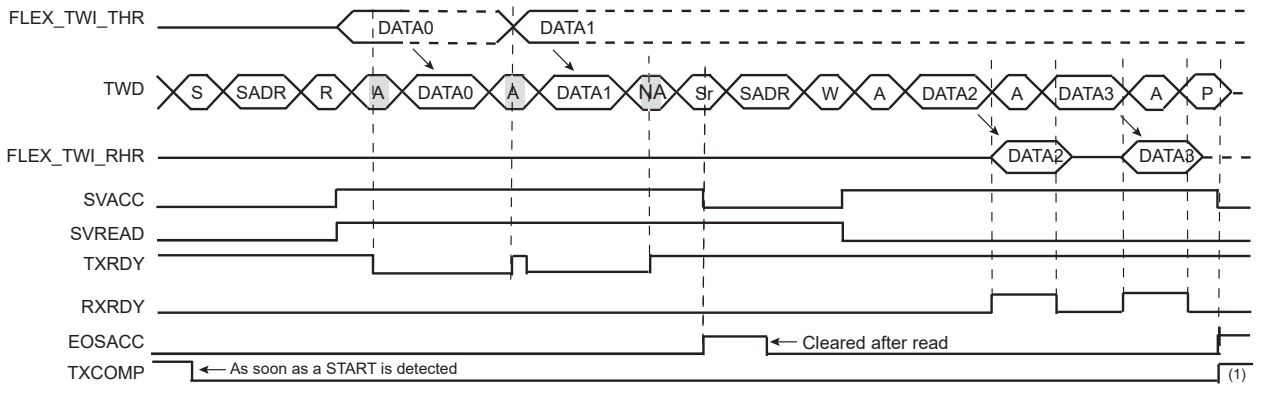
The following figure describes the clock stretching in Write mode.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.129. Clock Stretching in Write Mode

Notes:

1. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED_START + an address different from SADR.
2. SCLWS is automatically set when the clock stretching mechanism is started and automatically reset when the mechanism is finished.



65.9.5.4.5.Reversal after a Repeated Start

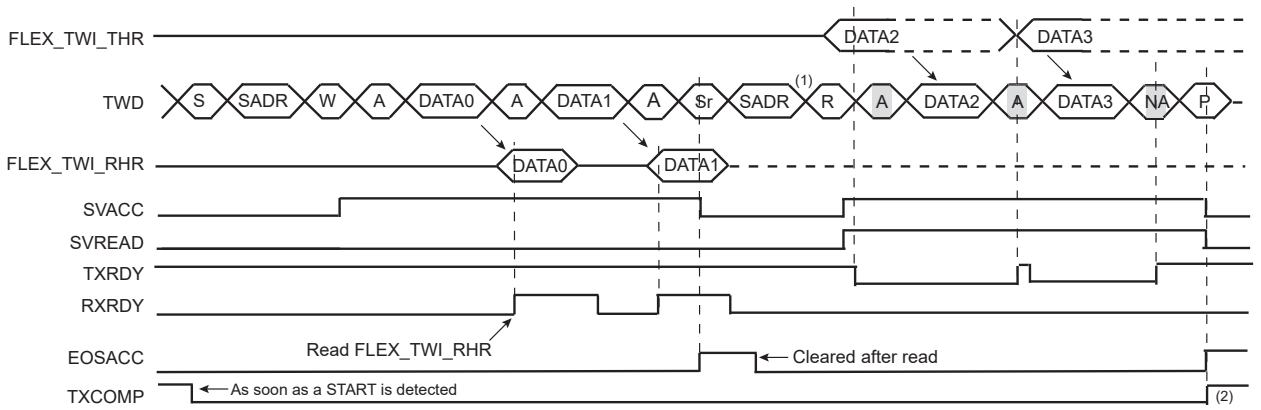
— Reversal of Read to Write

The host initiates the communication by a read command and finishes it by a write command.

The following figure describes the repeated start and the reversal from Read mode to Write mode.

Figure 65.130. Repeated Start and Reversal from Read Mode to Write Mode

Note:
1. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.



© 2026 Microchip Technology Inc. and its subsidiaries

— Reversal of Write to Read

The host initiates the communication by a write command and finishes it by a read command.

The following figure describes the repeated start and the reversal from Write mode to Read mode.

Figure 65.131. Repeated Start and Reversal from Write Mode to Read Mode

Notes:
1. In this case, if FLEX_TWI_THR has not been written at the end of the read command, the clock is automatically stretched before the ACK.
2. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

65.9.5.4.6.SMBus Mode

SMBus mode is enabled when the FLEX_TWI_CR.SMEN bit is written to one. SMBus mode operation is similar to I²C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX_TWI_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
4. A set of addresses have been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX_TWI_CR appropriately.

— Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX_TWI_CR.PECEN bit to one will send/check the FLEX_TWI_ACR.PEC field in the current transfer. The PEC generator is always updated on every bit transmitted or received, so that PEC handling on following linked transfers will be correct.

In Client Receiver mode, the host calculates a PEC value and transmits it to the client after all data bytes have been transmitted. Upon reception of this PEC byte, the client will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the client will return an ACK to the host. If the PEC values differ, data was corrupted, and the client will return a NACK value. The FLEX_TWI_SR.PECERR bit is set automatically if a PEC error occurred.

In Client Transmitter mode, the client calculates a PEC value and transmits it to the host after all data bytes have been transmitted. Upon reception of this PEC byte, the host will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the host must take appropriate action.

See Client Read/Write Flowcharts for detailed flowcharts.

© 2026 Microchip Technology Inc. and its subsidiaries

— Timeouts

The TWI SMBus Timing register (FLEX_TWI_SMBTR) configures the SMBus timeout values. If a timeout occurs, the client leaves the bus. Furthermore, the FLEX_TWI_SR.TOUT bit is set.

65.9.5.5.High-Speed Client Mode

High-speed mode is enabled when the FLEX_TWI_CR.HSEN bit is written to one. Furthermore, the analog pad filter must be enabled, the FLEX_TWI_FILTR.PADFEN bit must be written to one and the FLEX_TWI_FILTR.FILT bit must be cleared. TWI High-speed mode operation is similar to TWI operation with the following exceptions:

1. A host code is received first at normal speed before entering High-speed mode period.
2. When TWI High-speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or repeated START (Sr) (asa consequence, OVF may happen).

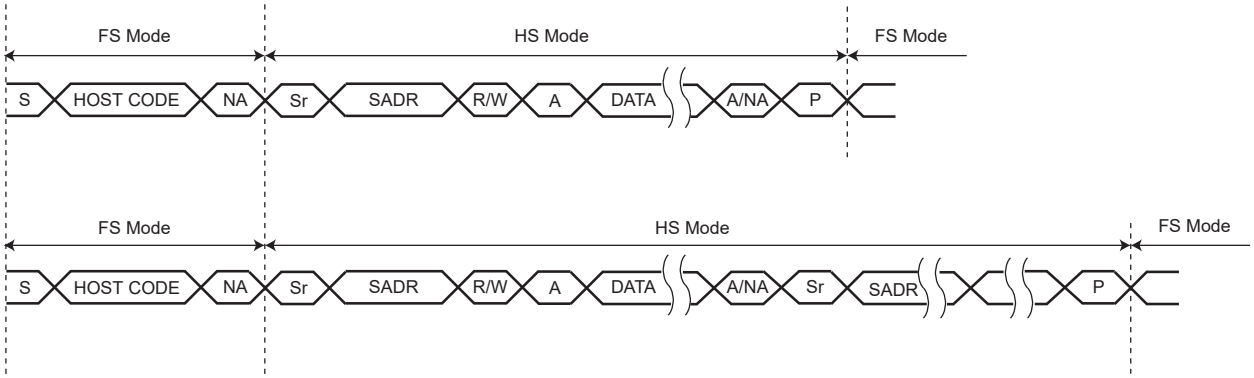
TWI High-speed mode allows transfers of up to 3.4 Mbit/s.

The TWI client in High-speed mode requires that the peripheral clock runs at a minimum of 14 MHz if client clock stretching is enabled (SCLWSDIS bit at ‘0’). If client clock stretching is disabled (SCLWSDIS bit at ‘1’), the peripheral clock must run at a minimum of 11 MHz (assuming the system has no latency).

Notes:

1. When client clock stretching is disabled, FLEX_TWI_RHR must always be read before receiving the next data (write access frame generated by the host). It is strongly recommended to use either the polling method on the FLEX_TWI_SR.RXRDY flag, or the DMA. If the receive is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid receive overrun.
2. When client clock stretching is disabled, FLEX_TWI_THR must be filled with the first data to send before the beginning of the frame (read access frame generated by the host). It is strongly recommended to use either the polling method on the FLEX_TWI_SR.TXRDY flag, or the DMA. If the transmit is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid transmit underrun.

65.9.5.5.1.Read/Write Operation



A TWI high-speed frame always begins with the following sequence:

1. START condition (S)
2. Host Code (0000 1XXX)
3. Not-acknowledge (NACK)

When the TWI is programmed in Client mode and TWI High-speed mode is activated, host code matching is activated and internal timings are set to match the TWI High-speed mode requirements.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.132. High-Speed Mode Read/Write

65.9.5.5.2.Usage

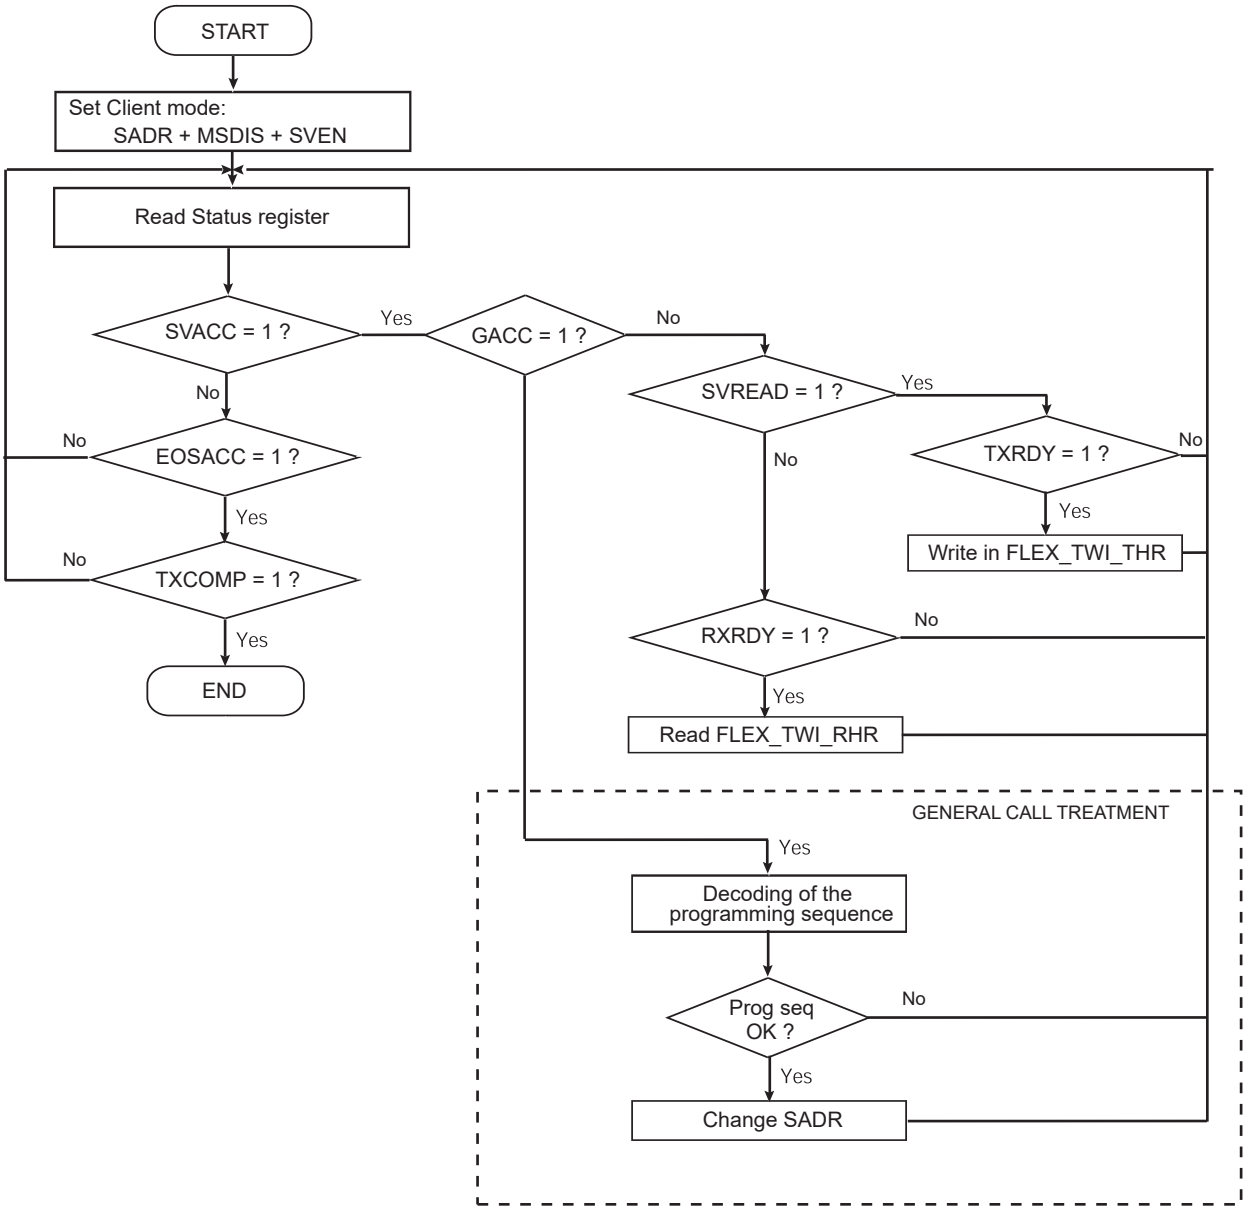
TWI High-speed mode usage is the same as the standard TWI (see Read/Write Flowcharts).

65.9.5.6.Alternative Command

In Client mode, the Alternative Command mode is used when the SMBus mode is enabled to send or check the PEC byte.

The Alternative Command mode is enabled by setting the ACMEN bit of the TWI Control register, and the transfer is configured in FLEX_TWI_ACR.

For a combined transfer with PEC, only the NPEC bit in FLEX_TWI_ACR must be set as the PEC byte is sent once at the end of the frame.



See Client Read/Write Flowcharts for detailed flowcharts.

65.9.5.7.Client Read/Write Flowcharts

The flowchart shown in the following figure gives an example of read and write operations in Client mode. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable register (FLEX_TWI_IER) be configured first.

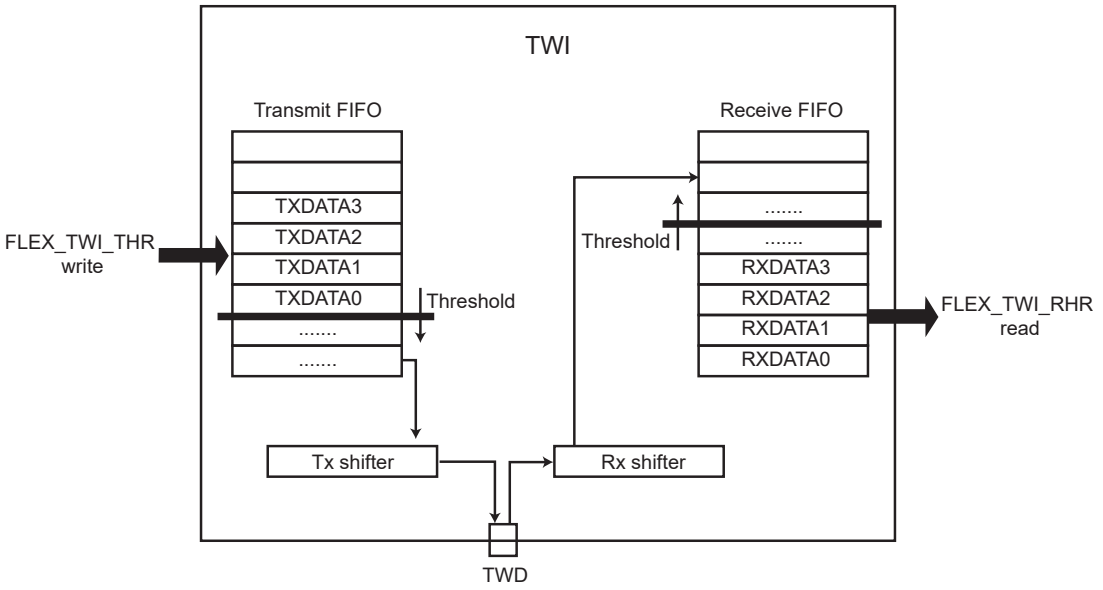
Figure 65.135. Read/Write in Client Mode with SMBus PEC and Alternative Command Mode

65.9.6. TWI FIFOs

65.9.6.1. Overview



The TWI includes two FIFOs which can be enabled/disabled using FLEX_TWI_CR.FIFOEN/FIFODIS. Both Host and Client modes must be disabled before enabling or disabling the FIFOs (FLEX_TWI_CR.MSDIS/SVDIS).

Writing FLEX_TWI_CR.FIFOEN to ‘1’ enables a 16-byte Transmit FIFO and a 16-byte Receive FIFO.

It is possible to write or to read single or multiple bytes in the same access to FLEX_TWI_THR/RHR, depending on FLEX_TWI_FMR.TXRDYM/RXRDYM settings.

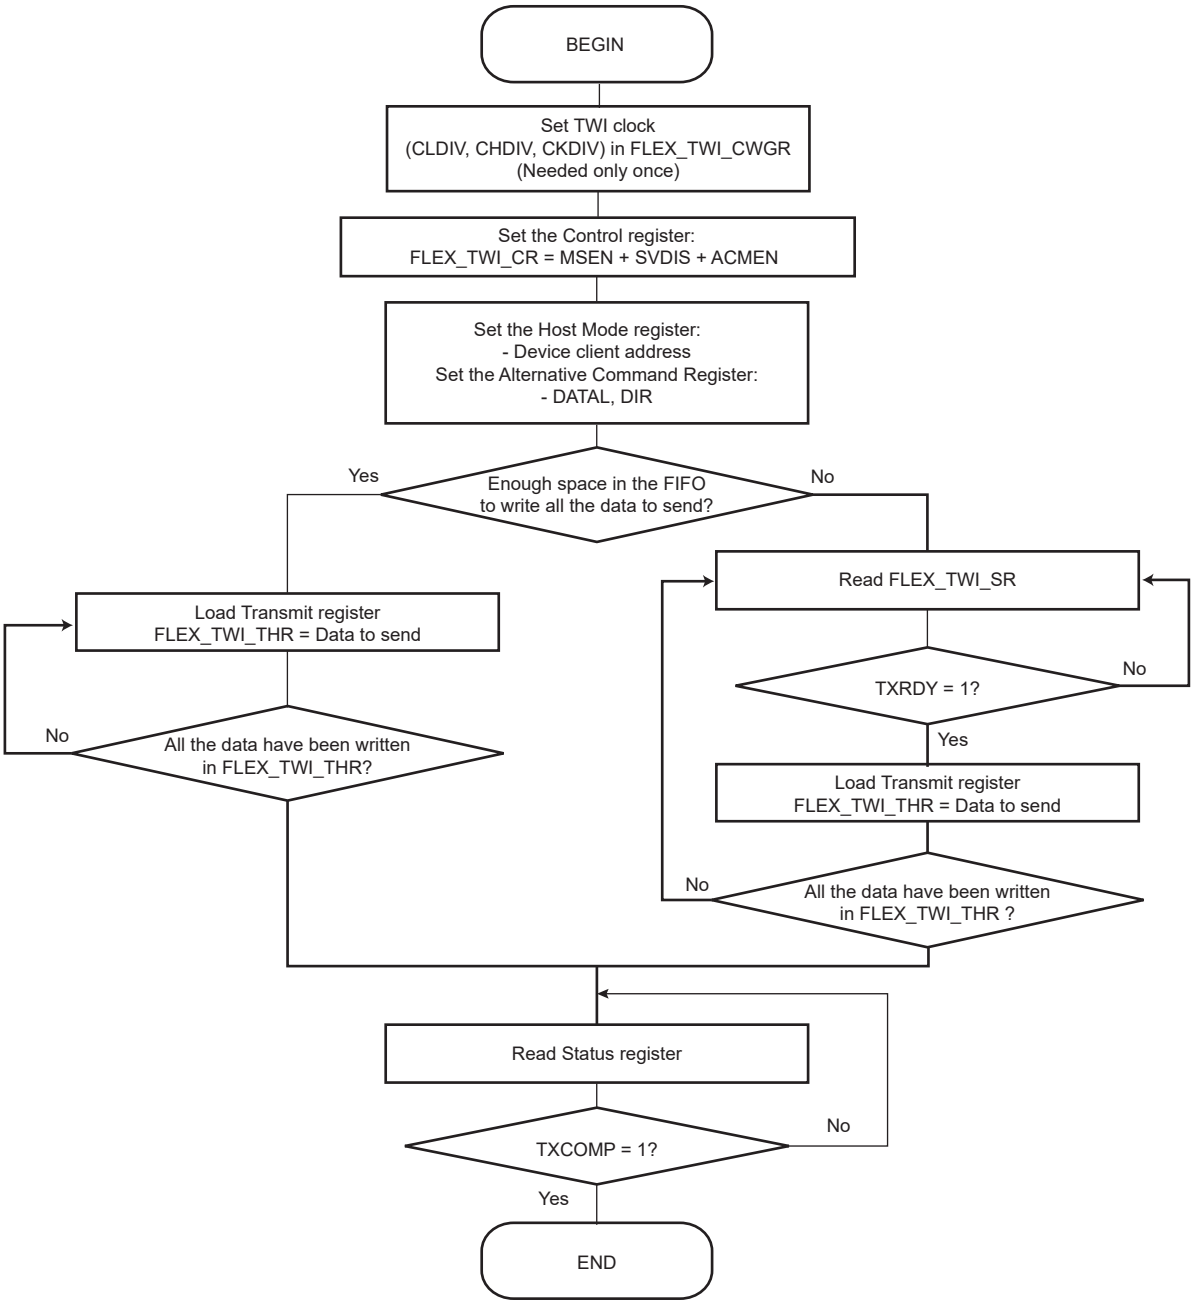
© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.136. TWI FIFOs Block Diagram

65.9.6.2.Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX_TWI_THR loads the Transmit FIFO.

The Transmit FIFO level is provided in FLEX_TWI_FLR.TXFL. If the FIFO can accept the number of bytes to be transmitted, there is no need to monitor FLEX_TWI_SR.TXRDY and the bytes can be successively written in FLEX_TWI_THR.



If the FIFO cannot accept the bytes due to insufficient space, wait for the TXRDY flag to be set before writing the bytes in FLEX_TWI_THR.

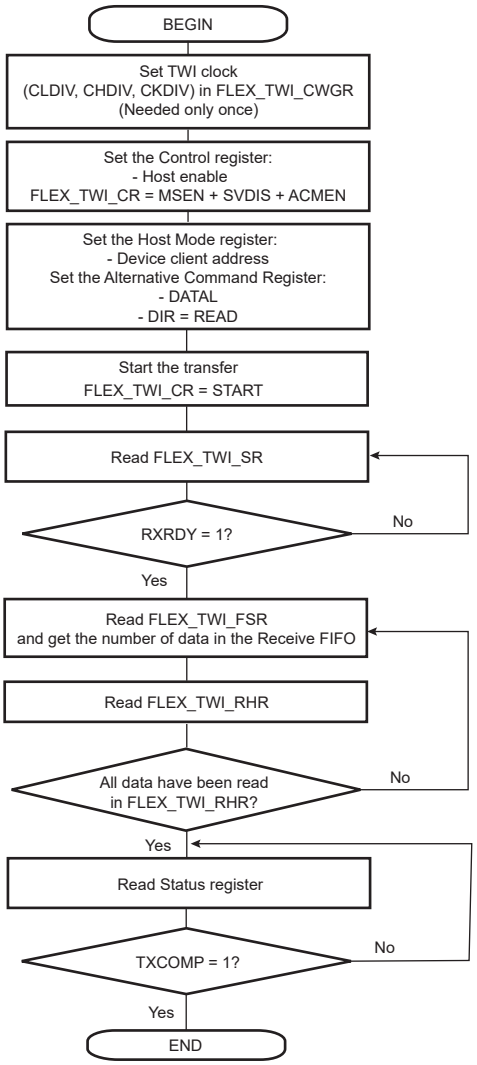
When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

See figures Sending Data with FIFO Enabled in Host Mode and Sending/Receiving Data with FIFO Enabled in Client Mode.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.137. Sending Data with FIFO Enabled in Host Mode

65.9.6.3.Receiving Data with FIFO Enabled



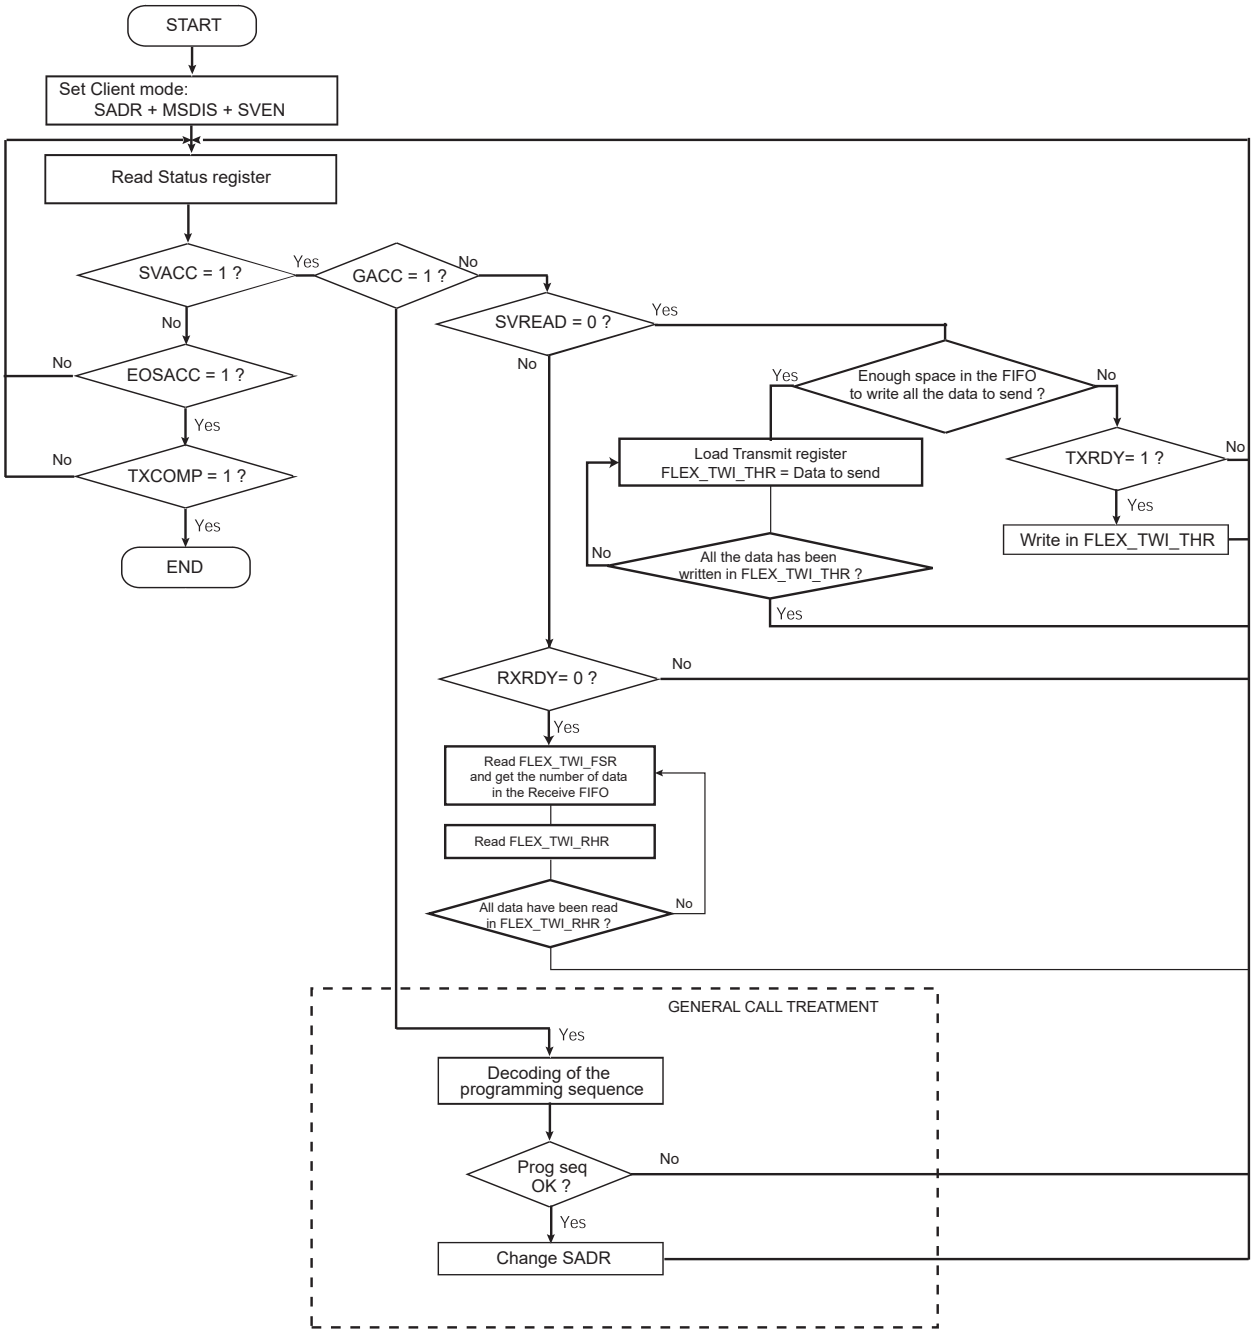
When the Receive FIFO is enabled, FLEX_TWI_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to ‘1’), the exact number of bytes can be checked with FLEX_TWI_FLR.RXFL. All the bytes can be read successively in FLEX_TWI_RHR without checking the FLEX_TWI_SR.RXRDY flag between each access.

See figures Receiving Data with FIFO Enabled in Host Mode and Sending/Receiving Data with FIFO Enabled in Client Mode.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.138. Receiving Data with FIFO Enabled in Host Mode



65.9.6.4.Sending/Receiving with FIFO Enabled in Client Mode

See Sending Data with FIFO Enabled and Receiving Data with FIFO Enabled for details.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 65.139. Sending/Receiving Data with FIFO Enabled in Client Mode

65.9.6.5.Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX_TWI_CR.TXFCLR/RXFCLR.

65.9.6.6.TXRDY and RXRDY Behavior

FLEX_TWI_SR.TXRDY/RXRDY flags display a specific behavior when FIFOs are enabled.

TXRDY indicates if a byte can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new byte. See figure TXRDY Behavior when TXRDYM = 0 in Host Mode.

RXRDY indicates if an unread byte is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread byte is in the Receive FIFO. See figure RXRDY Behavior when RXRDYM = 0 in Host and Client Modes.

© 2026 Microchip Technology Inc. and its subsidiaries

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the TWI FIFO Mode register (FLEX_TWI_FMR) to reduce the number of accesses to FLEX_TWI_THR/RHR.

As an example, in Host mode, the Transmit FIFO can be loaded with multiple bytes in the same access by configuring TXRDYM>0.

See FLEX_TWI_FMR for the FIFO configuration.

Figure 65.140. TXRDY Behavior when TXRDYM = 0 in Host Mode

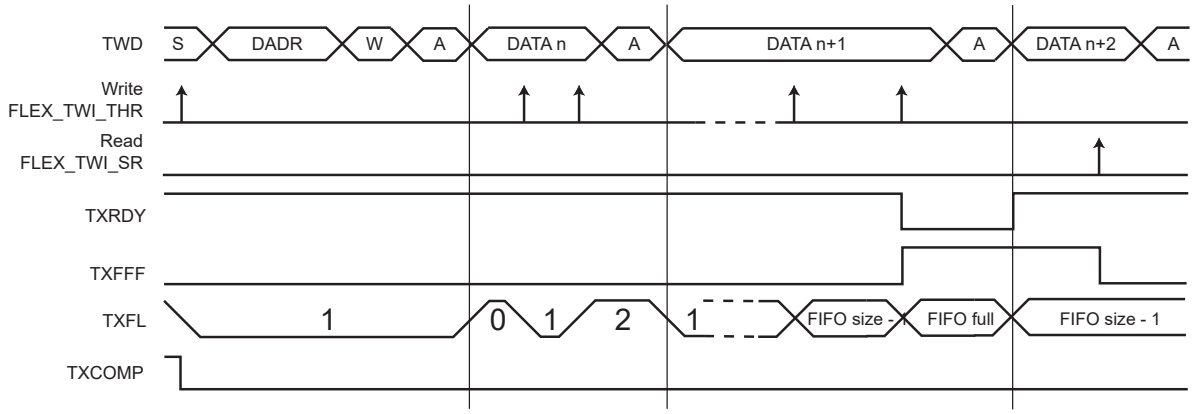


Figure 65.141. RXRDY Behavior when RXRDYM = 0 in Host and Client Modes

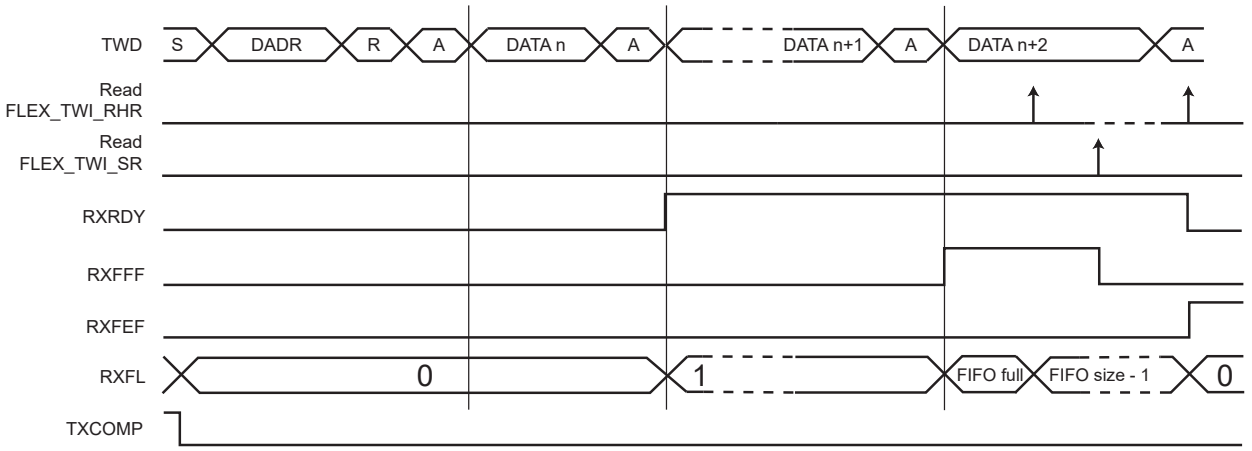

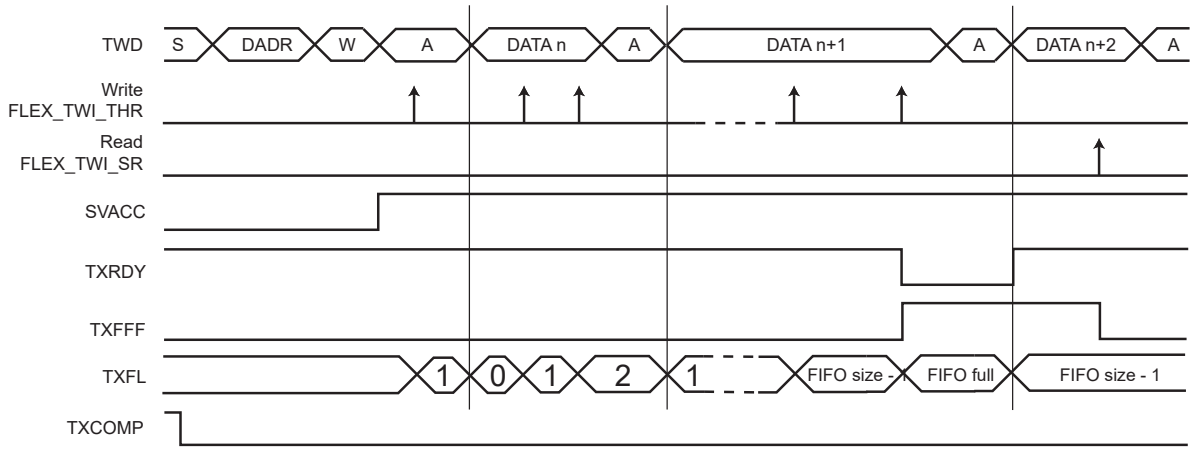

Figure 65.142. TXRDY Behavior when TXRDYM = 0 in Client Mode

© 2026 Microchip Technology Inc. and its subsidiaries

65.9.6.7.TWI Single Data Access

When FIFO is enabled and a byte access is performed in FLEX_TWI_THR, one byte is written in the FIFO. The same behavior applies for FLEX_TWI_RHR.

See TWI Transmit Holding Register and TWI Receive Holding Register.

However, it is possible to write/read multiple data each time FLEX_THR_THR/FLEX_US_RHR is accessed. See TWI Multiple Data Access.

65.9.6.8.TWI Multiple Data Access

It is possible to reduce the number of accesses to/from FLEX_TWI_THR/FLEX_US_RHR required to transfer an amount of data, by concatenating multiple bytes.

Up to four data can be written/read in one FLEX_TWI_THR/FLEX_TWI_RHR access when the FIFO is enabled (FLEX_TWI_CR.FIFOEN=1) and Sniffer mode is disabled (FLEX_TWI_SMR.SNIFF=0).

When the FIFO is enabled, the number of bytes to write/read is defined by the type of access in the holding register. If the access is a byte, only one byte is written/read (single data access), if the access is a halfword or a word a multiple data access is performed. If the access is a halfword, then two bytes are written/read and if the access is a word, four bytes are written/read.

Written/Read data are always right-aligned, as described in sections TWI Receive Holding Register (FIFO Enabled) and TWI Transmit Holding Register (FIFO Enabled).

As an example, if the Transmit FIFO is empty and there are six bytes to send, either of the following write accesses may be performed:

- Six FLEX_TWI_THR-byte write accesses
- Three FLEX_TWI_THR-halfword write accesses
- One FLEX_TWI_THR-word write access and one FLEX_TWI_THR halfword write access

With a Receive FIFO containing six bytes, any of the following read accesses may be performed:

- Six FLEX_TWI_RHR-byte read accesses
- Three FLEX_TWI_RHR-halfword read accesses
- One FLEX_TWI_RHR-word read access and one FLEX_TWI_RHR-halfword read access

65.9.6.8.1.TXRDY and RXRDY Configuration

It is possible to write one or more bytes in the same FLEX_TWI_THR/FLEX_TWI_RHR access. The TXRDY flag indicates if one or more bytes can be written in the FIFO depending on the configuration of FLEX_TWI_FMR.TXRDYM/RXRDYM.

When two bytes are written for each FLEX_TWI_THR access, the TXRDYM field can be configured so that the TXRDY flag is at '1' only when at least two bytes can be written in the Transmit FIFO.

When four bytes are read for each FLEX_TWI_RHR access, the RXRDYM field can be configured so that the RXRDY flag is at '1' only when at least four unread bytes are in the Receive FIFO.

65.9.6.8.2.DMA

The DMA transfer type must be configured according to the FLEX_TWI_FMR.TXRDYM/RXRDYM settings.

As example, FLEX_TWI_FMR.TXRDYM/RXRDYM=0 is not compatible with DMA transfers in word (32-bit).

65.9.6.9.Transmit FIFO Lock

If a frame is terminated early due to a not-acknowledge error (NACK flag), SMBus timeout error (TOUT flag) or host code acknowledge error (MACK flag), a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMA channels, etc., without any risk.

FLEX_TWI_SR.LOCK is used to check the state of the Transmit FIFO lock.

© 2026 Microchip Technology Inc. and its subsidiaries

The Transmit FIFO lock can be cleared by setting FLEX_TWI_CR.TXFLCLR to '1'.

65.9.6.10.FIFO Overflow/Underflow Error

If the Transmit FIFO is full and a write access is performed on FLEX_TWI_THR, it generates a Transmit FIFO overflow error and sets FLEX_TWI_FSR.TXFPTEF.

If the number of data written in FLEX_TWI_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO overflow error is generated and FLEX_TWI_FSR.TXFPTEF is set.

If the number of bytes read in FLEX_TWI_RHR (according to the register access size) is greater than the number of unread bytes in the Receive FIFO, a Receive FIFO underflow error is generated and FLEX_TWI_FSR.RXFPTEF is set.

No error occurs if the FIFO state/level is checked before writing/reading in FLEX_TWI_THR/ FLEX_TWI_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When such error occurs, other FIFO flags may not behave as expected; their states should be ignored. A software reset must be performed using FLEX_TWI_CR.SWRST. Note that issuing a software reset during transmission may leave a client in an unknown state holding the TWD line. In this case, a Bus Clear command may instruct the client to release the TWD line (the first frame sent afterward may not be received properly by the client). See Bus Clear Command to initiate the Bus Clear command.

65.9.6.11.FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of bytes in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of bytes currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX_TWI_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX_TWI_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX_TWI_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX_TWI_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX_TWI_FIER and FLEX_TWI_FIDR.

65.9.6.12.FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX_TWI_FIER and FLEX_TWI_FIDR.

FIFO flags state can be read in FLEX_TWI_FSR. They are cleared when FLEX_TWI_FSR is read.

65.9.7. TWI Comparison Function on Received Character

The TWI has the capability to extend the address matching on up to three client addresses. The FLEX_TWI_SMR.SADR1EN/SADR2EN/SADR3EN bits enable address matching on additional addresses which can be configured through the FLEX_TWI_SWMR.SADR1/SADR2/SADR3 fields. The DATAMEN bit has no effect.

The SVACC bit is set when there is a comparison match with the received client address.

65.9.8. Sniffer Mode

The Client Sniffer mode of a TWI can be enabled to ease the analysis/debug of a TWI bus activity. The TWI bus to be analyzed can be monitored by one TWI host embedded in the product or by an I2C host outside the product.

© 2026 Microchip Technology Inc. and its subsidiaries

In this mode, the TWI reports all (or part of) the TWI bus activity without impacting the TWI bus (no bus drive is performed). Depending on the MASK field value, only some specific transfers can be logged instead of the whole activity.

The peripheral TWIn can be configured to analyze the peripheral TWIn-1 (TWI0 analyzes TWImax) in a full transparent mode via predefined internal connections between TWI instances (n is the index of the TWI instance).

The predefined internal connections provide the capability to use the TWD and TWCK pins for alternate functions while the TWI peripheral is configured in Sniffer Client mode and the selected TWI bus to analyze is carried on these internal links.

The following fields must be programmed before entering Client mode:

1. FLEX_TWI_SMR.SADR: Use the client device address to indicate which frame(s) to log.
2. FLEX_TWI_SMR.MASK: Indicate which SADR bits should be masked and thus which transfers should be logged (set to 0x7F to log the whole TWI bus activity; all SADR bits are masked in this case). General Call accesses will always match.
3. FLEX_TWI_SMR.BSEL: Select the TWI bus to analyze (see figure Sniffer Mode Application Overview).
4. FLEX_TWI_SMR.SNIFF: Set to '1' to enable Client Sniffer mode.
5. FLEX_TWI_CR.MSDIS: Disable Host mode.
6. FLEX_TWI_CR.SVEN: Enable Client mode.

As the device receives the clock, values written in FLEX_TWI_CWGR are not relevant.

Once configured in Client Sniffer mode, the FLEX_TWI_SR.RXRDY bit indicates when a transfer has been logged in FLEX_TWI_RHR. An interrupt can be generated if configured. The FLEX_TWI_SR.OVRE flag indicates if an overrun error occurred if the application is not fast enough to read FLEX_TWI_RHR.

In Client Sniffer mode, FLEX_TWI_RHR logs data as follows:

- The RXDATA field reports the sniffed 8-bit data field.
- The SSTATE field indicates if a START condition has been detected before the 8-bit data field.
- The PSTATE field indicates if a STOP condition has been detected after the previously sniffed 8-bit data field.
- The ASTATE field indicates which acknowledge condition has been detected after the previously sniffed 8-bit data field.

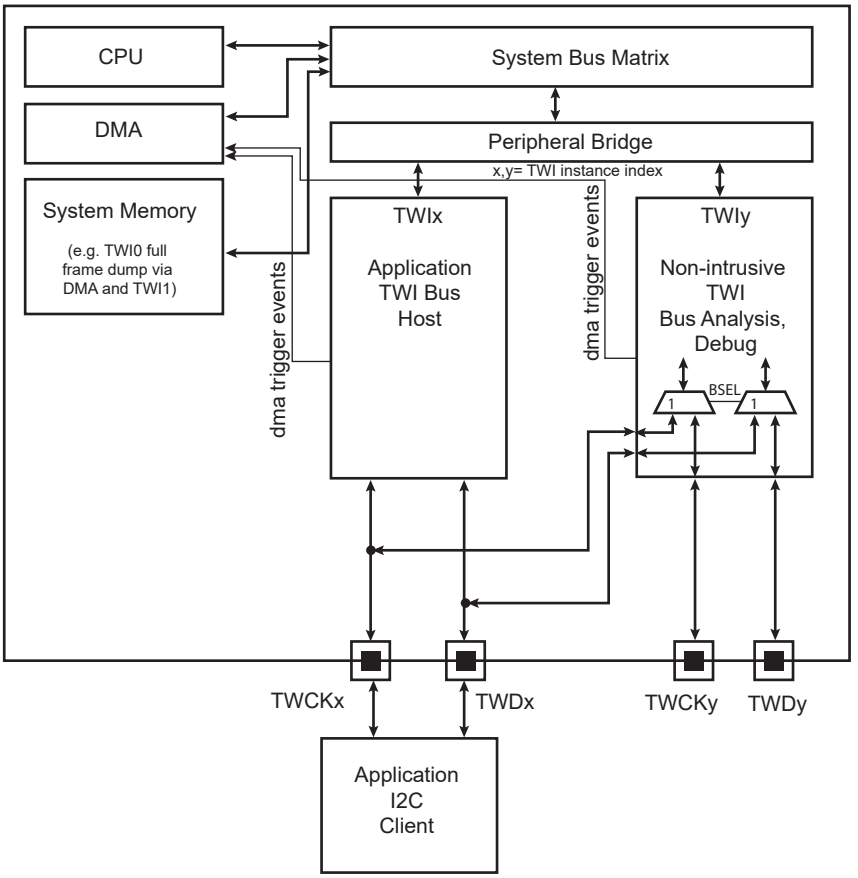
Figure 65.143. Sniffer Mode Application Overview



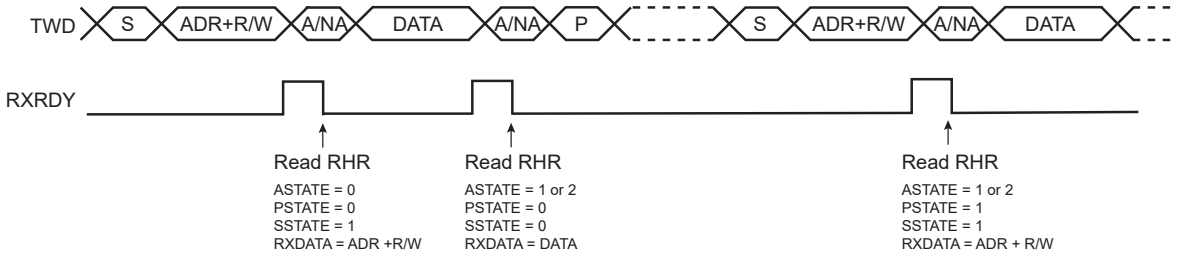


Figure 65.144. Client Sniffer Mode Log

65.9.9. TWI Register Write Protection

The FLEXCOM operating mode (FLEX_MR.OPMODE) must be set to FLEX_MR_OPMODE_TWI to enable access to the write protection registers.

To prevent any single software error from corrupting TWI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the TWI Write Protection Mode Register (FLEX_TWI_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the TWI Write Protection Status Register (FLEX_TWI_WPSR) is set and the Write Protection Violation Source (WPVSRC) field indicates the register in which the write access has been attempted.

© 2026 Microchip Technology Inc. and its subsidiaries

The WPVS bit is automatically cleared after reading FLEX_TWI_WPSR.

The following register(s) can be write-protected when WPEN is set:

- TWI Client Mode Register
- TWI Clock Waveform Generator Register
- TWI SMBus Timing Register
- TWI FIFO Mode Register

The following register(s) can be write-protected when WPITEN is set:

- TWI Interrupt Enable Register
- TWI Interrupt Disable Register

The following register(s) can be write-protected when WPCREN is set:

- TWI Control Register

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							OPMODE[1:0]	
Access							R/W	R/W
Reset							0	1

Bits 1:0 – OPMODE[1:0] FLEXCOM Operating Mode

Value	Name	Description
0	NO_COM	No communication
1	USART	All UART-related protocols are selected (RS232, RS485, IrDA, ISO7816, LIN, LON) SPI/TWI-related registers are not accessible and have no impact on IOs.
2	SPI	SPI operating mode is selected. USART/TWI related registers are not accessible and have no impact on IOs.
3	TWI	All TWI-related protocols are selected (TWI, SMBus). USART/SPI-related registers are not accessible and have no impact on IOs.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – TXDATA[15:0] Transmit Data
This register is a mirror of:
- USART Transmit Holding Register (FLEX_US_THR) if FLEX_MR.OPMODE field equals 1
- SPI Transmit Data Register (FLEX_SPI_TDR) if FLEX_MR.OPMODE field equals 2
- TWI Transmit Holding Register (FLEX_TWI_THR) if FLEX_MR.OPMODE field equals 3

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.4. USART Control Register

Name: FLEX_US_CR
Offset: 0x200
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	FIFODIS	FIFOEN		REQCLR		TXFLCLR	RXFCLR	TXFCLR
Access	W	W		W		W	W	W
Reset	–	–		–		–	–	–

Bit	23	22	21	20	19	18	17	16
			LINWKUP	LINABT	RTSDIS	RTSEN		
Access			W	W	W	W		
Reset			–	–	–	–		

Bit	15	14	13	12	11	10	9	8
	RETTO	RSTNACK	RSTIT	SENDA	STTTO	STPBRK	STTBRK	RSTSTA
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	TXDIS	TXEN	RXDIS	RXEN	RSTTX	RSTRX		
Access	W	W	W	W	W	W		
Reset	–	–	–	–	–	–		

Bit 31 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs.

Bit 30 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs.

Bit 28 – REQCLR Request to Clear the Comparison Trigger

Value	Description
0	No effect.
1	Restarts the comparison trigger to enable FLEX_US_RHR loading.

Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

Value	Description
0	No effect.
1	Clears the Transmit FIFO Lock.

Bit 25 – RXFCLR Receive FIFO Clear

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Empties the Receive FIFO.

Bit 24 – TXFCLR Transmit FIFO Clear

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

Bit 21 – LINWKUP Send LIN Wakeup Signal

Value	Description
0	No effect:
1	Sends a wakeup signal on the LIN bus.

Bit 20 – LINABT Abort LIN Transmission

Value	Description
0	No effect.
1	Aborts the current LIN transmission.

Bit 19 – RTSDIS Request to Send Disable

Value	Description
0	No effect.
1	Drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 0.

Bit 18 – RTSEN Request to Send Enable

Value	Description
0	No effect.
1	Drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 0.

Bit 15 – RETTO Start Timeout Immediately

Value	Description
0	No effect
1	Immediately restarts timeout period.

Bit 14 – RSTNACK Reset Non Acknowledge

Value	Description
0	No effect
1	Resets FLEX_US_CSR.NACK.

Bit 13 – RSTIT Reset Iterations

Value	Description
0	No effect.
1	Resets FLEX_US_CSR.ITER. No effect if the ISO7816 is not enabled.

Bit 12 – SENDA Send Address

Value	Description
0	No effect.
1	In Multidrop mode only, the next character written to FLEX_US_THR is sent with the address bit set.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 11 – STTTO Clear TIMEOUT Flag and Start Timeout After Next Character Received

Value	Description
0	No effect.
1	Starts waiting for a character before clocking the timeout counter. Immediately disables a timeout period in progress. Resets the FLEX_US_CSR.TIMEOUT status bit.

Bit 10 – STPBRK Stop Break

Value	Description
0	No effect.
1	Stops transmission of the break after a minimum of one character length and transmits a high level during 12-bit periods. No effect if no break is being transmitted.

Bit 9 – STTBRK Start Break

Value	Description
0	No effect.
1	Starts transmission of a break after the characters present in FLEX_US_THR and the Transmit Shift Register have been transmitted. No effect if a break is already being transmitted.

Bit 8 – RSTSTA Reset Status Bits

Value	Description
0	No effect.
1	Resets the PARE, FRAME, OVRE, MANE, LINBE, LINISFE, LINIPE, LINCE, LINSNRE, LINSTE, LINHTE, LINID, LINTC, LINBK, CMP and RXBRK in FLEX_US_CSR status bits, as well as the TXFEF, TXFFF, TXFTHF, RXFEF, RXFFF, RXFTHF, TXFPTEF, RXFPTEF in FLEX_US_FESR status bits.

Bit 7 – TXDIS Transmitter Disable

Value	Description
0	No effect.
1	Disables the transmitter.

Bit 6 – TXEN Transmitter Enable

Value	Description
0	No effect.
1	Enables the transmitter if TXDIS is 0.

Bit 5 – RXDIS Receiver Disable

Value	Description
0	No effect.
1	Disables the receiver.

Bit 4 – RXEN Receiver Enable

Value	Description
0	No effect.
1	Enables the receiver, if RXDIS is 0.

Bit 3 – RSTTX Reset Transmitter

Value	Description
0	No effect.
1	Resets the transmitter.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 2 – RSTRX Reset Receiver

Value	Description
0	No effect.
1	Resets the receiver.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.5. USART Mode Register

Name: FLEX_US_MR
Offset: 0x204
Reset: 0xC0000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	ONEBIT	MODSYNC	MAN	FILTER		MAX_ITERATION[2:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	–	–	–	–		–	–	–

Bit	23	22	21	20	19	18	17	16
	INVDATA	VAR_SYNC	DSNACK	INACK	OVER	CLKO	MODE9	MSBF
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8
	CHMODE[1:0]		NBSTOP[1:0]		PAR[2:0]			SYNC
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	CHRL[1:0]		USCLKS[1:0]		USART_MODE[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–

Bit 31 – ONEBIT Start Frame Delimiter Selector

Value	Description
0	Start frame delimiter is COMMAND or DATA SYNC.
1	Start frame delimiter is one bit.

Bit 30 – MODSYNC Manchester Synchronization Mode

Value	Description
0	The Manchester start bit is a 0 to 1 transition
1	The Manchester start bit is a 1 to 0 transition.

Bit 29 – MAN Manchester Encoder/Decoder Enable

Value	Description
0	Manchester encoder/decoder are disabled.
1	Manchester encoder/decoder are enabled.

Bit 28 – FILTER Receive Line Filter

Value	Description
0	The USART does not filter the receive line.
1	The USART filters the receive line using a three-sample filter (1/16-bit clock) (2 over 3 majority).

Bits 26:24 – MAX_ITERATION[2:0] Maximum Number of Automatic Iterations

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0–7	Defines the maximum number of iterations in mode ISO7816, protocol T = 0.

Bit 23 – INVDATA Inverted Data

Value	Description
0	The data field transmitted on TXD line is the same as the one written in FLEX_US_THR or the content read in FLEX_US_RHR is the same as RXD line. Normal mode of operation.
1	The data field transmitted on TXD line is inverted (voltage polarity only) compared to the value written in FLEX_US_THR or the content read in FLEX_US_RHR is inverted compared to what is received on RXD line (or ISO7816 IO line). Inverted mode of operation, useful for contactless card application. To be used with configuration bit MSBF.

Bit 22 – VAR_SYNC Variable Synchronization of Command/Data Sync Start Frame Delimiter

Value	Description
0	User defined configuration of command or data sync field depending on MODSYNC value.
1	The sync field is updated when a character is written into FLEX_US_THR.

Bit 21 – DSNACK Disable Successive NACK

The MAX_ITERATION field must be cleared if DSNACK is cleared.

Value	Description
0	NACK is sent on the ISO line as soon as a parity error occurs in the received character (unless INACK is set).
1	Successive parity errors are counted up to the value specified in the MAX_ITERATION field. These parity errors generate a NACK on the ISO line. As soon as this value is reached, no additional NACK is sent on the ISO line. The flag ITER is asserted.

Bit 20 – INACK Inhibit Non Acknowledge

Value	Description
0	The NACK is generated.
1	The NACK is not generated.

Bit 19 – OVER Oversampling Mode

Value	Description
0	16x Oversampling.
1	8x Oversampling.

Bit 18 – CLKO Clock Output Select

Value	Description
0	The USART does not drive the SCK pin (Synchronous Client mode or Asynchronous mode with external baud rate clock source).
1	The USART drives the SCK pin if USCLKS does not select the external clock SCK (USART Synchronous Host mode).

Bit 17 – MODE9 9-bit Character Length

Value	Description
0	CHRL defines character length.
1	9-bit character length.

Bit 16 – MSBF Bit Order

Value	Description
0	Least significant bit is sent/received first.
1	Most significant bit is sent/received first.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 15:14 – CHMODE[1:0] Channel Mode

Value	Name	Description
0	NORMAL	Normal mode
1	AUTOMATIC	Automatic Echo. Receiver input is connected to the TXD pin.
2	LOCAL_LOOPBACK	Local Loopback. Transmitter output is connected to the Receiver Input.
3	REMOTE_LOOPBACK	Remote Loopback. RXD pin is internally connected to the TXD pin.

Bits 13:12 – NBSTOP[1:0] Number of Stop Bits

Value	Name	Description
0	1_BIT	1 stop bit
1	1_5_BIT	1.5 stop bit (SYNC = 0) or reserved (SYNC = 1)
2	2_BIT	2 stop bits

Bits 11:9 – PAR[2:0] Parity Type

Value	Name	Description
0	EVEN	Even parity
1	ODD	Odd parity
2	SPACE	Parity forced to 0 (Space)
3	MARK	Parity forced to 1 (Mark)
4	NO	No parity
6	MULTIDROP	Multidrop mode

Bit 8 – SYNC Synchronous Mode Select

Value	Description
0	USART operates in Asynchronous mode (UART).
1	USART operates in Synchronous mode.

Bits 7:6 – CHRL[1:0] Character Length

Value	Name	Description
0	5_BIT	Character length is 5 bits
1	6_BIT	Character length is 6 bits
2	7_BIT	Character length is 7 bits
3	8_BIT	Character length is 8 bits

Bits 5:4 – USCLKS[1:0] Clock Selection

Value	Name	Description
0	MCK	Peripheral clock is selected
1	DIV	Peripheral clock divided (DIV = 8) is selected
2	GCLK	PMC generic clock is selected. If the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.
3	SCK	External pin SCK is selected

Bits 3:0 – USART_MODE[3:0] USART Mode of Operation
Values not listed in the table below should be considered ‘reserved’.

Value	Name	Description
0x0	NORMAL	Normal mode
0x1	RS485	RS485
0x2	HW_HANDSHAKING	Hardware handshaking
0x4	ISO7816_T_0	ISO7816 Protocol: T = 0
0x6	ISO7816_T_1	ISO7816 Protocol: T = 1
0x8	IRDA	IrDA
0x9	LON	LON

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0xA	LIN_MASTER	LIN Host mode
0xB	LIN_SLAVE	LIN Client mode
0xC	DATA16BIT_MASTER	16-bit data host
0xD	DATA16BIT_SLAVE	16-bit data client

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.6. USART Interrupt Enable Register (Default Mode)

Name: FLEX_US_IER (DEFAULT_MODE)
Offset: 0x208
Reset: –
Property: Write-only

For LIN-specific configurations, see USART Interrupt Enable Register (LIN_MODE).

For LON-specific configurations, see USART Interrupt Enable Register (LON_MODE).

This register can only be written if the WPITEN bit is cleared in the USART Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								MANE
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
		CMP			CTSIC			
Access		W			W			
Reset		–			–			

Bit	15	14	13	12	11	10	9	8
			NACK			ITER	TXEMPTY	TIMEOUT
Access			W			W	W	W
Reset			–			–	–	–

Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE			RXBRK	TXRDY	RXRDY
Access	W	W	W			W	W	W
Reset	–	–	–			–	–	–

Bit 24 – MANE Manchester Error Interrupt Enable

Bit 22 – CMP Comparison Interrupt Enable

Bit 19 – CTSIC Clear to Send Input Change Interrupt Enable

Bit 13 – NACK Non Acknowledge Interrupt Enable

Bit 10 – ITER Max number of Repetitions Reached Interrupt Enable

Bit 9 – TXEMPTY TXEMPTY Interrupt Enable

Bit 8 – TIMEOUT Timeout Interrupt Enable

Bit 7 – PARE Parity Error Interrupt Enable

Bit 6 – FRAME Framing Error Interrupt Enable

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 5 – OVRE Overrun Error Interrupt Enable

Bit 2 – RXBRK Receiver Break Interrupt Enable

Bit 1 – TXRDY TXRDY Interrupt Enable

Bit 0 – RXRDY RXRDY Interrupt Enable

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.7. USART Interrupt Enable Register (LIN_MODE)

Name: FLEX_US_IER (LIN_MODE)
Offset: 0x208
Reset: –
Property: Write-only

This configuration is relevant only if USART_MODE = 0xA or 0xB in the USART Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

65.10.9. USART Interrupt Disable Register (Default Mode)

Name: FLEX_US_IDR (DEFAULT_MODE)
Offset: 0x20C
Reset: –
Property: Write-only

For LIN-specific configurations, see USART Interrupt Disable Register (LIN_MODE).

For LON-specific configurations, see USART Interrupt Disable Register (LON_MODE).

This register can only be written if the WPITEN bit is cleared in the USART Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

	PARE	FRAME	OVRE			RXBRK	TXRDY	RXRDY
Access	R	R	R			R	R	R
Reset	–	–	–			–	–	–

Bit 24 – MANE Manchester Error

Value	Description
0	No Manchester error has been detected since the last RSTSTA command was issued.
1	At least one Manchester error has been detected since the last RSTSTA command was issued.

Bit 23 – CTS Image of CTS Input

Value	Description
0	CTS input is driven low.
1	CTS input is driven high.

Bit 22 – CMP Comparison Status

Value	Description
0	No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in since the last RSTSTA command was issued.
1	A received character matched the comparison criteria since the last RSTSTA command was issued.

Bit 19 – CTSIC Clear to Send Input Change Flag

Value	Description
0	No input change has been detected on the CTS pin since the last read of FLEX_US_CSR.
1	At least one input change has been detected on the CTS pin since the last read of FLEX_US_CSR.

Bit 13 – NACK Non Acknowledge Interrupt

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Non acknowledge has not been detected since the last RSTNACK.
1	At least one non acknowledge has been detected since the last RSTNACK.

Bit 10 – ITER Max Number of Repetitions Reached

Value	Description
0	Maximum number of repetitions has not been reached since the last RSTIT command was issued.
1	Maximum number of repetitions has been reached since the last RSTIT command was issued.

Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX_US_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

Bit 8 – TIMEOUT Receiver Timeout

Value	Description
0	There has not been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0.
1	There has been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO).

Bit 7 – PARE Parity Error

Value	Description
0	No parity error has been detected since the last RSTSTA command was issued.
1	At least one parity error has been detected since the last RSTSTA command was issued.

Bit 6 – FRAME Framing Error

Value	Description
0	No stop bit has been detected low since the last RSTSTA command was issued.
1	At least one stop bit has been detected low since the last RSTSTA command was issued.

Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

Bit 2 – RXBRK Break Received/End of Break

Value	Description
0	No break received or end of break detected since the last RSTSTA command was issued.
1	Break received or end of break detected since the last RSTSTA command was issued.

Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX_US_THR)

When FIFOs are disabled:
0: A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or an STTBRK command has been requested, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.
1: There is no character in FLEX_US_THR.
When FIFOs are enabled:
0: Transmit FIFO is full and cannot accept more data.
1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.
TXRDY behavior with FIFO enabled is illustrated in TXEMPTY, TXRDY and RXRDY Behavior.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX_US_RHR)

When FIFOs are disabled:
0: No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.
1: At least one complete character has been received and FLEX_US_RHR has not yet been read.
When FIFOs are enabled:
0: Receive FIFO is empty; no data to read
1: At least one unread data is in the Receive FIFO
RXRDY behavior with FIFO enabled is illustrated in TXEMPTY, TXRDY and RXRDY Behavior.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.16.USART Channel Status Register (LIN_MODE)

Name: FLEX_US_CSR (LIN_MODE)
Offset: 0x214
Reset: –
Property: Read-only

This configuration is relevant only if USART_MODE = 0xA or 0xB in the USART Mode Register.

Access	R	R	R				R	R
Reset	–	–	–				–	–

Bit 31 – LINHTE LIN Header Timeout Error

Value	Description
0	No LIN header timeout error has been detected since the last RSTSTA command was issued.
1	A LIN header timeout error has been detected since the last RSTSTA command was issued.

Bit 30 – LINSTE LIN Synch Tolerance Error

Value	Description
0	No LIN synch tolerance error has been detected since the last RSTSTA command was issued.
1	A LIN synch tolerance error has been detected since the last RSTSTA command was issued.

Bit 29 – LINSNRE LIN Client Not Responding Error

Value	Description
0	No LIN client not responding error has been detected since the last RSTSTA command was issued.
1	A LIN client not responding error has been detected since the last RSTSTA command was issued.

Bit 28 – LINCE LIN Checksum Error

Value	Description
0	No LIN checksum error has been detected since the last RSTSTA command was issued.
1	A LIN checksum error has been detected since the last RSTSTA command was issued.

Bit 27 – LINIPE LIN Identifier Parity Error

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No LIN identifier parity error has been detected since the last RSTSTA command was issued.
1	A LIN identifier parity error has been detected since the last RSTSTA command was issued.

Bit 26 – LINISFE LIN Inconsistent Synch Field Error

Value	Description
0	No LIN inconsistent synch field error has been detected since the last RSTSTA
1	The USART is configured as a client node and a LIN Inconsistent synch field error has been detected since the last RSTSTA command was issued.

Bit 25 – LINBE LIN Bit Error

Value	Description
0	No bit error has been detected since the last RSTSTA command was issued.
1	A bit error has been detected since the last RSTSTA command was issued.

Bit 23 – LINBLS LIN Bus Line Status

Value	Description
0	LIN bus line is set to 0.
1	LIN bus line is set to 1.

Bit 15 – LINTC LIN Transfer Completed

Value	Description
0	The USART is idle or a LIN transfer is ongoing.
1	A LIN transfer has been completed since the last RSTSTA command was issued.

Bit 14 – LINID LIN Identifier Sent or LIN Identifier Received

If USART operates in LIN Host mode (USART_MODE = 0xA):
0: No LIN identifier has been sent since the last RSTSTA command was issued.
1: At least one LIN identifier has been sent since the last RSTSTA command was issued.
If USART operates in LIN Client mode (USART_MODE = 0xB):
0: No LIN identifier has been received since the last RSTSTA command was issued.
1: At least one LIN identifier has been received since the last RSTSTA.

Bit 13 – LINBK LIN Break Sent or LIN Break Received

Applicable if USART operates in LIN Host mode (USART_MODE = 0xA):
0: No LIN break has been sent since the last RSTSTA command was issued.
1: At least one LIN break has been sent since the last RSTSTA.
If USART operates in LIN Client mode (USART_MODE = 0xB):
0: No LIN break has been received since the last RSTSTA command was issued.
1: At least one LIN break has been received since the last RSTSTA command was issued.

Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX_US_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

Bit 8 – TIMEOUT Receiver Timeout

Value	Description
0	There has not been a timeout since the last start timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0.
1	There has been a timeout since the last start timeout command (FLEX_US_CR.STTTO).

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 7 – PARE Parity Error

Value	Description
0	No parity error has been detected since the last RSTSTA command was issued.
1	At least one parity error has been detected since the last RSTSTA command was issued.

Bit 6 – FRAME Framing Error

Value	Description
0	No stop bit has been detected low since the last RSTSTA command was issued.
1	At least one stop bit has been detected low since the last RSTSTA command was issued.

Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX_US_THR)

Value	Description
0	A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.
1	There is no character in FLEX_US_THR.

Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX_US_RHR)

Value	Description
0	No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.
1	At least one complete character has been received and FLEX_US_RHR has not yet been read.

	LCRCE	LSFE	OVRE				TXRDY	RXRDY
Access	R	R	R				R	R
Reset	–	–	–				–	–

Bit 28 – LBLOVFE LON Backlog Overflow Error

Value	Description
0	No backlog overflow error occurred since the last RSTSTA command was issued.
1	At least one backlog error overflow occurred since the last RSTSTA command was issued.

Bit 27 – LRXD LON Reception End Flag

Value	Description
0	Reception on going or no reception occurred since the last RSTSTA command was issued.
1	At least one reception has been performed since the last RSTSTA command was issued.

Bit 26 – LFET LON Frame Early Termination

Value	Description
0	No frame has been terminated early due to collision detection since the last RSTSTA command was issued.
1	At least one transmission has been terminated due to collision detection since the last RSTSTA command was issued. (This stops the DMA until reset with RSTSTA bit).

Bit 25 – LCOL LON Collision Detected Flag

Value	Description
0	No collision occurred while transmitting since the last RSTSTA command was issued.
1	At least one collision occurred while transmitting since the last RSTSTA command was issued.

Bit 24 – LTXD LON Transmission End Flag

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Transmission on going or no transmission occurred since the last RSTSTA command was issued.
1	At least one transmission has been performed since the last RSTSTA command was issued.

Bit 10 – UNRE Underrun Error

Value	Description
0	No LON underrun error has occurred since the last RSTSTA command was issued.
1	At least one LON underrun error has occurred since the last RSTSTA command was issued.

Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX_US_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

Bit 7 – LCRCE LON CRC Error

Value	Description
0	No CRC error has been detected since the last RSTSTA command was issued.
1	At least one CRC error has been detected since the last RSTSTA command was issued.

Bit 6 – LSFE LON Short Frame Error

Value	Description
0	No short frame received since the last RSTSTA command was issued.
1	At least one short frame received since the last RSTSTA command was issued.

Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX_US_THR)

Value	Description
0	A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.
1	There is no character in FLEX_US_THR.

Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX_US_RHR)

Value	Description
0	No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.
1	At least one complete character has been received and FLEX_US_RHR has not yet been read.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.18.USART Receive Holding Register (Default Mode)

Name: FLEX_US_RHR (DEFAULT_MODE)
Offset: 0x218
Reset: 0x00000000
Property: Read-only

If FIFO is enabled (FLEX_US_CR.FIFOEN=1), a byte access on FLEX_SPI_TDR reads one byte (FLEX_US_RHR.MODE9=0), see FIFO Single Data Access for details.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

	RXCHR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 15 – RXSYNH Received Sync

Value	Description
0	Last character received is a data.
1	Last character received is a command.

Bits 8:0 – RXCHR[8:0] Received Character
Last character received if RXRDY is set.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.19.USART Receive Holding Register (FIFO Multi Data)

Name: FLEX_US_RHR (FIFO_MULTI_DATA)
Offset: 0x218
Reset: 0x00000000
Property: Read-only

To read multi-data in a single access, the FIFO must be enabled (FLEX_US_CR.FIFOEN=1) and FLEX_US_MR.MODE9=0. The access type (byte, halfword or word) determines the number of data written in a single access (1, 2, 4), see FIFO Multiple Data Access for details.

Bit	31	30	29	28	27	26	25	24
	RXCHR3[7:0]

	TXCHR[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 15 – TXSYNH Sync Field to be Transmitted

Value	Description
0	The next character sent is encoded as a data. Start frame delimiter is DATA SYNC.
1	The next character sent is encoded as a command. Start frame delimiter is COMMAND SYNC.

Bits 8:0 – TXCHR[8:0] Character to be Transmitted
The next character to be transmitted after the current character if TXRDY is not set.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.21.USART Transmit Holding Register (FIFO Multi Data)

Name: FLEX_US_THR (FIFO_MULTI_DATA)
Offset: 0x21C
Reset: –
Property: Write-only

To write multi-data in a single access, the FIFO must be enabled (FLEX_US_CR.FIFOEN=1) and FLEX_US_MR.MODE9=0. The access type (byte, halfword or word) determines the number of data written in a single access (1, 2 or 4), see FIFO Multiple Data Access for details.

Bit	31	30	29	28	27	26	25	24
	TXCHR3[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	23	22	21	20	19	18	17	16

	TXCHR0[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 0:7, 8:15, 16:23, 24:31 – TXCHRx Character to be Transmitted
Next character to be transmitted.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.22.USART Baud Rate Generator Register

Name: FLEX_US_BRGR
Offset: 0x220
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						FP[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8
	CD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 18:16 – FP[2:0] Fractional Part

WARNING When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by "selected clock" period from time to time. The duty cycle depends on the value of the CD field.

Value	Description
0	Fractional divider is disabled.
1–7	Baud rate resolution, defined by FP × 1/8.

Bits 15:0 – CD[15:0] Clock Divider

CD	USART_MODE ≠ ISO7816			USART_MODE = ISO7816
	SYNC = 0		SYNC = 1	
	OVER = 0	OVER = 1		
0	Baud Rate Clock disabled			
1 to 65535	CD = Selected Clock / (16 × Baud Rate)	CD = Selected Clock / (8 × Baud Rate)	CD = Selected Clock / Baud Rate	CD = Selected Clock / (FI_DI_RATIO × Baud Rate)

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.23.USART Receiver Timeout Register

Name: FLEX_US_RTOR
Offset: 0x224
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
								TO[16]
Access								R/W
Reset								0

Bit	15	14	13	12	11	10	9	8
	TO[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TO[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 16:0 – TO[16:0] Timeout Value
The TO field size is limited to 8 bits if the ISO7816 logic is not implemented on some instances of FLEXCOM. The ISO7816 logic is implemented if it is possible to write FLEX_US_MR.MAX_ITERATIONS=1 (a read operation must be performed after the write operation to check that MAX_ITERATIONS equals 1).

Value	Description
0	The receiver timeout is disabled.
1–131071	The receiver timeout is enabled and the timeout delay is TO × bit period.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.24.USART Transmitter Timeguard Register

Name: FLEX_US_TTGR
Offset: 0x228
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

For LON-specific configurations, see USART Transmitter Timeguard Register (LON_MODE).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	TG[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 7:0 – TG[7:0] Timeguard Value

Value	Description
0	The transmitter timeguard is disabled.
1–255	The transmitter timeguard is enabled and TG is timeguard delay / bit period.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.25.USART Transmitter Timeguard Register (LON_MODE)

Name: FLEX_US_TTGR (LON_MODE)
Offset: 0x228
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	PCYCLE[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	PCYCLE[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PCYCLE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:0 – PCYCLE[23:0] LON PCYCLE Length

Value	Description
1–16777215	LON PCYCLE length in t_{bit}.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.26.USART FI DI RATIO Register

Name: FLEX_US_FIDI
Offset: 0x240
Reset: 0x174
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

For LON-specific configurations, see USART Transmitter Timeguard Register (LON_MODE).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	FI_DI_RATIO[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1

Bit	7	6	5	4	3	2	1	0
	FI_DI_RATIO[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	1	0	1	0	0

Bits 15:0 – FI_DI_RATIO[15:0] FI Over DI Ratio Value

Value	Description
0	If ISO7816 mode is selected, the baud rate generator generates no signal.
1–2	Do not use.
3–65535	If ISO7816 mode is selected, the baud rate is the clock provided on SCK divided by FI_DI_RATIO.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.27.USART FI DI RATIO Register (LON_MODE)

Name: FLEX_US_FIDI (LON_MODE)
Offset: 0x240
Reset: 0x174
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	BETA2[23:16]

	BETA2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	1	0	1	0	0

Bits 23:0 – BETA2[23:0] LON BETA2 Length

Value	Description
1–16777215	LON BETA2 length in t_{bit}. **Note:** The configured value must be lower than 2^{18}.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.28.USART Number of Errors Register

Name: FLEX_US_NER
Offset: 0x244
Reset: 0x00000000
Property: Read-only

This register is relevant only if USART_MODE = 0x4 or 0x6 in the USART Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	NB_ERRORS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–

Bits 7:0 – NB_ERRORS[7:0] Number of Errors
Total number of errors that occurred during an ISO7816 transfer. This register automatically clears when read.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.29.USART IrDA FILTER Register

Name: FLEX_US_IF
Offset: 0x24C
Reset: 0x00000000
Property: Read/Write

This register is relevant only if USART_MODE = 0x8 in the USART Mode Register.

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	IRDA_FILTER[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 7:0 – IRDA_FILTER[7:0] IrDA Filter

The IRDA_FILTER value must be defined to meet the following criteria:

$t_{peripheral\ clock} \times (IRDA_FILTER + 3) < 1.41\ \mu s$

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.30.USART Manchester Configuration Register

Name: FLEX_US_MAN
Offset: 0x250
Reset: 0xB0011004
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	RXIDLEV	DRIFT	ONE	RX_MPOL			RX_PP[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	1	0	1	1			0	0

Bit	23	22	21	20	19	18	17	16
					RX_PL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	1

Bit	15	14	13	12	11	10	9	8
				TX_MPOL			TX_PP[1:0]	
Access				R/W			R/W	R/W
Reset				1			0	0

Bit	7	6	5	4	3	2	1	0
					TX_PL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	1	0	0

Bit 31 – RXIDLEV Receiver Idle Value

Value	Description
0	Receiver line idle value is 0.
1	Receiver line idle value is 1.

Bit 30 – DRIFT Drift Compensation

Value	Description
0	The USART cannot recover from an important clock drift.
1	The USART can recover from clock drift. The 16X Clock mode must be enabled.

Bit 29 – ONE Must Be Set to 1
Bit 29 must always be set to 1 when programming the FLEX_US_MAN register.

Bit 28 – RX_MPOL Receiver Manchester Polarity

Value	Description
0	Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.
1	Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

Bits 25:24 – RX_PP[1:0] Receiver Preamble Pattern detected
The following values assume that RX_MPOL field is not set:

Value	Name	Description
0	ALL_ONE	The preamble is composed of '1's.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	ALL_ZERO	The preamble is composed of ‘0’s.
2	ZERO_ONE	The preamble is composed of ‘01’s.
3	ONE_ZERO	The preamble is composed of ‘10’s.

Bits 19:16 – RX_PL[3:0] Receiver Preamble Length

Value	Description
0	The receiver preamble pattern detection is disabled.
1–15	The detected preamble length is RX_PL × Bit Period.

Bit 12 – TX_MPOL Transmitter Manchester Polarity

Value	Description
0	Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.
1	Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

Bits 9:8 – TX_PP[1:0] Transmitter Preamble Pattern
The following values assume that TX_MPOL field is not set:

Value	Name	Description
0	ALL_ONE	The preamble is composed of ‘1’s.
1	ALL_ZERO	The preamble is composed of ‘0’s.
2	ZERO_ONE	The preamble is composed of ‘01’s.
3	ONE_ZERO	The preamble is composed of ‘10’s.

Bits 3:0 – TX_PL[3:0] Transmitter Preamble Length

Value	Description
0	The transmitter preamble pattern generation is disabled.
1–15	The preamble length is TX_PL × Bit Period.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.31.USART LIN Mode Register

Name: FLEX_US_LINMR
Offset: 0x254
Reset: 0x00000000
Property: Read/Write

This register is relevant only if USART_MODE = 0xA or 0xB in the USART Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
							SYNCDIS	PDCM
Access							R/W	R/W
Reset							0	0

Bit	15	14	13	12	11	10	9	8
	DLC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	WKUPTYP	FSDIS	DLM	CHKTYP	CHKDIS	PARDIS	NACT[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 17 – SYNCDIS Synchronization Disable

Value	Description
0	The synchronization procedure is performed in LIN client node configuration.
1	The synchronization procedure is not performed in LIN client node configuration.

Bit 16 – PDCM DMA Mode

Value	Description
0	The LIN mode register FLEX_US_LINMR is not written by the DMA.
1	The LIN mode register FLEX_US_LINMR (excepting that flag) is written by the DMA.

Bits 15:8 – DLC[7:0] Data Length Control

Value	Description
0–255	Defines the response data length if DLM = 0, in that case the response data length is equal to DLC+1 bytes.

Bit 7 – WKUPTYP Wake-up Signal Type

Value	Description
0	Setting the LINWKUP bit in the control register sends a LIN 2.0 wake-up signal.
1	Setting the LINWKUP bit in the control register sends a LIN 1.3 wake-up signal.

Bit 6 – FSDIS Frame Slot Mode Disable

Value	Description
0	The Frame Slot mode is enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	The Frame Slot mode is disabled.

Bit 5 – DLM Data Length Mode

Value	Description
0	The response data length is defined by the DLC field of this register.
1	The response data length is defined by the bits 5 and 6 of the identifier (FLEX_US_LINIR.IDCHR).

Bit 4 – CHKTYP Checksum Type

Value	Description
0	LIN 2.0 “enhanced” checksum
1	LIN 1.3 “classic” checksum

Bit 3 – CHKDIS Checksum Disable

Value	Description
0	In host node configuration, the checksum is computed and sent automatically. In client node configuration, the checksum is checked automatically.
1	Whatever the node configuration is, the checksum is not computed/sent and it is not checked.

Bit 2 – PARDIS Parity Disable

Value	Description
0	In host node configuration, the identifier parity is computed and sent automatically. In host node and client node configuration, the parity is checked automatically.
1	Whatever the node configuration is, the Identifier parity is not computed/sent and it is not checked.

Bits 1:0 – NACT[1:0] LIN Node Action

Values which are not listed in the table must be considered as “reserved”.

Value	Name	Description
0	PUBLISH	The USART transmits the response.
1	SUBSCRIBE	The USART receives the response.
2	IGNORE	The USART does not transmit and does not receive the response.

65.10.32.USART LIN Identifier Register

Name: FLEX_US_LINIR
Offset: 0x258
Reset: 0x00000000
Property: Read/Write

Write is possible only in LIN host node configuration.

This register is relevant only if USART_MODE = 0xA or 0xB in USART Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	IDCHR[7:0]							
Access	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R
Reset	0	0	0	0	0	0	0	0

Bits 7:0 – IDCHR[7:0] Identifier Character

If USART_MODE = 0xA (host node configuration):

- IDCHR is Read/Write and its value is the identifier character to be transmitted.

If USART_MODE = 0xB (client node configuration):

- IDCHR is Read-only and its value is the last identifier character that has been received.

65.10.33.USART LIN Baud Rate Register

Name: FLEX_US_LINBRR
Offset: 0x25C
Reset: 0x00000000
Property: Read-only

This register is relevant only if USART_MODE = 0xA or 0xB in USART Mode Register.

Returns the baud rate value after the synchronization process completion.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						LINFP[2:0]		
Access						R	R	R
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8

Bit	7	6	5	4	3	2	1	0
	LINCD[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 18:16 – LINFP[2:0] Fractional Part after Synchronization

Bits 15:0 – LINCD[15:0] Clock Divider after Synchronization

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.34.USART LON Mode Register

Name: FLEX_US_LONMR
Offset: 0x260
Reset: 0x00000000
Property: Read/Write

This register is relevant only if USART_MODE = 0x9 in the USART Mode Register.

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	EOFS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			LCDS	DMAM	CDTAIL	TCOL	COLDET	COMMT
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 23:16 – EOFS[7:0] End of Frame Condition Size

Value	Description
0–255	Defines the minimum transitionless time for the IP to detect a LON end of frame condition. t_{eof} = (EOFS+1) × t_{clock} × 8 × (2- OVER)

Bit 5 – LCDS LON Collision Detection Source

Value	Description
0	LON collision detection source is external.
1	LON collision detection source is internal.

Bit 4 – DMAM LON DMA Mode

Value	Description
0	The LON data length register FLEX_US_LONDL is not written by the DMA.
1	The LON data length register FLEX_US_LONDL is written by the DMA.

Bit 3 – CDTAIL LON Collision Detection on Frame Tail

Value	Description
0	Detect collisions after CRC has been sent but prior end of transmission in LON comm_type = 1 mode.
1	Ignore collisions after CRC has been sent but prior end of transmission in LON comm_type = 1 mode.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 2 – TCOL Terminate Frame upon Collision Notification

Value	Description
0	Do not terminate the frame in LON comm_type = 1 mode upon collision detection.
1	Terminate the frame in LON comm_type = 1 mode upon collision detection if possible.

Bit 1 – COLDET LON Collision Detection Feature

Value	Description
0	LON collision detection feature disabled.
1	LON collision detection feature enabled.

Bit 0 – COMMT LON comm_type Parameter Value

Value	Description
0	LON comm_type = 1 mode.
1	LON comm_type = 2 mode.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 7 – PB LON Priority Bit

Value	Description
0	LON priority bit reset.
1	LON priority bit set.

Bit 6 – ALTP LON Alternate Path Bit

Value	Description
0	LON alternate path bit reset.
1	LON alternate path bit set.

Bits 5:0 – BLI[5:0] LON Backlog Increment

Value	Description
0–63	LON backlog increment to be generated as a result of delivering the LON frame.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.38.USART LON Backlog Register

Name: FLEX_US_LONBL
Offset: 0x270
Reset: 0x00000000
Property: Read-only

This register is relevant only if USART_MODE = 0x9 in the USART Mode Register.

65.10.45.USART Comparison Register

Name: FLEX_US_CMPR
Offset: 0x290
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
								VAL2[8]
Access								R/W
Reset								0

Bit	23	22	21	20	19	18	17	16
	VAL2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
		CMPPAR	CMPMODE[1:0]					VAL1[8]
Access		R/W	R/W	R/W				R/W
Reset		0	0	0				0

Bit	7	6	5	4	3	2	1	0
	VAL1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 24:16 – VAL2[8:0] Second Comparison Value for Received Character

Value	Description
0–511	The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_US_CSR.CMP flag.

Bit 14 – CMPPAR Compare Parity

Value	Description
0	The parity is not checked and a bad parity cannot prevent from waking up the system.
1	The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wakeup is performed.

Bits 13:12 – CMPMODE[1:0] Comparison Mode

Value	Name	Description
0	FLAG_ONLY	Any character is received and comparison function drives CMP flag.
1	START_CONDITION	Comparison condition must be met to start reception.
2	FILTER	Comparison must be met to receive the current data only

Bits 8:0 – VAL1[8:0] First Comparison Value for Received Character

Value	Description
0–511	The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_US_CSR.CMP flag.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.46.USART FIFO Mode Register

Name: FLEX_US_FMR
Offset: 0x2A0
Reset: 0x00000000
Property: Read/Write

This register reads '0' if the FIFO is disabled (see FLEX_US_CR to enable/disable the internal FIFO).

Bit	31	30	29	28	27	26	25	24
			RXFTHRES2[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
			RXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
			TXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	FRTSC		RXRDYM[1:0]				TXRDYM[1:0]	
Access	R/W		R/W	R/W			R/W	R/W
Reset	0		0	0			0	0

Bits 29:24 – RXFTHRES2[5:0] Receive FIFO Threshold 2

Value	Description
0–16	Defines the Receive FIFO threshold 2 value (number of bytes). The FLEX_US_FESR.RXFTHF2 flag will be set when Receive FIFO goes from "above" threshold state to "equal to or below" threshold state.

Bits 21:16 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–16	Defines the Receive FIFO threshold value (number of bytes). The FLEX_US_FESR.RXFTHF flag will be set when Receive FIFO goes from "below" threshold state to "equal to or above" threshold state.

Bits 13:8 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–16	Defines the Transmit FIFO threshold value (number of bytes). The FLEX_US_FESR.TXFTHF flag will be set when Transmit FIFO goes from "above" threshold state to "equal to or below" threshold state.

Bit 7 – FRTSC FIFO RTS Pin Control enable (Hardware Handshaking mode only)
See Hardware Handshaking for details.

Value	Description
0	RTS pin is not controlled by Receive FIFO thresholds.
1	RTS pin is controlled by Receive FIFO thresholds.

Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode
If FIFOs are enabled, the FLEX_US_CSR.RXRDY flag behaves as follows.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	ONE_DATA	RXRDY will be at level '1' when at least one unread data is in the receive FIFO. When DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 byte must be configured in the DMA. If the transfer is performed by software, the access type must be defined as a byte.
1	TWO_DATA	RXRDY will be at level '1' when at least two unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA (chunk size=1 and halfword access). If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).
2	FOUR_DATA	RXRDY will be at level '1' when at least four unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).

Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode
If FIFOs are enabled, the FLEX_US_CSR.TXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	TXRDY will be at level '1' when at least one data can be written in the transmit FIFO. When DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 byte must be configured in the DMA. If the transfer is performed by software, the access type must be defined as a byte.
1	TWO_DATA	TXRDY will be at level '1' when at least two data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).
2	FOUR_DATA	TXRDY will be at level '1' when at least four data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA (chunk size=1 and word access). If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).

65.10.47.USART FIFO Level Register

Name: FLEX_US_FLR
Offset: 0x2A4
Reset: 0x00000000
Property: Read-only

This register reads '0' if the FIFO is disabled (see FLEX_US_CR to enable/disable the internal FIFO).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
			RXFL[5:0]

Bit	7	6	5	4	3	2	1	0
			TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–16	Indicates the number of unread data in the Receive FIFO.

Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–16	Indicates the number of data in the Transmit FIFO.

65.10.51.USART FIFO Event Status Register

Name: FLEX_US_FESR
Offset: 0x2B4
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
							RXFTHF2	TXFLOCK
Access							R	R
Reset							0	0

Bit	7	6	5	4	3	2	1	0
	RXFPTEF	TXFPTEF	RXFTHF	RXFFF	RXFEF	TXFTHF	TXFFF	TXFEF
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 9 – RXFTHF2 Receive FIFO Threshold Flag 2 (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Number of unread data in Receive FIFO is above RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES2 threshold since the last RSTSTA command was issued.

Bit 8 – TXFLOCK Transmit FIFO Lock

Value	Description
0	The Transmit FIFO is not locked.
1	The Transmit FIFO is locked.

Bit 7 – RXFPTEF Receive FIFO Underflow Error Flag
See FIFO Overflow/Underflow Error for details.

Value	Description
0	No Receive FIFO underflow occurred.
1	Receive FIFO underflow error occurred due to an incorrect software access (read data exceeding available data in FIFO). Receiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 6 – TXFPTEF Transmit FIFO Overflow Error Flag
See FIFO Overflow/Underflow Error for details.

Value	Description
0	No Transmit FIFO overflow occurred.
1	Transmit FIFO overflow error occurred due to an incorrect software access (written data exceeding available space). Transceiver must be reset by writing FLEX_SPI_CR.SWRST=1.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 5 – RXFTHF Receive FIFO Threshold Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last RSTSTA command was issued.

Bit 4 – RXFFF Receive FIFO Full Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been filled since the last RSTSTA command was issued.

Bit 3 – RXFEF Receive FIFO Empty Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been emptied since the last RSTSTA command was issued.

Bit 2 – TXFTHF Transmit FIFO Threshold Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last RSTSTA command was issued.

Bit 1 – TXFFF Transmit FIFO Full Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Transmit FIFO is not full.
1	Transmit FIFO has been filled since the last RSTSTA command was issued.

Bit 0 – TXFEF Transmit FIFO Empty Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last RSTSTA command was issued.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.52.USART Write Protection Mode Register

Name: FLEX_US_WPMR
Offset: 0x2E4
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x555341	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

Bit 2 – WPCREN Write Protection Control Enable
See USART Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x555341 (“USA” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x555341 (“USA” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable
See USART Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).

Bit 0 – WPEN Write Protection Enable
See USART Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).
1	Enables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.53.USART Write Protection Status Register

Name: FLEX_US_WPSR
Offset: 0x2E8
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	WPVSRC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

Bits 23:8 – WPVSRC[15:0] Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of FLEX_US_WPSR.
1	A write protection violation has occurred since the last read of FLEX_US_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.54.SPI Control Register

Name: FLEX_SPI_CR
Offset: 0x400
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the SPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	FIFODIS	FIFOEN						LASTXFER
Access	W	W						W
Reset	–	–						–

Bit	23	22	21	20	19	18	17	16
							RXFCLR	TXFCLR
Access							W	W
Reset							–	–

Bit	15	14	13	12	11	10	9	8
				REQCLR				
Access				W				
Reset				–				

Bit	7	6	5	4	3	2	1	0
	SWRST						SPIDIS	SPIEN
Access	W						W	W
Reset	–						–	–

Bit 31 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs

Bit 30 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs

Bit 24 – LASTXFER Last Transfer
See Peripheral Selection for more details.

Value	Description
0	No effect.
1	The current NPCS will be de-asserted after the character written in TD has been transferred. When CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

Bit 17 – RXFCLR Receive FIFO Clear

Value	Description
0	No effect.
1	Empties the Receive FIFO.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 16 – TXFCLR Transmit FIFO Clear

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

Bit 12 – REQCLR Request to Clear the Comparison Trigger

Value	Description
0	No effect.
1	Restarts the comparison trigger to enable FLEX_SPI_RDR.

Bit 7 – SWRST SPI Software Reset

The SPI is in Client mode after software reset.

Value	Description
0	No effect.
1	Resets the SPI. A software-triggered hardware reset of the SPI interface is performed.

Bit 1 – SPIDIS SPI Disable

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if the FLEX_US_THR is loaded.
All pins are set to Input mode after completion of the transmission in progress, if any.

Value	Description
0	No effect.
1	Disables the SPI.

Bit 0 – SPIEN SPI Enable

Value	Description
0	No effect.
1	Enables the SPI to transfer and receive data.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.55.SPI Mode Register

Name: FLEX_SPI_MR
Offset: 0x404
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	DLYBCS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
					PCS[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
	MOSIIE	CSIE	TPMEN	CMPMODE				LSBHALF
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0

Bit	7	6	5	4	3	2	1	0
	LLB	CRCEN	WDRBT	MODFDIS	BRSRCCLK	PCSDEC	PS	MSTR
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:24 – DLYBCS[7:0] Delay Between Chip Selects
This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time ensures chip selects do not overlap and solves bus contentions in case of peripherals having long data float times.
If DLYBCS is ≤ 6, six peripheral clock periods are inserted by default.
Otherwise, the following equations determine the delay:
If FLEX_SPI_MR.BRSRCCLK = 0: DLYBCS = Delay Between Chip Selects × $f_{peripheral\ clock}$
If FLEX_SPI_MR.BRSRCCLK = 1: DLYBCS = Delay Between Chip Selects × f_{GCLK}

Bits 19:16 – PCS[3:0] Peripheral Chip Select
This field is only used if fixed peripheral select is active (PS = 0).
If PCSDEC = 0:
PCS = xxx0 NPCS[3:0] = 1110
PCS = xx01 NPCS[3:0] = 1101
PCS = x011 NPCS[3:0] = 1011
PCS = 0111 NPCS[3:0] = 0111
PCS = 1111 forbidden (no peripheral is selected)
(x = don't care)
If PCSDEC = 1:
NPCS[3:0] output signals = PCS

Bit 15 – MOSIIE MOSI Inversion Enable

Value	Description
0	MOSI input is not inverted.
1	MOSI input is internally inverted before being processed by the SPI.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 14 – CSIE Chip Select Inversion Enable

Value	Description
0	Chip select NPCS active polarity is low.
1	Chip select NPCS active polarity is high.

Bit 13 – TPMEN Two-Pin Mode Enable

Value	Description
0	Two-Pin mode is disabled.
1	Two-Pin mode is enabled.

Bit 12 – CMPMODE Comparison Mode

Value	Name	Description
0	FLAG_ONLY	Any character is received and comparison function drives CMP flag.
1	START_CONDITION	Comparison condition must be met to start reception of all incoming characters until REQCLR is set.

Bit 8 – LSBHALF Last Bit Half Period Compatibility

Value	Description
0	Normal SPI mode of operation: all bits have a 1-bit time duration (standard SPI mode)
1	Compatibility mode when connected to an SPI client having only a half bit period duration time for the last bit of the frame (non-standard SPI mode)

Bit 7 – LLB Local Loopback Enable

LLB controls the local loopback on the data shift register for testing in Host mode only (MISO is internally connected on MOSI).

Value	Description
0	Local loopback path disabled.
1	Local loopback path enabled.

Bit 6 – CRCEN CRC Enable

Value	Description
0	CRC calculation is disabled.
1	CRC calculation is enabled. BITS in FLEX_SPI_CSRx registers must be at value '0'.

Bit 5 – WDRBT Wait Data Read Before Transfer

Value	Description
0	No Effect. In Host mode, a transfer can be initiated regardless of the FLEX_SPI_RDR state.
1	In Host mode, a transfer can start only if FLEX_SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

Bit 4 – MODFDIS Mode Fault Detection

Value	Description
0	Mode fault detection is enabled.
1	Mode fault detection is disabled.

Bit 3 – BRSRCCLK Bit Rate Source Clock

If the bit BRSRCCLK = 1, the FLEX_US_CSRx.SCBR field must be programmed with a value greater than 1.

Value	Name	Description
0	PERIPH_CLK	The peripheral clock is the source clock for the bit rate generation.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	GCLK	GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

Bit 2 – PCSDEC Chip Select Decode

When PCSDEC equals one, up to 15 Chip Select signals can be generated with the four NPCS lines using an external 4- to 16-bit decoder. The Chip Select registers define the characteristics of the 15 chip selects, with the following rules:
FLEX_SPI_CSR0 defines peripheral chip select signals 0 to 3.
FLEX_SPI_CSR1 defines peripheral chip select signals 4 to 7.
FLEX_SPI_CSR2 defines peripheral chip select signals 8 to 11.
FLEX_SPI_CSR3 defines peripheral chip select signals 12 to 14.

Value	Description
0	The chip selects are directly connected to a peripheral device.
1	The four NPCS chip select lines are connected to a 4- to 16-bit decoder.

Bit 1 – PS Peripheral Select

Value	Description
0	Fixed Peripheral Select
1	Variable Peripheral Select

Bit 0 – MSTR Host/Client Mode

Value	Description
0	SPI is in Client mode.
1	SPI is in Host mode.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.56.SPI Receive Data Register (Default Mode)

Name: FLEX_SPI_RDR (DEFAULT_MODE)
Offset: 0x408
Reset: 0x00000000
Property: Read-only

If FIFO is enabled (FLEX_SPI_CR.FIFOEN) and FLEX_SPI_FMR.RXRDYM = 0, see SPI Single Data Access for details.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					PCS[3:0]			
Access					R	R	R	R
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RD[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RD[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 19:16 – PCS[3:0] Peripheral Chip Select
In Host mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.
Note: When using Variable Peripheral Select mode (FLEX_SPI_MR.PS = 1), it is mandatory to set the FLEX_SPI_MR.WDRBT bit to 1 if the PCS field must be processed in FLEX_SPI_RDR.

Bits 15:0 – RD[15:0] Receive Data
Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.57.SPI Receive Data Register (Multiple Data, 8-bit)

Name: FLEX_SPI_RDR (FIFO_MULTI_DATA_8)
Offset: 0x408
Reset: 0x00000000
Property: Read-only

To read multi-data, the FIFO must be enabled (FLEX_SPI_CR.FIFOEN=1, FLEX_SPI_MR.MSTR=0, FLEX_SPI_MR.PS=0). The access type (byte, halfword or word) determines the number of data written in a single access (1, 2 or 4). See SPI Multiple Data Access for details.

Bit	31	30	29	28	27	26	25	24
	RD3[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	RD2[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

	RD1[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RD0[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 0:7, 8:15, 16:23, 24:31 – RDx Receive Data
First unread data in the Receive FIFO. Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.58.SPI Receive Data Register (Multiple Data, 16-bit)

Name: FLEX_SPI_RDR (FIFO_MULTI_DATA_16)
Offset: 0x408
Reset: 0x00000000
Property: Read-only

To read multi-data, the FIFO must be enabled (FLEX_SPI_CR.FIFOEN=1, FLEX_SPI_MR.MSTR=0, FLEX_SPI_MR.PS=0). The access type (byte, halfword or word) determines the number of data written in a single access (1 or 2). See SPI Multiple Data Access for details.

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 0:15, 16:31 – RDx Receive Data
First unread data in the Receive FIFO. Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.59.SPI Transmit Data Register (Default Mode)

Name: FLEX_SPI_TDR (DEFAULT_MODE)
Offset: 0x40C
Reset: –
Property: Write-only

If FIFO is enabled (FLEX_SPI_CR.FIFOEN=1), a byte/halfword access on FLEX_SPI_TDR writes one byte/halfword, see SPI Single Data Access for details.

Bit	31	30	29	28	27	26	25	24
								LASTXFER
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
					PCS[3:0]			
Access					W	W	W	W
Reset					–	–	–	–

Bit	15	14	13	12	11	10	9	8
	TD[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	TD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 24 – LASTXFER Last Transfer
This field is only used if variable peripheral select is active (FLEX_SPI_MR.PS = 1).

Value	Description
0	No effect.
1	The current NPCS is de-asserted after the transfer of the character written in TD. When FLEX_SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

Bits 19:16 – PCS[3:0] Peripheral Chip Select
This field is only used if variable peripheral select is active (FLEX_SPI_MR.PS = 1).
If FLEX_SPI_MR.PCSDEC = 0:
PCS = xxx0 NPCS[3:0] = 1110
PCS = xx01 NPCS[3:0] = 1101
PCS = x011 NPCS[3:0] = 1011
PCS = 0111 NPCS[3:0] = 0111
PCS = 1111 forbidden (no peripheral is selected)
(x = don't care)
If FLEX_SPI_MR.PCSDEC = 1:
NPCS[3:0] output signals = PCS

Bits 15:0 – TD[15:0] Transmit Data
Data to be transmitted by the SPI Interface is stored in this register. Information to be transmitted must be written to the transmit data register in a right-justified format.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.60.SPI Transmit Data Register (Multiple Data, 8- to 16-bit)

Name: FLEX_SPI_TDR (FIFO_MULTI_DATA)
Offset: 0x40C
Reset: –
Property: Write-only

To write multi-data, the FIFO must be enabled (FLEX_SPI_CR.FIFOEN=1) and FLEX_SPI_MR.PS=0. The access type (byte, halfword or word) determines the number of data written in a single access (1 or 2). See SPI Single Data Access for details.

Bit	31	30	29	28	27	26	25	24

Access					R	R	R	R
Reset					0	0	0	0

Bit 31 – RXFPTEF Receive FIFO Underflow Error Flag
See FIFO Overflow/Underflow Error for details.
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	No Receive FIFO underflow occurred.
1	Receive FIFO underflow error occurred due to an incorrect software access (read data exceeding available data in FIFO). Receiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 30 – TXFPTEF Transmit FIFO Overflow Error Flag
See FIFO Overflow/Underflow Error for details.
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	No Transmit FIFO overflow occurred.
1	Transmit FIFO overflow error occurred due to an incorrect software access (written data exceeding available space). Transceiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 29 – RXFTHF Receive FIFO Threshold Flag
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold (changing states from “below threshold” to “equal to or above threshold”).

Bit 28 – RXFFF Receive FIFO Full Flag
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has been filled (changing states from “not full” to “full”).

Bit 27 – RXFEF Receive FIFO Empty Flag
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has been emptied (changing states from “not empty” to “empty”).

Bit 26 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_SPI_SR.

Bit 25 – TXFFF Transmit FIFO Full Flag (cleared on read)
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Transmit FIFO is not full or TXFF flag has been cleared.
1	Transmit FIFO has been filled since the last read of FLEX_SPI_SR.

Bit 24 – TXFEF Transmit FIFO Empty Flag (cleared on read)
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of FLEX_SPI_SR.

Bit 16 – SPIENS SPI Enable Status

Value	Description
0	SPI is disabled.
1	SPI is enabled.

Bit 13 – CRCERR CRC Error (cleared on read)

Value	Description
0	CRC calculation is disabled or no received frame contains a CRC error since the last read of FLEX_SPI_SR.
1	Since the last read of FLEX_SPI_SR, a received frame contains a CRC error.

Bit 12 – SFERR Client Mode Frame Error (cleared on read)

Value	Description
0	No frame error has been detected for a client access since the last read of FLEX_SPI_SR.
1	In Client mode, the chip select raised while the character defined in FLEX_SPI_CSR0.BITS was not complete.

Bit 11 – CMP Comparison Status (cleared on read)

Value	Description
0	No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in FLEX_SPI_CMPR since the last read of FLEX_SPI_SR.
1	A received character matched the comparison criteria since the last read of FLEX_SPI_SR.

Bit 10 – UNDES Underrun Error Status (Client mode only) (cleared on read)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No underrun has been detected since the last read of FLEX_SPI_SR.
1	A transfer starts whereas no data has been loaded in FLEX_SPI_TDR, cleared when FLEX_SPI_SR is read.

Bit 9 – TXEMPTY Transmission Registers Empty (cleared by writing FLEX_SPI_TDR)

Value	Description
0	As soon as data is written in FLEX_SPI_TDR.
1	FLEX_SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay.

Bit 8 – NSSR NSS Rising (cleared on read)

Value	Description
0	No rising edge detected on NSS pin since the last read of FLEX_SPI_SR.
1	A rising edge occurred on NSS pin since the last read of FLEX_SPI_SR.

Bit 3 – OVRES Overrun Error Status (cleared on read)

An overrun occurs when FLEX_SPI_RDR is loaded at least twice from the shift register since the last read of FLEX_SPI_RDR.

Value	Description
0	No overrun has been detected since the last read of FLEX_SPI_SR.
1	An overrun has occurred since the last read of FLEX_SPI_SR.

Bit 2 – MODF Mode Fault Error (cleared on read)

Value	Description
0	No mode fault has been detected since the last read of FLEX_SPI_SR.
1	A mode fault occurred since the last read of FLEX_SPI_SR.

Bit 1 – TDRE Transmit Data Register Empty (cleared by writing FLEX_SPI_TDR)

When FIFOs are disabled:
0: Data has been written to FLEX_SPI_TDR and not yet transferred to the internal shift register.
1: The last data written to FLEX_SPI_TDR has been transferred to the internal shift register.
TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.
When FIFOs are enabled:
0: Transmit FIFO cannot accept more data.
1: Transmit FIFO can accept data; one or more data can be written according to TXRDYM field configuration.
TDRE behavior with FIFOs enabled is illustrated in TXEMPTY, TDRE and RDRF Behavior.

Bit 0 – RDRF Receive Data Register Full (cleared by reading FLEX_SPI_RDR)

When FIFOs are disabled:
0: No data has been received since the last read of FLEX_SPI_RDR.
1: Data has been received and the received data has been transferred from the internal shift register to FLEX_SPI_RDR since the last read of FLEX_SPI_RDR.
When FIFOs are enabled:
0: Receive FIFO is empty; no data to read.
1: At least one unread data is in the Receive FIFO.
RDRF behavior with FIFOs enabled is illustrated in TXEMPTY, TDRE and RDRF Behavior.

65.10.65.SPI Chip Select Register

Name: FLEX_SPI_CSRx
Offset: 0x0430 + x*0x04 [x=0..3]
Reset: 0x00000000
Property: R/W

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

FLEX_SPI_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

Bit	31	30	29	28	27	26	25	24
	DLYBCT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8
	SCBR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	BITS[3:0]				CSAAT	CSNAAT	NCPHA	CPOL
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:24 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.
When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.
Otherwise, the following equations determine the delay:
If FLEX_SPI_MR.BRSRCCLK = 0: DLYBCT = Delay Between Consecutive Transfers × $f_{peripheral\ clock}$ / 32
If FLEX_SPI_MR.BRSRCCLK = 1: DLYBCT = Delay Between Consecutive Transfers × f_{GCLK} / 32

Bits 23:16 – DLYBS[7:0] Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.
When DLYBS = 0, the delay is half the SPCK clock period.
Otherwise, the following equations determine the delay:
If FLEX_SPI_MR.BRSRCCLK = 0: DLYBS = Delay Before SPCK × $f_{peripheral\ clock}$
If FLEX_SPI_MR.BRSRCCLK = 1: DLYBS = Delay Before SPCK × f_{GCLK}

Bits 15:8 – SCBR[7:0] Serial Clock Bit Rate

In Host mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by the bit BRSRCCLK. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:
If FLEX_SPI_MR.BRSRCCLK = 0: SCBR = $f_{peripheral\ clock}$ / SPCK Bit Rate
If FLEX_SPI_MR.BRSRCCLK = 1: SCBR = f_{GCLK} / SPCK Bit Rate

© 2026 Microchip Technology Inc. and its subsidiaries

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.
If BRSRCCLK = 1 in FLEX_SPI_MR, SCBR must be programmed with a value greater than 1.
At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.
Note: If one of the FLEX_SPI_CSRx.SCBR fields is set to 1, the other FLEX_SPI_CSRx.SCBR fields must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

Bits 7:4 – BITS[3:0] Bits Per Transfer
See Note.
The BITS field determines the number of data bits transferred. Reserved values should not be used.

Value	Name	Description
0	8_BIT	8 bits for transfer
1	9_BIT	9 bits for transfer
2	10_BIT	10 bits for transfer
3	11_BIT	11 bits for transfer
4	12_BIT	12 bits for transfer
5	13_BIT	13 bits for transfer
6	14_BIT	14 bits for transfer
7	15_BIT	15 bits for transfer
8	16_BIT	16 bits for transfer
9–15	Reserved	

Bit 3 – CSAAT Chip Select Active After Transfer

Value	Description
0	The Peripheral Chip Select Line rises as soon as the last transfer is achieved.
1	The Peripheral Chip Select does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select.

Bit 2 – CSNAAT Chip Select Not Active After Transfer (Ignored if CSAAT = 1)
If FLEX_SPI_MR.BRSRCCLK = 0: $\frac{\text{DLYBCS}}{\text{f}_{\text{peripheral clock}}}$(if DLYBCS ≠ 0)
If FLEX_SPI_MR.BRSRCCLK = 1: $\frac{\text{DLYBCS}}{\text{f}_{GCLK}}$
If DLYBCS < 6, a minimum of six periods is introduced.

Value	Description
0	The Peripheral Chip Select does not rise between two transfers if the FLEX_SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same Chip Select.
1	The Peripheral Chip Select rises systematically after each transfer performed on the same client. It remains inactive after the end of transfer for a minimal duration of:

Bit 1 – NCPHA Clock Phase
NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between host and client devices.

Value	Description
0	Data are changed on the leading edge of SPCK and captured on the following edge of SPCK.
1	Data are captured on the leading edge of SPCK and changed on the following edge of SPCK.

Bit 0 – CPOL Clock Polarity
CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between host and client devices.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	The inactive state value of SPCK is logic level zero.
1	The inactive state value of SPCK is logic level one.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.66.SPI FIFO Mode Register

Name: FLEX_SPI_FMR
Offset: 0x440
Reset: 0x00000000
Property: Read/Write

This register reads '0' if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO)

Bit	31	30	29	28	27	26	25	24
			RXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
			TXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			RXRDYM[1:0]				TXRDYM[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–16	Defines the Receive FIFO threshold value (number of data). The FLEX_SPI_SR.RXFTH flag will be set when Receive FIFO goes from "below" threshold state to "equal to or above" threshold state.

Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–16	Defines the Transmit FIFO threshold value (number of data). The FLEX_SPI_SR.TXFTH flag will be set when Transmit FIFO goes from "above" threshold state to "equal to or below" threshold state.

Bits 5:4 – RXRDYM[1:0] Receive Data Register Full Mode
If FIFOs are enabled, the FLEX_SPI_SR.RDRF flag behaves as follows.

Value	Name	Description
0	ONE_DATA	RDRF will be at level '1' when at least one unread data is in the receive FIFO. When DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 1 byte must be configured in the DMA. When FLEX_SPI_CSR0.BITS>0 (9 to 16 bits transferred on SPI line), the chunk of 1 halfword must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte or halfword depending on FLEX_SPI_CSR0.BITS.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	TWO_DATA	RDRF will be at level '1' when at least two unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA. When FLEX_SPI_CSR0.BITS>0 (9 to 16 bits transferred on SPI line), the chunk of 1 word (1 word carries 2 halfwords) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as halfword (2 bytes per access, 1 access when FLEX_SPI_CSR0.BITS=0), or word (2 halfwords per access, 2 accesses when FLEX_SPI_CSR0.BITS>0).
2	FOUR_DATA	RDRF will be at level '1' when at least four unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 1 word (1 halfword carries 4 bytes) must be configured in the DMA. When FLEX_SPI_CSR0.BITS>0 (9 to 16 bits transferred on SPI line), the chunk of 2 words (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as word (4 bytes per access, 1 access when FLEX_SPI_CSR0.BITS=0 or 2 halfwords per access, 2 accesses when FLEX_SPI_CSR0.BITS>0).

Bits 1:0 – TXRDYM[1:0] Transmit Data Register Empty Mode
If FIFOs are enabled, the FLEX_SPI_SR.TDRE flag behaves as follows.

Value	Name	Description
0	ONE_DATA	TDRE will be at level '1' when at least one data can be written in the transmit FIFO. When DMA is enabled to transfer data, the chunk of 1 data (byte or halfword) must be configured in the DMA depending on FLEX_SPI_CSR0.BITS. If the transfer is performed by software, the access type (byte, halfword) must be defined depending on FLEX_SPI_CSR0.BITS.
1	TWO_DATA	TDRE will be at level '1' when at least two data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 word (1 word carries 2 data) must be configured in the DMA. If the transfer is performed by software, the access type must be defined as word (2 data per access, 1 access).

65.10.67.SPI FIFO Level Register

Name: FLEX_SPI_FLR
Offset: 0x444
Reset: 0x00000000
Property: Read-only

This register reads '0' if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
			RXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–16	Indicates the number of unread data in the Receive FIFO.

Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–16	Indicates the number of data in the Transmit FIFO.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.68.SPI Comparison Register

Name: FLEX_SPI_CMPR
Offset: 0x448
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	VAL2[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	VAL2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:16 – VAL2[15:0] Second Comparison Value for Received Character

Value	Description
0–65535	The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_SPI_CSR.CMP flag.

Bits 15:0 – VAL1[15:0] First Comparison Value for Received Character

Value	Description
0–65535	The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_SPI_SR.CMP flag.

65.10.69.SPI CRC Register

Name: FLEX_SPI_CRCR
Offset: 0x44C
Reset: 0x00000000
Property: Read/Write

This register can only be written if WPEN is cleared in the SPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
					DHRX	DCRX	FHE	CRM
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	23	22	21	20	19	18	17	16
	FRHL[3:0]							CRCS
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	FRL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 27 – DHRX Disable Header Receiving

Value	Description
0	Header is received and supplied to FLEX_SPI_RDR as a classic data.
1	Header is received and checked but not supplied to FLEX_SPI_RDR (RDRF will not rise upon Header receiving).

Bit 26 – DCRX Disable CRC Receiving

Value	Description
0	CRC is received and supplied to FLEX_SPI_RDR as a classic data.
1	CRC is received and checked but not supplied to FLEX_SPI_RDR (RDRF will not rise upon CRC receiving).

Bit 25 – FHE Frame Header Excluded

Value	Description
0	The frame header is included in the CRC calculation.
1	The frame header is excluded from the CRC calculation.

Bit 24 – CRM Continuous Read Mode

Value	Description
0	A header is sent every frame in case of contiguous frames (without de-asserting the corresponding NPCS).
1	A header is sent only on the first frame in case of contiguous frames (without de-asserting the corresponding NPCS).

Bits 23:20 – FRHL[3:0] Frame Header Length
If FLEX_SPI_MR.TPMEN= 0, this value is the length of the frame header, in bytes.

© 2026 Microchip Technology Inc. and its subsidiaries

If FLEX_SPI_MR.TPMEN= 1, this value is the length of the frame header minus 1, in bytes.

Bit 16 – CRCS CRC Size

Value	Name	Description
0	16B_CRC	CRC size is 16 bits.
1	32B_CRC	CRC size is 32 bits.

Bits 7:0 – FRL[7:0] Frame Length

If FLEX_SPI_MR.TPMEN= 0, this value is the length of the frame (header and CRC included), in bytes.
If FLEX_SPI_MR.TPMEN= 1, this value is the length in bytes of the frame starting from the SYNC field (included) with CRC included.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.70.SPI Two-Pin Mode Register

Name: FLEX_SPI_TPMR
Offset: 0x450
Reset: 0x00000000
Property: Read/Write

This register can only be written if WPEN is cleared in the SPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8

Bit	7	6	5	4	3	2	1	0
					OSR[1:0]		ALWAYS0	CSM
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 3:2 – OSR[1:0] Oversampling Rate
Defines the MCP3910 OSR setting used.

Bit 1 – ALWAYS0 Always Written to 0

Bit 0 – CSM Chip Select Mode

Value	Description
0	Chip select is not driven.
1	Chip select is driven and can be used to control enable pin of the external device. Depending on FLEX_SPI_MR.PCSDEC, an external decoder can be used to minimize the number of IOs used.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.71.SPI Two-Pin Header Register

Name: FLEX_SPI_TPHR
Offset: 0x454
Reset: 0x00000000
Property: Read-only

This register can only be written if WPEN is cleared in the SPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x535049	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII).

Bit 0 – WPEN Write Protection Enable

See SPI Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII).

Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

Bits 15:8 – WPVSRC[7:0] Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protect violation has occurred since the last read of FLEX_SPI_WPSR.
1	A write protect violation has occurred since the last read of FLEX_SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.74.TWI Control Register (Default Mode)

Name: FLEX_TWI_CR (DEFAULT_MODE)
Offset: 0x600
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the TWI Write Protection Mode register.

Bit	31	30	29	28	27	26	25	24
			FIFODIS	FIFOEN		LOCKCLR		THRCLR
Access			W	W		W		W
Reset			–	–		–		–

	SWRST	QUICK	SVDIS	SVEN	MSDIS	MSEN	STOP	START
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 29 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disable the Transmit and Receive FIFOs

Bit 28 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enable the Transmit and Receive FIFOs

Bit 26 – LOCKCLR Lock Clear

Value	Description
0	No effect.
1	Clear the TWI FSM lock.

Bit 24 – THRCLR Transmit Holding Register Clear

Value	Description
0	No effect.
1	Clear the Transmit Holding register and set TXRDY, TXCOMP flags.

Bit 19 – SCLRBE SCL Rise Boost Enable

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	SCL rise time is boosted in High-Speed mode. Duration of the boost is configured with FLEX_TWI_MMR.SCLRBL. See SCL Rising Time Control for details.

Bit 18 – SCLRBD SCL Rise Boost Disable

Value	Description
0	No effect.
1	SCL rise time boost is disabled. See SCL Rising Time Control for details.

Bit 17 – ACMDIS Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

Bit 16 – ACMEN Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

Bit 15 – CLEAR Bus CLEAR Command

When TWD (SDA)=0, the Bus Clear command must be performed via the PIO. When TWCK=0, no Bus Clear command can be issued.

Value	Description
0	No effect.
1	When Host mode is enabled and TWD (SDA)=1, sends a Bus Clear command.

Bit 14 – PECRQ PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

Bit 13 – PECDIS Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

Bit 12 – PECEN Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

Bit 11 – SMBDIS SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

Bit 10 – SMBEN SMBus Mode Enabled

Value	Description
0	No effect.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	If SMBDIS = 0, SMBus mode enabled.

Bit 9 – HSDIS TWI High-Speed Mode Disabled

Value	Description
0	No effect.
1	High-speed mode disabled.

Bit 8 – HSEN TWI High-Speed Mode Enabled

Value	Description
0	No effect.
1	High-speed mode enabled.

Bit 7 – SWRST Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

Bit 6 – QUICK SMBus Quick Command

Value	Description
0	No effect.
1	If Host mode is enabled, an SMBus Quick Command is sent.

Bit 5 – SVDIS TWI Client Mode Disabled

Value	Description
0	No effect.
1	Client mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling.

Bit 4 – SVEN TWI Client Mode Enabled
Switching from Host to Client mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Client mode (SVDIS must be written to 0).

Bit 3 – MSDIS TWI Host Mode Disabled

Value	Description
0	No effect.
1	Host mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling.

Bit 2 – MSEN TWI Host Mode Enabled
Switching from Client to Host mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Host mode (MSDIS must be written to 0).

Bit 1 – STOP Send a STOP Condition

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	STOP condition is sent just after completing the current byte transmission in Host Read mode. – In single data byte host read, both START and STOP must be set. – In multiple data bytes host read, the STOP must be set after the last data received but one. – In Host Read mode, if a NACK bit is received, the STOP is automatically performed. – In host data write operation, a STOP condition will be sent after the transmission of the current data is finished.

Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a client. When configured in Host mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding register (FLEX_TWI_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWI Host Mode register (FLEX_TWI_MMR).

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.75.TWI Control Register (FIFO_ENABLED)

Name: FLEX_TWI_CR (FIFO_ENABLED)
Offset: 0x600
Reset: –
Property: Write-only

If FIFO is enabled (FLEX_US_CR.FIFOEN=1), see TWI Multiple Data Access for details.

Bit	31	30	29	28	27	26	25	24
			FIFODIS	FIFOEN		TXFLCLR	RXFCLR	TXFCLR

Reset	–	–	–	–	–	–	–	–

Bit 29 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disable the Transmit and Receive FIFOs.

Bit 28 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enable the Transmit and Receive FIFOs.

Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

Value	Description
0	No effect.
1	Clears the Transmit FIFO Lock.

Bit 25 – RXFCLR Receive FIFO Clear

Value	Description
0	No effect.
1	Empties the Receive FIFO.

Bit 24 – TXFCLR Transmit FIFO Clear

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

Bit 17 – ACMDIS Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

Bit 16 – ACMEN Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

Bit 15 – CLEAR Bus CLEAR Command

Value	Description
0	No effect.
1	If Host mode is enabled, send a bus clear command.

Bit 14 – PECRQ PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

Bit 13 – PECDIS Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

Bit 12 – PECEN Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

Bit 11 – SMBDIS SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

Bit 10 – SMBEN SMBus Mode Enabled

Value	Description
0	No effect.
1	If SMBDIS = 0, SMBus mode enabled.

Bit 9 – HSDIS TWI High-Speed Mode Disabled

Value	Description
0	No effect.
1	High-speed mode disabled.

Bit 8 – HSEN TWI High-Speed Mode Enabled

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	High-speed mode enabled.

Bit 7 – SWRST Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

Bit 6 – QUICK SMBus Quick Command

Value	Description
0	No effect.
1	If Host mode is enabled, a SMBus Quick Command is sent.

Bit 5 – SVDIS TWI Client Mode Disabled

Value	Description
0	No effect.
1	Client mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling.

Bit 4 – SVEN TWI Client Mode Enabled

Switching from Host to Client mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Client mode (SVDIS must be written to 0).

Bit 3 – MSDIS TWI Host Mode Disabled

Value	Description
0	No effect.
1	Host mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in the case of a write operation. In a read operation, the character being transferred must be completely received before disabling.

Bit 2 – MSEN TWI Host Mode Enabled

Switching from Client to Host mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Host mode (MSDIS must be written to 0).

Bit 1 – STOP Send a STOP Condition

Value	Description
0	No effect.
1	STOP condition is sent just after completing the current byte transmission in Host Read mode. – In single data byte host read, both START and STOP must be set. – In multiple data bytes host read, the STOP must be set after the last data received but one. – In Host Read mode, if a NACK bit is received, the STOP is automatically performed. – In host data write operation, a STOP condition will be sent after the transmission of the current data is finished.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a client. When configured in Host mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding register (FLEX_TWI_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWI Host Mode register (FLEX_TWI_MMR).

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.76.TWI Host Mode Register

Bit 24 – NOAP No Auto-Stop On NACK Error

Value	Description
0	A stop condition is sent automatically upon Not-Acknowledge error detection.
1	No automatic action is performed upon Not-Acknowledge error detection.

Bits 22:16 – DADR[6:0] Device Address
The device address is used to access client devices in Read or Write mode. Those bits are only used in Host mode.

Bits 14:13 – SCLRBL[1:0] SCL Rise Boost Level
Number of clock periods during which SCL rise is boosted (meaning line driven to level ‘1’).

Bit 12 – MREAD Host Read Direction

Value	Description
0	Host write direction.
1	Host read direction.

Bits 9:8 – IADRSZ[1:0] Internal Device Address Size

Value	Name	Description
0	NONE	No internal device address
1	1_BYTE	One-byte internal device address
2	2_BYTE	Two-byte internal device address
3	3_BYTE	Three-byte internal device address

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.77.TWI Client Mode Register

Name: FLEX_TWI_SMR
Offset: 0x608
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
		SADR[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
		MASK[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	SNIFF	SCLWSDIS	BSEL	SADAT	SMHH	SMDA		NACKEN
Access	R/W	R/W	R/W	R/W	R/W	R/W		R/W
Reset	0	0	0	0	0	0		0

Bits 22:16 – SADR[6:0] Client Address
The client device address is used in Client mode in order to be accessed by host devices in Read or Write mode.
SADR must be programmed before enabling Client mode or after a general call. Writes at other times have no effect.

Bits 14:8 – MASK[6:0] Client Address Mask
A mask can be applied on the client device address in Client mode in order to allow multiple address answer. For each bit of the MASK field set to one, the corresponding SADR bit will be masked.
If the MASK field is set to 0, no mask is applied to the SADR field.

Bit 7 – SNIFF Client Sniffer Mode

Value	Description
0	Client Sniffer mode is disabled.
1	Client Sniffer mode is enabled.

Bit 6 – SCLWSDIS Clock Wait State Disable

Value	Description
0	No effect.
1	Clock stretching disabled in Client mode, OVRE and UNRE will indicate overrun and underrun.

Bit 5 – BSEL TWI Bus Selection

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	TWI analyzes the TWCK and TWD pins from its TWI bus.
1	TWIn analyzes the TWCK and TWD pins of the peripheral TWIn-1 (TWI0 analyzes TWImax).

Bit 4 – SADAT Client Address Treated as Data

When Client Sniffer Mode is enabled, the client address is always received as data in FLEX_TWI_RHR and SADAT has no effect.

Value	Description
0	Client address is handled normally (will not trig RXRDY flag and will not fill FLEX_TWI_RHR upon reception).
1	Client address is handled as data field, RXRDY will be set and FLEX_TWI_RHR filled upon client address reception.

Bit 3 – SMHH SMBus Host Header

Value	Description
0	Acknowledge of the SMBus Host Header disabled.
1	Acknowledge of the SMBus Host Header enabled.

Bit 2 – SMDA SMBus Default Address

Value	Description
0	Acknowledge of the SMBus Default Address disabled.
1	Acknowledge of the SMBus Default Address enabled.

Bit 0 – NACKEN Client Receiver Data Phase NACK Enable

Value	Description
0	Normal value to be returned in the ACK cycle of the data phase in Client Receiver mode.
1	NACK value to be returned in the ACK cycle of the data phase in Client Receiver mode.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.78.TWI Internal Address Register

Name: FLEX_TWI_IADR
Offset: 0x60C
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	IADR[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	IADR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	IADR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:0 – IADR[23:0] Internal Address
0, 1, 2 or 3 bytes depending on IADRSZ.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.79.TWI Clock Waveform Generator Register

Name: FLEX_TWI_CWGR
Offset: 0x610
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

FLEX_TWI_CWGR is only used in Host mode.

Bit	31	30	29	28	27	26	25	24
		HOLD[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
				BRSRCCLK		CKDIV[2:0]		
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

Bit	15	14	13	12	11	10	9	8
	CHDIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CLDIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 30:24 – HOLD[6:0] TWD Hold Time Versus TWCK Falling
If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the I2C specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of (HOLD + 3) × $t_{peripheral\ clock}$.

Bit 20 – BRSRCCLK Bit Rate Source Clock

Value	Name	Description
0	PERIPH_CLK	The peripheral clock is the source clock for the bit rate generation.
1	GCLK	GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

Bits 18:16 – CKDIV[2:0] Clock Divider
The CKDIV is used to increase both SCL high and low periods.

Bits 15:8 – CHDIV[7:0] Clock High Divider
The SCL high period is defined as follows:
If FLEX_TWI_FILTR.FILT = 0

- If BRSRCCLK = 0: CHDIV = $((t_{high}/t_{peripheral\ clock}) - 3)/2^{CKDIV}$
- If BRSRCCLK = 1: CHDIV = $(t_{high}/t_{ext_ck})/2^{CKDIV}$

If FLEX_TWI_FILTR.FILT = 1

- If BRSRCCLK = 0: CHDIV = $((t_{high}/t_{peripheral\ clock}) - 3 - (THRES+1))/2^{CKDIV}$

© 2026 Microchip Technology Inc. and its subsidiaries

- If BRSRCCLK = 1: CHDIV = ((t_{high} - (THRES+1) * $t_{peripheral\ clock}$)/t_{ext_ck})/2^{CKDIV}

Bits 7:0 – CLDIV[7:0] Clock Low Divider

The SCL low period is defined as follows:

If FLEX_TWI_FILTR.FILT = 0

- If BRSRCCLK = 0: CLDIV = ((t_{low}/$t_{peripheral\ clock}$) - 3)/2^{CKDIV}
- If BRSRCCLK = 1: CLDIV = (t_{low}/t_{ext_ck})/2^{CKDIV}

If FLEX_TWI_FILTR.FILT = 1

- If BRSRCCLK = 0: CLDIV = ((t_{low}/$t_{peripheral\ clock}$) - 3 - (THRES+1))/2^{CKDIV}
- If BRSRCCLK = 1: CLDIV = ((t_{low} - (THRES+1) * $t_{peripheral\ clock}$)/t_{ext_ck})/2^{CKDIV}

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.80.TWI Status Register (Default Mode)

Name: FLEX_TWI_SR (DEFAULT_MODE)
Offset: 0x620
Reset: 0x03000009
Property: Read-only

Bit	31	30	29	28	27	26	25	24
						SR	SDA	SCL
Access						R	R	R
Reset						0	1	1

Bit	23	22	21	20	19	18	17	16
	LOCK		SMBHHM	SMBDAM	PECERR	TOUT		MCACK
Access	R		R	R	R	R		R
Reset	0		0	0	0	0		0

Bit	15	14	13	12	11	10	9	8
					EOSACC	SCLWS	ARBLST	NACK
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	UNRE	OVRE	GACC	SVACC	SVREAD	TXRDY	RXRDY	TXCOMP
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	1	0	0	1

Bit 26 – SR Start Repeated

Value	Description
0	No repeated start has been detected since last FLEX_TWI_SR read.
1	At least one repeated start has been detected since last FLEX_TWI_SR read.

Bit 25 – SDA SDA Line Value

Value	Description
0	SDA line sampled value is ‘0’.
1	SDA line sampled value is ‘1’.

Bit 24 – SCL SCL Line Value

Value	Description
0	SCL line sampled value is ‘0’.
1	SCL line sampled value is ‘1.’

Bit 23 – LOCK TWI Lock Due to Frame Errors

Value	Description
0	The TWI is not locked.
1	The TWI is locked due to frame errors (see Handling Errors in Alternative Command and TWI FIFOs).

Bit 21 – SMBHHM SMBus Host Header Address Match (cleared on read)

Value	Description
0	No SMBus Host Header Address received.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	A SMBus Host Header Address was received.

Bit 20 – SMBDAM SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received.
1	A SMBus Default Address was received.

Bit 19 – PECERR PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred.
1	A SMBus PEC error occurred.

Bit 18 – TOUT Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred.
1	SMBus timeout occurred.

Bit 16 – MCACK Host Code Acknowledge (cleared on read)
MACK used in Client mode:

Value	Description
0	No host code has been received.
1	A host code has been received.

Bit 11 – EOSACC End Of Client Access (cleared on read)
This bit is only used in Client mode.
EOSACC behavior can be seen in figures Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	A client access is being performed.
1	Client Access is finished. End Of Client Access is automatically set as soon as SVACC is reset.

Bit 10 – SCLWS Clock Wait State
This bit is only used in Client mode.
SCLWS behavior can be seen in figures Clock Stretching in Read Mode and Clock Stretching in Write Mode.

Value	Description
0	The clock is not stretched.
1	The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character.

Bit 9 – ARBLST Arbitration Lost (cleared on read)
This bit is only used in Host mode.

Value	Description
0	Arbitration won.
1	Arbitration lost. Another host of the TWI bus has won the multi-host arbitration. TXCOMP is set at the same time.

Bit 8 – NACK Not Acknowledged (cleared on read)
NACK used in Host mode:
0: Each data byte has been correctly received by the far-end side TWI client component.

© 2026 Microchip Technology Inc. and its subsidiaries

1: A data or address byte has not been acknowledged by the client component. Set at the same time as TXCOMP.
NACK used in Client Read mode:
0: Each data byte has been correctly received by the host.
1: In Read mode, a data byte has not been acknowledged by the host. When NACK is set, the user must not fill FLEX_TWI_THR even if TXRDY is set, because it means that the host will stop the data transfer or reinitiate it.
Note that in Client Write mode, all data are acknowledged by the TWI.

Bit 7 – UNRE Underrun Error (cleared on read)
This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_THR has been filled on time.
1	FLEX_TWI_THR has not been filled on time.

Bit 6 – OVRE Overrun Error (cleared on read)
This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_RHR has not been loaded while RXRDY was set.
1	FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set.

Bit 5 – GACC General Call Access (cleared on read)
This bit is only used in Client mode.
GACC behavior can be seen in figure Host Performs a General Call.

Value	Description
0	No general call has been detected.
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

Bit 4 – SVACC Client Access
This bit is only used in Client mode.
SVACC behavior can be seen in figures Read Access Ordered by a Host, Write Access Ordered by a Host, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (a host has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

Bit 3 – SVREAD Client Read
This bit is only used in Client mode. When SVACC is low (no client access has been detected) SVREAD is irrelevant.
SVREAD behavior can be seen in figures Read Access Ordered by a Host, Write Access Ordered by a Host, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	Indicates that a write access is performed by a host.
1	Indicates that a read access is performed by a host.

Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX_TWI_THR)
TXRDY used in Host mode:

© 2026 Microchip Technology Inc. and its subsidiaries

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX_TWI_THR.
1: As soon as a data byte is transferred from FLEX_TWI_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).
TXRDY behavior in Host mode can be seen in figures Host Write with One Data Byte,Host Write with Multiple Data Bytes and Host Write with One Byte Internal Address and Multiple Data Bytes.
TXRDY used in Client mode:
0: As soon as data is written in FLEX_TWI_THR, until this data has been transmitted and acknowledged (ACK or NACK).
1: Indicates that FLEX_TWI_THR is empty and that data has been transmitted and acknowledged.
If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX_TWI_THR to avoid losing it.
TXRDY behavior in Client mode can be seen in figures Read Access Ordered by a Host, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.
When FIFOs are enabled:
0: Transmit FIFO is full and cannot accept more data.
1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.
TXRDY behavior with FIFOs enabled is illustrated in TXRDY and RXRDY Behavior.

Bit 1 – RXRDY Receive Holding Register Ready (cleared when reading FLEX_TWI_RHR)
When FIFOs are disabled:
0: No character has been received since the last FLEX_TWI_RHR read operation.
1: A byte has been received in FLEX_TWI_RHR since the last read.
RXRDY behavior in Host mode can be seen in figure Host Read with Multiple Data Bytes.
RXRDY behavior in Client mode can be seen in figures Write Access Ordered by a Host, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.
When FIFOs are enabled:
0: Receive FIFO is empty; no data to read.
1: At least one unread data is in the Receive FIFO.
RXRDY behavior with FIFO enabled is illustrated in TXRDY and RXRDY Behavior.

Bit 0 – TXCOMP Transmission Completed (cleared by writing FLEX_TWI_THR)
TXCOMP used in Host mode:
0: During the length of the current frame.
1: When both the holding register and the internal shifter are empty and STOP condition has been sent.
TXCOMP behavior in Host mode can be seen in figures Host Write with One Byte Internal Address and Multiple Data Bytes and Host Read with Multiple Data Bytes.
TXCOMP used in Client mode:
0: As soon as a Start is detected.
1: After a Stop or a Repeated Start + an address different from SADR is detected.
TXCOMP behavior in Client mode can be seen in figures Clock Stretching in Read Mode, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.81.TWI Status Register (FIFO ENABLED)

Name: FLEX_TWI_SR (FIFO_ENABLED)
Offset: 0x620
Reset: 0x0300F009
Property: Read-only

If FIFO is enabled (FLEX_US_CR.FIFOEN bit), see TWI Multiple Data Access for details.

Bit	31	30	29	28	27	26	25	24
						SR	SDA	SCL
Access						R	R	R
Reset						0	1	1

	UNRE	OVRE	GACC	SVACC	SVREAD	TXRDY	RXRDY	TXCOMP
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	1	0	0	1

Bit 26 – SR Start Repeated

Value	Description
0	No repeated start has been detected since last FLEX_TWI_SR read.
1	At least one repeated start has been detected since last FLEX_TWI_SR read.

Bit 25 – SDA SDA Line Value

Value	Description
0	SDA line sampled value is ‘0’.
1	SDA line sampled value is ‘1’.

Bit 24 – SCL SCL Line Value

Value	Description
0	SCL line sampled value is ‘0’.
1	SCL line sampled value is ‘1.’

Bit 23 – TXFLOCK Transmit FIFO Lock

Value	Description
0	The Transmit FIFO is not locked.
1	The Transmit FIFO is locked.

Bit 21 – SMBHHM SMBus Host Header Address Match (cleared on read)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No SMBus Host Header Address received.
1	A SMBus Host Header Address was received.

Bit 20 – SMBDAM SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received.
1	A SMBus Default Address was received.

Bit 19 – PECERR PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred.
1	A SMBus PEC error occurred.

Bit 18 – TOUT Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred.
1	SMBus timeout occurred.

Bit 16 – MCACK Host Code Acknowledge (cleared on read)
MACK used in Client mode:

Value	Description
0	No host code has been received.
1	A host code has been received.

Bit 11 – EOSACC End Of Client Access (cleared on read)
This bit is only used in Client mode.
EOSACC behavior can be seen in figures Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	A Client Access is being performed.
1	Client Access is finished. End Of Client Access is automatically set as soon as SVACC is reset.

Bit 10 – SCLWS Clock Wait State
This bit is only used in Client mode.
SCLWS behavior can be seen in figures Clock Stretching in Read Mode and Clock Stretching in Write Mode.

Value	Description
0	The clock is not stretched.
1	The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character.

Bit 9 – ARBLST Arbitration Lost (cleared on read)
This bit is only used in Host mode.

Value	Description
0	Arbitration won.
1	Arbitration lost. Another host of the TWI bus has won the multi-host arbitration. TXCOMP is set at the same time.

Bit 8 – NACK Not Acknowledged (cleared on read)
NACK used in Host mode:

© 2026 Microchip Technology Inc. and its subsidiaries

0: Each data byte has been correctly received by the far-end side TWI client component.
1: A data or address byte has not been acknowledged by the client component. Set at the same time as TXCOMP.
NACK used in Client Read mode:
0: Each data byte has been correctly received by the host.
1: In Read mode, a data byte has not been acknowledged by the host. When NACK is set the user must not fill FLEX_TWI_THR even if TXRDY is set, because it means that the host will stop the data transfer or re initiate it.
Note that in Client Write mode all data are acknowledged by the TWI.

Bit 7 – UNRE Underrun Error (cleared on read)
This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_THR has been filled on time.
1	FLEX_TWI_THR has not been filled on time.

Bit 6 – OVRE Overrun Error (cleared on read)
This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_RHR has not been loaded while RXRDY was set.
1	FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set.

Bit 5 – GACC General Call Access (cleared on read)
This bit is only used in Client mode.
GACC behavior can be seen in figure Host Performs a General Call.

Value	Description
0	No general call has been detected.
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

Bit 4 – SVACC Client Access
This bit is only used in Client mode.
SVACC behavior can be seen in figures Read Access Ordered by a Host, Write Access Ordered by a Host, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (a host has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

Bit 3 – SVREAD Client Read
This bit is only used in Client mode. When SVACC is low (no client access has been detected) SVREAD is irrelevant.
SVREAD behavior can be seen in figures Read Access Ordered by a Host, Write Access Ordered by a Host, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	Indicates that a write access is performed by a host.
1	Indicates that a read access is performed by a host.

Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX_TWI_THR)
TXRDY used in Host mode:

© 2026 Microchip Technology Inc. and its subsidiaries

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX_TWI_THR.
1: As soon as a data byte is transferred from FLEX_TWI_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).
TXRDY behavior in Host mode can be seen in figures Host Write with One Data Byte,Host Write with Multiple Data Bytes and Host Write with One Byte Internal Address and Multiple Data Bytes.
TXRDY used in Client mode:
0: As soon as data is written in FLEX_TWI_THR, until this data has been transmitted and acknowledged (ACK or NACK).
1: Indicates that FLEX_TWI_THR is empty and that data has been transmitted and acknowledged.
If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX_TWI_THR to avoid losing it.
TXRDY behavior in Client mode can be seen in figures Read Access Ordered by a Host, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.
When FIFOs are enabled:
0: Transmit FIFO is full and cannot accept more data.
1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.
TXRDY behavior with FIFOs enabled is illustrated in TXRDY and RXRDY Behavior.

Bit 1 – RXRDY Receive Holding Register Ready (cleared when reading FLEX_TWI_RHR)
When FIFOs are disabled:
0: No character has been received since the last FLEX_TWI_RHR read operation.
1: A byte has been received in FLEX_TWI_RHR since the last read.
RXRDY behavior in Host mode can be seen in figure Host Read with Multiple Data Bytes.
RXRDY behavior in Client mode can be seen in figures Write Access Ordered by a Host, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.
When FIFOs are enabled:
0: Receive FIFO is empty; no data to read.
1: At least one unread data is in the Receive FIFO.
RXRDY behavior with FIFO enabled is illustrated in TXRDY and RXRDY Behavior.

Bit 0 – TXCOMP Transmission Completed (cleared by writing FLEX_TWI_THR)
TXCOMP used in Host mode:
0: During the length of the current frame.
1: When both holding register and internal shifter are empty and STOP condition has been sent.
TXCOMP behavior in Host mode can be seen in figures Host Write with One Byte Internal Address and Multiple Data Bytes and Host Read with Multiple Data Bytes.
TXCOMP used in Client mode:
0: As soon as a Start is detected.
1: After a Stop or a Repeated Start + an address different from SADR is detected.
TXCOMP behavior in Client mode can be seen in figures Clock Stretching in Read Mode, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.82.TWI Interrupt Enable Register

Name: FLEX_TWI_IER
Offset: 0x624
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TWI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access

65.10.85.TWI Receive Holding Register (Default Mode)

Name: FLEX_TWI_RHR (DEFAULT_MODE)
Offset: 0x630
Reset: 0x00000000
Property: Read-only

If FIFO is enabled (FLEX_TWI_CR.FIFOEN=1), a byte access on FLEX_TWI_RHR reads one data, see TWI Single Data Access for details.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
				ASTATE[1:0]		PSTATE	SSTATE[1:0]	
Access				R	R	R	R	R
Reset				0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RXDATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 12:11 – ASTATE[1:0] Acknowledge State (Client Sniffer Mode only)

Value	Name	Description
0	NONE	No Acknowledge or Nacknowledge detected after previously logged data
1	ACK	Acknowledge (A) detected after previously logged data
2	NACK	Nacknowledge (NA) detected after previously logged data
3	UNDEF	Not defined

Bit 10 – PSTATE Stop State (Client Sniffer Mode only)

Value	Description
0	No STOP (P) detected after previous logged data.
1	Stop detected (P) after previous logged data.

Bits 9:8 – SSTATE[1:0] Start State (Client Sniffer Mode only)

Value	Name	Description
0	NOSTART	No START detected with the logged data
1	START	START (S) detected with the logged data
2	RSTART	Repeated START (Sr) detected with the logged data
3	UNDEF	Not defined

Bits 7:0 – RXDATA[7:0] Host or Client Receive Holding Data

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.86.TWI Receive Holding Register (FIFO Enabled)

Name: FLEX_TWI_RHR (FIFO_ENABLED)
Offset: 0x630
Reset: 0x00000000
Property: Read-only

To read multi-data, the FIFO must be enabled (FLEX_TWI_CR.FIFOEN=1) and Sniffer mode disabled (FLEX_TWI_SMR.SNIFF=0). The access type (byte, halfword or word) determines the number of data written in a single access (1, 2 or 4), see TWI Multiple Data Access for details.

	TLOWM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	TLOWS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					PRESC[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 31:24 – THMAX[7:0] Clock High Maximum Cycles
Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

Bits 23:16 – TLOWM[7:0] Main System Bus Clock Stretch Maximum Cycles

Value	Description
0	TLOW:MEXT timeout check disabled.
1–255	Clock cycles in main system bus maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT.

Bits 15:8 – TLOWS[7:0] Client Clock Stretch Maximum Cycles

Value	Description
0	TLOW:SEXT timeout check disabled.
1–255	Clock cycles in client maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT.

Bits 3:0 – PRESC[3:0] SMBus Clock Prescaler
Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula: PRESC = Log(fMCK / $f_{Prescaled}$) / Log(2) - 1

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 25 – NPEC Next PEC Request (SMBus Mode only)

Value	Description
0	The next transfer does not use a PEC byte.
1	The next transfer uses a PEC byte.

Bit 24 – NDIR Next Transfer Direction

Value	Description
0	Write direction.
1	Read direction.

Bits 23:16 – NDATAL[7:0] Next Data Length

Value	Description
0	No data to send (see Alternative Command).
1–255	Number of bytes to send for the next transfer.

Bit 9 – PEC PEC Request (SMBus Mode only)

Value	Description
0	The transfer does not use a PEC byte.
1	The transfer uses a PEC byte.

Bit 8 – DIR Transfer Direction

Value	Description
0	Write direction.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Read direction.

Bits 7:0 – DATAL[7:0] Data Length

Value	Description
0	No data to send (see Alternative Command).
1–255	Number of bytes to send during the transfer.

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.92.TWI Filter Register

Name: FLEX_TWI_FILTR
Offset: 0x644
Reset: 0x00000000
Property: Read/Write

Important:
FILT and THRES are used to configure digital filters on data and clock lines.

In Standard, Fast and Fast Plus modes, the digital filter must be enabled (FILT=1) and a pulse width threshold defined (THRES > 0).

The field THRES must be set according to the peripheral clock to suppress spikes lower than 50 ns. The recommended value is calculated using the formula below:

THRES > 50 ns/$t_{peripheral_clock\ (ns)}$

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
						THRES[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
							PADFEN	FILT
Access							R/W	R/W
Reset							0	0

Bits 10:8 – THRES[2:0] Digital Filter Threshold

Value	Description
0	No filtering applied on TWI inputs.
1–7	Maximum pulse width of spikes which will be suppressed by the input filter, defined in peripheral clock cycles.

Bit 1 – PADFEN PAD Filter Enable

Value	Description
0	PAD analog filter is disabled.
1	PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.)

Bit 0 – FILT RX Digital Filter

TWI digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No filtering applied on TWI inputs.
1	TWI input filtering is active. (Only in Standard and Fast modes)

© 2026 Microchip Technology Inc. and its subsidiaries

65.10.93.TWI High-Speed Clock Waveform Generator Register

Name: FLEX_TWI_HSCWGR
Offset: 0x648
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

FLEX_TWI_HSCWGR is only used in High-Speed Host mode.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						HSCKDIV[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8
	HSCHDIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	HSCLDIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 18:16 – HSCKDIV[2:0] High-Speed Clock Divider
The CKDIV is used to increase both SCL high and low periods.

Bits 15:8 – HSCHDIV[7:0] High-Speed Clock High Divider
The SCL high period is defined as follows:

- If BRSRCCLK = 0: CHDIV = $((t_{high}/t_{peripheralclock}) - 3)/2^{CKDIV}$
- If BRSRCCLK = 1: CHDIV = $(t_{high}/t_{ext_ck})/2^{CKDIV}$

Bits 7:0 – HSCLDIV[7:0] High-Speed Clock Low Divider
The SCL low period is defined as follows:

- If BRSRCCLK = 0: CLDIV = $((t_{low}/t_{peripheralclock}) - 3)/2^{CKDIV}$
- If BRSRCCLK = 1: CLDIV = $(t_{low}/t_{ext_ck})/2^{CKDIV}$

65.10.94.TWI FIFO Mode Register

Name: FLEX_TWI_FMR
Offset: 0x650
Reset: 0x00000000
Property: Read/Write

This register reads '0' if the FIFO is disabled (see FLEX_TWI_CR to enable/disable the internal FIFO). This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
			RXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
			TXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			RXRDYM[1:0]				TXRDYM[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–16	Defines the Receive FIFO threshold value (number of bytes). The FLEX_TWI_FSR.RXFTH flag will be set when Receive FIFO goes from "below" threshold state to "equal to or above" threshold state.

Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–16	Defines the Transmit FIFO threshold value (number of bytes). The FLEX_TWI_FSR.TXFTH flag will be set when Transmit FIFO goes from "above" threshold state to "equal to or below" threshold state.

Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode
If FIFOs are enabled, the FLEX_TWI_SR.RXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	RXRDY will be at level '1' when at least one unread data is in the receive FIFO. When DMA is enabled to transfer data the chunk of 1 byte must be configured in the DMA. If the transfer is performed by software, the access type (byte, halfword) must be defined accordingly.
1	TWO_DATA	RXRDY will be at level '1' when at least two unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
2	FOUR_DATA	RXRDY will be at level '1' when at least four unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).

Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode
If FIFOs are enabled, the FLEX_TWI_SR.TXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	TXRDY will be at level '1' when at least one data can be written in the transmit FIFO. When DMA is enabled to transfer data, the chunk of 1 byte must be configured in the DMA. If the transfer is performed by software, the access type must be defined as byte.
1	TWO_DATA	TXRDY will be at level '1' when at least two data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).
2	FOUR_DATA	TXRDY will be at level '1' when at least four data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).

65.10.95.TWI FIFO Level Register

Name: FLEX_TWI_FLR
Offset: 0x654
Reset: 0x00000000
Property: Read-only

This register reads '0' if the FIFO is disabled (see FLEX_TWI_CR to enable/disable the internal FIFO).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
			RXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–16	Indicates the number of unread data in the Receive FIFO.

Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–16	Indicates the number of data in the Transmit FIFO.

65.10.96.TWI FIFO Status Register

Name: FLEX_TWI_FSR
Offset: 0x660
Reset: 0x00000000
Property: Read-only

This register reads '0' if the FIFO is disabled (see FLEX_TWI_CR to enable/disable the internal FIFO)

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access

	RXFPTEF	TXFPTEF	RXFTHF	RXFFF	RXFEF	TXFTHF	TXFFF	TXFEF
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 7 – RXFPTEF Receive FIFO Underflow Error Flag
See FIFO Overflow/Underflow Error for details.

Value	Description
0	No Receive FIFO underflow occurred.
1	Receive FIFO underflow error occurred due to an incorrect software access (read data exceeding available data in FIFO). Receiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 6 – TXFPTEF Transmit FIFO Overflow Error Flag
See FIFO Overflow/Underflow Error for details.

Value	Description
0	No Transmit FIFO overflow occurred.
1	Transmit FIFO overflow error occurred due to an incorrect software access (written data exceeding available space). Transceiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 5 – RXFTHF Receive FIFO Threshold Flag

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last read of FLEX_TWI_FSR.

Bit 4 – RXFFF Receive FIFO Full Flag

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been filled since the last read of FLEX_TWI_FSR.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 3 – RXFEF Receive FIFO Empty Flag

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been emptied since the last read of FLEX_TWI_FSR.

Bit 2 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_TWI_FSR.

Bit 1 – TXFFF Transmit FIFO Full Flag (cleared on read)

Value	Description
0	Transmit FIFO is not full.
1	Transmit FIFO has been filled since the last read of FLEX_TWI_FSR.

Bit 0 – TXFEF Transmit FIFO Empty Flag (cleared on read)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of FLEX_TWI_FSR.

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x545749	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

Bit 0 – WPEN Write Protection Enable

See TWI Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

66. Quad Serial Peripheral Interface (QSPI)

66.1. Description

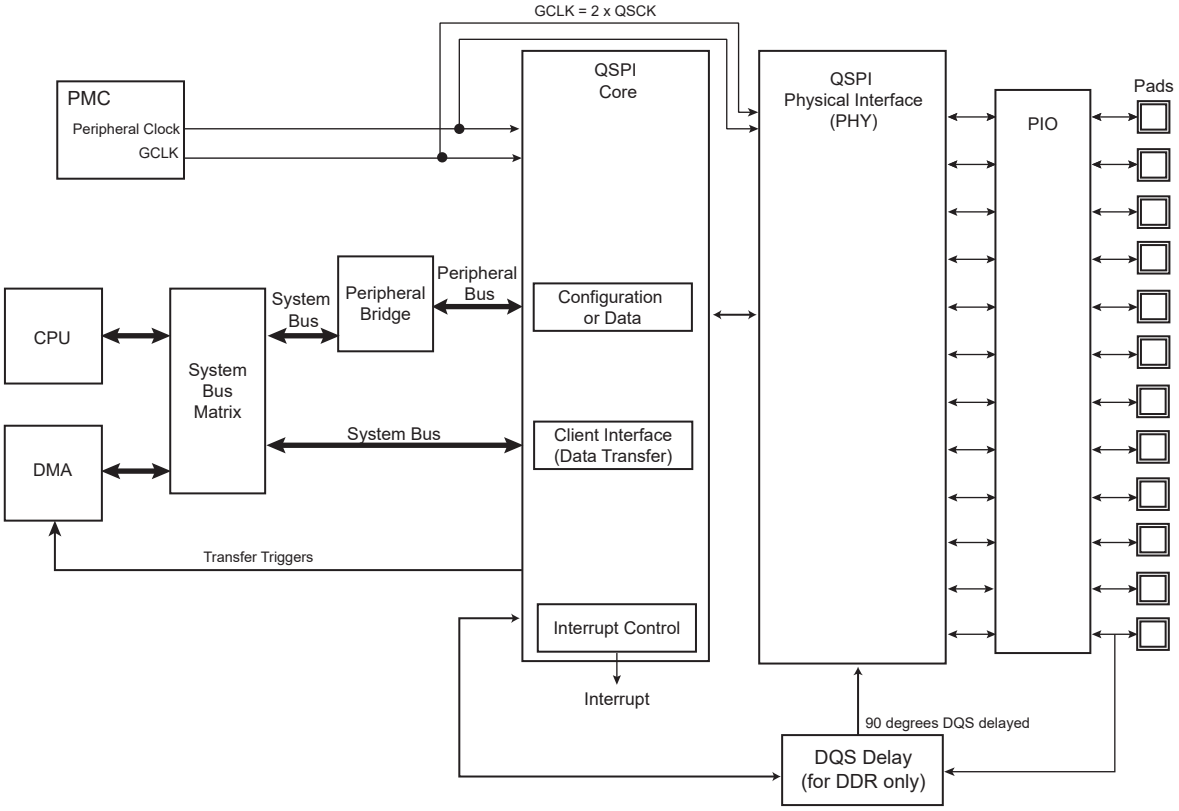
The Quad Serial Peripheral Interface (QSPI) is a synchronous serial data link that provides communication with external devices in Host mode.

The QSPI allows the system to execute code directly from a serial Flash memory (XiP) without code shadowing to RAM. In the system, the mapped serial Flash memory is seen as any other memory.

With the support of the Quad SPI protocol, the QSPI allows the system to use high-performance serial Flash memories which are small and inexpensive, instead of larger and more expensive parallel Flash memories.

The QSPI can be used in SPI legacy mode to interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors using register accesses, or in Serial Memory mode to interface to serial Flash memories or other devices in an automated way.

Note: Stacked devices with a rollover in the memory address space at each die boundary are not supported.



66.2. Embedded Characteristics

- Host SPI Interface
  - Octal/Quad/Dual/Single/Twin-Quad communication support
  - Single Data Rate (SDR) and Dual Data Rate (DDR) support
  - Flash/NANDmemory support (supports various vendors and modes)
  - Supports “Execute in Place” (XiP)—code execution by the system directly from a serial memory
- Legacy SPI Mode
  - Interface to serial peripherals such as ADCs and sensors
  - 8-bit/16-bit programmable data length
- Serial Memory Mode
  - Versatile instruction and timing registers for compatibility with all serial Flash memories and SPI devices
  - Up to 32-bit address mode to support serial Flash memories larger than 128 Mbits
  - “On-the-fly” zero latency scrambling/unscrambling
- Functional Safety Monitors and Reports
  - Abnormal functional behavior reports (access to undefined device address, access to locked registers, abnormal DMA requests, etc.)
  - Register write protection
- Connection to DMA Channel Capabilities for DMA Chip-Wide Integration
  - One channel for the receiver, one channel for the transmitter
- Supported standards are:
  - JESD251 (xSPI)
  - JESD251-1 (x4 Quad I/O with Data Strobe)
  - JESD216D (SFDP)

© 2026 Microchip Technology Inc. and its subsidiaries

66.3. Block Diagram

Figure 66.1. QSPI Block Diagram

66.4. Signal Description

Table 66.1. Signal Description for External IOs

Pin Name	Pin Description	Type
QSCK	Serial clock	Output
MOSI (QIO0)[123]	Data output (data input/output 0)	Output (input/output)
MISO (QIO1)[123]	Data input (data input/output 1)	Input (input/output)
QIO2[3]	Data input/output 2	Input/output
QIO3[3]	Data input/output 3	Input/output
QIO4[4]	Data input/output 4	Input/output
QIO5[4]	Data input/output 5	Input/output
QIO6[4]	Data input/output 6	Input/output
QIO7[4]	Data input/output 7	Input/output
QCS	Peripheral chip select	Output
QINT	Optional. Interrupt output of an external memory device. Set to 0 if not used.	Input
QDQS[5678]	Data strobe (input for read accesses, output for write accesses)	Input

© 2026 Microchip Technology Inc. and its subsidiaries

Notes:

1. MOSI and MISO are used for Single-bit SPI operation.
2. QIO0–QIO1 are used for Dual SPI operation.
3. QIO0–QIO3 are used for Quad SPI operation.
4. QIO4–QIO7 are used for Octal SPI operation.
5. QDQS is supplied by most Octal SPI memories.
6. Pre-cycle is not supported on the QDQS signal.
7. Preamble bits are not supported on the QDQS signal.
8. OCTAL SDR with DQS is not supported (QSPI_IFR.DDREN=0, QSPI_IFR.WIDTH=OCT_OUTPUT/OCT_IO/OCT_CMD, QSPI_IFR.DQSEN=1).

66.5. Product Dependencies

66.5.1. I/O Lines

The pins used to interface compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the QSPI pins to their peripheral functions.

66.5.2. Power Management

The QSPI must be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the QSPI clocks.

66.5.3. Interrupt Sources

The QSPI has an interrupt line connected to the Interrupt Controller. Handling the QSPI interrupt requires programming the interrupt controller before configuring the QSPI.

66.5.4. Direct Memory Access Controller (DMAC)

The QSPI can be used in conjunction with the system-wide Direct Memory Access Controller (DMAC) in order to reduce processor overhead. For a full description of the DMAC, refer to the section “DMA Controller (XDMAC)”.

66.6. Functional Description

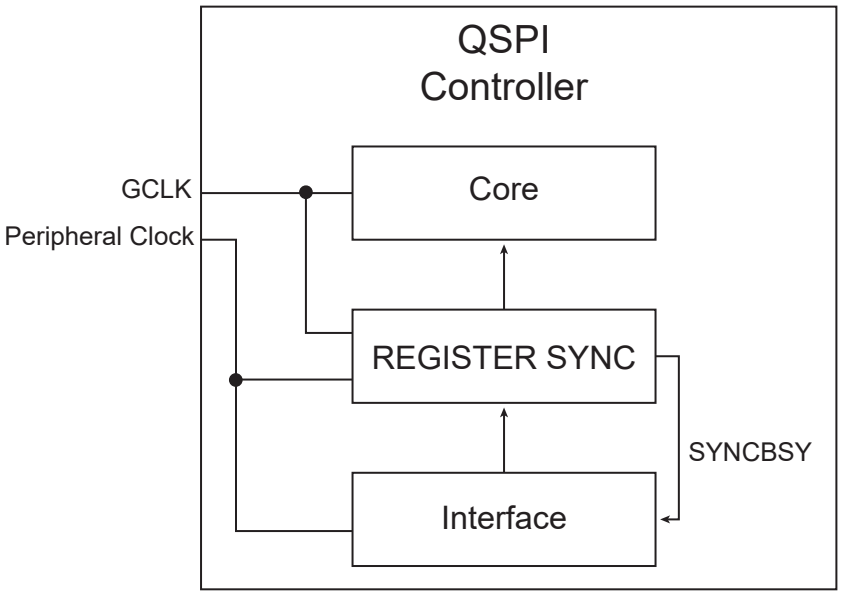
66.6.1. Register Synchronization

As the Quad Serial Peripheral Interface and the QSPI Controller core use different clocks, the following events must be synchronized with the core after being configured:

- QSPI_CR.QSPIEN
- QSPI_CR.QSPIDIS
- QSPI_CR.SRFRSH
- QSPI_CR.SWRST
- QSPI_CR.UPDCFG
- QSPI_CR.STTFR
- QSPI_CR.RTOUT
- QSPI_CR.LASTXFER
- QSPI_RDR.RD (synchronization only when QSPI_MR.SMM is set to ‘1 ‘)
- QSPI_TDR.TD
- QSPI_WRACNT.NBWRA

© 2026 Microchip Technology Inc. and its subsidiaries

Before accessing any of these bits/fields, check that the SYNCBSY bit in the Status register (QSPI_SR) is at 0 to ensure that no synchronization process is ongoing.



When synchronization is in progress, SYNCBSY is at 1.

As long as SYNCBSY is at 1, no access to the registers requiring synchronization is allowed.

When using UPDCFG in the Control register (QSPI_CR) to update the system configuration, SYNCBSY must be at 0 before and after writing UPDCFG. This ensures that the update is completed before going on to the next step.

Note: If the TDRE or RDRF flag is checked, checking QSPI_SR.SYNCBSY for QSPI_RDR.RD and QSPI_TDR.TD is not necessary. See Figure 66.13, Figure 66.17 and Figure 66.23 for detailed procedures.

Figure 66.2. Register Synchronization with QSPI Controller Core

66.6.2. Updating the QSPI Configuration

Once written in the registers, the configuration must be synchronized with the QSPI core.

At any time, the QSPI Controller core configuration can be updated by writing the QSPI_CR.UPDCFG bit to 1. This will update the QSPI core with the current register configuration. Note that QSPI_SR.SYNCBSY must be 0 before writing QSPI_CR.UPDCFG.

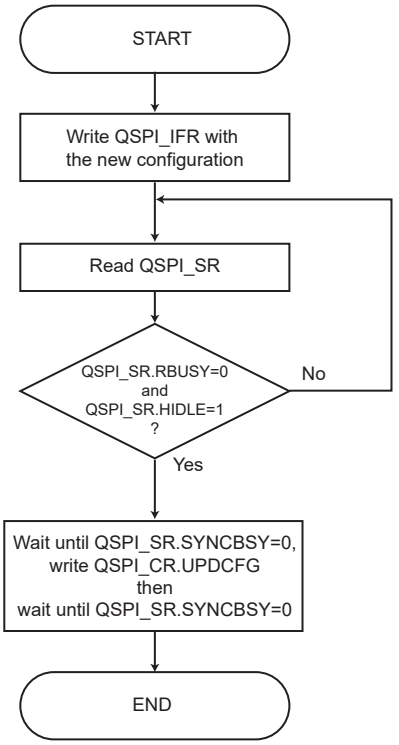
The configuration registers that require synchronization (writing QSPI_CR.UPDCFG to 1) with the QSPI Controller core are:

- QSPI Mode Register(1)
- QSPI Serial Clock Register
- QSPI Instruction Address Register
- QSPI Write Instruction Code Register
- QSPI Read Instruction Code Register
- QSPI Scrambling Mode Register
- QSPI Scrambling Key Register
- QSPI Refresh Register
- QSPI Write Access Counter Register

© 2026 Microchip Technology Inc. and its subsidiaries

- QSPI Instruction Frame Register

Note:



1. TAMPCLR in the Mode register (QSPI_MR) does not require synchronization with the QSPI core.

66.6.2.1. Changing Frame Configuration in Serial Memory Mode (XiP)

Accesses in Serial Memory mode (QSPI_MR.SMM=1) are triggered by QSPI register accesses or by performing accesses in the QSPI memory space depending on the configuration of SMRM and TFRTYP in the Instruction Frame register (QSPI_IFR).

To modify QSPI_IFR after the initial configuration, proceed as illustrated in the figure below to ensure no frame loss. For details, see Instruction Frame and Table 66.3.

Figure 66.3. Changing QSPI_IFR

66.6.3. Serial Clock Phase and Polarity

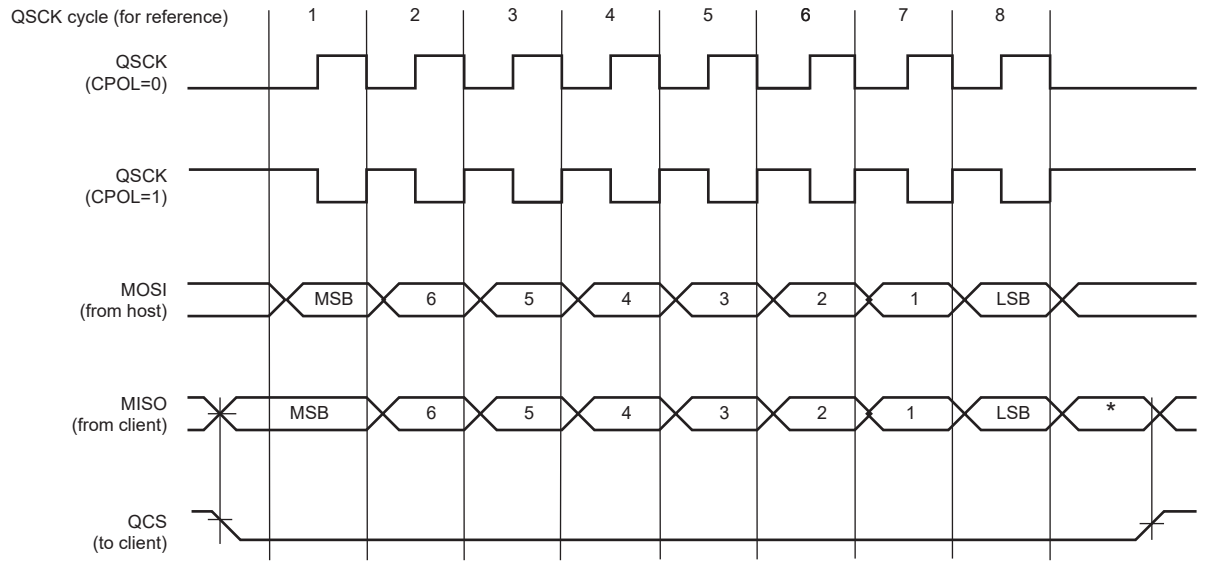
Only Mode 0 is supported with QSPI_MR.SMM=1.

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the QSPI Serial Clock register (QSPI_SCR). QSPI_SCR.CPHA programs the clock phase. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of these parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, the interfaced client must use the same parameter values to communicate.

The table below shows the four modes and the corresponding parameter settings.

Table 66.2. QSPI Bus Clock Modes

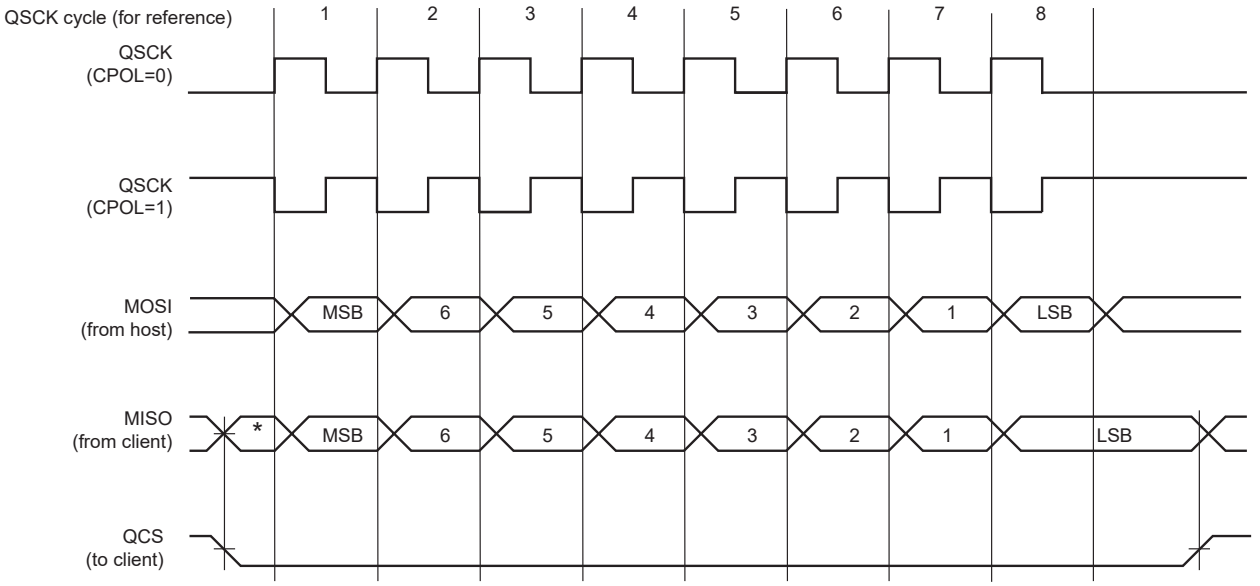
QSPI Clock Mode	QSPI_SCR.CPOL	QSPI_SCR.CPHA	Shift QSCK Edge	Capture QSCK Edge	QSCK Inactive Level
0	0	0	Falling	Falling	Low
1	0	1	Rising	Rising	Low
2	1	0	Rising	Rising	High



© 2026 Microchip Technology Inc. and its subsidiaries

Table 66.2. QSPI Bus Clock Modes (continued)

QSPI Clock Mode	QSPI_SCR.CPOL	QSPI_SCR.CPHA	Shift QSCK Edge	Capture QSCK Edge	QSCK Inactive Level
3	1	1	Falling	Falling	High



The figures below show examples of data transfers.

Figure 66.4. QSPI Transfer Format (QSPI_SCR.CPHA=0, 8 bits per transfer)

* Not defined, but normally the MSB of the previous character is received.

Figure 66.5. QSPI Transfer Format (QSPI_SCR.CPHA=1, 8 bits per transfer)

* Not defined, but normally the LSB of the previous character is transmitted.

66.6.4. Transfer Delays

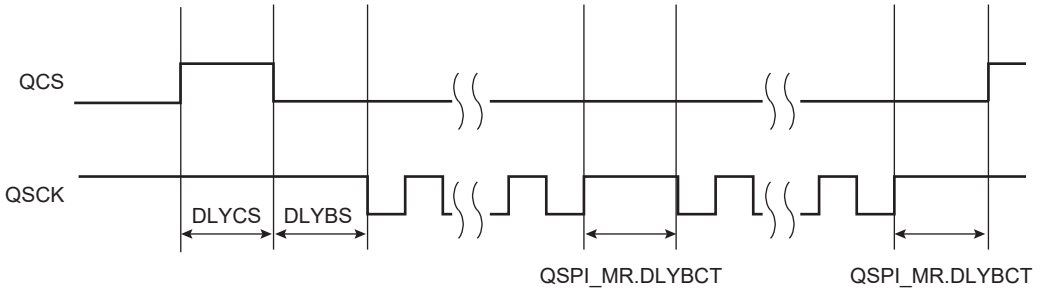
Figure 66.6 and Figure 66.7 show several consecutive transfers while the chip select is active. Three delays can be programmed to modify the transfer waveforms:

© 2026 Microchip Technology Inc. and its subsidiaries

- The delay between the deactivation and the activation of QCS, programmed by writing QSPI_MR.DLYCS—to adjust the minimum time of QCS at high level.
- The delay before QSCK, programmed by writing QSPI_SCR.DLYBS—to start delaying QSCK after the chip select has been asserted.
- The delay between consecutive transfers, programmed by writing QSPI_MR.DLYBCT.
  - QSPI_MR.SMM=0, to insert a delay between two consecutive transfers
  - QSPI_MR.SMM=1, to insert a delay between the last QSCK pulse and the QCS rise.
- The delay between consecutive transfers when SMM=1, programmed by writing QSPI_SCR.DLYBCT.

These delays allow the QSPI to be adapted to the interfaced peripherals and their speed and bus release time.

Figure 66.6. Programmable Delays (SMM=0)



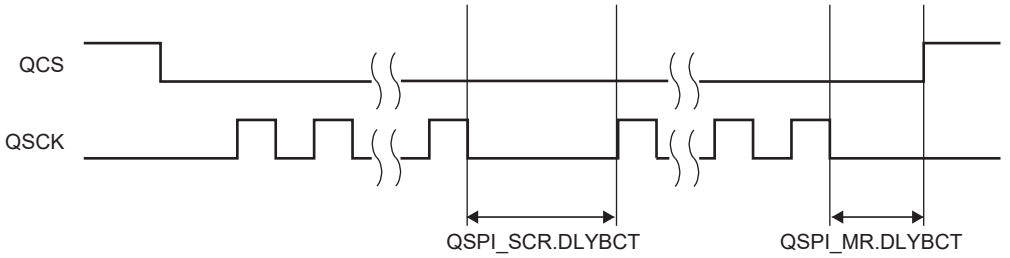


Figure 66.7. DLYBCT with SMM=1

66.6.5. Data Strobe Delay Management

When DQS/DS is output by the memory edge-aligned with read data, the QSPI must delay the signal by an appropriate value to correctly sample the data sent by the memory.

The QSPI embeds a delay circuitry that must be enabled by writing QSPI_MR.DQSDLYEN to 1 prior to enabling the QSPI. DQS/DS management must be also be enabled by writing QSPI_IFR.DQSEN=1.

Periodically, the delay line must be calibrated. The calibration can be performed automatically or manually through a refresh. The calibration process is described in the section Refresh Sequence.

66.6.6. Refresh Sequence

The QSPI uses some analog blocks:

- A DQS delay line

Once calibrated at first start of the QSPI, the product properties (power, voltage, temperature, etc.) continue to change over time, so the analog blocks used by the QSPI require an updated calibration.

© 2026 Microchip Technology Inc. and its subsidiaries

The QSPI refresh sequence allows the QSPI to stop transfers on a regular basis to perform a calibration update. A 1 ms refresh interval is a safe value for Refresh register (QSPI_REFRESH).

The following analog blocks are refreshed during the refresh sequence:

- DQS delay

66.6.6.1. Automatic Refresh

QSPI_REFRESH defines the periodicity of the automatic refresh sequence.

Automatic refresh is enabled if the following conditions are met:

- The QSPI is enabled (QSPI_CR.QSPIEN is written to 1).
- QSPI_REFRESH.REFRESH is not set to 0.
- QSPI_MR.DQSDLYEN is set.

An automatic refresh sequence of analog blocks is performed:

- after the first QSPI enable,
- when the internal refresh counter is set to 0 if REFRESH is not set to 0.

66.6.6.2. On-Demand Refresh

A refresh sequence can be launched at any time by writing QSPI_CR.STPCAL to 1. This minimizes the latency of the first access as the first calibration is always longer than the one generated by a refresh. To avoid conflicts with an automatic refresh, automatic refresh must be disabled, or the on-demand refresh process should be started only when the QSPI is disabled. The QSPI_ISR.RFRSHD flag indicates the end of the refresh process.

66.6.7. QSPI SPI Mode

In SPI mode, the QSPI acts as a standard SPI host.

To activate this mode, QSPI_MR.SMM must be written to 0.

66.6.7.1. SPI Mode Operations

The QSPI in standard SPI mode operates on the GCLK clock. It fully controls the data transfers to and from the client connected to the SPI bus. The QSPI drives the chip select line to the client (QCS) and the serial clock signal (QSCK).

Note: GCLK must be set to 2 x QSCK.

The QSPI features two holding registers, the Transmit Data register (QSPI_TDR) and the Receive Data register (QSPI_RDR), and a single internal shift register. The holding registers maintain the data flow at a constant rate.

After enabling the QSPI, a data transfer begins when the processor writes to QSPI_TDR. The written data is immediately transferred to the internal shift register and transfer on the SPI bus starts. While the data in the internal shift register is shifted on the MOSI line, the MISO line is sampled and shifted to the internal shift register. Receiving data cannot occur without transmitting data. If receiving mode is not needed, for example when communicating with a client receiver only (such as an LCD), the receive status flags in the Interrupt Status register (QSPI_ISR) can be discarded.

If new data is written in QSPI_TDR during the transfer, it is retained there until the current transfer is completed. Then, the received data is transferred from the internal shift register to QSPI_RDR, the data in QSPI_TDR is loaded in the internal shift register and a new transfer starts.

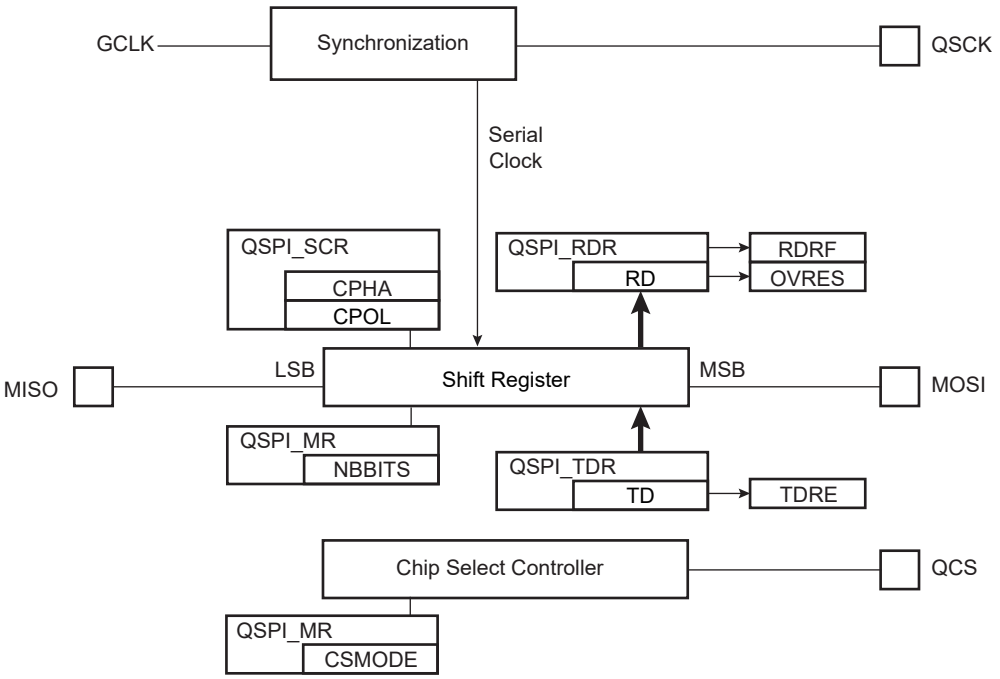
The transfer of a data written in QSPI_TDR in the internal shift register is indicated by the Transmit Data Register Empty (TDRE) bit in QSPI_ISR. When new data is written in QSPI_TDR, this bit is cleared. QSPI_ISR.TDRE is used to trigger the Transmit DMA channel.

The end of transfer is indicated by the TXEMPTY flag in QSPI_ISR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, QSPI_ISR.TXEMPTY is set after the completion of this delay. The

© 2026 Microchip Technology Inc. and its subsidiaries

peripheral clock and GCLK clock can be switched off at this time (after the current frame has ended). See Deactivation Procedure for a detailed suspend procedure.

The transfer of received data from the internal shift register in QSPI_RDR is indicated by the Receive Data Register Full (RDRF) bit in QSPI_ISR. When the received data is read, the QSPI_ISR.RDRF bit is cleared.



If QSPI_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in QSPI_ISR is set. As long as this flag is set, new data will overwrite the old QSPI_RDR.RD value. The user must read QSPI_ISR to clear the OVRES bit.

The figure below shows a block diagram of the SPI when operating in Host mode. Figure 66.9 shows a flow chart describing how transfers are handled.

66.6.7.2. Legacy SPI Mode Block Diagram

See QSPI SPI Mode.

66.6.7.3.SPI Mode Flow Diagram

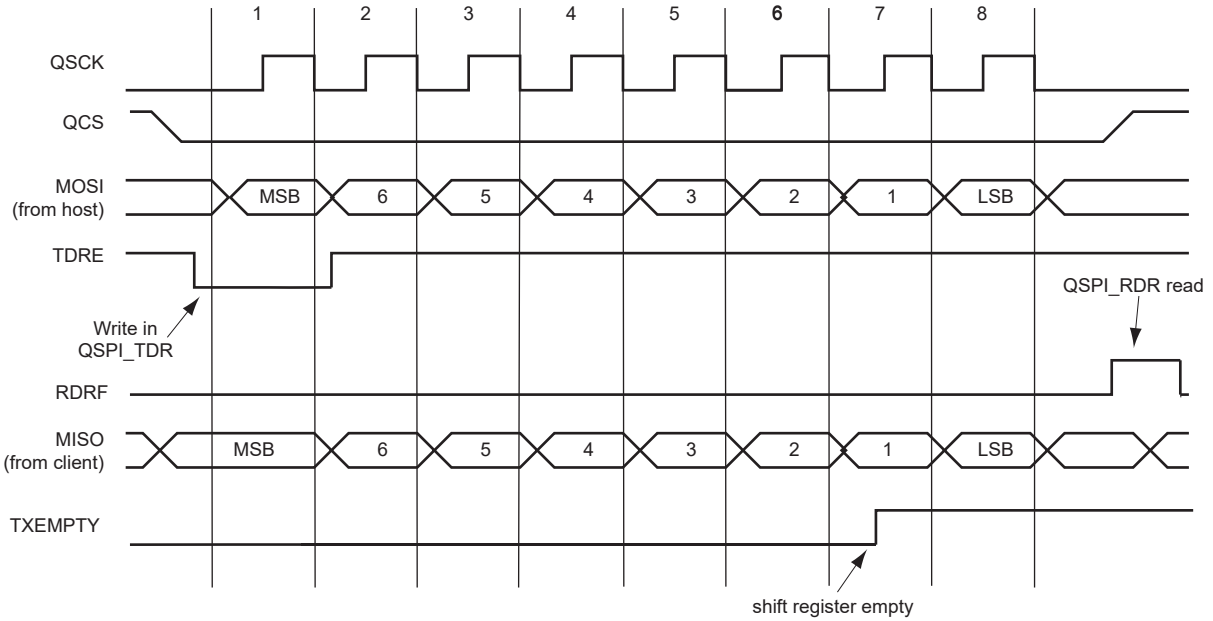

Figure 66.9. SPI Mode Flow Diagram

The figure below shows Transmit Data Register Empty (TDRE), Receive Data Register Full (RDRF) and Transmission Register Empty (TXEMPTY) status flags behavior within the QSPI_ISR during an 8-bit data transfer, without DMA.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 66.10. Status Register Flags Behavior

Notes: Due to the internal architecture (see Block Diagram):

- A latency occurs between the TXEMPTY rise and the end of the frame
- A delay occurs between the end of the frame and the RDRF flag rise

66.6.7.4.Chip Select Management without DMA

During a transfer of more than one data on a chip select without the DMA, the QSPI_TDR is loaded by the processor and the flag TDRE rises as soon as the content of the QSPI_TDR is transferred into the internal shift register. When this flag is detected high, the QSPI_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, the chip select is not deasserted between the two transfers. Depending on the application software handling the QSPI_ISR flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload the QSPI_TDR in time to keep the chip select active (low). A null Delay Between Consecutive Transfer (DLYBCT) value in the QSPI_MR gives even less time for the processor to reload the QSPI_TDR. With some SPI client peripherals, requiring the chip select line to remain active (low) during a full set of transfers may lead to communication errors.

To facilitate interfacing with such devices, QSPI_MR.CSMODE may be configured to 1. This allows the chip select lines to remain in their current state (low=active) until the end of transfer is indicated by the Last Transfer (LASTXFER) bit in the Control register (QSPI_CR). Even if the QSPI_TDR is not reloaded, the chip select remains active. To have the chip select line rise at the end of the last data transfer, QSPI_CR.LASTXFER must be written to 1 at the same time or after writing the last data to transmit into the QSPI_TDR.

66.6.7.5.Peripheral Deselection with DMA

When the DMA Controller is used, the chip select line remains low during the transfer since the TDRE flag is managed by the DMA itself. Reloading QSPI_TDR by the DMA is done as soon as the TDRE flag is set. In this case, writing QSPI_MR.CSMODE to 1 may not be needed. However, when other DMA channels connected to other peripherals are also in use, the QSPI DMA could be delayed by another DMA with a higher priority on the bus. Having DMA buffers in slower memories like Flash memory or SDRAM compared to fast internal SRAM may lengthen the reload time of QSPI_TDR by the DMA as well. This means that QSPI_TDR might not be reloaded in time to keep the chip select line low. In this case, the chip select line may toggle between data transfer and, on some SPI client devices, the communication might get lost. It may be necessary to configure CSMODE to 1.

66.6.8. QSPI Serial Memory Mode

In Serial Memory mode, the QSPI acts as a serial Flash memory controller. The QSPI can be used to read data from the serial Flash memory allowing the CPU to execute code from it (XiP, or Execute in Place). The QSPI can also be used to control the serial Flash memory (Program, Erase, Lock, etc.) by sending specific commands. In this mode, the QSPI is compatible with Single-bit SPI, Dual SPI, Quad and Octal SPI protocols.

To activate this mode, QSPI_MR.SMM must be written to 1.

In Serial Memory mode, data is transferred either by QSPI_TDR and QSPI_RDR or by writing or reading in the QSPI memory space depending on QSPI_IFR.TFRTYP and QSPI_IFR.SMRM configuration.

66.6.8.1. Initialization Procedure

The QSPI initialization procedure must follow the specific steps below to ensure proper behavior.

1. Enable the GCLK clock.
2. Configure QSPI_REFRESH, QSPI_MR, QSPI_SCR, QSPI_SMR, etc.
3. Wait for QSPI_SR.SYNCBSY=0, then write QSPI_CR.UPDCFG. Wait for QSPI_SR.SYNCBSY=0.
4. Write QSPI_CR.QSPIEN.
5. Wait for QSPI_SR.QSPIENS=1.
6. If automatic refresh is enabled, wait for QSPI_ISR.RFRSHD=1 by polling or interrupt (see Automatic Refresh).

66.6.8.2. Deactivation Procedure

The QSPI deactivation procedure is as follows.

1. Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
2. Send a QSPI_CR.LASTXFER command.
3. If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA=1.
4. Set QSPI_CR.QSPIDIS and wait for QSPI_SR.QSPIENS=0.
5. Disable the GCLK clock.
6. Disable the peripheral clock.

66.6.8.3. GCLK Frequency Change Procedure

The GCLK frequency change procedure is as follows.

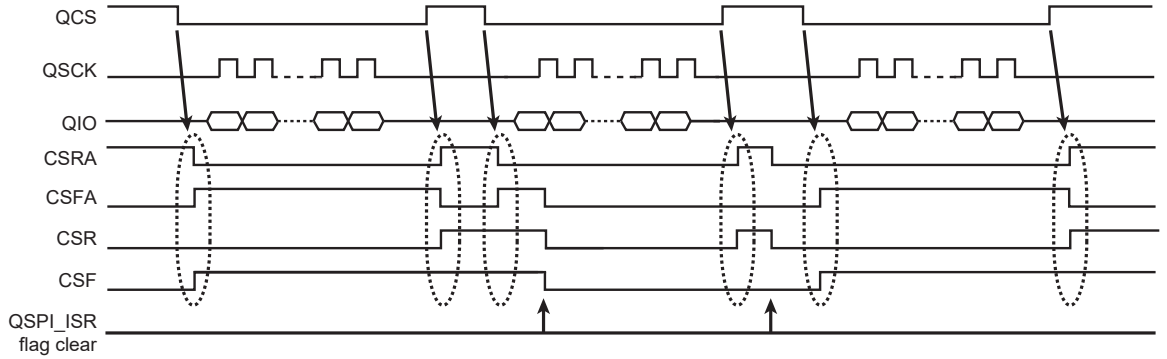
1. Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
2. Send a QSPI_CR.LASTXFER command.
3. If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA=1.
4. Set QSPI_CR.QSPIDIS and wait for QSPI_SR.QSPIENS=0.
5. Disable the GCLK clock.
6. If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA=1.
7. Change GCLK frequency.
8. Write QSPI_CR.QSPIEN.
9. Wait for QSPI_SR.QSPIENS=1.
10. If automatic refresh is enabled, wait for QSPI_ISR.RFRSHD=1 by polling or interrupt (see Automatic Refresh).

66.6.8.4. End of Frame Procedure

If the QSPI needs reconfiguring, first apply the following procedure to close the current frame safely:

© 2026 Microchip Technology Inc. and its subsidiaries

1. Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
2. Send a QSPI_CR.LASTXFER command.
3. If QSPI_SR.CSS=0 or QSPI_SR.CSS1=0, wait for QSPI_ISR.CSRA=1.
4. Set QSPI_CR.QSPIDIS and wait for QSPI_SR.QSPIENS=0.



Note: Consider using a memory barrier when writing the application code before executing the above procedure.

66.6.8.5.Device Selection Flags

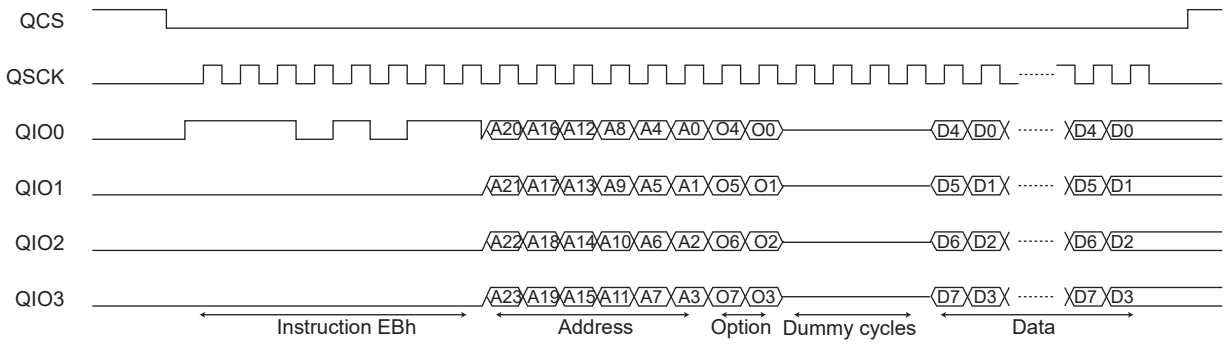
To control the QSPI frames, the following flags showing the state of the device selection are available in QSPI_ISR:

- CSR and CSRA indicate when a rising edge of QCS has been detected. CSRA is automatically cleared when a QCS falling edge is detected.
- CSFA indicates when a falling edge of QCS has been detected. CSFA is automatically cleared when a QCS rising edge is detected.

Figure 66.11. Device Selection Flags

66.6.8.6.Instruction Frame

In order to control serial Flash memories, the QSPI can send instructions via the SPI bus (READ, PROGRAM, ERASE, LOCK, etc.). The QSPI includes a complete Instruction Frame register (QSPI_IFR) to ensure compatibility with all serial Flash memories.



An instruction frame includes:

- (Optional) An instruction code (see Continuous Read Mode).
- An address (size: 8, 16, 24 or 32 bits). The address is optional but is required by instructions such as READ, PROGRAM, ERASE, LOCK. By default, the address is 8 bits long, but can be increased up to 32 bits to support serial Flash memories larger than 128 Mbits.
- An option code (size: 1/2/4/8 bits). The option code can be used to activate some memory features.
- Dummy cycles. Dummy are required by some instructions.
- Data bytes. Data bytes are present for data transfer instructions such as READ or PROGRAM.

The instruction code, the address/option and the data can be sent with the Single-bit SPI, Dual SPI, Quad SPI or Octal SPI protocol.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 66.12. Instruction Frame

66.6.8.7.Instruction Frame Transmission

If the instruction frame includes the instruction code and/or the option code, the user must configure the fields WRINST, WROPT, RDINST and RDOPT in the Write Instruction Code register (QSPI_WICR) and the Read Instruction Code register (QSPI_RICR). QSPI_WICR configures instruction code and option code for write accesses, and QSPI_RICR configures instruction code and option code for read accesses. For a frame without data (QSPI_IFR.DATAEN=0), QSPI_WICR is used for instruction and option codes.

QSPI_IFR must be configured with the instruction frame to send.

The instruction frame is configured by the following QSPI_IFR bits and fields:

- WIDTH field—configures which data lanes are used to send the instruction code, the address, the option code and to transfer the data.
- INSTEN bit—enables an instruction code.
- ADDREN bit—enables an address after the instruction code.
- OPTEN bit—enables an option code after the address.
- DATAEN bit—enables the transfer of data (READ or PROGRAM instruction).
- OPTL field—configures the option code length. The value written in OPTL must be consistent with the value written in the field WIDTH. For example: OPTL=0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).
- ADDRL bit—configures the QSPI address field size.
- TFRTYP field—defines the type of memory access. See the table below.
- CRM bit—enables Continuous Read mode, see Continuous Read Mode.
- DDREN bit—configures the Double Data Rate mode; the instruction code is still transmitted in Single Data Rate mode. The instruction code can be transmitted in DDR mode by writing a 1 to QSPI_IFR.DDRCMDEN.
- NBDUM field—configures the number of dummy cycles when reading data from the serial Flash memory. Between the address/option and the data, with some instructions, dummy cycles are required by the serial Flash memory.
- END bit—defines the endianness of the targeted memory.
- SMRM bit—when TFRTYP=0, defines if the instruction frame transmission is triggered by register accesses or QSPI memory space accesses.
- APBTFRTYP bit—defines the peripheral bus register transfer to memory type (read or write) when QSPI_IFR.TFRTYP is written to 0.
- DQSEN bit—defines if the targeted memory supplies a DQS signal.

© 2026 Microchip Technology Inc. and its subsidiaries

- DDRCMDEN bit—defines if the instruction code must be sent in DDR mode when QSPI_IFR.DDREN bit is written to 1.
- HFWBEN field—enables the HyperFlash Write Buffer command support. In this mode, a new command is generated for each write access. See HyperFlash Mode.
- PROTTYP bit—defines the QSPI protocol type.

See Instruction Frame register.

Depending on TFRTYP and SMRM memory accesses, the applicable methods are as follows.

Table 66.3. Memory Access Methods

QSPI_IFR Configuration	Memory Accesses via the System Bus	Memory Accesses via the Peripheral Bus
TFRTYP=0 and SMRM=1	No	Yes
TFRTYP=0 and SMRM=0	Yes	No
TFRTYP=1 or SMRM=0	Yes	No

66.6.8.7.1.Memory Registers/Commands Access

To perform memory register/command accesses, QSPI_IFR.TFRTYP must be set to 0.

If the frame does not contain any data (such as the WRITE ENABLE command) or if QSPI_IFR.SMRM is set to 1, the user must first configure the address to send by writing ADDR in the Instruction Address register (QSPI_IAR) (if the frame contains an address field).

- SMRM=1
  When QSPI_IFR.SMRM is set to 1, accesses to the memory are triggered and controlled by QSPI registers.

  QSPI_IAR.ADDR must be configured if the frame contains an address field.

  QSPI_IFR.APBTFRTYP defines whether the access is a read or a write access. Write frames are triggered by writing QSPI_TDR, and read frames (or frames with no data such as WRITE_ENABLE) are triggered by setting QSPI_CR.STTFR. Each time a new transfer is issued, an SPI transfer is performed with a byte size or halfword size if the QSPI_IFR.WIDTH field is configured to either OCT_OUTPUT, OCT_IO or OCT_CMD and QSPI_IFR.DDREN=1. Reading QSPI_RDR triggers a new read access to the next sequential data in the memory[(1)]. QSPI_TDR can be written when the flag TDRE is set. The QSPI transfer ends by writing QSPI_CR.LASTXFER. See Figure 66.13 for details.
- SMRM=0
  When QSPI_IFR.SMRM is set to 0, accesses to the memory are triggered by performing an access in the QSPI memory space. The address of the instruction frame is defined by the address of the first data access in the QSPI memory space. The addresses of the next accesses are not used by the QSPI.

  Note:

  a. If QSPI_RDR is read while the QPSI controller is busy receiving the data, the QSPI_ISR.RBSYERR error flag is set, indicating a possible data corruption.

66.6.8.7.2.Write Access Counter

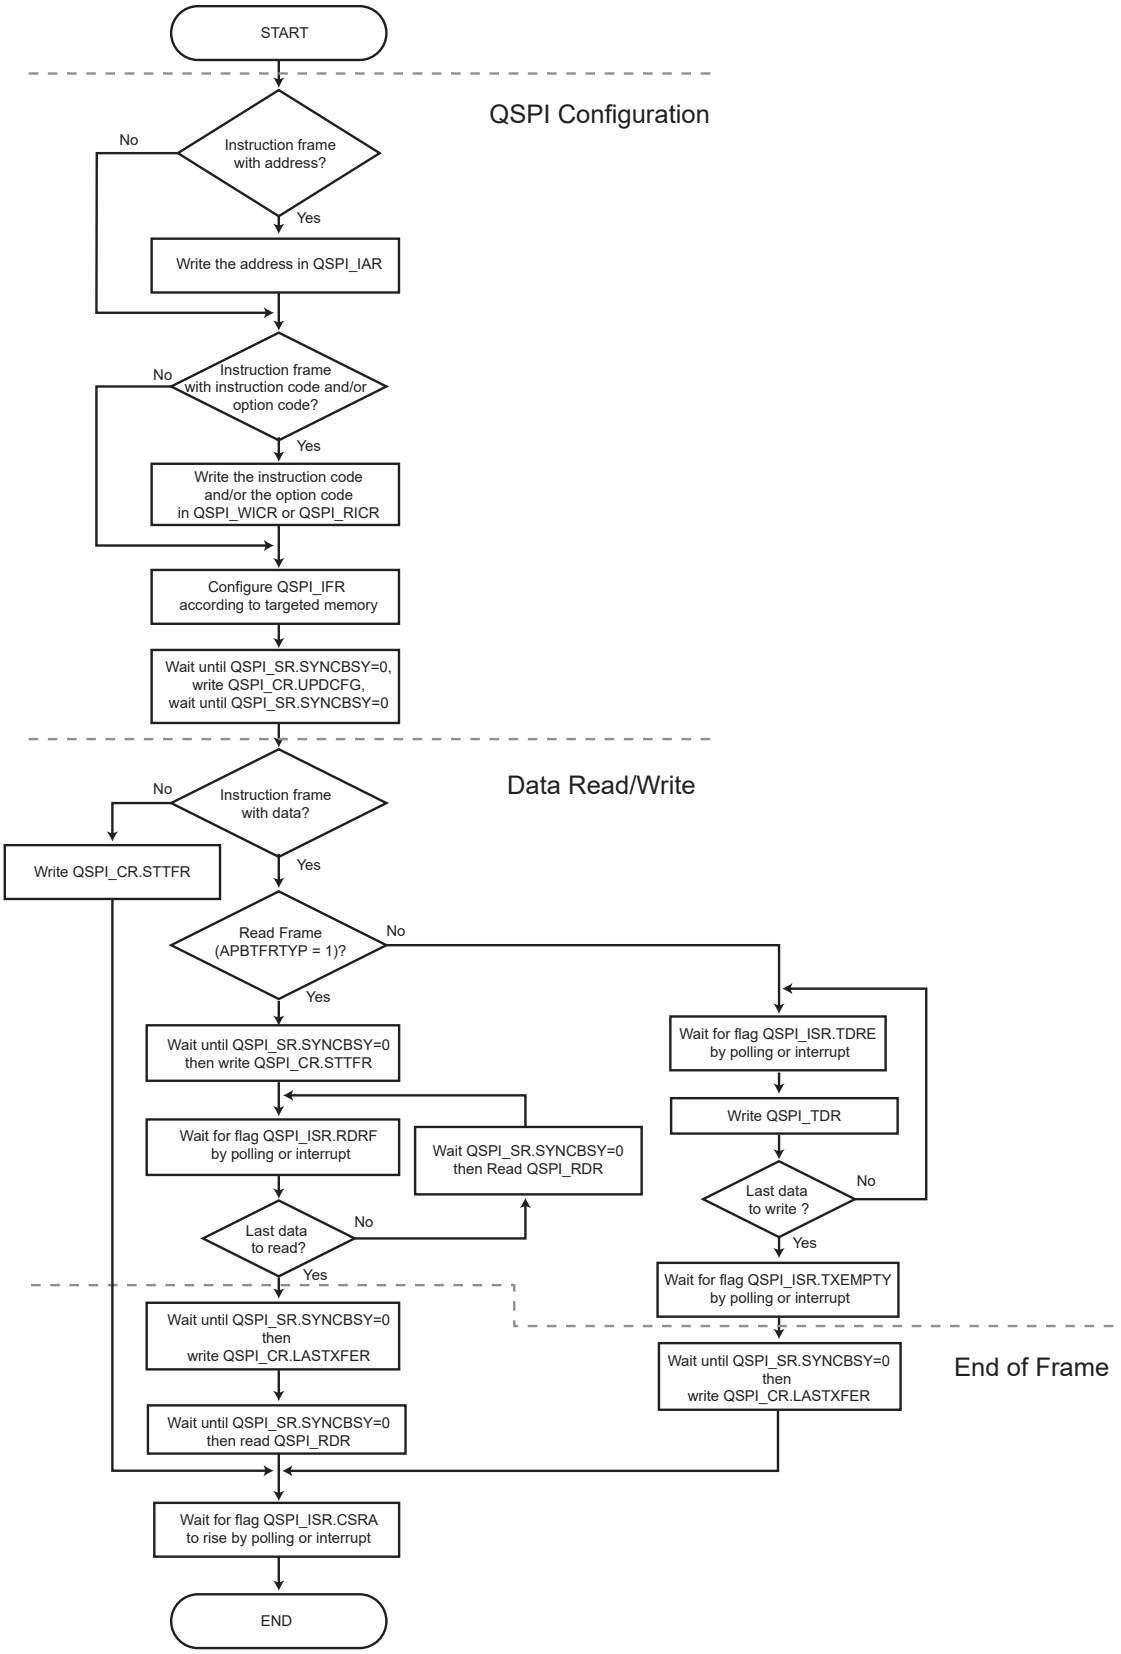
The field NBWRA, in the Write Access Counter register (QSPI_WRACNT) defines the number of bytes to be sent to the memory before QSPI_ISR.LWRA rises, which indicates that the last byte has been transmitted. NBWRA is reset and begins counting after each start of the instruction frame. If

© 2026 Microchip Technology Inc. and its subsidiaries

QSPI_IFR.PROTTYP=3 and QSPI_IFR.HFWBEN=1, NBWRA is reset after setting QSPI_IFR.HFWBEN bit to 1 and counts data on every frame.

66.6.8.7.3.Memory Array Access

To access the memory array, QSPI_IFR.TFRTYP must be set to 1. In the case of write access to the memory array, TFRTYP can be set to 0 with QSPI_IFR.SMRM set to 1.



- TFRTYP=0 and SMRM=1
  This configuration is allowed for write memory array access only (read access to the memory array is not supported in this configuration). When QSPI_IFR.SMRM is set to 1, accesses to the memory are triggered and controlled by QSPI registers. QSPI_IAR.ADDR must be configured with the address of the first data to write if the frame contains an address field, this field is the one used for the instruction frame address field. The QSPI_IFR.APBTFRTYP must be set to 0. Write frames are triggered by writing QSPI_TDR. Each time a new transfer trigger is issued, an SPI transfer is performed with a byte size or halfword size if the QSPI_IFR.WIDTH field is set to OCT_OUTPUT, OCT_IO or OCT_CMD and QSPI_IFR.DDREN=1. Another byte or halfword is written each time QSPI_TDR is written (flag TDRE shows when a new data can be written). If a data is not consecutive to the previously sent data, a new frame must be issued. The SPI transfer ends by writing QSPI_CR.LASTXFER. See Figure 66.17 for details.
- TFRTYP=1
  When QSPI_IFR.TFRTYP is set to 1, accesses to the memory are triggered by performing an access in the QSPI memory space. The address of the instruction frame is defined by the address of the first data access in the QSPI memory space. Each time the accesses become non-sequential (addresses are not consecutive), a new instruction frame may be sent (depending on optimization) with the last system bus access address. This way, the system can read/write data at a random location in the serial memory. QSPI_WRACNT.NBWRA generates a rising flag when a given number of bytes have been sent to the memory. QSPI_ISR.LWRA indicates the transmission of the last byte. The NBWRA internal counter is reset and begins counting after each start of instruction frame except when QSPI_IFR.PROTTYP=3 and QSPI_IFR.HFWBEN=1 where the NBWRA counter is reset after setting the QSPI_IFR.HFWBEN bit to 1 and counts data on every frame.

  In the case of read accesses to the memory array, QSPI_SR.RBUSY must be at 0 and QSPI_SR.HIDLE at 1 before terminating the frame. The last SPI transfer ends by writing QSPI_CR.LASTXFER. See Figure 66.19 and Figure 66.21 for details.

66.6.8.8.Write Memory Transfer

Many QSPI Flash memories impose a sequential write of their data buffer. When using this type of memory, the access to the memory must be performed in a strongly ordered way.

66.6.8.9.Read Memory Transfer

The user can access the data of the serial memory by sending an instruction with QSPI_IFR.DATAEN=1 and QSPI_IFR.TFRTYP=1.

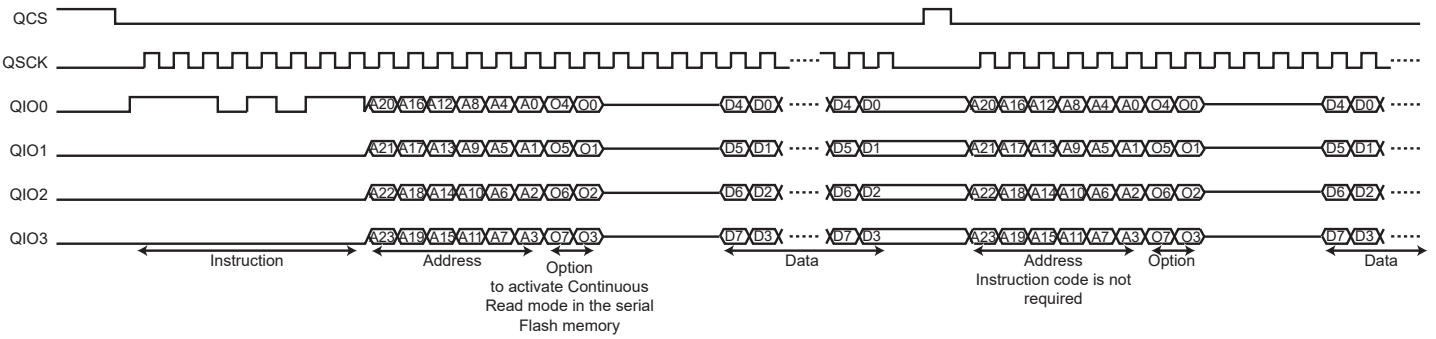
In this mode, the QSPI is able to read data at a random address into the serial Flash memory, allowing the CPU to execute code directly from it (XiP, or Execute in Place).

In order to read data, the user must first configure the instruction frame by writing the QSPI_IFR. Then data can be read at any address in the QSPI address space mapping. The address of the system bus read accesses matches the address of the data inside the serial Flash memory.

When the Read mode is used, several instruction frames can be sent before writing QSPI_CR.LASTXFR. Each time the system bus read accesses become non-sequential (addresses are not consecutive), a new instruction frame may be sent (depending on optimization) with the corresponding address.

66.6.8.10.Continuous Read Mode

The QSPI is compatible with the Continuous Read mode which is implemented in some serial Flash memories.



In Continuous Read mode, the instruction overhead is reduced by excluding the instruction code from the instruction frame. When the Continuous Read mode is activated in a serial Flash memory by a specific option code, the instruction code is stored in the memory. For the next instruction frames, the instruction code is not required as the memory uses the stored one.

In the QSPI, Continuous Read mode is used when reading data from the memory (QSPI_IFR.TFRTYP=1). The addresses of the system bus read accesses are often nonsequential and this may lead to many instruction frames that have the same instruction code. By disabling the send of the instruction code, the Continuous Read mode reduces the access time of the data.

To be functional, this mode must be enabled in both the QSPI and the serial Flash memory. The Continuous Read mode is enabled in the QSPI by writing CRM to 1 in the QSPI_IFR (TFRTYP set to 1). The Continuous Read mode is enabled in the serial Flash memory by sending a specific option code.

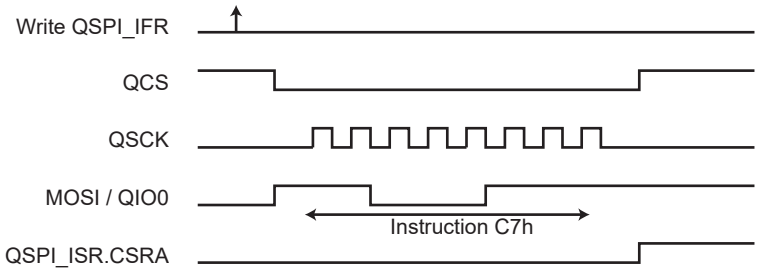
CAUTION Check the connected Memory Continuous read mode compatibility before enabling.

Figure 66.25. Continuous Read Mode

66.6.8.11.Instruction Frame Transmission Examples

All waveforms in the following examples describe SPI transfers in SPI Clock mode 0 (QSPI_SCR.CPOL = 0 and QSPI_SCR.CPHA = 0. See Serial Clock Phase and Polarity).

© 2026 Microchip Technology Inc. and its subsidiaries



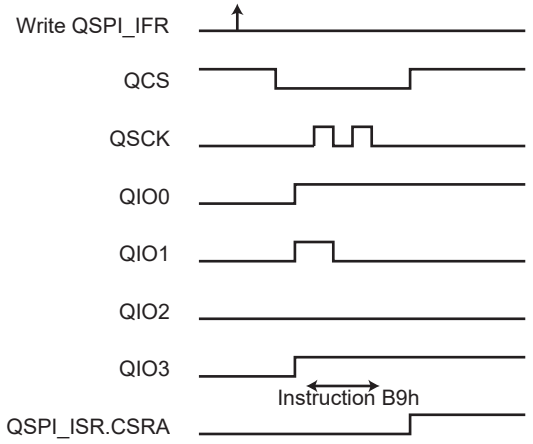
Example 1:

Instruction in Single-bit SPI, without address, without option, without data.

Command: CHIP ERASE (C7h).

- Write 0x0000_00C7 in QSPI_WICR.
- Write 0x0000_0010 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write QSPI_CR.STTFR to 1.
- Wait for QSPI_ISR.CSRA to rise.

Figure 66.26. Instruction Transmission Waveform 1



Example 2:

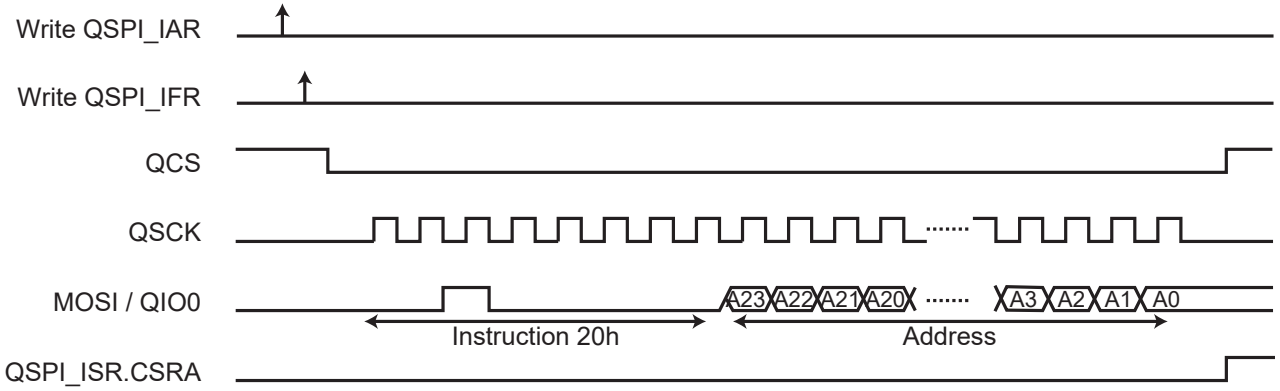
Instruction in Quad SPI, without address, without option, without data.

Command: POWER DOWN (B9h)

- Write 0x0000_00B9 in QSPI_WICR.
- Write 0x0000_0016 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write QSPI_CR.STTFR to 1.
- Wait for QSPI_ISR.CSRA to rise.

Figure 66.27. Instruction Transmission Waveform 2

Example 3:



Instruction in Single-bit SPI, with address in Single-bit SPI, without option, without data.

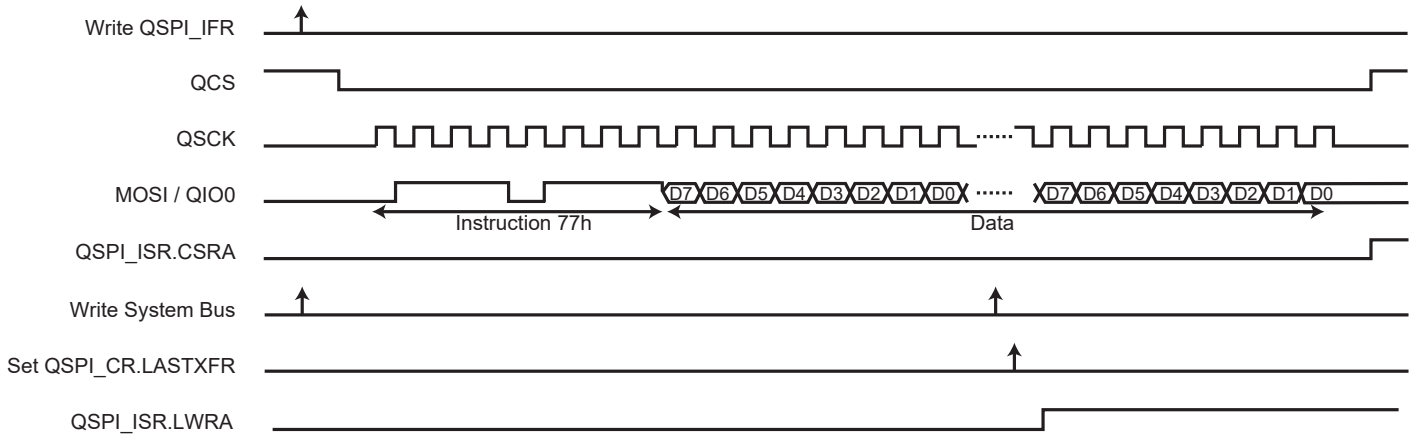
Command: BLOCK ERASE (20h)

© 2026 Microchip Technology Inc. and its subsidiaries

- Write the address (of the block to erase) in QSPI_IAR.
- Write 0x0000_0020 in QSPI_WICR.
- Write 0x0000_0030 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write QSPI_CR.STTFR to 1.
- Wait for QSPI_ISR.CSRA to rise.

Figure 66.28. Instruction Transmission Waveform 3

Example 4:



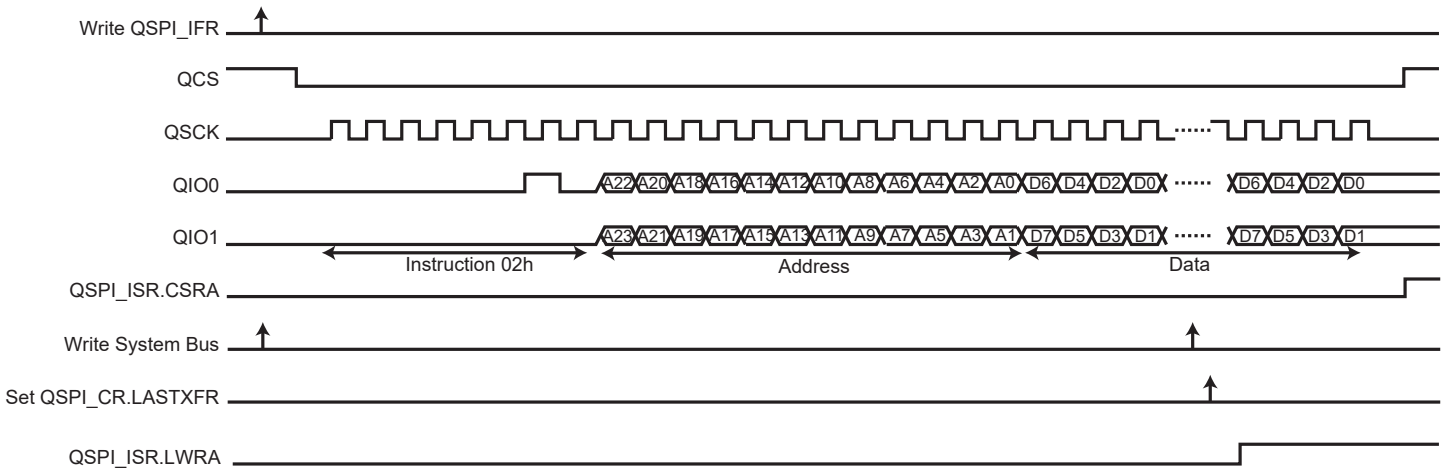
Instruction in Single-bit SPI, without address, without option, with data write in Single-bit SPI.

Command: SET BURST (77h)

- Write 0x0000_0077 in QSPI_WICR.
- Write 0x0000_0090 in QSPI_IFR.
- Write QSPI_WRACNT.NBWRA with the number of bytes to write.
- Update configuration (see Updating the QSPI Configuration).
- Write data in the system bus memory space (0x60000000 - 0x80000000).
  The address of system bus write accesses is not used.
- Wait for QSPI_ISR.LWRA to rise.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 66.29. Instruction Transmission Waveform 4



Example 5:

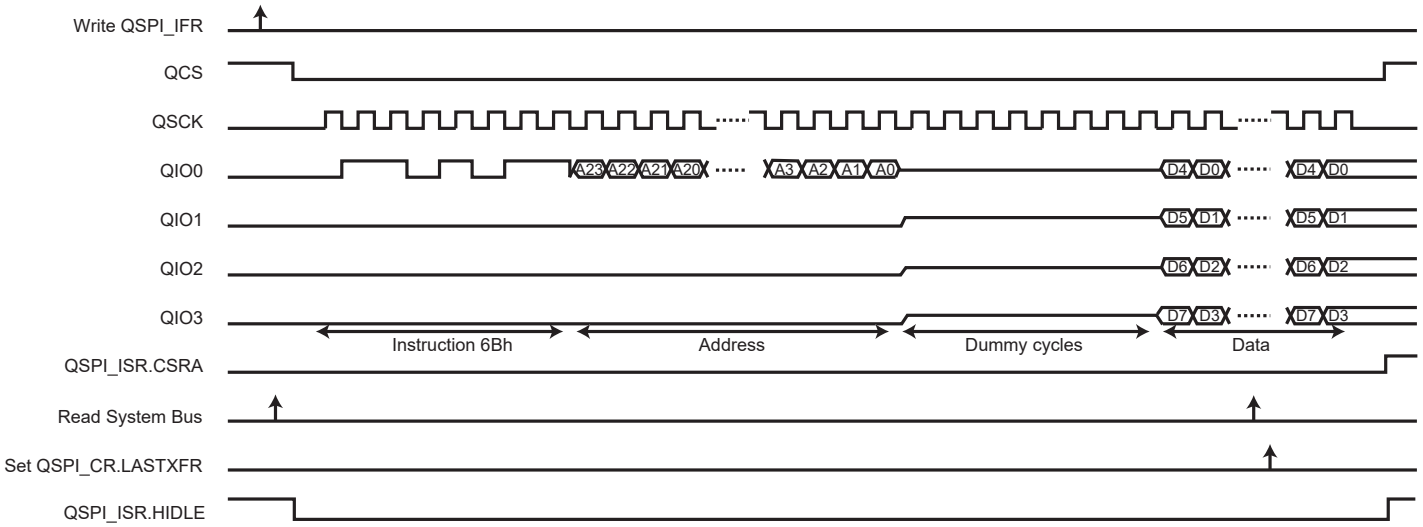
Instruction in Single-bit SPI, with 24-bit address in Dual SPI, without option, with data write in Dual SPI.

Command: BYTE/PAGE PROGRAM (02h)

- Write 0x0000_0002 in QSPI_WICR.
- Write 0x0000_18B3 in QSPI_IFR.
- Write QSPI_WRACNT.NBWRA with the number of bytes to write.
- Update configuration (see Updating the QSPI Configuration).
- Write data in the QSPI system bus memory space (0x60000000 - 0x80000000).
  The address of the first system bus write access is sent in the instruction frame.
  The address of the next system bus write accesses is not used.
- Wait for QSPI_ISR.LWRA to rise.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

Figure 66.30. Instruction Transmission Waveform 5

Example 6:



© 2026 Microchip Technology Inc. and its subsidiaries

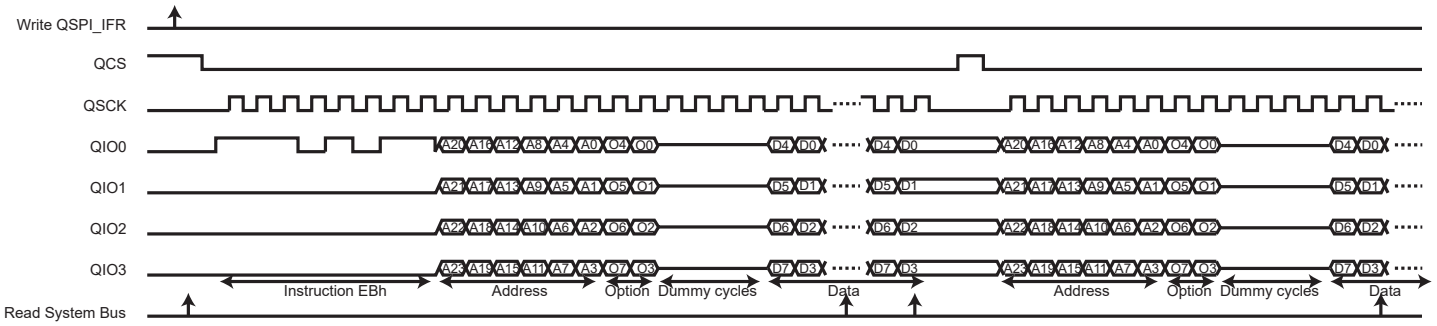
Instruction in Single-bit SPI, with 24-bit address in Single-bit SPI, without option, with data read in Quad SPI, with eight dummy cycles.

Command: QUAD_OUTPUT READ ARRAY (6Bh)

- Write 0x0000_006B in QSPI_RICR.
- Write 0x0008_18B2 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Read data in the QSPI system bus memory space (0x60000000 - 0x80000000).
  The address of the first system bus read access is sent in the instruction frame.
  The address of the next system bus read accesses is not used.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
- Write a 1 to QSPI_CR.LASTXFR.
- If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA to rise.

Figure 66.31. Instruction Transmission Waveform 6

Example 7:



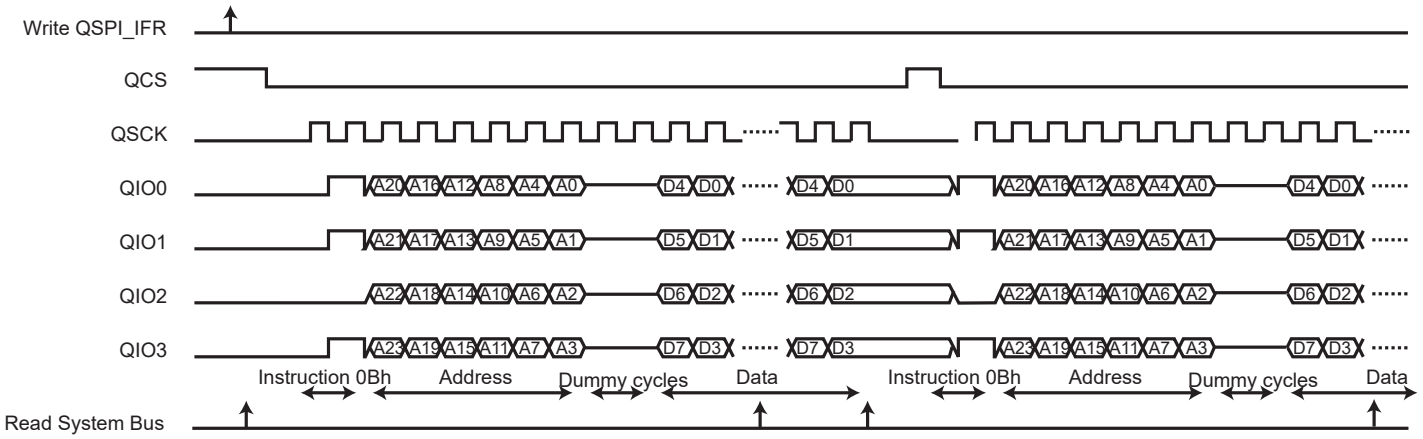
Instruction in Single-bit SPI, with 24-bit address and option in Quad SPI, with data read in Quad SPI, with four dummy cycles and continuous read.

Command: FAST READ QUAD I/O (EBh) - 8-BIT OPTION (0x30h)

- Write 0x0030_00EB in QSPI_RICR.
- Write 0x0004_1BF4 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Read data in the QSPI system bus memory space (0x60000000 - 0x80000000).
  The address of the system bus read accesses is always used.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
- Write a 1 to QSPI_CR.LASTXFR.
- If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA to rise.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 66.32. Instruction Transmission Waveform 7



Example 8:

Instruction in Quad SPI, with 24-bit address in Quad SPI, without option, with data read in Quad SPI and two dummy cycles.

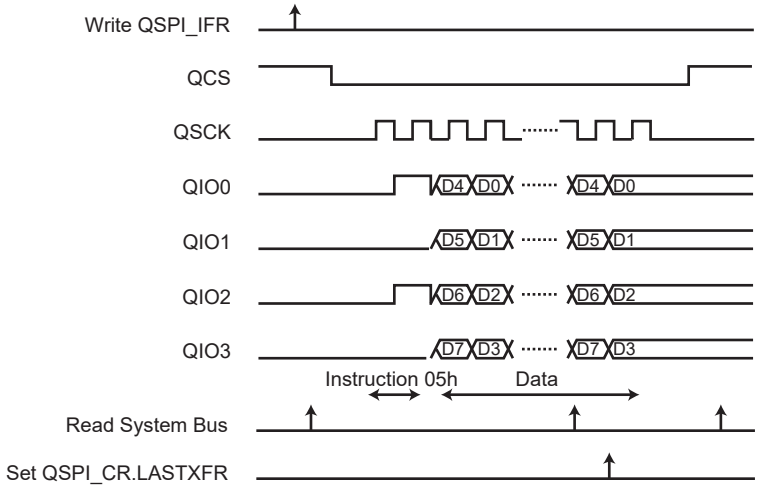
Command: HIGH-SPEED READ (0Bh)

- Write 0x0000_000B in QSPI_RICR.
- Write 0x0002_08B6 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Read data in the QSPI system bus memory space (0x60000000 - 0x80000000). The address of the system bus read accesses is always used.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
- Write a 1 to QSPI_CR.LASTXFR.
- If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA to rise.

Figure 66.33. Instruction Transmission Waveform 8

Example 9:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch.



Command: Read Status register (05h)

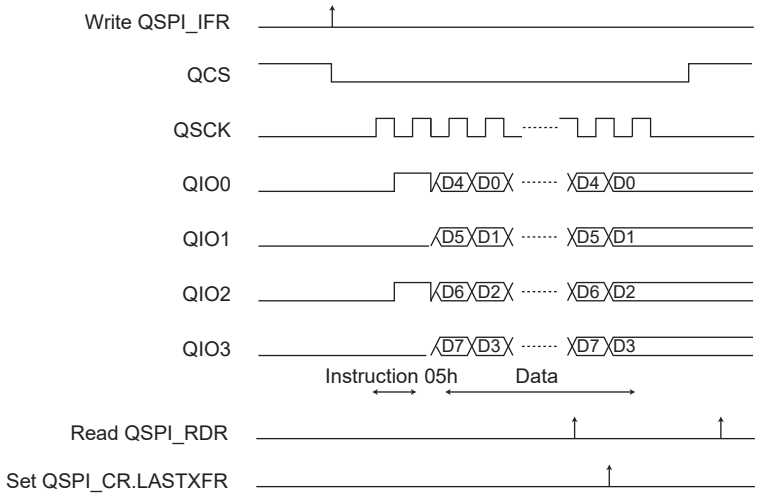
- Write 0x0000_0005 in QSPI_RICR.
- Write 0x0000_0096 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).

© 2026 Microchip Technology Inc. and its subsidiaries

- Read data in the QSPI system bus memory space (0x60000000 - 0x80000000). Fetch is disabled.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

Figure 66.34. Instruction Transmission Waveform 9

Example 10:



Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, and read launched through the peripheral bus.

Command: Read Status register (05h)

- Set SMRM to 1 and TFRTYP to 0 in QSPI_MR
- Write 0x0000_0005 in QSPI_RICR.
- Write 0x0100_0096 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write a 1 to QSPI_CR.STTFR.
- Wait for flag RDRF and Read data in QSPI_RDR.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.
- Read data in QSPI_RDR.

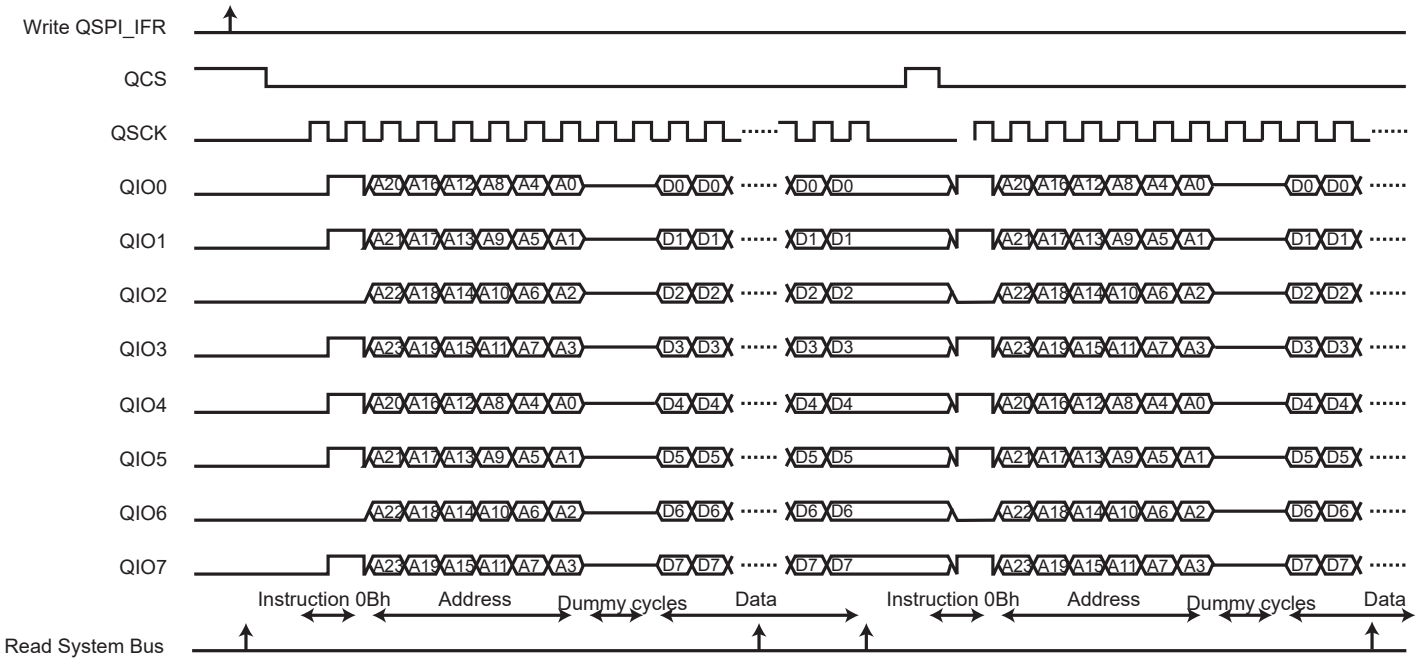
Figure 66.35. Instruction Transmission Waveform 10

Example 11:



Instruction in Octal Twin-Quad SPI, with 24-bit address in Octal Twin-Quad SPI, without option, with data read in Octal Twin-Quad SPI and two dummy cycles.

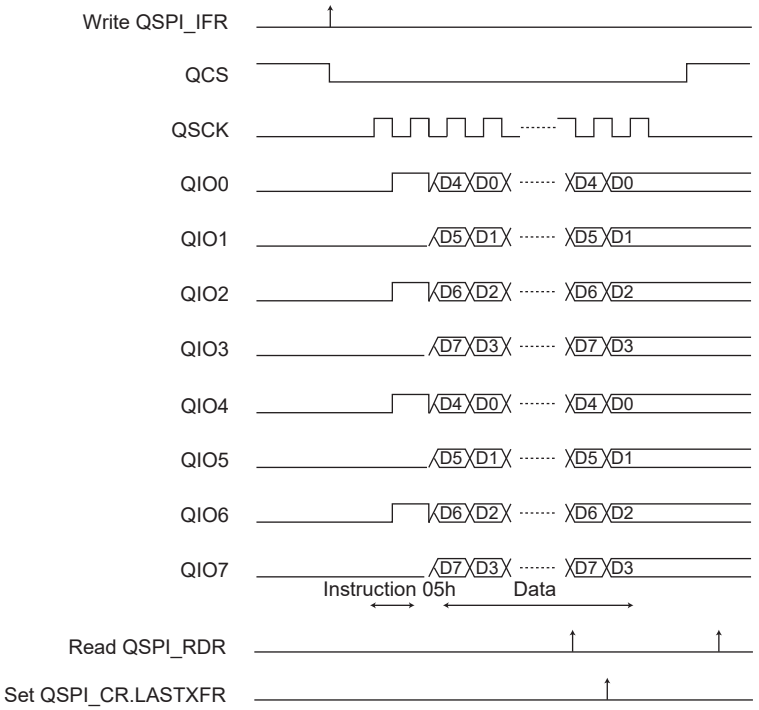
Command: HIGH-SPEED READ (0Bh)

- Write 0x0000_000B in QSPI_RICR.
- Write 0x1002_18B9 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Read data in the QSPI system bus memory space (0x60000000 - 0x80000000). The address of the system bus read accesses is always used.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1'.
- Write a 1 to QSPI_CR.LASTXFR.
- If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA to rise.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 66.36. Instruction Transmission Waveform 11

Example 12:



Instruction in Octal Twin-Quad SPI, without address, without option, with data read in Octal Twin-Quad SPI, without dummy cycles and read launched through the peripheral bus.

Command: Read Status register (05h)

- Write a 1 to QSPI_MR.SMRM and a 0 to TFRTYP.
- Write 0x0000_0005 in QSPI_RICR.
- Write 0x1100_0099 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write a 1 to QSPI_CR.STTFR.
- Wait flag RDRF and Read data in the QSPI_RDR register.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.
- Read data in the QSPI_RDR register.

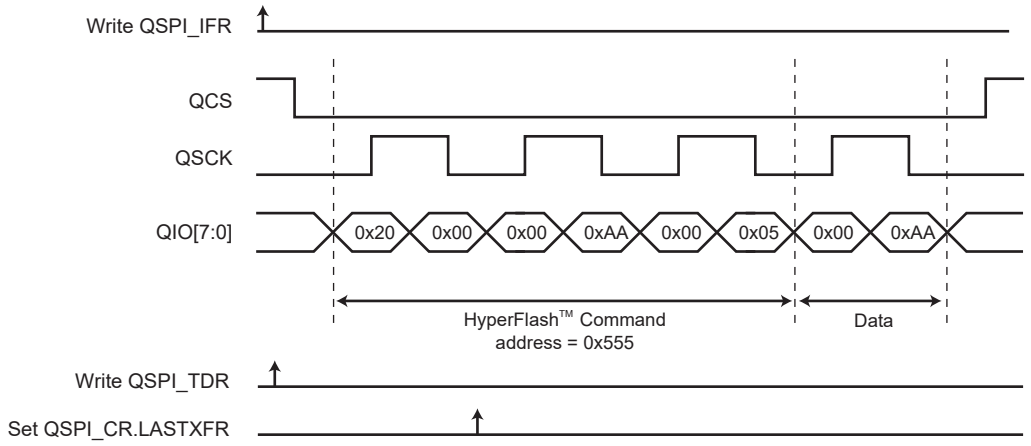
Figure 66.37. Instruction Transmission Waveform 12

Example 13:



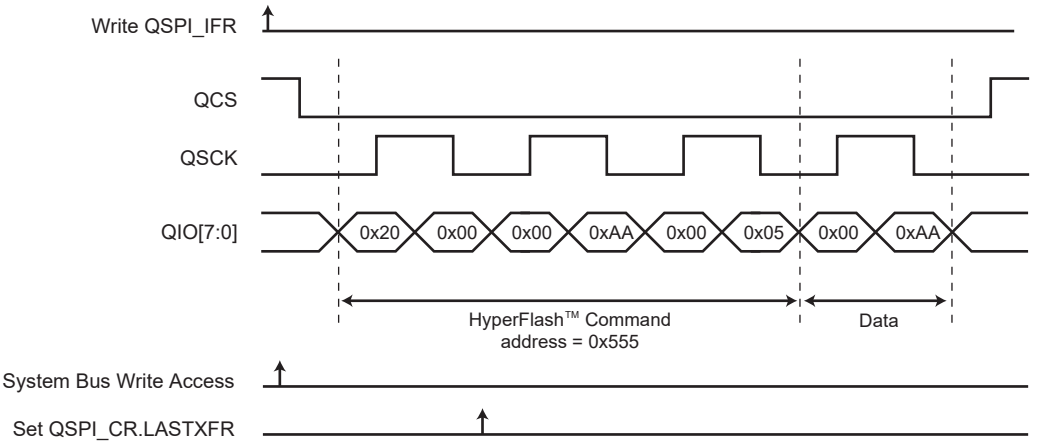
Classic HyperFlash command. Instruction in Octal DDR SPI, HyperFlash mode, without option, with data write, without dummy cycles and write launched through the peripheral bus.

Command: Data 0xAA at address 0x555

- Write 0x36C0_8099 in QSPI_IFR.
- Write 0x555 to QSPI_IADR.
- Update configuration (see Updating the QSPI Configuration).
- Wait QSPI_ISR.TDRE Flag
- Write 0xAA to QSPI_TDR.
- Wait QSPI_ISR.TXEMPTY Flag.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 66.38. Instruction Transmission Waveform 13



Example 14:

Classic HyperFlash command. Instruction in Octal DDR SPI, HyperFlash mode, without option, with data write, without dummy cycles, without fetch, write launched through the system bus interface.

Command: Data 0xAA at address 0x555

- Write 0x3640_8099 in QSPI_IFR.
- Write 0x01 in QSPI_WRACNT
- Update configuration (see Updating the QSPI Configuration).
- Write data 0xAA (byte access) in the QSPI system bus memory space with LSB address bytes=0x555 (0x60000000 - 0x80000000).
- Wait for QSPI_ISR.LWRA to rise.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

Figure 66.39. Instruction Transmission Waveform 14

66.6.8.12.Twin-Quad Mode

The Twin-Quad mode is activated by writing a 1 to QSPI_IFR.PROTTYP (Twin-Quad protocol). In this mode, the QSPI communicates with two Quad SPI memories as a single octal memory.

See examples 11 and 12 in Instruction Frame Transmission Examples.

© 2026 Microchip Technology Inc. and its subsidiaries

In this mode, only the DUAL_CMD, OCT_OUTPUT, OCT_IO and OCT_CMD configurations are supported by QSPI_IFR.WIDTH.

- DUAL_CMD: addresses both dies included in the Twin-Quad memory in single bit SPI for the Instruction, Address and Data phases (1-1-1).
- OCT_OUTPUT: addresses both dies included in the Twin-Quad memory in single bit SPI for the Instruction and Address phases, then in Quad SPI for the Data phase (1-1-4).
- OCT_IO: addresses both dies included in the Twin-Quad memory in single bit SPI for the Instruction phase, then in Quad SPI for the Address and Data phases (1-4-4).
- OCT_CMD: addresses both dies included in the Twin-Quad memory in Quad SPI for the Instruction, Address and Data phases (4-4-4).

When QSPI_IFR.TFRTYP is written to 1, programming is the same as in the standard Quad SPI protocol.

When QSPI_IFR.TFRTYP is written to 0, programming differs due to the fact that each Quad SPI die has its own internal registers.

If QSPI_MR.SMRM is written to 0 (see Instruction Frame Transmission), a halfword read/write transfer must be issued instead of a byte transfer (one byte for each register of each die) to the Twin-Quad memory to write/read the registers of both dies.

- For read transfers, the halfword read is as follows: {reg_byte[3:0], reg_byte[3:0], reg_byte[7:4], reg_byte[7:4]}.
  - Example: if data 0xA7 is to be read in both registers of both dies, the halfword read will be 0x77AA.
- For write transfers, the halfword must be sent as follows: {reg_byte[3:0], reg_byte[3:0], reg_byte[7:4], reg_byte[7:4]}.
  - Example: if data 0xB5 is to be written in both registers of both dies, the halfword to write is 0x55BB.

If QSPI_MR.SMRM is written to 1 (see Instruction Frame Transmission), a two-byte read/write transfer must be issued instead of a one-byte transfer (one byte for each register of each die) to the Twin-Quad memory to write/read the registers of both dies.

- For read transfers, the first byte read is {reg_byte[3:0], reg_byte[3:0]}. The second byte read is {reg_byte[7:4], reg_byte[7:4]}.
  - Example: if data 0xA7 is read in both registers of both dies, the first byte read is 0xAA and the second byte read is 0x77.
- For write transfers, the first byte sent must be {reg_byte[3:0], reg_byte[3:0]}. The second byte sent must be {reg_byte[7:4], reg_byte[7:4]}.
  - Example: if data 0xB5 is to be written in both registers of both dies, the first byte to write is 0xBB and the second byte to write is 0x55.

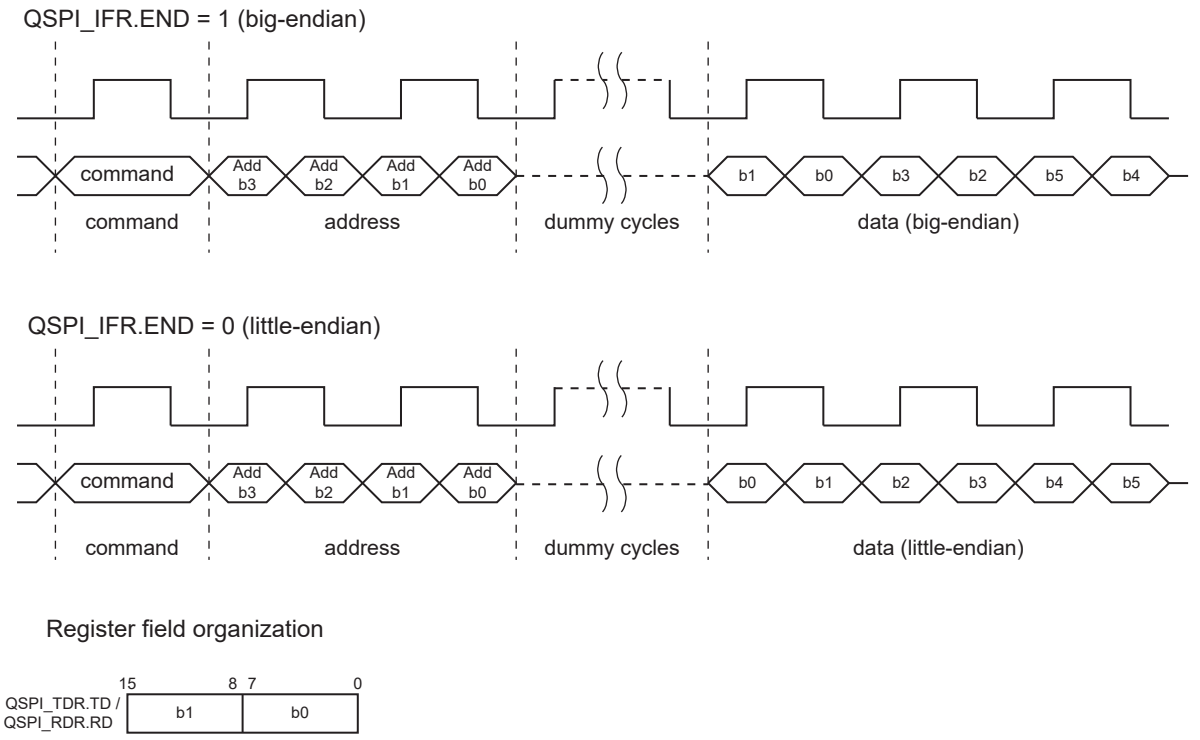
If QSPI_IFR.WIDTH is configured to OCT_CMD, and DDREN is written to 1, then a halfword must be read/written instead of a byte for each QSPI_RDR or QSPI_TDR access.

In this configuration, the halfword to write in QSPI_TDR in case of a write transfer is {reg_byte[7:4], reg_byte[7:4], reg_byte[3:0], reg_byte[3:0]}.

For example, if data 0xB5 is to be written in both registers of both dies, the halfword to write in QSPI_TDR is 0xBB55.

In this configuration, the halfword read in QSPI_RDR in case of a read transfer is {reg_byte[7:4], reg_byte[7:4], reg_byte[3:0], reg_byte[3:0]}.

For example, if data 0xA7 is to be read in both registers of both dies, the halfword read in QSPI_RDR is 0xAA77.



© 2026 Microchip Technology Inc. and its subsidiaries

66.6.8.13.Endianness

If the QSPI is not configured in Octal DDR mode, endianness does not matter and QSPI_IFER.END should be left at 0 (default=little-endian).

When the QSPI is configured in Octal DDR mode, halfwords are sent/received instead of bytes. Endianness must be configured according to the memory data sheet.

Figure 66.40. Instruction Frame Endianness

66.6.8.14.Octal DDR Mode

Some memories support Octal DDR communication. To enable Octal DDR mode, configure QSPI_IFR.WIDTH to either '7', '8' or '9' and QSPI_IFR.DDREN to 1. Configure the other parameters in QSPI_IFR to the targeted memory.

In this mode, QSPI_TDR.TD and QSPI_RDR.RD use the full 16-bit width.

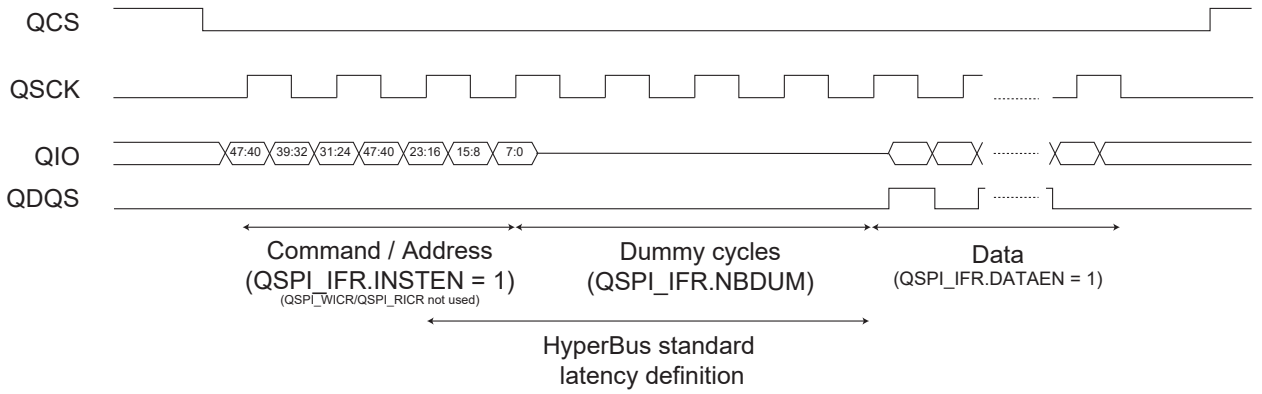
For memories using 8-bit registers:

- SMRM=0
  The memory register can be read/written by performing a byte access in the QSPI memory space. In the case of a read, only the first byte read is considered. In the case of a write, check if the memory supports receiving the register value only on the first byte. If not, a halfword access must be performed (refer to the memory data sheet to build the halfword).
- SMRM=1
  In Octal DDR mode, QSPI_TDR.TD and QSPI_RDR.RD use the full 16-bit width. Therefore, it is mandatory to write/read a halfword in this configuration.

66.6.8.15.HyperFlash Mode

The QSPI supports HyperFlash memories. To enable HyperFlash mode, set QSPI_IFR.PROTTYP to 3.

See examples 13 and 14 in Instruction Frame Transmission Examples.



HyperFlash memories use Octal DDR communication. Recommendations provided in Octal DDR Mode must be followed.

© 2026 Microchip Technology Inc. and its subsidiaries

HyperFlash memories define a “command/address” field where the address of the transfer is included and merged in the command. For this reason, in this mode QSPI_IFR.ADDREN must be set to 0 and QSPI_IFR.INSTEN must be set to 1.

The HyperFlash “command/address” field merges the transfer address and the transfer characteristics (such as read/write, memory/register space, burst type, etc.) so that there is no specific opcode per transfer type. As a consequence, QSPI_WICR and QSPI_RICR are not used in this mode. See the following figure.

Figure 66.41. HyperBus Frame

Once HyperFlash mode is enabled, the procedure to access the memory is the same as for classic QSPI memories. See Instruction Frame Transmission (see Figure 66.14, Figure 66.15, Figure 66.18, Figure 66.20, Figure 66.22).

For the HyperFlash Write Buffer procedure, QSPI_IFR.HFWBEN must be set. When this bit is set, a new command is issued for each halfword written. In this mode, halfword accesses are mandatory. See Figure 66.23 and Figure 66.24.

Note:

1. In HyperFlash mode, some bits of the HyperFlash command are set automatically. For instance, the “Burst Type” bit of the HyperFlash command (bit 45) is always set to 1 (linear burst).
2. The HyperFlash standard latency definition counts the latency starting from the fourth byte of the instruction, whereas the QSPI counts the dummy cycles starting from the end of the instruction field. Therefore, the value to set in QSPI_IFR.NBDUM is the HyperFlash latency value minus 1.

66.6.8.16.Time-Out

The QSPI includes a time-out counter. This time-out counter detects any blocking state on the memory side (hardware connection issue, unknown command sent, etc.). If the QSPI is expecting data from the memory, it starts counting and if the counter reaches the value set in the TCNTM field of the Timeout register (QSPI_TOUT), the flag QSPI_ISR.TOUT rises.

When the TOUT flag rises, any access waiting on the QSPI core is released with an error response so that the system bus is released. Any further access to the QSPI core receives an error response until the TOUT flag is cleared.

After a time-out error, the TOUT flag must be cleared by writing QSPI_CR.RTOUT to 1. This also resets the QSPI internal state machines.

If QSPI_TOUT.TCNTM is set to 0, the time-out feature is disabled.

66.6.9. Scrambling/Unscrambling Function

The scrambling/unscrambling function cannot be performed on devices other than memories.

© 2026 Microchip Technology Inc. and its subsidiaries

Scrambling is possible only if SMM =1.

If TFRTYP=1, on-the-fly scrambling via system bus accesses is possible (see Figure 66.19, Figure 66.21 and Figure 66.24 for specific flowcharts).

If TFRTYP=0 and SMRM=1, scrambling via peripheral bus accesses is possible for write accesses (see Figure 66.17 and Figure 66.23 for specific flowcharts).

The external data lines can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the QSPI client device (memory, for example).

The scrambling/unscrambling function can be enabled by writing a 1 to the SCREN bit in the QSPI Scrambling Mode register (QSPI_SMR).

The scrambling and unscrambling are performed on-the-fly without impacting the throughput.

The scrambling method depends on the user-configurable user scrambling key (field USRK) in the QSPI Scrambling Key register (QSPI_SKR). QSPI_SKR is only accessible in Write mode.

When QSPI_SMR.SCRKL has been written once to 1, QSPI_SKR.USRK cannot be written again until the next reset.

If QSPI_SMR.RVDIS is written to 0, the scrambling/unscrambling algorithm includes the user scrambling key plus a random value depending on device processing characteristics. Data scrambled by a given microcontroller cannot be unscrambled by another.

If QSPI_SMR.RVDIS is written to 1, the scrambling/unscrambling algorithm includes only the user scrambling key. No random value is part of the key.

The user scrambling key or the seed for key generation must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory.

66.6.9.1. Clearing Scrambling Keys on a Tamper Event

On a tamper detection event, an immediate clear of the scrambling key (in the Scrambling Key register QSPI_SKR) is performed if QSPI_MR.TAMPCLR is set. For details about the tamper event source, refer to sections Safety and Security Features and/or Pinout.

66.6.10. Register Write Protection

To prevent any single software error from corrupting QSPI behavior, certain registers can be write-protected by setting the WPEN bit in the Write Protection Mode register (QSPI_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the WPEN bit in the Write Protection Status register (QSPI_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading QSPI_WPSR.

The following registers can be write-protected when WPEN is set in QSPI_WPMR:

- QSPI Mode Register
- QSPI Serial Clock Register
- QSPI Scrambling Mode Register
- QSPI Scrambling Key Register
- QSPI Write Instruction Code Register
- QSPI Read Instruction Code Register
- QSPI Instruction Address Register
- QSPI Instruction Frame Register
- QSPI Refresh Register

© 2026 Microchip Technology Inc. and its subsidiaries

- QSPI Write Access Counter Register
- QSPI Timeout Register

The following register can be write-protected when WPCREN is set in QSPI_WPMR:

- QSPI Control Register

The following registers can be write-protected when WPITEN is set in QSPI_WPMR:

- QSPI Interrupt Enable Register
- QSPI Interrupt Disable Register

66.6.11. Peripheral Bus Access Errors

Some peripheral bus accesses (to the QSPI register interface) can result in errors if they generate an issue with the QSPI configuration.

Error flags considered as peripheral bus access errors are(1):

- QSPI_WPSR.WPVS
- QSPI_WPSR.SWE[2]
- QSPI_ISR.RBSYERR

In addition to the above error flags, any peripheral bus access error sets the QSPI_ISR.SECE flag.

Peripheral bus access errors are reported through interrupts (via QSPI_ISR.SECE) and the QSPI_WPSR flags.

Notes:

1. When a peripheral bus access error occurs, disable the QSPI and then check and/or reconfigure all registers.
2. QSPI_WPSR.SWETYP indicates the software error type when QSPI_WPSR.SWE is set. Note that SWETYP=UNDEF_DEVICE and SWETYP=UNEXP_DMACMD are not peripheral bus access errors.

66.7.1. QSPI Control Register

Name: QSPI_CR
Offset: 0x00
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
								LASTXFER
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
						RTOUT	STTFR	UPDCFG
Access						W	W	W
Reset						–	–	–

Bit	7	6	5	4	3	2	1	0
	SWRST		SRFRSH				QSPIDIS	QSPIEN
Access	W		W				W	W
Reset	–		–				–	–

Bit 24 – LASTXFER Last Transfer

Value	Description
0	No effect.
1	The chip select is deasserted after the end of character transmission.

Bit 10 – RTOUT Reset Time-out

Value	Description
0	No effect.
1	Request a TOUT flag reset.

Bit 9 – STTFR Start Transfer

Value	Description
0	No effect.
1	Starts the transfer when TFRTYP=0 and SMRM=1 or when DATAEN=0.

Bit 8 – UPDCFG Update Configuration

Value	Description
0	No effect.
1	Requests an update of the QSPI Controller core configuration.

Bit 7 – SWRST QSPI Software Reset
DMA channels state are not affected by a software reset.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Resets the QSPI. A software reset of the QSPI interface is performed.

Bit 5 – SRFRSH Start Refresh

Value	Description
0	No effect.
1	Starts a refresh sequence. QSPI_ISR.RFRSHD indicates when the refresh sequence is over.

Bit 1 – QSPIDIS QSPI Disable

As soon as QSPIDIS is set, the QSPI finishes its transfer.
All pins are set in Input mode and no data is received or transmitted.
If a transfer is in progress, the transfer is finished before the QSPI is disabled.
If QSPIEN and QSPIDIS are set to 1 when QSPI_CR is written, the QSPI is disabled.

Value	Description
0	No effect.
1	Disables the QSPI.

Bit 0 – QSPIEN QSPI Enable

Value	Description
0	No effect.
1	Enables the QSPI.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.2. QSPI Mode Register

Name: QSPI_MR
Offset: 0x04
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	DLYCS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	DLYBCT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
			AQICMEN		NBBITS[3:0]			
Access			R/W		R/W	R/W	R/W	R/W
Reset			0		0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TAMPCLR		CSMODE[1:0]		DQSDLYEN	WDRBT		SMM
Access	R/W		R/W	R/W	R/W	R/W		R/W
Reset	0		0	0	0	0		0

Bits 31:24 – DLYCS[7:0] Minimum Inactive QCS Delay
This field defines the minimum delay between the deactivation and the activation of QCS. The DLYCS time ensures the client minimum deselect time is respected.
If DLYCS is written to 0, one GCLK period is inserted by default.
Otherwise, the following equation determines the delay:

- DLYCS=Minimum inactive × f_{GCLK}

Bits 23:16 – DLYBCT[7:0] Delay Between Consecutive Transfers

- SMM=0
  This field defines the delay between two consecutive transfers without releasing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.
  The following equation determines the delay:
  - DLYBCT=(Delay Between Consecutive Transfers × f_{GCLK}) / 32
- SMM=1
  This field defines the delay between last QSCK pulse and QCS rise.
  When DLYBCT is written to 0, no delay is inserted and the clock keeps its duty cycle over the character transfers.
  The following equation determines the delay:
  - DLYBCT=Delay Between Consecutive Transfers × f_{GCLK}

Bit 13 – AQICMEN QSPI Inter-Chip Communication Mode Enable All

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	DISABLED	The QSPI Inter-Chip mode is disabled.
1	ENABLED	The QSPI Inter-Chip mode is enabled.

Bits 11:8 – NBBITS[3:0] Number of Bits per Transfer
NBBITS is used only when SMM is set to '0'.

Value	Name	Description
0	8_BIT	8 bits for transfer
8	16_BIT	16 bits for transfer

Bit 7 – TAMPCLR Tamper Clear Enable

Value	Description
0	A tamper detection event has no effect on QSPI scrambling keys.
1	A tamper detection event immediately clears QSPI scrambling keys.

Bits 5:4 – CSMODE[1:0] Chip Select Mode
The CSMODE field determines how the chip select is deasserted.
This field is forced to LASTXFER when SMM is written to 1 and QSPI_IFR.PROTYP is not selecting a RAM memory.

Value	Name	Description
0	NOT_RELOADED	The chip select is deasserted if QSPI_TDR.TD has not been reloaded before the end of the current transfer.
1	LASTXFER	The chip select is deasserted when the bit LASTXFER is written to 1 and the character written in QSPI_TDR.TD has been transferred.
2	SYSTEMATICALLY	The chip select is deasserted systematically after each transfer.

Bit 3 – DQSDLYEN DQS Delay Enable

Value	Name	Description
0	DISABLED	The DQS Delay cell is disabled.
1	ENABLED	The DQS Delay cell is enabled. The DQS Delay cell automatic refresh is triggered according to the QSPI_REFRESH configuration.

Bit 2 – WDRBT Wait for Data Read Before Transfer

Value	Name	Description
0	DISABLED	No effect. In SPI mode, a transfer can be initiated whatever the state of QSPI_RDR is.
1	ENABLED	In SPI mode, a transfer can start only if QSPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

Bit 0 – SMM Serial Memory Mode

Value	Name	Description
0	SPI	The QSPI is in SPI mode.
1	MEMORY	The QSPI is in Serial Memory mode.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.3. QSPI Receive Data Register

Name: QSPI_RDR
Offset: 0x08
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

	RD[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RD[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – RD[15:0] Receive Data
Data received by the QSPI is stored in this register right-justified. Unused bits read zero.

- QSPI_MR.SMM=0
  RD is defined by QSPI_MR.NBBITS.
- QSPI_MR.SMM=1
  RD is 8 bits or 16 bits in Octal DDR mode.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.4. QSPI Transmit Data Register

Name: QSPI_TDR
Offset: 0x0C
Reset: –
Property: Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset

Bits 15:0 – TD[15:0] Transmit Data

Data to be transmitted by the QSPI is stored in this register. Information to be transmitted must be written to the Transmit Data register in a right-justified format.

- QSPI_MR.SMM=0
  TD is defined by QSPI_MR.NBBITS field.
- QSPI_MR.SMM=1
  TD is 8 bits or 16 bits in Octal DDR mode.

Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF
Access					R	R	R	R
Reset					0	0	0	0

Bit 17 – TOUT QSPI Time-out (cleared by writing QSPI_CR.RTOUT)

Value	Description
0	No QSPI time-out occurred.
1	At least one QSPI time-out occurred.

Bit 16 – RFRSHD Refresh Done (cleared on read)

Value	Description
0	No ‘refresh done’ event occurred since the last read of QSPI_ISR.
1	One ‘refresh done’ event has been detected since the end of the last refresh command or the last read of QSPI_ISR.

Bit 15 – CSRA Chip Select Rise Autoclear
See Device Selection Flags.

Value	Description
0	No chip select rise has been detected since beginning of the last command or the last read of QSPI_ISR.
1	One chip select rise has been detected since the beginning of the last command or the last read of QSPI_ISR.

Bit 14 – CSFA Chip Select Fall Autoclear
See Device Selection Flags.

Value	Description
0	No chip select fall has been detected since end of the last command or the last read of QSPI_ISR.
1	One chip select fall has been detected since the end of the last command or the last read of QSPI_ISR.

Bit 13 – QITR QSPI Interrupt Rise (cleared on read)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No rising of the QSPI memory interrupt line has been detected since the last read of QSPI_ISR.
1	At least one QSPI memory interrupt line rising edge occurred since the last read of QSPI_ISR.

Bit 12 – QITF QSPI Interrupt Fall (cleared on read)

Value	Description
0	No falling of the QSPI memory interrupt line has been detected since the last read of QSPI_ISR.
1	At least one QSPI memory interrupt line falling edge occurred since the last read of QSPI_ISR.

Bit 11 – LWRA Last Write Access (cleared on read)

Value	Description
0	Last write access has not been sent since the last read of QSPI_ISR or NBWRA=0.
1	At least one last write access has been sent since the last read of QSPI_ISR.

Bit 10 – INSTRE Instruction End Status (cleared on read)

Value	Description
0	No instruction end has been detected since the last read of QSPI_ISR.
1	At least one instruction end has been detected since the last read of QSPI_ISR.

Bit 8 – CSR Chip Select Rise (cleared on read)
See Device Selection Flags.

Value	Description
0	No chip select rise has been detected since the last read of QSPI_ISR.
1	At least one chip select rise has been detected since the last read of QSPI_ISR.

Bit 3 – OVRES Overrun Error Status (cleared on read)
An overrun occurs when QSPI_RDR is loaded at least twice from the serializer since the last read of the QSPI_RDR.

Value	Description
0	No overrun has been detected since the last read of QSPI_ISR.
1	At least one overrun error has occurred since the last read of QSPI_ISR.

Bit 2 – TXEMPTY Transmission Registers Empty (cleared by writing QSPI_TDR)
TXEMPTY is set to zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

Value	Description
0	As soon as data is written in QSPI_TDR.
1	QSPI_TDR and the internal shifter are empty. If a transfer delay has been defined, TXEMPTY is set after the completion of such delay.

Bit 1 – TDRE Transmit Data Register Empty (cleared by writing QSPI_TDR)
TDRE is set to zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

Value	Description
0	Data has been written to QSPI_TDR and not yet transferred to the serializer.
1	The last data written in the QSPI_TDR has been transferred to the serializer.

Bit 0 – RDRF Receive Data Register Full (cleared by reading QSPI_RDR)

Value	Description
0	No data has been received since the last read of QSPI_RDR.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Data has been received and the received data has been transferred from the serializer to QSPI_RDR since the last read of QSPI_RDR.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.6. QSPI Interrupt Enable Register

Name: QSPI_IER
Offset: 0x14
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the QSPI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access

Bit 2 – TXEMPTY Transmission Registers Empty Enable

Bit 1 – TDRE Transmit Data Register Empty Interrupt Enable

Bit 0 – RDRF Receive Data Register Full Interrupt Enable

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.7. QSPI Interrupt Disable Register

Name: QSPI_IDR
Offset: 0x18
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the QSPI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset

66.7.9. QSPI Serial Clock Register

Name: QSPI_SCR
Offset: 0x20
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	DLYBS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							CPHA	CPOL
Access							R/W	R/W
Reset							0	0

Bits 23:16 – DLYBS[7:0] Delay Before QSCK
This field defines the delay from QCS valid to the first valid QSCK transition.
When DLYBS is set to zero, the QCS valid to QSCK transition is half the QSCK clock period.
Otherwise, the following equation determines the delay:

- DLYBS = Delay Before QSCK × f_{GCLK}

Bit 1 – CPHA Clock Phase
CPHA determines which edge of QSCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between host and client devices.

Value	Description
0	Data is captured on the leading edge of QSCK and changed on the following edge of QSCK.
1	Data is changed on the leading edge of QSCK and captured on the following edge of QSCK.

Bit 0 – CPOL Clock Polarity
CPOL is used to determine the inactive state value of the serial clock (QSCK). It is used with CPHA to produce the required clock/data relationship between host and client devices.

Value	Description
0	The inactive state value of QSCK is logic level zero.
1	The inactive state value of QSCK is logic level one.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.10. QSPI Status Register

Name: QSPI_SR
Offset: 0x24
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access

Bit	7	6	5	4	3	2	1	0
				HIDLE	RBUSY	CSS	QSPIENS	SYNCBSY
Access				R	R	R	R	R
Reset				0	0	0	0	0

Bit 4 – HIDLE QSPI Idle

Value	Description
0	The QSPI is not in Idle state (either transmitting or chip select is active).
1	The QSPI is in Idle state (not transmitting and chip select is inactive).

Bit 3 – RBUSY Read Busy

Value	Description
0	The client bus interface has no activity.
1	The client bus interface is currently processing accesses.

Bit 2 – CSS Chip Select Status

Value	Description
0	The chip select is asserted.
1	The chip select is not asserted.

Bit 1 – QSPIENS QSPI Enable Status

Value	Description
0	The QSPI is disabled.
1	The QSPI is enabled.

Bit 0 – SYNCBSY Synchronization Busy

Value	Description
0	Allows access to any register.
1	Some register accesses must not be accessed. See Register Synchronization.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.11. QSPI Instruction Address Register

Name: QSPI_IAR
Offset: 0x30
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the "QSPI Write Protection Mode Register" .

Bit	31	30	29	28	27	26	25	24
	ADDR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

Bits 23:16 – WROPT[7:0] Write Option Code
Option code to send to the serial Flash memory in case of write transfer.

Bits 15:0 – WRINST[15:0] Write Instruction Code
Instruction code to send to the serial Flash memory in case of write transfer.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.13. QSPI Instruction Frame Register

Name: QSPI_IFR
Offset: 0x38
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
		PROTTYP[2:0]			HFWBEN	DDRCMDEN	DQSEN	APBTFRTYP
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	DDREN	CRM		TFRTYP	ADDRL[1:0]		OPTL[1:0]	
Access	R/W	R/W		R/W	R/W	R/W	R/W	R/W
Reset	0	0		0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DATAEN	OPTEN	ADDREN	INSTEN	WIDTH[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 30:28 – PROTTYP[2:0] Protocol Type

Value	Name	Description
0	STD_SPI	Standard (Q)SPI protocol (to be selected if no other value matches the device)
1	TWIN_QUAD	Twin-Quad protocol
2	OCTAFLASH	OctaFlash protocol or Octal DDR protocol with 16-bit instruction code
3	HYPERFLASH	HyperFlash protocol

Bit 27 – HFWBEN HyperFlash Write Buffer Enable

Value	Description
0	No effect.
1	Each write access received on the system bus interface generates a new command. **Mandatory if the HyperFlash Write Buffer feature is used.**

Bit 26 – DDRCMDEN DDR Mode Command Enable

Value	Name	Description
0	DISABLED	Transfer of instruction field is performed in Single Data Rate mode even if DDREN is written to 1.
1	ENABLED	Transfer of instruction field is performed in Double Data Rate mode if DDREN bit is written to 1. If DDREN is written to 0, the instruction field is sent in Single Data Rate mode.

Bit 25 – DQSEN DQS Sampling Enable

Value	Description
0	Data from the memory are not sampled with the DQS signal.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Data from the memory are sampled with the DQS signal.

Bit 24 – APBTFRTYP Peripheral Bus Transfer Type

Value	Description
0	Register transfer to the memory is a write transfer. Used when TRFTYP is written to 0 and SMRM to 1.
1	Register transfer to the memory is a read transfer. Used when TRFTYP is written to 0 and SMRM to 1.

Bit 23 – SMRM Serial Memory Register Mode
See Instruction Frame Transmission for details.

Value	Description
0	Serial Memory registers are written via system bus access.
1	Serial Memory registers are written via peripheral bus access.

Bit 22 – END Endianness

Value	Description
0	Data are sent in little-endian format to the memory.
1	Data are sent in big-endian format to the memory.

Bits 21:16 – NBDUM[5:0] Number Of Dummy Cycles
Defines the number of dummy cycles (also called read latency) required by the serial memory before data transfer.

Bit 15 – DDREN DDR Mode Enable
DDRCMDEN defines how the instruction field is sent when Double Data Rate mode is enabled. If DDRCMDEN is at 0, the instruction field is sent in Single Data Rate mode.

Value	Name	Description
0	DISABLED	Transfers are performed in Single Data Rate mode.
1	ENABLED	Transfers are performed in Double Data Rate mode, whereas the instruction field is still transferred in Single Data Rate mode.

Bit 14 – CRM Continuous Read Mode

Value	Name	Description
0	DISABLED	Continuous Read mode is disabled.
1	ENABLED	Continuous Read mode is enabled.

Bit 12 – TFRTYP Data Transfer Type

Value	Name	Description
0	TRSFR_REGISTER	Read/Write of memory register, write of memory page buffer. This configuration implies the following: • Either the system bus or the peripheral bus can be used to initiate the transfer (SMRM bit). • If the peripheral bus is used, the RDRF and TDRE flags help to control the frame. • Scrambling is possible only for write accesses and if the peripheral bus is used. • For HyperFlash memories the “target” bit is set to register space in the HyperFlash header.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	TRSFR_MEMORY	Read/Write accesses to the memory space. This configuration implies the following: • Only the System Bus interface can be used to trigger accesses. • Access to random location is possible. • Address mask is applied and full system bus size accesses only are performed. • The internal optimization algorithm is enabled to minimize latency, and protocol specificities are handled automatically. • Seamless scrambling is possible. • Seamless handling of HyperFlash Write Buffer programming command (one command for each data) • Address shift is handled seamlessly (halfword memories, for example).

Bits 11:10 – ADDRL[1:0] Address Length

The ADDRL bit determines the length of the address.

Value	Name	Description
0	8_BIT	8-bit address size
1	16_BIT	16-bit address size
2	24_BIT	24-bit address size
3	32_BIT	32-bit address size

Bits 9:8 – OPTL[1:0] Option Code Length

Determines the length of the option code. The value written in OPTL must be consistent with the value written in the field WIDTH. For example, OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with the Quad SPI protocol, requiring a minimum length of 4 bits).

Value	Name	Description
0	OPTION_1BIT	The option code is 1 bit long.
1	OPTION_2BIT	The option code is 2 bits long.
2	OPTION_4BIT	The option code is 4 bits long.
3	OPTION_8BIT	The option code is 8 bits long.

Bit 7 – DATAEN Data Enable

Value	Description
0	No data is sent/received to/from the serial Flash memory.
1	Data is sent/received to/from the serial Flash memory.

Bit 6 – OPTEN Option Enable

Value	Description
0	The option is not sent to the serial Flash memory.
1	The option is sent to the serial Flash memory.

Bit 5 – ADDREN Address Enable

Value	Description
0	The transfer address is not sent to the serial Flash memory.
1	The transfer address is sent to the serial Flash memory.

Bit 4 – INSTEN Instruction Enable

Value	Description
0	The instruction is not sent to the serial Flash memory.
1	The instruction is sent to the serial Flash memory.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 3:0 – WIDTH[3:0] Width of Instruction Code, Address, Option Code and Data
OCT_OUTPUT, OCT_IO and OCT_CMD are supported only in DDR mode (QSPI_IFR.DDREN must be set). However, the instruction code can still be sent in SDR or DDR mode depending on DDRCMDEN configuration.

Value	Name	Description
0	SINGLE_BIT_SPI	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Single-bit SPI
1	DUAL_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Dual SPI
2	QUAD_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Quad SPI
3	DUAL_IO	Instruction: Single-bit SPI / Address-Option: Dual SPI / Data: Dual SPI
4	QUAD_IO	Instruction: Single-bit SPI / Address-Option: Quad SPI / Data: Quad SPI
5	DUAL_CMD	Instruction: Dual SPI / Address-Option: Dual SPI / Data: Dual SPI
6	QUAD_CMD	Instruction: Quad SPI / Address-Option: Quad SPI / Data: Quad SPI
7	OCT_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Octal SPI
8	OCT_IO	Instruction: Single-bit SPI / Address-Option: Octal SPI / Data: Octal SPI
9	OCT_CMD	Instruction: Octal SPI / Address-Option: Octal SPI / Data: Octal SPI

66.7.15. QSPI Scrambling Mode Register

Name: QSPI_SMR
Offset: 0x40
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						SCRKL	RVDIS	SCREN
Access						R/W	R/W	R/W
Reset						0	0	0

Bit 2 – SCRKL Scrambling Key Lock

Value	Description
0	No action.
1	QSPI_SKR.USRK cannot be written until the next VDDCORE reset.

Bit 1 – RVDIS Scrambling/Unscrambling Random Value Disable

Value	Description
0	The scrambling/unscrambling algorithm includes the user scrambling key plus a random value that may differ between devices.
1	The scrambling/unscrambling algorithm includes only the user scrambling key.

Bit 0 – SCREN Scrambling/Unscrambling Enable

Value	Name	Description
0	DISABLED	Scrambling/unscrambling is disabled.
1	ENABLED	Scrambling/unscrambling is enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.16. QSPI Scrambling Key Register

Name: QSPI_SKR
Offset: 0x44
Reset: –
Property: Write-only

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	USRK[31:24]							
Access	W	W	W	W	W	W	W	W

Bit	7	6	5	4	3	2	1	0
	REFRESH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – REFRESH[31:0] Refresh Delay Counter
Defines in GCLK clock periods the delay between two refreshes of analog blocks. See Refresh Sequence.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.18. QSPI Write Access Counter Register

Name: QSPI_WRACNT
Offset: 0x54
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	NBWRA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	NBWRA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	NBWRA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	NBWRA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – NBWRA[31:0] Number of Write Accesses

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.19. QSPI Timeout Register

Name: QSPI_TOUT
Offset: 0x64
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	TCNTM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TCNTM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – TCNTM[15:0] Time-out Counter Maximum Value
Indicates the time in GCLK clock periods when the connected client does not answer and before the TOUT flag is set.

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.20. QSPI Write Protection Mode Register

Name: QSPI_WPMR
Offset: 0xE4
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x515350	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

Bit 2 – WPCREN Write Protection Control Register Enable

Value	Description
0	Disables the write protection on the Control register if WPKEY corresponds to 0x515350.
1	Enables the write protection on the Control register if WPKEY corresponds to 0x515350.

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on Interrupt registers if WPKEY corresponds to 0x515350.
1	Enables the write protection on Interrupt registers if WPKEY corresponds to 0x515350.

Bit 0 – WPEN Write Protection Enable

See Register Write Protection for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x515350 (“QSP” in ASCII)
1	Enables the write protection if WPKEY corresponds to 0x515350 (“QSP” in ASCII)

© 2026 Microchip Technology Inc. and its subsidiaries

66.7.21. QSPI Write Protection Status Register

Name: QSPI_WPSR
Offset: 0xE8
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

Bits 15:8 – WPVSRC[7:0] Write Protection Violation Source
When WPVS=1, WPVSRC indicates the register address offset at which a write access has been attempted. When SWE=1, indicates the faulty register address, if relevant.

Bit 0 – WPVS Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of the QSPI_WPSR.
1	A write protection violation has occurred since the last read of the QSPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

67. Secure Digital MultiMedia Card Controller (SDMMC)

67.1. Description

The Secure Digital MultiMedia Card Controller (SDMMC) supports the embedded MultiMedia Card (e.MMC) Specification V4.51, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

The SDMMC includes the register set defined in the “SD Host Controller Simplified Specification V3.00” and additional registers to manage e.MMC devices and enhanced features.

The SDMMC is clocked by three asynchronous clocks (see Block Diagram) and requires the PMC to be configured first.

67.2. Embedded Characteristics

- Compatible with SD Host Controller Standard Specification Version 3.00
- Compatible with MultiMedia Card Specification Version V4.51
- Compatible with SD Memory Card Specification Version 3.00
- Compatible with SDIO Specification Version 3.00
- Support for 1-bit/4-bit SD/SDIO Devices
- Support for 1-bit/4-bit e.MMC Devices
- Support for SD/SDIO Default Speed (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO High Speed (Maximum SDCLK Frequency = 50 MHz)
- Support for SDSC, SDHC and SDXC
- Support for MMC/e.MMC Default Speed (Maximum SDCLK Frequency = 26 MHz)
- Support for MMC/e.MMC High Speed (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC High Speed DDR (Maximum SDCLK Frequency = 52 MHz)
- e.MMC Boot Operation Mode Support
- Support for Block Size from 1 to 512 Bytes
- Support for Stream, Block and Multiblock Data Read and Write
  - Advanced DMA and SDMA capability
- Internal 1024-byte Dual Port RAM
- Support for both Synchronous and Asynchronous Abort
- Support for SDIO Card Interrupt

67.3. Reference Documents

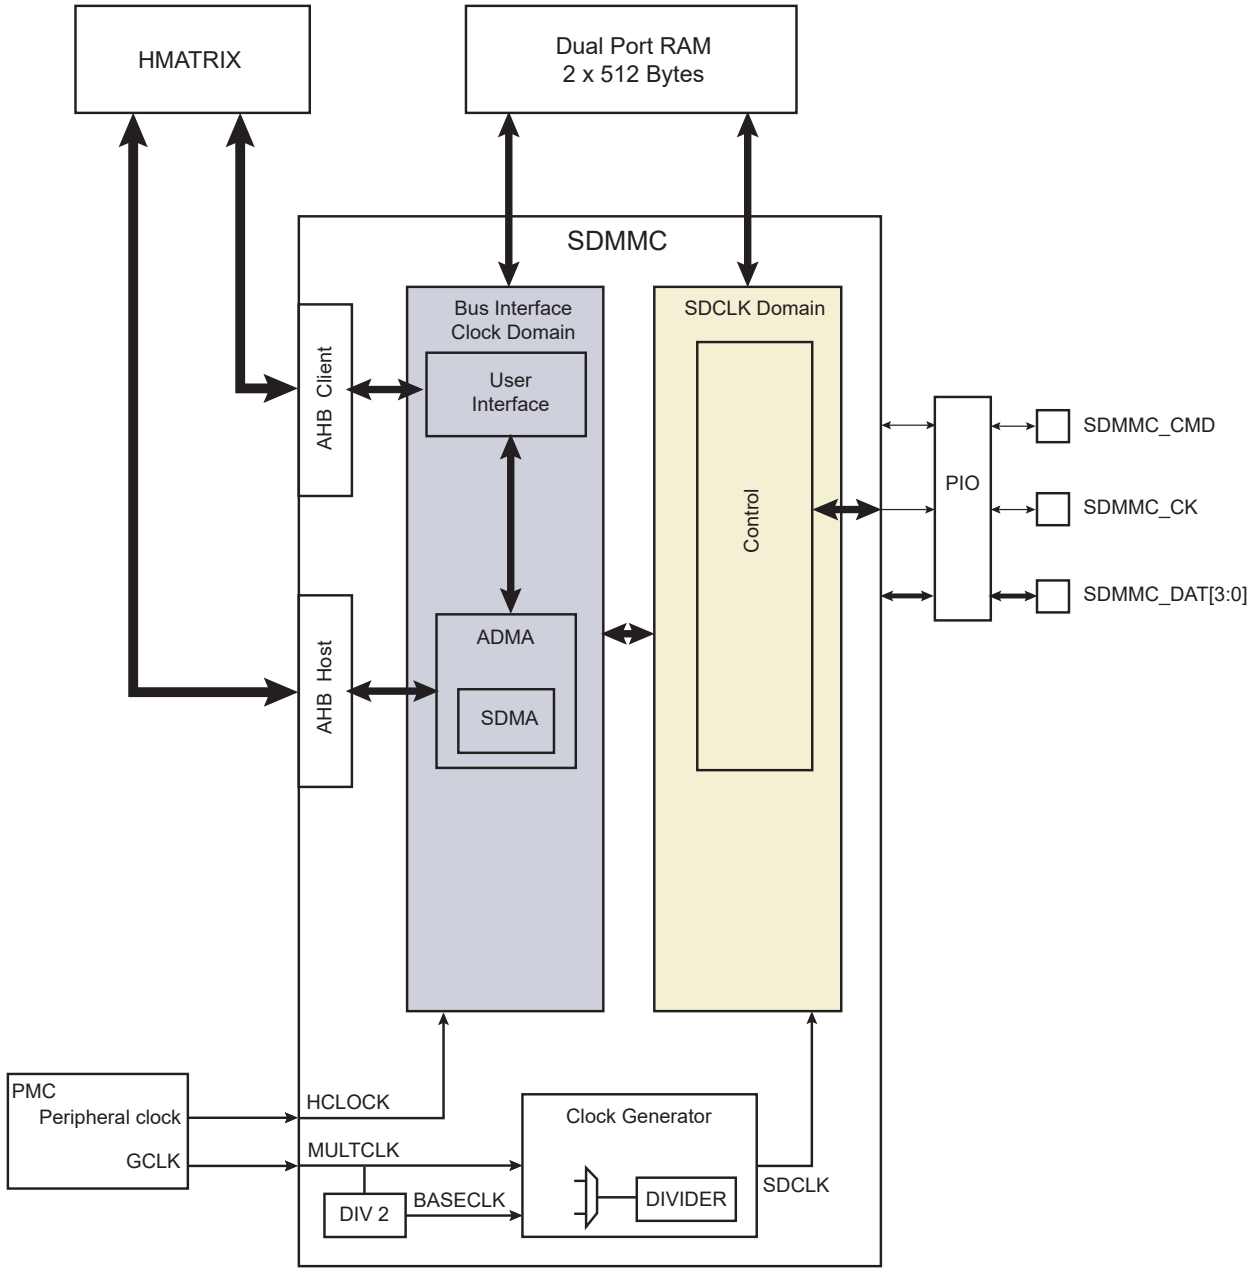

Table 67.1. Reference Documents

67.4. Block Diagram

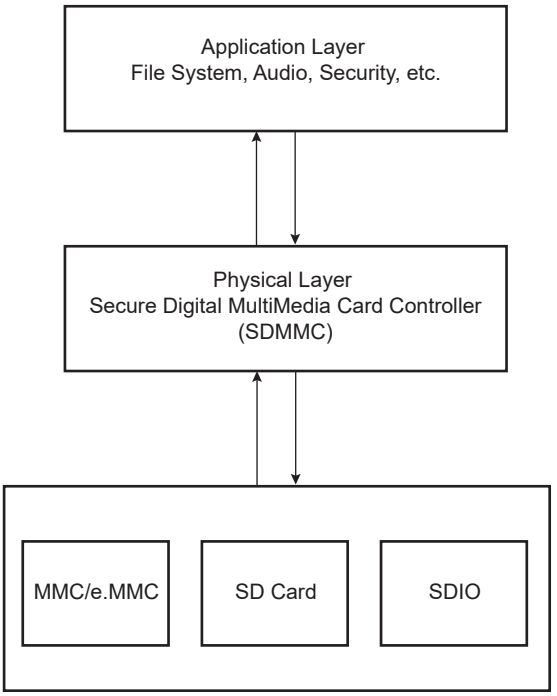

Figure 67.1. SDMMC Block Diagram

© 2026 Microchip Technology Inc. and its subsidiaries

67.5. Application Block Diagram

Figure 67.2. Application Block Diagram

67.6. Pin Name List

Table 67.2. I/O Lines Description for 8-bit Configuration

Pin Name	Pin Description	Type
SDMMC_CMD	SD Card/SDIO/e.MMC Command/Response Line	I/O
SDMMC_CK	SD Card/SDIO/e.MMC Clock Signal	Output
SDMMC_DAT[3:0]	SD Card/SDIO/e.MMC Data Lines	I/O

Note: When several SDMMCs are embedded in a product, SDMMC_CK refers to SDMMCx_CK, SDMMC_CMD to SDMMCx_CMD and SDMMC_DATy to SDMMCx_DATy.

67.7. Product Dependencies

67.7.1. I/O Lines

The pins used for interfacing the Secure Digital MultiMedia Card (SDMMC) Controller are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the peripheral functions to SDMMC pins.

67.7.2. Power Management

The SDMMC is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SDMMC clocks.

67.7.3. Interrupt Sources

The SDMMC has an interrupt line connected to the interrupt controller.

Handling the SDMMC interrupt requires programming the interrupt controller before configuring the SDMMC.

© 2026 Microchip Technology Inc. and its subsidiaries

67.8. SD/SDIO Operating Mode

The SDMMC is fully compliant with the “SD Host Controller Simplified Specification V3.00” for SD/SDIO devices. See this specification for the SDMMC configuration.

See “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” for SD/SDIO management.

67.9. e.MMC Operating Mode

The SDMMC supports management of e.MMC devices. As the “SD Host Controller Simplified Specification V3.00” does not apply to e.MMC devices, some registers have been added to those described in this specification in order to manage e.MMC devices. Most of the registers described in the “SD Host Controller Simplified Specification V3.00” must be used for e.MMC management, but e.MMC-specific features are managed using SDMMC_MC1R and SDMMC_MC2R.

67.9.1. Boot Operation Mode

In Boot Operation mode, the processor can read boot data from the e.MMC device by keeping the CMD line low after power-on before issuing the CMD1. The data can be read from either one of the boot partitions or the User area according to BOOT_PARTITION_ENABLE in the Extended CSD register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).

67.9.1.1. Boot Procedure, Processor Mode

1. Configure the SDMMC:
   a. Set the data bus width using SDMMC_HC1R.DW and SDMMC_HC1R.EXTDW according to the BOOT_BUS_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).
   b. Select the speed mode (using SDMMC_HC1R.HSEN or SDMMC_MC1R.DDR) according to BOOT_MODE in the Extended CSD Register.
   c. Set the SDCLK frequency according to the selected speed mode.
   d. If the Boot Acknowledge is sent by the e.MMC device (BOOT_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to ‘1’ (SDMMC_MC1R.BOOTA = 1).
   e. Enable the interrupt on Boot Acknowledge Received (SDMMC_NISTER.BOOTAR = 1 and SDMMC_NISIER.BOOTAR = 1).
   f. Set the e.MMC Command Type to BOOT (SDMMC_MC1R.CMDTYP = 3)
   g. Set SDMMC_TMR to read multiple blocks for the e.MMC device (SDMMC_TMR.MSBSEL = 1 and SDMMC_TMR.DTDSEL = 1).
   h. Select the NonDMA transfer (SDMMC_TMR.DMAEN = 0).
   i. Optional: select the Auto CMD method (using SDMMC_TMR.ACMDEN).
   j. Set the block size to 512 bytes (SDMMC_BSR.BLKSIZE = 512).
   k. Set the required number of read blocks (using SDMMC_BCR.BLKCNT). SDMMC_TMR.BCEN must be set to ‘1’.
2. Write SDMMC_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC_MC2R.ABOOT to ‘1’.

67.9.1.2. Boot Procedure, SDMA Mode

1. Configure SDMMC:
   a. Set the data bus width using SDMMC_HC1R.DW and SDMMC_HC1R.EXTDW according to BOOT_BUS_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).

© 2026 Microchip Technology Inc. and its subsidiaries

b. Select the speed mode (SDMMC_HC1R.HSEN or SDMMC_MC1R.DDR) according to BOOT_MODE in the Extended CSD Register.

c. Set the SDCLK frequency according to the selected speed mode.

d. If the Boot Acknowledge is sent by the e.MMC device (BOOT_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to 1 (SDMMC_MC1R.BOOTA = 1).

e. Enable interrupt on Boot Acknowledge Received (SDMMC_NISTER.BOOTAR = 1 and SDMMC_NISIER.BOOTAR = 1).

f. Set the e.MMC Command Type to BOOT (SDMMC_MC1R.CMDTYP = 3).

g. Set SDMMC_TMR to read multiple blocks for the e.MMC device (SDMMC_TMR.MSBSEL = 1 and SDMMC_TMR.TDSEL = 1).

h. Select the SDMA transfer (SDMMC_TMR.DMAEN = 1 and SDMMC_HC1R.DMASEL = 0).

i. Write the SDMA system address where the boot data will be copied (SDMMC_SSAR.ADDR).

j. Optional: select the Auto CMD method (SDMMC_TMR.ACMDEN).
Note: Auto CMD23 cannot be used with SDMA.

k. Set the block size to 512 bytes (SDMMC_BSR.BLKSIZE = 512).

l. Set the required number of read blocks (SDMMC_BCR.BLKCNT). SDMMC_TMR.BCEN must be set to 1.

2. Write SDMMC_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC_MC2R.ABOOT to ‘1’.

67.9.1.3.Boot Procedure, ADMA Mode

1. Configure the SDMMC:
   a. Set the data bus width using SDMMC_HC1R.DW and SDMMC_HC1R.EXTDW according to BOOT_BUS_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).

   b. Select the speed mode (SDMMC_HC1R.HSEN or SDMMC_MC1R.DDR) according to BOOT_MODE in the Extended CSD register.

   c. Set the SDCLK frequency according to the selected speed mode.

   d. If the Boot Acknowledge is sent by the e.MMC device (BOOT_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to ‘1’ (SDMMC_MC1R.BOOTA = 1).

   e. Enable interrupt on Boot Acknowledge Received (SDMMC_NISTER.BOOTAR = 1 and SDMMC_NISIER.BOOTAR = 1).

   f. Set the e.MMC Command Type to BOOT (SDMMC_MC1R.CMDTYP = 3).

   g. Set SDMMC_TMR to read multiple blocks for the e.MMC device (SDMMC_TMR.MSBSEL = 1 and SDMMC_TMR.DTDSEL = 1).

   h. Select the ADMA transfer (SDMMC_TMR.DMAEN = 1 and SDMMC_HC1R.DMASEL = 2 or 3).

   i. Write the address of the descriptor table in the ADMA system address (SDMMC_ASARx [1:0].ADMASA).

   j. Optional: select the Auto CMD method (SDMMC_TMR.ACMDEN).

   k. Set the block size to 512 bytes (SDMMC_BSR.BLKSIZE = 512).

   l. Set the required number of read blocks (SDMMC_BCR.BLKCNT). SDMMC_TMR.BCEN must be set to ‘1’.

2. Write SDMMC_CR = 20(hexa) to set the e.MMC in Boot Operation Mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).

© 2026 Microchip Technology Inc. and its subsidiaries

4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC_MC2R.ABOOT to ‘1’.

67.10.1. SDMMC SDMA System Address Register (Default Mode)

Name: SDMMC_SSAR (DEFAULT_MODE)
Offset: 0x00
Reset: 0x00000000
Property: Read/Write

This register contains the physical system memory address used for SDMA transfers.

Bit	31	30	29	28	27	26	25	24
	ADDR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	ADDR[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ADDR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ADDR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ADDR[31:0] SDMA System Address
The system memory address for an SDMA transfer. When the SDMMC stops an SDMA transfer, this field points to the system address of the next contiguous data position. This field can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. An interrupt can be generated to instruct the software to update this field. Writing the next system address of the next data position restarts the SDMA transfer.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.2. SDMMC SDMA Argument 2 Register

Name: SDMMC_SSAR (CMD23)
Offset: 0x00
Reset: 0x00000000
Property: Read/Write

This register contains the physical system memory address used for the second argument for Auto CMD23.

Bit	31	30	29	28	27	26	25	24
	ARG2[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	ARG2[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ARG2[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ARG2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ARG2[31:0] SDMA Argument 2
Used with Auto CMD23 to set a 32-bit block count value to the CMD23 argument while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by SDMMC_BCR. In this case, 65535 blocks is the maximum value.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.3. SDMMC Block Size Register

Name: SDMMC_BSR
Offset: 0x04
Reset: 0x0000
Property: Read/Write

Bit	15	14	13	12	11	10	9	8
		BOUNDARY[2:0]					BLKSIZE[9:8]	
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0

Bit	7	6	5	4	3	2	1	0
	BLKSIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 14:12 – BOUNDARY[2:0] SDMA Buffer Boundary
Specifies the size of the contiguous buffer in the system memory. The SDMA transfer waits at every boundary specified by this field and the SDMMC generates the DMA Interrupt to instruct the software to update SDMMC_SSAR. If this field is set to 0 (buffer size = 4 Kbytes), the lowest 12 bits of SDMMC_SSAR.ADDRESS point to data in the contiguous buffer, and the upper 20 bits point to the location of the buffer in the system memory. This function is active when SDMMC_TMR.DMAEN is set.

Value	Name	Description
0	4K	4-Kbyte boundary
1	8K	8-Kbyte boundary
2	16K	16-Kbyte boundary
3	32K	32-Kbyte boundary
4	64K	64-Kbyte boundary
5	128K	128-Kbyte boundary
6	256K	256-Kbyte boundary
7	512K	512-Kbyte boundary

Bits 9:0 – BLKSIZE[9:0] Transfer Block Size
Specifies the block size of data transfers for CMD14, CMD17, CMD18, CMD19, CMD24, CMD25, CMD53 and other data transfer commands such as CMD6, CMD8, ACMD13 and ACMD51. Values ranging from 1 to 512 can be set. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations are ignored.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.4. SDMMC Block Count Register

Name: SDMMC_BCR
Offset: 0x06
Reset: 0x0000
Property: Read/Write

Bit	15	14	13	12	11	10	9	8
	BLKCNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	BLKCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – BLKCNT[15:0] Block Count for Current Transfer

This field is used only if SDMMC_TMR.BCEN (Block Count Enable) is set to 1 and is valid only for multiple block transfers. BLKCNT is the number of blocks to be transferred and it must be set to a value between 1 and the maximum block count. The SDMMC decrements the block count after each block transfer and stops when the count reaches 0. When this field is set to 0, no data block is transferred.

This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored.

When a suspend command is completed, the number of blocks yet to be transferred can be determined by reading this register. Before issuing a resume command, the previously saved block count is restored.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.5. SDMMC Argument 1 Register

Name: SDMMC_ARG1R
Offset: 0x08
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	ARG1[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	ARG1[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ARG1[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ARG1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ARG1[31:0] Argument 1
This register contains the SD command argument which is specified as the bit 39-8 of Command-Format in the “Physical Layer Simplified Specification V3.01” or “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.6. SDMMC Transfer Mode Register

Name: SDMMC_TMR
Offset: 0x0C
Reset: 0x0000
Property: Read/Write

This register is used to control data transfers. The user shall set this register before issuing a command which transfers data (see SDMMC_CR.DPSEL), or before issuing a Resume command. The user must save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, this register cannot be written while data transactions are in progress. Writes to this register are ignored when SDMMC_PSR.CMDINHD is 1.

Table 67.3. Determining the Transfer Type

MSBSEL	BCEN	BLKCNT (SDMMC_BCR)	Function
0	Don't care	Don't care	Single Transfer
1	0	Don't care	Infinite Transfer
1	1	Not Zero	Multiple Transfer
1	1	Zero	Stop Multiple Transfer

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			MSBSEL	DTDSEL	ACMDEN[1:0]		BCEN	DMAEN
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 5 – MSBSEL Multi/Single Block Selection
This bit is set to 1 when issuing multiple-block transfer commands using DAT line(s). For any other commands, set this bit to 0. If this bit is 0, it is not necessary to set SDMMC_BCR (see the table Determining the Transfer Type).

Bit 4 – DTDSEL Data Transfer Direction Selection
This bit defines the direction of the DAT lines data transfers. Set this bit to 1 to transfer data from the device (SD card/SDIO/e.MMC) to the SDMMC, and to 0 for all other commands.

Value	Name	Description
0	WRITE	Writes data from the SDMMC to the device.
1	READ	Reads data from the device to the SDMMC.

Bits 3:2 – ACMDEN[1:0] Auto Command Enable
Two methods can be used to stop Multiple-block read and write operation:

- Auto CMD12: when the ACMDEN field is set to 1, the SDMMC issues CMD12 automatically when the last block transfer is completed. An Auto CMD12 error is indicated to SDMMC_ACESR. Auto CMD12 is not enabled if the command does not require CMD12.
- Auto CMD23: when the ACMDEN field is set to 2, the SDMMC issues a CMD23 automatically before issuing a command specified in SDMMC_CR.

The following conditions are required to use Auto CMD23:

- A memory card that supports CMD23 (SCR[33] = 1)

© 2026 Microchip Technology Inc. and its subsidiaries

- If DMA is used, it must be ADMA (SDMA not supported).
- Only CMD18 or CMD25 is issued.

Note: The SDMMC does not check the command index.

Auto CMD23 can be used with or without ADMA. By writing SDMMC_CR, the SDMMC issues a CMD23 first and then issues a command specified by the SDMMC_CR.CMDIDX field. If CMD23 response errors are detected, the second command is not issued. A CMD23 error is indicated in SDMMC_ACESR. The CMD23 argument (32-bit block count value) is set in SDMMC_SSAR.
This field determines the use of auto command functions.

Value	Name	Description
0	DISABLED	Auto Command Disabled
1	CMD12	Auto CMD12 Enabled
2	CMD23	Auto CMD23 Enabled
3	–	Reserved

Bit 1 – BCEN Block Count Enable

This bit is used to enable SDMMC_BCR, which is only relevant for multiple block transfers. When this bit is 0, SDMMC_BCR is disabled, which is useful when executing an infinite transfer (see the table Determining the Transfer Type). If an ADMA2 transfer is more than 65535 blocks, this bit is set to 0 and the data transfer length is designated by the Descriptor Table.

Value	Name	Description
0	DISABLED	Block count is disabled.
1	ENABLED	Block count is enabled.

Bit 0 – DMAEN DMA Enable

This bit enables the DMA functionality described in section “Supporting DMA” in “SD Host Controller Simplified Specification V3.00” . DMA can be enabled only if it is supported as indicated by the bit SDMMC_CA0R.ADMA2SUP. One of the DMA modes can be selected using the field SDMMC_HC1R.DMASEL. If DMA is not supported, this bit is meaningless and then always reads 0. When this bit is set to 1, a DMA operation begins when the user writes to the upper byte of SDMMC_CR.

Value	Name	Description
0	DISABLED	DMA functionality is disabled.
1	ENABLED	DMA functionality is enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.7. SDMMC Command Register

Name: SDMMC_CR
Offset: 0x0E
Reset: 0x0000
Property: Read/Write

Bit	15	14	13	12	11	10	9	8
			CMDIDX[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CMDTYP[1:0]		DPSEL	CMDICEN	CMDCCEN		RESPTYP[1:0]	
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

Bits 13:8 – CMDIDX[5:0] Command Index
This bit shall be set to the command number (CMD0–63, ACMD0–63) that is specified in bits 45–40 of the Command-Format in the “Physical Layer Simplified Specification V3.01” , “SDIO Simplified Specification V3.00” , and “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .

Bits 7:6 – CMDTYP[1:0] Command Type

Value	Name	Description
0	NORMAL	Other commands
1	SUSPEND	CMD52 to write “Bus Suspend” in the Card Common Control registers (CCCR) (for SDIO only)
2	RESUME	CMD52 to write “Function Select” in the Card Common Control registers (CCCR) (for SDIO only)
3	ABORT	CMD12, CMD52 to write “I/O Abort” in the Card Common Control registers (CCCR) (for SDIO only)

Bit 5 – DPSEL Data Present Select
This bit is set to 1 to indicate that data is present and shall be transferred using the DAT lines. It is set to 0 for the following:

- Commands using only CMD line (Ex. CMD52)
- Commands with no data transfer but using Busy signal on DAT[0] line (Ex. CMD38)
- Resume command

Value	Description
0	No data present
1	Data present

Bit 4 – CMDICEN Command Index Check Enable
If this bit is set to 1, the SDMMC checks the Index field in the response to see if it has the same value as the command index. If it has not, it is reported as a Command Index Error (CMDIDX) in SDMMC_EISTR. If this bit is set to 0, the Index field of the response is not checked.

Value	Name	Description
0	DISABLED	The Command Index Check is disabled.
1	ENABLED	The Command Index Check is enabled.

Bit 3 – CMDCCEN Command CRC Check Enable
If this bit is set to 1, the SDMMC checks the CRC field in the response. If an error is detected, it is reported as a Command CRC Error (CMDCRC) in SDMMC_EISTR. If this bit is set to 0, the CRC field is not checked. The position of the CRC field is determined according to the length of the response.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	DISABLED	The Command CRC Check is disabled.
1	ENABLED	The Command CRC Check is enabled.

Bits 1:0 – RESPTYP[1:0] Response Type
This field is set according to the response type expected for the command index (CMDIDX).

Value	Name	Description
0	NORESP	No Response
1	RL136	Response Length 136
2	RL48	Response Length 48
3	RL48BUSY	Response Length 48 with Busy

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.8. SDMMC Response Register x

Name: SDMMC_RRx
Offset: 0x10 + x*0x04 [x=0..3]
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	CMDRESP[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	CMDRESP[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	CMDRESP[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

	CMDRESP[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – CMDRESP[31:0] Command Response

The table below describes the mapping of command responses from the SD_SDIO/e.MMC bus to these registers for each responses type. In this table, R[] refers to a bit range of the response data as transmitted on the SD_SDIO/e.MMC bus.

Type of Response	Meaning of Response	Response Field	Response Register
R1, R1b (normal response)	Card Status	R[39:8]	SDMMC_RR0[31:0]
R1b (Auto CMD12 response)	Card Status for Auto CMD12	R[39:8]	SDMMC_RR3[31:0]
R1 (Auto CMD23 response)	Card Status for Auto CMD23	R[39:8]	SDMMC_RR3[31:0]
R2 (CID, CSD register)	CID or CSD register	R[127:8]	SDMMC_RR0[31:0] SDMMC_RR1[31:0] SDMMC_RR2[31:0] SDMMC_RR3[23:0]
R3 (OCR register)	OCR register for memory	R[39:8]	SDMMC_RR0[31:0]
R4 (OCR register)	OCR register for I/O	R[39:8]	SDMMC_RR0[31:0]
R5, R5b	SDIO response	R[39:8]	SDMMC_RR0[31:0]
R6 (Published RCA response)	New published RCA[31:16] and Card status bits	R[39:8]	SDMMC_RR0[31:0]

Reset	–	–	–	–	–	–	–	–

Bits 31:0 – BUFDATA[31:0] Buffer Data
The SDMMC data buffer can be accessed through this 32-bit Data Port register.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.10.SDMMC Present State Register

Name: SDMMC_PSR
Offset: 0x24
Reset: 0x01F80000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
								CMDLL
Access								R
Reset								1

Bit	23	22	21	20	19	18	17	16
	DATLL[3:0]							
Access	R	R	R	R				
Reset	1	1	1	1				

Bit	15	14	13	12	11	10	9	8
					BUFRDEN	BUFWREN	RTACT	WTACT
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
						DLACT	CMDINHD	CMDINHC
Access						R	R	R
Reset						0	0	0

Bit 24 – CMDLL CMD Line Level
This status is used to check the CMD line level to recover from errors, and for debugging.

Bits 23:20 – DATLL[3:0] DAT[3:0] Line Level
This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the Busy signal level from DAT[0].

Bit 11 – BUFRDEN Buffer Read Enable
This bit is used for nonDMA read transfers. This flag indicates that valid data exists in the SDMMC data buffer. If this bit is 1, readable data exists in the buffer.
A change from 1 to 0 occurs when all the block data is read from the buffer.
A change from 0 to 1 occurs when block data is ready in the buffer. This raises the Buffer Read Ready (BRDRDY) status flag in SDMMC_NISTR if SDMMC_NISTER.BRDRDY is set to 1. An interrupt is generated if SDMMC_NISIER.BRDRDY is set to 1.

Bit 10 – BUFWREN Buffer Write Enable
This bit is used for nonDMA write transfers. This flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer.
A change from 1 to 0 occurs when all the block data are written to the buffer.
A change from 0 to 1 occurs when top of block data can be written to the buffer. This raises the Buffer Write Ready (BWRRDY) status flag in SDMMC_NISTR if SDMMC_NISTER.BWRRDY is set to 1. An interrupt is generated if SDMMC_NISIER.BWRRDY is set to 1.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 9 – RTACT Read Transfer Active

This bit is used to detect completion of a read transfer. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
This bit is set to 1 in either of the following conditions:

- After the end bit of the read command.
- When a read operation is restarted by writing a 1 to SDMMC_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- When the last data block as specified by Transfer Block Size (BLKSIZE) is transferred to the system.
- In case of ADMA2, end of read is designated by the descriptor table.
- When all valid data blocks in the SDMMC have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request (STPBGR) of SDMMC_BGCR being set to 1.

A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1.

Bit 8 – WTACT Write Transfer Active

This bit indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the SDMMC. See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
This bit is set to 1 in either of the following conditions:

- After the end bit of the write command.
- When a write operation is restarted by writing a 1 to SDMMC_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- After getting the CRC status of the last data block as specified by the transfer count (single and multiple). In case of ADMA2, transfer count is designated by the descriptor table.
- After getting the CRC status of any block where a data transmission is about to be stopped by a Stop At Block Gap Request (STPBGR) of SDMMC_BGCR.

During a write transaction and as the result of the Stop At Block Gap Request (STPBGR) being set, a change from 1 to 0 raises the Block Gap Event (BLKGE) status flag in SDMMC_NISTR if SDMMC_NISTER.BLKGE is set to 1. An interrupt is generated if BLKGE is set to 1 in SDMMC_NISIER. This status is useful to determine whether nonDAT line commands can be issued during Write Busy.

Bit 2 – DLACT DAT Line Active

This bit indicates whether one of the DAT lines on the bus is in use.
In the case of read transactions:

- This status indicates whether a read transfer is executing on the bus. A change from 1 to 0 resulting from setting the Stop At Block Gap Request (STPBGR) raises the Block Gap Event (BLKGE) status flag in SDMMC_NISTR if SDMMC_NISTER.BLKGE is set to 1. An interrupt is generated if SDMMC_NISIER.BLKGE is set to 1. See the section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the read command.
  - When writing 1 to SDMMC_BGCR.CONTR (Continue Request) to restart a read transfer.
- This bit is SDMMC cleared in either of the following cases:
  - When the end bit of the last data block is sent from the bus to the SDMMC. In case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.

© 2026 Microchip Technology Inc. and its subsidiaries

  - When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request (STPBGR).

- The SDMMC stops a read operation at the start of the interrupt cycle by driving the Read Wait (DAT[2] line) or by stopping the SD Clock. If the Read Wait signal is already driven (due to the fact that the data buffer cannot receive data), the SDMMC can continue to stop the read operation by driving the Read Wait signal. It is necessary to support the Read Wait in order to use the Suspend/Resume operation.

In the case of write transactions:

- This status indicates that a write transfer is executing on the bus. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1. See the section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the write command.
  - When writing 1 to SDMMC_BGCR.CONTR (Continue Request) to continue a write transfer.
- This bit is cleared in either of the following cases:
  - When the card releases Write Busy of the last data block. If the card does not drive a Busy signal for 8 SDCLK, the SDMMC considers the card drive “Not Busy”. In the case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When the card releases Write Busy prior to waiting for a write transfer as a result of a Stop At Block Gap Request (STPBGR).

Command with Busy:
This status indicates whether a command that indicates Busy (ex. erase command for memory) is executing on the bus. This bit is set to 1 after the end bit of the command with Busy and cleared when Busy is deasserted. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1. See Figures 2.11 to 2.13 in the “SD Host Controller Simplified Specification V3.00” .

Value	Description
0	DAT line inactive.
1	DAT line active.

Bit 1 – CMDINHD Command Inhibit (DAT)

This status bit is 1 if either the DAT Line Active (DLACT) or the Read Transfer Active (RTACT) is set to 1. If this bit is 0, it indicates that the SDMMC can issue the next command. Commands with a Busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1.
Note: The software can save registers in the 000–00Dh range for a suspend transaction after this bit has changed from 1 to 0.

Value	Description
0	Can issue a command which uses the DAT line(s).
1	Cannot issue a command which uses the DAT line(s).

Bit 0 – CMDINHC Command Inhibit (CMD)

If this bit is 0, it indicates the CMD line is not in use and the SDMMC can issue a command using the CMD line. This bit is set to 1 immediately after SDMMC_CR is written. This bit is cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the CMD12 or CMD23 response, but by the Read/Write command response.

© 2026 Microchip Technology Inc. and its subsidiaries

Status issuing Auto CMD12 is not read from this bit. So, if a command is issued during Auto CMD12 operation, the SDMMC manages to issue both commands: CMD12 and a command set by SDMMC_CR.
Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0.
A change from 1 to 0 raises the Command Complete (CMDC) status flag in SDMMC_NISTR if SDMMC_NISTER.CMDC is set to 1. An interrupt is generated if SDMMC_NISIER.CMDC is set to 1.
If the SDMMC cannot issue the command because of a command conflict error (see SDMMC_EISTR.CMDCRC) or because of a 'Command Not Issued By Auto CMD12' error (see section "SDMMC Auto CMD Error Status Register"), this bit remains 1 and Command Complete is not set.

Value	Description
0	Can issue a command using only CMD line.
1	Cannot issue a command.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.11.SDMMC Host Control 1 Register (SD_SDIO)

Name: SDMMC_HC1R (SD_SDIO)
Offset: 0x28
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
		CARDDTL		DMASEL[1:0]		HSEN	DW	LEDCTRL
Access		R/W		R/W	R/W	R/W	R/W	R/W
Reset		0		0	0	0	0	0

Bit 6 – CARDDTL Card Detect Test Level
This bit is enabled while the Card Detect Signal Selection (CARDDSEL) is set to 1 and it indicates whether the card is inserted or not.

Value	Description
0	No card.
1	Card inserted.

Bits 4:3 – DMASEL[1:0] DMA Select
One of the supported DMA modes can be selected. The DMA modes supported are given in SDMMC_CA0R. Use of a selected DMA is determined by DMA Enable (DMAEN) in SDMMC_TMR.

Value	Name	Description
0	SDMA	SDMA is selected
1	–	Reserved
2	ADMA32	32-bit Address ADMA2 is selected
3	–	Reserved

Bit 2 – HSEN High Speed Enable
Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC_CA0R.
If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).
If Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, the user needs to reset SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.
Note: This bit is effective only if SDMMC_MC1R.DDR is set to 0.

Note: The clock divider (DIV) in the Clock Control register (SDMMC_CCR) must be set to a value different from 0 when HSEN is 1.

Value	Description
0	Normal Speed mode.
1	High Speed mode.

Bit 1 – DW Data Width
This bit selects the data width of the SDMMC. It must be set to match the data width of the card.
Note: If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

Value	Name	Description
0	1_BIT	1-bit mode.
1	4_BIT	4-bit mode.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 0 – LEDCTRL LED Control

This bit is used to caution the user not to remove the card while it is being accessed. If the software is going to issue multiple commands, this bit is set to 1 during all transactions.

Value	Name	Description
0	OFF	LED off.
1	ON	LED on.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.12.SDMMC Host Control 1 Register (e.MMC)

Name: SDMMC_HC1R (EMMC)
Offset: 0x28
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	7	6	5	4	3	2	1	0
			EXTDW	DMASEL[1:0]		HSEN	DW	
Access			R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	

Bit 5 – EXTDW Extended Data Width
This bit controls the 8-bit Bus Width mode for embedded devices. Support of this function is indicated in 8-bit Support for Embedded Device in SDMMC_CA0R. If a device supports the 8-bit mode, this may be set to 1. If this bit is 0, the bus width is controlled by Data Width (DW).

Bits 4:3 – DMASEL[1:0] DMA Select
One of the supported DAM modes can be selected. The DMA modes supported are given in SDMMC_CA0R. Use of selected DMA is determined by DMA Enable (DMAEN) in SDMMC_TMR.

Value	Name	Description
0	SDMA	SDMA is selected
1	–	Reserved
2	ADMA32	32-bit Address ADMA2 is selected
3	–	Reserved

Bit 2 – HSEN High Speed Enable
Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC_CA0R.
If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).
If Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, the user needs to reset the SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.
This bit is effective only if SDMMC_MC1R.DDR is set to 0.
Note: The clock divider (DIV) in SDMMC_CCR must be set to a value different from 0 when HSEN is 1.

Value	Description
0	Normal Speed mode.
1	High Speed mode.

Bit 1 – DW Data Width
This bit selects the data width of the SDMMC. It must be set to match the data width of the card.
Note: If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

Value	Name	Description
0	1_BIT	1-bit mode.
1	4_BIT	4-bit mode.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.13.SDMMC Power Control Register

Name: SDMMC_PCR
Offset: 0x29
Reset: 0x0E
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
								SDBPWR
Access								R/W
Reset								0

Bit 0 – SDBPWR SD Bus Power
This bit is automatically cleared by the SDMMC if the card is removed. If this bit is cleared, the SDMMC stops driving SDMMC_CMD and SDMMC_DAT[3:0] (tri-state) and drives SDMMC_CK to low level.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.14.SDMMC Block Gap Control Register (SD_SDIO)

Name: SDMMC_BGCR (SD_SDIO)
Offset: 0x2A
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
					INTBG	RWCTRL	CONTR	STPBGR
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit 3 – INTBG Interrupt at Block Gap
This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. If the SDIO card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the software detects an SDIO card insertion, it sets this bit according to the CCCR of the SDIO card.

Value	Name	Description
0	DISABLED	Interrupt detection disabled.
1	ENABLED	Interrupt detection enabled.

Bit 2 – RWCTRL Read Wait Control
The Read Wait control is optional for SDIO cards. If the card supports Read Wait, set this bit to enable use of the Read Wait protocol to stop read data using the SDMMC_DAT[2] line. Otherwise, the SDMMC stops the SDCLK to hold read data, which restricts command generation. When the software detects an SD card insertion, this bit must be set according to the CCCR of the SDIO card. If the card does not support Read Wait, this bit shall never be set to 1, otherwise an SDMMC_DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.

Value	Description
0	Disables Read Wait control.
1	Enables Read Wait control.

Bit 1 – CONTR Continue Request
This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.
The SDMMC automatically clears this bit in either of the following cases:
– In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
– In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.
Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored. See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	No effect.
1	Restart.

Bit 0 – STPBGR Stop At Block Gap Request
This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in

© 2026 Microchip Technology Inc. and its subsidiaries

SDMMC_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not. During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC_DAT[2]) if supported, or by stopping the SD clock otherwise.
In case of write transfers in which the user writes data to SDMMC_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC_BDPR.
This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.
See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	Transfer
1	Stop

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.15.SDMMC Block Gap Control Register (e.MMC)

Name: SDMMC_BGCR (EMMC)
Offset: 0x2A
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	7	6	5	4	3	2	1	0
							CONTR	STPBGR
Access							R/W	R/W
Reset							0	0

Bit 1 – CONTR Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.
The SDMMC automatically clears this bit in either of the following cases:
– In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
– In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.
Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.
See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	No effect.
1	Restart.

Bit 0 – STPBGR Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.
During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC_DAT[2]) if supported, or by stopping the SD clock otherwise.
In case of write transfers in which the user writes data to SDMMC_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC_BDPR.
This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.
See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	Transfer
1	Stop

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.16.SDMMC Wake-up Control Register (SD_SDIO)

Name: SDMMC_WCR (SD_SDIO)
Offset: 0x2B
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
								WKENCINT
Access								R/W
Reset								0

Bit 0 – WKENCINT Wake-up Event Enable on Card Interrupt
This bit enables a wake-up event via Card Interrupt (CINT) in SDMMC_NISTR. This bit can be set to 1 if FN_WUS (Wake-up Support) in the CIS (Card Information Structure) is set to 1 in the SDIO card.
0 (DISABLED): Wake-up Event disabled.
1 (ENABLED): Wake-up Event enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.17.SDMMC Clock Control Register

Name: SDMMC_CCR
Offset: 0x2C
Reset: 0x0000
Property: Read/Write

Bit	15	14	13	12	11	10	9	8
	SDCLKFSEL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	USDCLKFSEL[1:0]		CLKGSEL			SDCLKEN	INTCLKS	INTCLKEN
Access	R/W	R/W	R/W			R/W	R/W	R/W
Reset	0	0	0			0	0	0

Bits 15:8 – SDCLKFSEL[7:0] SDCLK Frequency Select
This register is used to select the frequency of the SDCLK pin. There are two SDCLK Frequency modes according to Clock Generator Select (CLKGSEL).
The length of the clock divider (DIV) is extended to 10 bits (DIV[9:8] = USDCLKFSEL, DIV[7:0] = SDCLKFSEL)

- 10-bit Divided Clock Mode (CLKGSEL = 0): $f_{SDCLK} = f_{BASECLK}/(2 \times DIV)$. If DIV = 0 then $f_{SDCLK} = f_{BASECLK}$
- Programmable Clock Mode (CLKGSEL = 1): $f_{SDCLK} = f_{MULTCLK}/(DIV + 1)$

When HSEN is set in SDMMC_HC1R, or DDR is set in SDMMC_MC1R, the clock divider (DIV) must be non-zero. This field depends on the setting of Preset Value Enable (PVALEN) in SDMMC_HC2R.
If PVALEN = 0, this field is set by the user.
If PVALEN = 1, this field is automatically set to a value specified in one of the SDMMC_PVR.

Bits 7:6 – USDCLKFSEL[1:0] Upper Bits of SDCLK Frequency Select
These bits expand the SDCLK Frequency Select (SDCLKFSEL) to 10 bits. These two bits are assigned to bit 09-08 of the clock divider as described in SDCLKFSEL.

Bit 5 – CLKGSEL Clock Generator Select
This bit is used to select the clock generator mode in the SDCLK Frequency Select field. If the Programmable mode is not supported (SDMMC_CA1R.CLKMULT (Clock Multiplier) set to 0), then this bit cannot be written and is always read at 0.
This bit depends on the setting of Preset Value Enable (PVALEN) in SDMMC_HC2R.
If PVALEN = 0, this bit is set by the user.
If PVALEN = 1, this bit is automatically set to a value specified in one of the SDMMC_PVRx.

Value	Description
0	Divided Clock mode (BASECLK is used to generate SDCLK).
1	Programmable Clock mode (MULTCLK is used to generate SDCLK).

Bit 2 – SDCLKEN SD Clock Enable
The SDMMC stops the SD Clock when writing this bit to 0. SDCLK Frequency Select (SDCLKFSEL) can be changed when this bit is 0. Then, the SDMMC maintains the same clock frequency until SDCLK is stopped (Stop at SDCLK = 0).

Value	Description
0	SD Clock disabled

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	SD Clock enabled

Bit 1 – INTCLKS Internal Clock Stable

This bit is set to 1 when the SD clock is stable after setting SDMMC_CCR.INTCLKEN (Internal Clock Enable) to 1. The user must wait to set SD Clock Enable (SDCLKEN) until this bit is set to 1.

Value	Description
0	Internal clock not ready.
1	Internal clock ready.

Bit 0 – INTCLKEN Internal Clock Enable

This bit is set to 0 when the SDMMC is not used or is awaiting a wake-up interrupt. In this case, its internal clock is stopped to reach a very low power state. Registers are still able to be read and written. The clock starts to oscillate when this bit is set to 1. Once the clock oscillation is stable, the SDMMC sets Internal Clock Stable (INTCLKS) in this register to 1.

Value	Description
0	The internal clock stops.
1	The internal clock oscillates.

67.10.18.SDMMC Timeout Control Register

Name: SDMMC_TCR
Offset: 0x2E
Reset: 0x00
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
					DTCVAL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 3:0 – DTCVAL[3:0] Data Timeout Counter Value
This value determines the interval at which DAT line timeouts are detected. For more information about timeout generation, see Data Timeout Error (DATTEO) in SDMMC_EISTR. When setting this register, the user can prevent inadvertent timeout events by clearing the Data Timeout Error Status Enable (in SDMMC_EISTER).

$$\mathrm{TIMEOUT}_{(\mu s)} = \frac{2^{13 + \mathrm{DTCVAL}}}{f_{\mathrm{FTEOCLK(MHz)}}}$$

Note: DTCVAL = $f_{(Hexa)}$ is reserved.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.19.SDMMC Software Reset Register

Name: SDMMC_SRR
Offset: 0x2F
Reset: 0x00000000
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
						SWRSTDAT	SWRSTCMD	SWRSTALL
Access						R/W	R/W	R/W
Reset						0	0	0

Bit 2 – SWRSTDAT Software Reset for DAT Line
Only part of a data circuit is reset. The DMA circuit is also reset.
The following registers and bits are cleared by this bit:

- SDMMC Buffer Data Port Register
  - Buffer is cleared and initialized.
- SDMMC Present State Register
  - Buffer Read Enable (BUFRDEN)
  - Buffer Write Enable (BUFWREN)
  - Read Transfer Active (RTACT)
  - Write Transfer Active (WTACT)
  - DAT Line Active (DATLL)
  - Command Inhibit (DAT) (CMDINHD)
- SDMMC Block Gap Control Register (SD_SDIO)
  - Continue Request (CONTR)
  - Stop At Block Gap Request (STPBGR)

  - Transfer Complete (TRFC)

Value	Description
0	Work
1	Reset

Bit 1 – SWRSTCMD Software Reset for CMD Line
Only part of a command circuit is reset.
The following registers and bits are cleared by this bit:

- SDMMC Present State Register
  - Command Inhibit (CMD) (CMDINHC)
- SDMMC Normal Interrupt Status Register (SD_SDIO) and SDMMC Normal Interrupt Status Register (e.MMC)
  - Command Complete (CMDC)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Work
1	Reset

Bit 0 – SWRSTALL Software Reset for All

This reset affects the entire SDMMC. During initialization, the SDMMC must be reset by setting this bit to '1'. This bit is automatically cleared to '0' when SDMMC_CA0R and SDMMC_CA1R are valid and the user can read them. If this bit is set to '1', the user should issue a reset command and reinitialize the card.

List of registers cleared to '0':

- SDMMC SDMA System Address / Argument 2 Register
- SDMMC Block Size Register
- SDMMC Block Count Register
- SDMMC Argument 1 Register
- SDMMC Command Register
- SDMMC Transfer Mode Register
- SDMMC Response Register
- SDMMC Buffer Data Port Register
- SDMMC Present State Register (except CMDLL, DATLL, WRPPL, CARDDDPL)
- SDMMC Host Control 1 Register (SD_SDIO)
- SDMMC Host Control 1 Register (e.MMC)
- SDMMC Power Control Register
- SDMMC Block Gap Control Register (SD_SDIO)
- SDMMC Block Gap Control Register (e.MMC)
- SDMMC Wake-up Control Register (SD_SDIO)
- SDMMC Clock Control Register
- SDMMC Timeout Control Register
- SDMMC Normal Interrupt Status Register (SD_SDIO)
- SDMMC Error Interrupt Status Register (SD_SDIO)
- SDMMC Normal Interrupt Status Enable Register (SD_SDIO)
- SDMMC Error Interrupt Status Enable Register (SD_SDIO)
- SDMMC Normal Interrupt Signal Enable Register (SD_SDIO)
- SDMMC Error Interrupt Signal Enable Register (SD_SDIO)

67.10.20.SDMMC Normal Interrupt Status Register (SD_SDIO)

Name: SDMMC_NISTR (SD_SDIO)
Offset: 0x30
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
	ERRINT							CINT
Access	R							R/W
Reset	0							0

Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 15 – ERRINT Error Interrupt
If any of the bits in SDMMC_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

Value	Description
0	No error.
1	Error.

Bit 8 – CINT Card Interrupt
Writing this bit to '1' does not clear this bit. It is cleared by resetting the SD card interrupt factor.
In 1-bit mode, the SDMMC detects the Card Interrupt without SDCLK to support wake-up. In 4-bit mode, the Card Interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the system.
When this bit is set to '1' and the user needs to start this interrupt service, Card Interrupt Status Enable (CINT) in SDMMC_NISTER may be set to '0' in order to clear the card interrupt statuses latched in the SDMMC and to stop driving the interrupt signal to the system. After completion of the card interrupt service (it should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set SDMMC_NISTER.CINT to '1' and start sampling the interrupt signal again.
Interrupt detected by DAT[1] is supported when there is one card per slot.
This bit can only be set to 1 if SDMMC_NISTER.CINT is set to 1. An interrupt can only be generated if SDMMC_NISIER.CINT is set to 1.

Value	Description
0	No card interrupt.
1	Card interrupt.

Bit 5 – BRDRDY Buffer Read Ready
This status is set to '1' if the Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See BUFRDEN in SDMMC_PSR.
This bit can only be set to '1' if SDMMC_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BRDRDY is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to read buffer.
1	Ready to read buffer.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 4 – BWRRDY Buffer Write Ready

This status is set to '1' if the Buffer Write Enable (BUFWREN) changes from '0' to '1'. See BUFWREN in SDMMC_PSR.
This bit can only be set to '1' if SDMMC_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BWRRDY is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to write buffer.
1	Ready to write buffer.

Bit 3 – DMAINT DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC_BSR.
In case of ADMA, by setting the “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after Transfer Complete (TRFC).
This bit can only be set to '1' if SDMMC_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC_NISIER.DMAINT is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No DMA Interrupt.
1	DMA Interrupt.

Bit 2 – BLKGE Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR is set to 1, this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to 1, this bit is not set to 1.
In the case of a Read transaction:
This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.
In the case of a Write transaction:
This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
This bit can only be set to '1' if SDMMC_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BLKGE is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No block gap event.
1	Transaction stopped at block gap.

Bit 1 – TRFC Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.
In the case of a Read Transaction:
This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data was read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR (after valid data was read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
In the case of a Write Transaction:
This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length

© 2026 Microchip Technology Inc. and its subsidiaries

and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

In the case of command with Busy:

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.

This bit can only be set to '1' if SDMMC_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears the bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

TRFC	DATTEO	Status Meaning
0	0	Interrupted by another factor
0	1	Timeout occurred during transfer
1	Don’t Care	Command execution complete

Value	Description
0	Command execution is not complete.
1	Command execution is complete.

Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See Command Inhibit (CMD) in SDMMC_PSR for details on how to control this bit.

This bit can only be set to 1 if SDMMC_NISTER.CMDC is set to 1. An interrupt can only be generated if SDMMC_NISIER.CMDC is set to 1.

Writing this bit to 1 clears the bit.

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to 1, it can be considered that the response was not received correctly.

CMDC	CMDTEO	Status Meaning
0	0	Interrupted by another factor
Don’t care	1	Response not received within 64 SDCLK cycles
1	0	Response received

Value	Description
0	No command complete.
1	Command complete.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.21.SDMMC Normal Interrupt Status Register (e.MMC)

Name: SDMMC_NISTR (EMMC)
Offset: 0x30
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
	ERRINT	BOOTAR						
Access	R	R/W						
Reset	0	0						

Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 15 – ERRINT Error Interrupt
If any of the bits in SDMMC_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

Value	Description
0	No error.
1	Error.

Bit 14 – BOOTAR Boot Acknowledge Received
This bit is set to '1' when the SDMMC received a Boot Acknowledge pattern from the e.MMC. This bit can only be set to '1' if SDMMC_NISTER.BOOTAR is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BOOTAR is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Boot Acknowledge pattern not received.
1	Boot Acknowledge pattern received.

Bit 5 – BRDRDY Buffer Read Ready
This status is set to '1' if Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See Buffer Read Enable (BUFRDEN) in SDMMC_PSR.
This bit can only be set to '1' if SDMMC_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BRDRDY is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to read buffer.
1	Ready to read buffer.

Bit 4 – BWRRDY Buffer Write Ready
This status is set to 1 if Buffer Write Enable (BUFWREN) changes from '0' to '1'. See Buffer Write Enable (BUFWREN) in SDMMC_PSR.
This bit can only be set to '1' if SDMMC_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BWRRDY is set to '1'.
Writing this bit to '1' clears the bit.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Not ready to write buffer.
1	Ready to write buffer.

Bit 3 – DMAINT DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC_BSR.
In case of ADMA, by setting “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after the Transfer Complete (TRFC).
This bit can only be set to '1' if SDMMC_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC_NISIER.DMAINT is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No DMA interrupt.
1	DMA interrupt.

Bit 2 – BLKGE Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR is set to '1', this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to '1', this bit is not set to '1'.
In the case of a Read transaction:
This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.
In the case of a Write transaction:
This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
This bit can only be set to '1' if SDMMC_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BLKGE is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No block gap event.
1	Transaction stopped at block gap.

Bit 1 – TRFC Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.
In the case of a Read Transaction:
This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data was read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR (after valid data was read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
In the case of a Write Transaction:
This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
In the case of command with Busy:

© 2026 Microchip Technology Inc. and its subsidiaries

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.
This bit can only be set to '1' if SDMMC_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC_NISIER.TRFC is set to '1'.
Writing this bit to '1' clears the bit.
The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

TRFC	DATTEO	Status Meaning
0	0	Interrupted by another factor
0	1	Timeout occurred during transfer
1	Don't Care	Command execution complete

Value	Description
0	Command execution is not complete.
1	Command execution is complete.

Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See CMRINHC in SDMMC_PSR for details on how to control this bit.
This bit can only be set to '1' if SDMMC_NISTER.CMDC is set to '1'. An interrupt can only be generated if SDMMC_NISIER.CMDC is set to '1'.
Writing this bit to '1' clears the bit.
The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to '1', it can be considered that the response was not received correctly.

CMDC	CMDTEO	Status Meaning
0	0	Interrupted by another factor
Don't care	1	Response not received within 64 SDCLK cycles
1	0	Response received

Value	Description
0	No command complete.
1	Command complete.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.22.SDMMC Error Interrupt Status Register (SD_SDIO)

Name: SDMMC_EISTR (SD_SDIO)
Offset: 0x32
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
							ADMA	ACMD
Access							R/W	R/W
Reset							0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 9 – ADMA ADMA Error
This bit is set to '1' when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC_AESR.
In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC_AESR indicates that an error occurred in ST_FDS state. The user may find that the Valid bit is not set at the error descriptor.
This bit can only be set to '1' if SDMMC_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ADMA is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 8 – ACMD Auto CMD Error
Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC_ACESR[4:0] has changed from '0' to '1'. In the case of Auto CMD12, this bit is set to '1', not only when errors occur in Auto CMD12 but also when auto CMD12 is not executed due to the previous command error.
This bit can only be set to '1' if SDMMC_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ACMD is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 7 – CURLIM Current Limit Error
By setting SD Bus Power (SDBPWR) in SDMMC_PCR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.
This bit can only be set to '1' if SDMMC_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CURLIM is set to '1'.

© 2026 Microchip Technology Inc. and its subsidiaries

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.
This bit can only be set to '1' if SDMMC_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATEND is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 5 – DATCRC Data CRC error

This bit is set to '1' when detecting a CRC error when transferring read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.
This bit can only be set to '1' if SDMMC_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATCRC is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 4 – DATTEO Data Timeout Error

This bit is set to '1' when detecting one of following timeout conditions.
– Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SD Host Controller Simplified Specification V3.00”).
– Busy timeout after Write CRC status.
– Write CRC Status timeout.
– Read data timeout
This bit can only be set to '1' if SDMMC_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATTEO is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 3 – CMDIDX Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.
This bit can only be set to '1' if SDMMC_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDIDX is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 2 – CMDEND Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.
This bit can only be set to '1' if SDMMC_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDEND is set to '1'.

© 2026 Microchip Technology Inc. and its subsidiaries

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 1 – CMDCRC Command CRC Error

The Command CRC Error is generated in two cases.
If a response is returned and the Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.
The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table above).
This bit can only be set to '1' if SDMMC_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDCRC is set to '1'.
Writing this bit to '1' clears the bit.

Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table below, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.
This bit can only be set to '1' if SDMMC_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDTEO is set to '1'.
Writing this bit to '1' clears the bit.

CMDCRC	CMDTEO	Error Types
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.23.SDMMC Error Interrupt Status Register (e.MMC)

Name: SDMMC_EISTR (EMMC)
Offset: 0x32
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
				BOOTAE			ADMA	ACMD
Access				R/W			R/W	R/W
Reset				0			0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 12 – BOOTAE Boot Acknowledge Error
This bit is set to '1' when detecting that the e.MMC Boot Acknowledge Status has a value other than '010'.
This bit can only be set to '1' if SDMMC_EISTER.BOOTAE is set to '1'. An interrupt can only be generated if SDMMC_EISIER.BOOTAE is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 9 – ADMA ADMA Error
This bit is set to 1 when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC_AESR.
In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC_AESR indicates that an error occurred in ST_FDS state. The user may find that the Valid bit is not set at the error descriptor.
This bit can only be set to '1' if SDMMC_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ADMA is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 8 – ACMD Auto CMD Error
Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC_ACESR[4:0] has changed from 0 to 1. In the case of Auto CMD12, this bit is set to '1', not only when errors occur in Auto CMD12, but also when Auto CMD12 is not executed due to the previous command error.
This bit can only be set to '1' if SDMMC_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ACMD is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Error.

Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC_PSR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.
This bit can only be set to '1' if SDMMC_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CURLIM is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.
This bit can only be set to '1' if SDMMC_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATEND is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 5 – DATCRC Data CRC Error

This bit is set to '1' when detecting a CRC error during a transfer of read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.
This bit can only be set to '1' if SDMMC_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER. DATCRC is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 4 – DATTEO Data Timeout error

This bit is set to '1' when detecting one of following timeout conditions.
– Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00”).
– Busy timeout after Write CRC Status.
– Write CRC Status timeout.
– Read data timeout
This bit can only be set to '1' if SDMMC_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATTEO is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 3 – CMDIDX Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.

© 2026 Microchip Technology Inc. and its subsidiaries

This bit can only be set to '1' if SDMMC_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDIDX is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 2 – CMDEND Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.
This bit can only be set to '1' if SDMMC_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDEND is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 1 – CMDCRC Command CRC Error

The Command CRC Error is generated in two cases.
If a response is returned and Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.
The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see he table “Relations between CMDCRC and CMDTEO”).
This bit can only be set to '1' if SDMMC_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDCRC is set to '1'.
Writing this bit to 1 clears the bit.

Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table “Relations between CMDCRC and CMDTEO”, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.
This bit can only be set to '1' if SDMMC_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDTEO is set to '1'.
Writing this bit to '1' clears the bit.

CMDCRC	CMDTEO	Error Types
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

67.10.24.SDMMC Normal Interrupt Status Enable Register (SD_SDIO)

Name: SDMMC_NISTER (SD_SDIO)
Offset: 0x34
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
								CINT
Access								R/W
Reset								0

Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 8 – CINT Card Interrupt Status Enable
If this bit is set to 0, the SDMMC clears interrupt requests to the system. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1. The user may clear this bit before servicing the Card Interrupt and may set this bit again after all interrupt requests from the card are cleared to prevent inadvertent interrupts.
0 (MASKED): The CINT status flag in SDMMC_NISTR is masked.
1 (ENABLED): The CINT status flag in SDMMC_NISTR is enabled.

Bit 5 – BRDRDY Buffer Read Ready Status Enable
0 (MASKED): The BRDRDY status flag in SDMMC_NISTR is masked.
1 (ENABLED): The BRDRDY status flag in SDMMC_NISTR is enabled.

67.10.32.SDMMC Auto CMD Error Status Register

Name: SDMMC_ACESR
Offset: 0x3C
Reset: 0x0000
Property: Read-only

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	CMDNI			ACMDIDX	ACMDEND	ACMDCRC	ACMDTEO	ACMD12NE
Access	R			R	R	R	R	R
Reset	0			0	0	0	0	0

Bit 7 – CMDNI Command Not Issued by Auto CMD12 Error
This bit is set to 1 when CMD_wo_DAT is not executed due to an Auto CMD12 error (SDMMC_ACESR[4:1]). This bit is set to 0 when Auto CMD Error is generated by Auto CMD23.

Value	Description
0	No error.
1	Error.

Bit 4 – ACMDIDX Auto CMD Index Error
This bit is set to 1 when the Command Index error occurs in response to a command.

Value	Description
0	No error.
1	Error.

Bit 3 – ACMDEND Auto CMD End Bit Error
This bit is set to 1 when detecting that the end bit of the command response is 0.

Value	Description
0	No error.
1	Error.

Bit 2 – ACMDCRC Auto CMD CRC Error
This bit is set to 1 when detecting a CRC error in the command response (see table Relation between ACMDCRC and ACMDTEO for more details).

Bit 1 – ACMDTEO Auto CMD Timeout Error
This bit is set to 1 if no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, the other error status bits (SDMMC_ACESR[4:2]) are meaningless.

Table 67.4. Relation between ACMDCRC and ACMDTEO

ACMDCRC	ACMDTEO	Error Types
0	0	No error
0	1	Response Timeout error
1	0	Response CRC error
1	1	CMD line conflict

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 0 – ACMD12NE Auto CMD12 Not Executed

If a memory multiple block data transfer is not started due to a command error, this bit is not set to 1 because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the SDMMC cannot issue Auto CMD12 to stop a memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits (SDMMC_ACESR[4:1]) are meaningless.
This bit is set to 0 when an Auto CMD error is generated by Auto CMD23.

Value	Description
0	No error.
1	Error.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.33.SDMMC Host Control 2 Register (SD_SDIO)

Name: SDMMC_HC2R (SD_SDIO)
Offset: 0x3E
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
	PVALEN	ASINTEN						
Access	R/W	R/W						
Reset	0	0						

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

Bit 15 – PVALEN Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When PVALEN is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC_PVR.
If this bit is set to 0, SDMMC_CCR.SDCLKFSEL and SDMMC_CCR.CLKGSEL are set by the user.
If this bit is set to 1, SDMMC_CCR.SDCLKFSEL and SDMMC_CCR.CLKGSEL are set by the SDMMC as specified in SDMMC_PVR.

Value	Description
0	SDCLK and Driver strength are controlled by the user.
1	Automatic selection by Preset Value is enabled.

Bit 14 – ASINTEN Asynchronous Interrupt Enable

This bit can be set to 1 if a card supports asynchronous interrupts and Asynchronous Interrupt Support (ASINTSUP) is set to 1 in SDMMC_CA0R. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode. If this bit is set to 1, the user can stop the SDCLK during the asynchronous interrupt period to save power. During this period, the SDMMC continues to deliver the Card Interrupt to the host when it is asserted by the card.

Value	Description
0	Disabled
1	Enabled

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.34.SDMMC Host Control 2 Register (e.MMC)

Name: SDMMC_HC2R (EMMC)
Offset: 0x3E
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
	PVALEN							
Access	R/W							
Reset	0							

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

Bit 15 – PVALEN Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When Preset Value Enable (PVALEN) is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC_PVR.
If this bit is set to 0, SDMMC_CCR.SDCLKFSEL and SDMMC_CCR.CLKGSEL are set by the user.
If this bit is set to 1, SDMMC_CCR.SDCLKFSEL and SDMMC_CCR.CLKGSEL are set by the SDMMC as specified in SDMMC_PVR.

Value	Description
0	SDCLK and Driver strength are controlled by the user.
1	Automatic selection by Preset Value is enabled.

67.10.35.SDMMC Capabilities 0 Register

Name: SDMMC_CA0R
Offset: 0x40
Reset: 0x27E832B2
Property: Read/Write

Note: The reset values match the capabilities of the MPU alone. The user should adjust the capability registers so that they also match the board design. Modify preset values only if the Capabilities Write Enable (CAPWREN) bit is set to 1 in SDMMC_CACR.

Bit	31	30	29	28	27	26	25	24
	SLTYPE[1:0]		ASINTSUP	SB64SUP		V18VSUP	V30VSUP	V33VSUP
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	1	0		1	1	1

Bit	23	22	21	20	19	18	17	16

	TEOCLKU		TEOCLKF[5:0]					
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	1		1	1	0	0	1	0

Bits 31:30 – SLTYPE[1:0] Slot Type
Indicates usage of a slot by a specific system. An SDMMC control register set is defined per slot. Embedded Slot for One Device means that only one nonremovable device is connected to a bus slot. The Standard Host Driver controls a removable card (SLTYPE = 0) or one embedded device (SLTYPE = 1) connected to an SD bus slot.

Value	Name	Description
0	REMOVABLECARD	Removable Card Slot
1	EMBEDDED	Embedded Slot for One Device
2	–	Reserved
3	–	Reserved

Bit 29 – ASINTSUP Asynchronous Interrupt Support
See section “Asynchronous Interrupt” in the “SDIO Simplified Specification V3.00” .

Value	Description
0	Asynchronous interrupt not supported
1	Asynchronous interrupt supported

Bit 28 – SB64SUP 64-Bit System Bus Support
Reading this bit to 1 means that the SDMMC supports the 64-bit Address Descriptor mode and is connected to the 64-bit address system bus.

Value	Description
0	64-bit address bus not supported

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	64-bit address bus supported

Bit 26 – V18VSUP Voltage Support 1.8V

Value	Description
0	1.8V voltage supply not supported
1	1.8V voltage supply supported

Bit 25 – V30VSUP Voltage Support 3.0V

Value	Description
0	3.0V voltage supply not supported
1	3.0V voltage supply supported

Bit 24 – V33VSUP Voltage Support 3.3V

Value	Description
0	3.3V voltage supply not supported
1	3.3V voltage supply supported

Bit 23 – SRSUP Suspend/Resume Support (read-only)

Indicates whether the SDMMC supports the Suspend/Resume functionality. If set to 0, the user does not issue either Suspend or Resume commands because the Suspend and Resume mechanism (see “Suspend and Resume Mechanism” in the “SD Host Controller Simplified Specification V3.00”) is not supported.

Value	Description
0	Suspend/Resume not supported
1	Suspend/Resume supported

Bit 22 – SDMASUP SDMA Support (read-only)

Indicates whether the SDMMC is capable of using SDMA to transfer data between system memory and the SDMMC directly.

Value	Description
0	SDMA not supported
1	SDMA supported

Bit 21 – HSSUP High Speed Support (read-only)

Indicates whether the SDMMC and the system support High Speed mode and they can supply SDCLK frequency from 25 MHz to 50 MHz.

Value	Description
0	High Speed not supported
1	High Speed supported

Bit 19 – ADMA2SUP ADMA2 Support (read-only)

Indicates whether the SDMMC is capable of using ADMA2.

Value	Description
0	ADMA2 not supported
1	ADMA2 supported

Bit 18 – ED8SUP 8-Bit Support for Embedded Device (read-only)

Indicates whether the SDMMC is capable of using the 8-bit bus width mode.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	8-bit bus width not supported
1	8-bit bus width supported

Bits 17:16 – MAXBLKL[1:0] Max Block Length (read-only)

Indicates the maximum block size that the user can read and write to the buffer in the SDMMC. Three sizes can be defined, as shown below. It is noted that the transfer block length is always 512 bytes for SD Memory Cards regardless of this field.

Value	Name	Description
0	512	512 bytes
1	1024	1024 bytes
2	2048	2048 bytes
3	NONE	Reserved

Bits 15:8 – BASECLKF[7:0] Base Clock Frequency

Indicates the frequency of the base clock (BASECLK). The user uses this value to calculate the clock divider value (see SDCLK Frequency Select (SDCLKFSEL) in SDMMC_CCR).
If this field is set to 0, the user must get the information via another method.

$f_{\mathrm{BASECLK}} = \mathrm{BASECLKF}_{\mathrm{MHz}}$

Bit 7 – TEOCLKU Timeout Clock Unit

Indicates the unit of the base clock frequency used to detect Data Timeout Error.

Value	Description
0	KHz
1	MHz

Bits 5:0 – TEOCLKF[5:0] Timeout Clock Frequency

Shows the timeout clock frequency (TEOCLK) used to detect Data Timeout Error.
If set to 0, the user must get the information via another method.
The Timeout Clock Unit (TEOCLKU) defines the unit of this field's value.
– TEOCLKU = 0: $f_{\mathrm{TEOCLK}} = \mathrm{TEOCLKF}_{\mathrm{KHz}}$
– TEOCLKU = 1: $f_{\mathrm{TEOCLK}} = \mathrm{TEOCLKF}_{\mathrm{MHz}}$

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.36.SDMMC Capabilities 1 Register

Name: SDMMC_CA1R
Offset: 0x44
Reset: 0x00010070
Property: Read/Write

Note: The reset values match the capabilities of the MPU alone. The user should adjust the capability registers so that they also match the board design. Modify preset values only if the Capabilities Write Enable (CAPWREN) bit is set to 1 in SDMMC_CACR.

Bit	31	30	29	28	27	26	25	24

Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	1	1		0	0	0

Bits 23:16 – CLKMULT[7:0] Clock Multiplier
This field indicates the multiplier factor between the Base Clock (BASECLK) used for the Divided Clock Mode and the Multiplied Clock (MULTCLK) used for the Programmable Clock mode (see SDMMC_CCR).
Reading this field to 0 means that the Programmable Clock mode is not supported.
$f_{\mathrm{MULTCLK}} = f_{\mathrm{BASECLK}} \times (\mathrm{CLKMULT} + 1)$

Bit 6 – DRVDSUP Driver Type D Support

Value	Description
0	Driver type D is not supported.
1	Driver type D is supported.

Bit 5 – DRVCSUP Driver Type C Support

Value	Description
0	Driver type C is not supported.
1	Driver type C is supported.

Bit 4 – DRVASUP Driver Type A Support

Value	Description
0	Driver type A is not supported.
1	Driver type A is supported.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 2 – DDR50SUP DDR50 Support

Value	Description
0	DDR50 mode is not supported.
1	DDR50 mode is supported.

Bit 1 – SDR104SUP SDR104 Support

Value	Description
0	SDR104 mode is not supported.
1	SDR104 mode is supported.

Bit 0 – SDR50SUP SDR50 Support

Value	Description
0	SDR50 mode is not supported.
1	SDR50 mode is supported.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.37.SDMMC Maximum Current Capabilities Register

Name: SDMMC_MCCAR
Offset: 0x48
Reset: 0x00000000
Property: Read/Write

Note: The user should adjust the Maximum Current Capabilities register so that it matches board design. The preset values can be modified only if the Capabilities Write Enable (CAPWREN) bit is set to 1 in SDMMC_CACR.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	MAXCUR30V[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MAXCUR33V[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:16 – MAXCUR18V[7:0] Maximum Current for 1.8V
This field indicates the maximum current capability for 1.8V voltage. This value is meaningful only if V18VSUP is set to 1 in SDMMC_CA0R. Reading MAXCUR18V at 0 means that the user must get information via another method.
$\mathrm{Imax}_{\mathrm{mA}} = 4 \times \mathrm{MAXCURR18}V$

Bits 15:8 – MAXCUR30V[7:0] Maximum Current for 3.0V
This field indicates the maximum current capability for 3.0V voltage. This value is meaningful only if V30VSUP is set to 1 in SDMMC_CA0R. Reading MAXCUR30V at 0 means that the user must get information via another method.
$\mathrm{Imax}_{\mathrm{mA}} = 4 \times \mathrm{MAXCURR30}V$

Bits 7:0 – MAXCUR33V[7:0] Maximum Current for 3.3V
This field indicates the maximum current capability for 3.3V voltage. This value is meaningful only if V33VSUP is set to 1 in SDMMC_CA0R. Reading MAXCUR33V at 0 means that the user must get information via another method.
$\mathrm{Imax}_{\mathrm{mA}} = 4 \times \mathrm{MAXCURR33}V$

67.10.38.SDMMC Force Event Register for Auto CMD Error Status

Name: SDMMC_FERACES
Offset: 0x50
Reset: –
Property: Write-only

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	CMDNI			ACMDIDX	ACMDEND	ACMDCRC	ACMDTEO	ACMD12NE
Access	W			W	W	W	W	W
Reset	–			–	–	–	–	–

Bit 7 – CMDNI Force Event for Command Not Issued by Auto CMD12 Error
For test purposes, the user can write this bit to 1 to raise the CMDNI status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 4 – ACMDIDX Force Event for Auto CMD Index Error
For test purposes, the user can write this bit to 1 to raise the ACMDIDX status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 3 – ACMDEND Force Event for Auto CMD End Bit Error
For test purposes, the user can write this bit to 1 to raise the ACMDEND status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 2 – ACMDCRC Force Event for Auto CMD CRC Error
For test purposes, the user can write this bit to 1 to raise the ACMDCRC status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 1 – ACMDTEO Force Event for Auto CMD Timeout Error
For test purposes, the user can write this bit to 1 to raise the ACMDTEO status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 0 – ACMD12NE Force Event for Auto CMD12 Not Executed
For test purposes, the user can write this bit to 1 to raise the ACMD12NE status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 12 – BOOTAE Force Event for Boot Acknowledge Error
For test purposes, the user can write this bit to 1 to raise the BOOTAE status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 9 – ADMA Force Event for ADMA Error
For test purposes, the user can write this bit to 1 to raise the ADMA status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 8 – ACMD Force Event for Auto CMD Error
For test purposes, the user can write this bit to 1 to raise the ACMD status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 7 – CURLIM Force Event for Current Limit Error
For test purposes, the user can write this bit to 1 to raise the CURLIM status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 6 – DATEND Force Event for Data End Bit Error
For test purposes, the user can write this bit to 1 to raise the DATEND status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 5 – DATCRC Force Event for Data CRC error
For test purposes, the user can write this bit to 1 to raise the DATCRC status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 4 – DATTEO Force Event for Data Timeout error
For test purposes, the user can write this bit to 1 to raise the DATTEO status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 3 – CMDIDX Force Event for Command Index Error
For test purposes, the user can write this bit to 1 to raise the CMDIDX status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 2 – CMDEND Force Event for Command End Bit Error
For test purposes, the user can write this bit to 1 to raise the CDMEND status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 1 – CMDCRC Force Event for Command CRC Error
For test purposes, the user can write this bit to 1 to raise the CMDCRC status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 0 – CMDTEO Force Event for Command Timeout Error
For test purposes, the user can write this bit to 1 to raise the CMDTEO status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

67.10.40.SDMMC ADMA Error Status Register

Name: SDMMC_AESR
Offset: 0x54
Reset: 0x00
Property: Read-only

Bit	7	6	5	4	3	2	1	0
						LMIS	ERRST[1:0]	
Access						R	R	R
Reset						0	0	0

Bit 2 – LMIS ADMA Length Mismatch Error
This error occurs in the following two cases:
– While Block Count Enable (BCEN) is being set, the total data length specified by the Descriptor table is different from that specified by the Block Count (BLKCNT) and Transfer Block Size (BLKSIZE).
– The total data length cannot be divided by the Transfer Block Size (BLKSIZE).

Value	Description
0	No error
1	Error

Bits 1:0 – ERRST[1:0] ADMA Error State
This field indicates the state of ADMA when an error has occurred during an ADMA data transfer. This field never reads 2 because ADMA never stops in this state.

Value	Name	Description
0	STOP	(Stop DMA) SDMMC_ASAR points to the descriptor following the error descriptor
1	FDS	(Fetch Descriptor) SDMMC_ASAR points to the error descriptor
2	–	(Not used)
3	TFR	(Transfer Data) SDMMC_ASAR points to the descriptor following the error descriptor

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.41.SDMMC ADMA System Address Register 0

Name: SDMMC_ASAR0
Offset: 0x58
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	ADMASA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ADMASA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ADMASA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ADMASA[31:0] ADMA System Address

This field holds the byte address of the executing command of the descriptor table. The 32-bit address descriptor uses SDMMC_ASAR. At the start of ADMA, the user must set the start address of the descriptor table. The ADMA increments this register address, which points to the next Descriptor line to be fetched.

When the ADMA Error (ADMA) status flag rises, this field holds a valid descriptor address depending on the ADMA Error State (ERRST). The user must program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. ADMA2 ignores the lower 2 bits of this register and assumes it to be 0.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.42.SDMMC Preset Value Register

Name: SDMMC_PVRx
Offset: 0x60 + x*0x02 [x=0..2]
Reset: 0x0000
Property: Read/Write

One of the Preset Value registers is effective based on the selected bus speed mode. The table below defines the conditions to select one of the SDMMC_PVRs.

Table 67.5. Preset Value Register Select Condition

Selected Bus Speed Mode	HSEN (SDMMC_HC1R)
Default Speed	0
High Speed	1

The table below shows the effective Preset Value Register according to the Selected Bus Speed mode.

Table 67.6. Preset Value Registers

SDMMC_PVRx	Selected Bus Speed Mode	Signal Voltage
SDMMC_PVR0	Initialization	3.3V
SDMMC_PVR1	Default Speed	3.3V
SDMMC_PVR2	High Speed	3.3V

When Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, SDCLK Frequency Select (SDLCKFSEL) and Clock Generator Select (CLKGSEL) in SDMMC_CCR are automatically set based on the Selected Bus Speed mode. This means that the user does not need to set these fields when preset is enabled. A Preset Value Register for Initialization (SDMMC_PVR0) is not selected by Bus Speed mode. Before starting the initialization sequence, the user needs to set a clock preset value to SDCLKFSEL in SDMMC_CCR.PVALEN can be set to 1 after the initialization is completed.

Bit	15	14	13	12	11	10	9	8
						CLKGSEL	SDCLKFSEL[9:8]	
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
	SDCLKFSEL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 10 – CLKGSEL Clock Generator Select
See CLKGSEL in SDMMC_CCR.

Bits 9:0 – SDCLKFSEL[9:0] SDCLK Frequency Select
See SDCLKFSEL in SDMMC_CCR.

67.10.46.SDMMC e.MMC Control 1 Register

Name: SDMMC_MC1R
Offset: 0x204
Reset: 0x00
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
			BOOTA	OPD	DDR		CMDTYP[1:0]	
Access			R/W	R/W	R/W		R/W	R/W
Reset			0	0	0		0	0

Bit 5 – BOOTA e.MMC Boot Acknowledge Enable

This bit must be set according to the value of BOOT_ACK in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51").
When this bit is set to 1, the SDMMC waits for boot acknowledge pattern from the e.MMC before receiving boot data.
If the boot acknowledge pattern is wrong, the BOOTAE status flag rises in SDMMC_EISTR if BOOTAE is set in SDMMC_EISTER. An interrupt is generated if BOOTAE is set in SDMMC_EISIER.
If the no boot acknowledge pattern is received, the DATTEO status flag rises in SDMMC_EISTR if DATTEO is set in SDMMC_EISTER. An interrupt is generated if DATTEO is set in SDMMC_EISIER.

Bit 4 – OPD e.MMC Open Drain Mode

This bit sets the command line in open drain.

Value	Description
0	The command line is in push-pull.
1	The command line is in open drain.

Bit 3 – DDR e.MMC HSDDR Mode

This bit selects the High Speed DDR mode.
The clock divider (DIV) in SDMMC_CCR must be set to a value different from 0 when DDR is 1.

Value	Description
0	High Speed DDR is not selected.
1	High Speed DDR is selected.

Bits 1:0 – CMDTYP[1:0] e.MMC Command Type

Value	Name	Description
0	NORMAL	The command is not an e.MMC specific command.
1	WAITIRQ	This bit must be set to 1 when the e.MMC is in Interrupt mode (CMD40). See "Interrupt Mode" in the "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51" .
2	STREAM	This bit must be set to 1 in the case of Stream Read(CMD11) or Stream Write (CMD20). Only effective for e.MMC up to revision 4.41.
3	BOOT	Starts a Boot Operation mode at the next write to SDMMC_CR. Boot data are read directly from e.MMC device.

© 2026 Microchip Technology Inc. and its subsidiaries

67.10.47.SDMMC e.MMC Control 2 Register

Name: SDMMC_MC2R
Offset: 0x205
Reset: –
Property: Write-only

Bit	7	6	5	4	3	2	1	0
							ABOOT	SRESP
Access							W	W
Reset							–	–

Bit 1 – ABOOT e.MMC Abort Boot

This bit is used to exit from Boot mode. Writing this bit to 1 exits the Boot Operation mode. Writing 0 is ignored.

Bit 0 – SRESP e.MMC Abort Wait IRQ

This bit is used to exit from the Interrupt mode. When this bit is written to 1, the SDMMC sends the CMD40 response automatically. This brings the e.MMC from Interrupt mode to the standard Data Transfer mode. Writing this bit to 0 is ignored.
This bit is only effective when CMD_TYP in SDMMC_MC1R is set to WAITIRQ.

67.10.49.SDMMC Clock Control 2 Register

Name: SDMMC_CC2R
Offset: 0x20C
Reset: 0x00000000
Property: Read/Write

Bit 0 – FSDCLKD Force SDCLK Disabled

The user can choose to maintain the SDCLK during 8 SDCLK cycles after the end bit of the last data block in case of a read transaction, or after the end bit of the CRC status in case of a write transaction.

Value	Description
0	The SDCLK is forced and it cannot be stopped immediately after the transaction.
1	The SDCLK is not forced and it can be stopped immediately after the transaction.

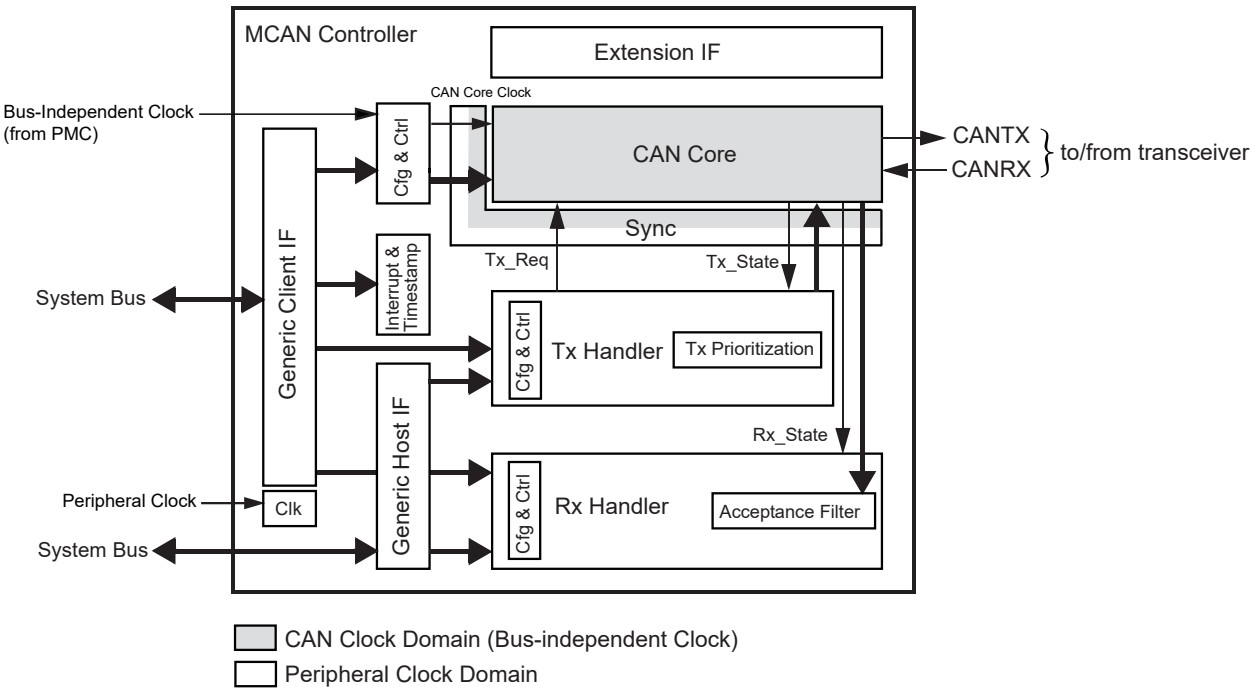
68. Controller Area Network (MCAN)

68.1. Description

The Controller Area Network (MCAN) performs communication according to ISO 11898-1:2015 and to Bosch CAN FD specification. Additional transceiver hardware is required for connection to the physical layer.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN core to the Message RAM, as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN core, as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 128 filter elements, where each element can be configured as a range, as a bit mask, or as a dedicated ID filter.



68.2. Embedded Characteristics

- Compliant with CAN Protocol Version 2.0 Part A, B and ISO 11898-1
- CAN FD with up to 64 Data Bytes Supported
- CAN Error Logging
- AUTOSAR Optimized
- SAE J1939 Optimized
- Improved Acceptance Filtering
- Two Configurable Receive FIFOs
- Separate Signalling on Reception of High Priority Messages
- Up to 64 Dedicated Receive Buffers
- Up to 32 Dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM Access for Processor
- Multiple MCANs May Share the Same Message RAM
- Programmable Loop-back Test Mode
- Maskable Module Interrupts
- Support for Asynchronous CAN and System Bus Clocks
- Power-down Support
- Debug on CAN Support

© 2026 Microchip Technology Inc. and its subsidiaries

68.3. Block Diagram

Figure 68.1. MCAN Block Diagram

Note: Refer to section "Power Management Controller (PMC)" for details about the bus-independent clock (GCLK).

68.4. Product Dependencies

68.4.1. I/O Lines

The pins used to interface to the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CAN pins to their peripheral functions.

68.4.2. Power Management

The MCAN can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the MCAN clock.

In order to achieve a stable function of the MCAN, the system bus clock must always be faster than or equal to the CAN clock.

It is recommended to use the CAN clock at frequencies of 20, 40 or 80 MHz. To achieve these frequencies, PMC GCLK must select the UPLLCK (480 MHz) as source clock and divide by 24,12, or 6. GCLK allows the system bus and processor clock to be modified without affecting the bit rate communication.

68.4.3. Interrupt Sources

The two MCAN interrupt lines (MCAN_INT0, MCAN_INT1) are connected on internal sources of the Interrupt Controller.

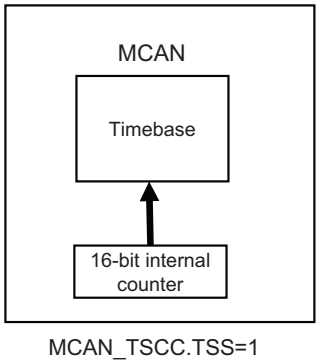
Using the MCAN interrupts requires the Interrupt Controller to be programmed first.

Interrupt sources can be routed either to MCAN_INT0 or to MCAN_INT1. By default, all interrupt sources are routed to interrupt line MCAN_INT0/1. By programming MCAN_ILE.EINT0 and MCAN_ILE.EINT1, the interrupt sources can be enabled or disabled separately.

© 2026 Microchip Technology Inc. and its subsidiaries

68.4.4. Address Configuration

The LSBs [bits 15:2] for each section of the CAN Message RAM are configured in the respective buffer configuration registers as detailed in Message RAM.



The MSBs [bits 31:16] of the CAN Message RAM for CAN0 and CAN1 are configured at 0x00300000.

68.4.5. Timestamping

68.4.5.1. Internal 16-bit Timestamp Generation

Set MCAN_TSCC.TSS to 1 to use an internal 16-bit timestamp. See the following figure.

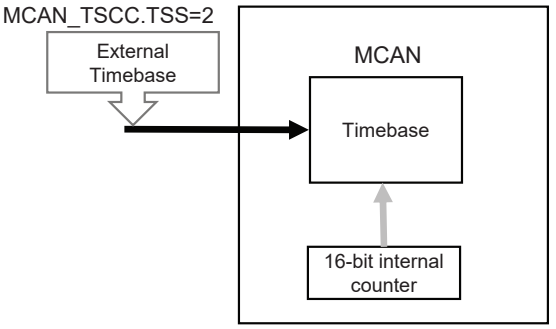


Figure 68.2. 16-Bit Timestamping with Internal Counter

68.4.5.2. External 16-bit Timestamp Generation

An external timebase is provided by TSU when MCAN_TSCC.TSS is set to 2. See the following figure.

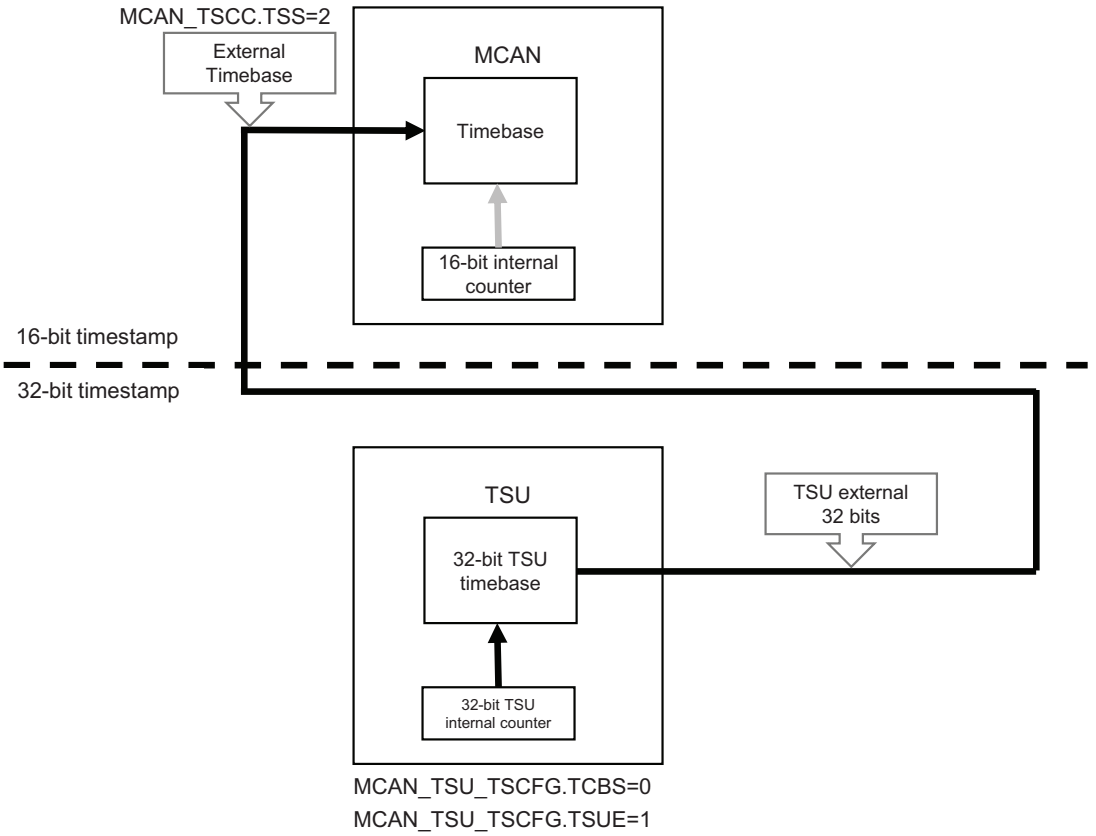

Figure 68.3. 16-Bit Timestamping with External Timebase

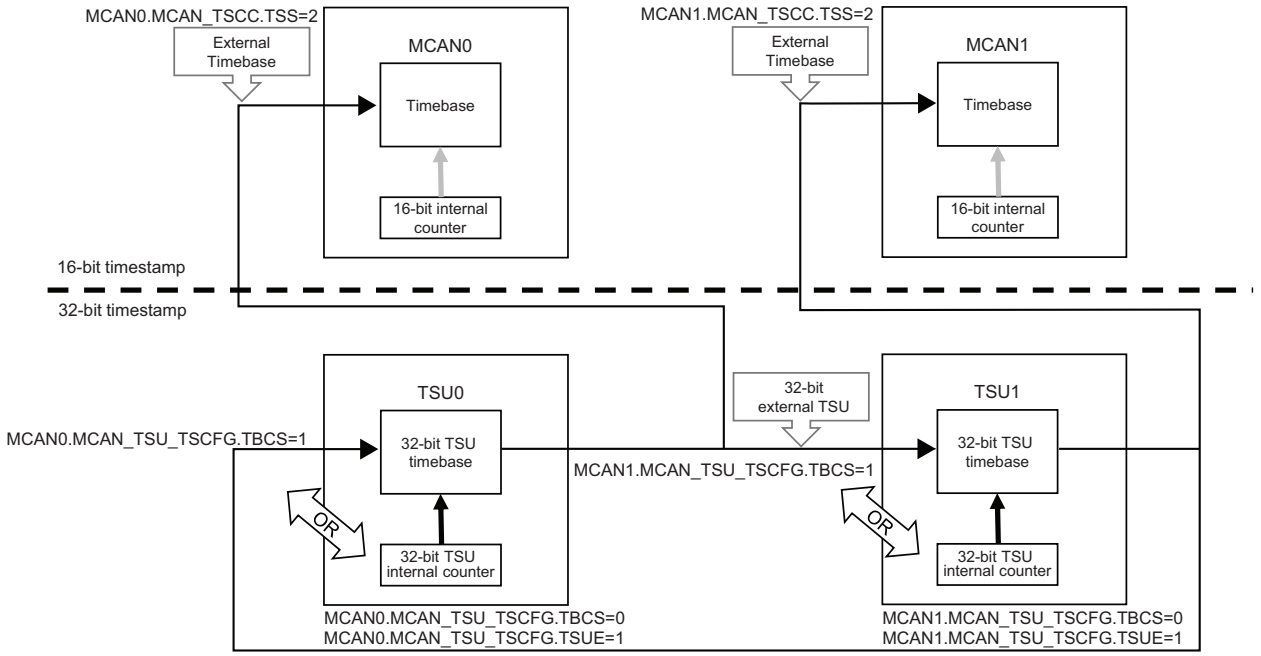
Timestamping uses the value of the TSU counter. In this case, both the register in MCAN (external timebase) and the register in TSU must be programmed to configure the counter. See the following figure.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 68.4. 16-Bit and 32-Bit Timestamping with External TSU



68.4.5.3. Either Internal or External 32-bit Timestamp Generation

Either the TSU internal timebase or the TSU external timebase can be selected for timestamping, by setting MCAN_TSU_TSCFG.TBCS to 0 or MCAN_TSU_TSCFG.TBCS to 1, respectively.

For each MCAN, MCAN_TSU_TSCFG.TSUE must be set to 1. See the following figure.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 68.5. 16-Bit and 32-Bit Timestamping with Chained External TSU

68.5. Functional Description

68.5.1. Operating Modes

68.5.1.1. Software Initialization

Software initialization is started by setting bit MCAN_CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off. While MCAN_CCCR.INIT is set, message transfer from and to the CAN bus is stopped and the status of the CAN bus output CANTX is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MCAN_CCCR.INIT does not change any configuration register. Resetting MCAN_CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (≡ Bus_Idle) before it can take part in bus activities and start the message transfer.

Access to the MCAN configuration registers is only enabled when both bits MCAN_CCCR.INIT and MCAN_CCCR.CCE are set (protected write).

MCAN_CCCR.CCE can only be configured when MCAN_CCCR.INIT = '1'. MCAN_CCCR.CCE is automatically cleared when MCAN_CCCR.INIT = '0'.

The following registers are cleared when MCAN_CCCR.CCE = '1':

- High Priority Message Status (MCAN_HPMS)
- Receive FIFO 0 Status (MCAN_RXF0S)
- Receive FIFO 1 Status (MCAN_RXF1S)
- Transmit FIFO/Queue Status (MCAN_TXFQS)
- Transmit Buffer Request Pending (MCAN_TXBRP)
- Transmit Buffer Transmission Occurred (MCAN_TXBTO)
- Transmit Buffer Cancellation Finished (MCAN_TXBCF)
- Transmit Event FIFO Status (MCAN_TXEFS)

© 2026 Microchip Technology Inc. and its subsidiaries

The Timeout Counter value MCAN_TOCV.TOC is loaded with the value configured by MCAN_TOCC.TOP when MCAN_CCCR.CCE = '1'.

In addition, the state machines of the Tx Handler and Rx Handler are held in idle state while MCAN_CCCR.CCE = '1'.

The following registers are only writeable while MCAN_CCCR.CCE = '0'

- Transmit Buffer Add Request (MCAN_TXBAR)
- Transmit Buffer Cancellation Request (MCAN_TXBCR)

MCAN_CCCR.TEST and MCAN_CCCR.MON can only be set when MCAN_CCCR.INIT = '1' and MCAN_CCCR.CCE = '1'. Both bits may be cleared at any time. MCAN_CCCR.DAR can only be configured when MCAN_CCCR.INIT = '1' and MCAN_CCCR.CCE = '1'.

68.5.1.2.Normal Operation

Once the MCAN is initialized and MCAN_CCCR.INIT is cleared, the MCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted, dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

68.5.1.3.CAN FD Operation

There are two variants in the CAN FD frame format, first the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the MCAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit MCAN_PSR.PXE. When Protocol Exception Handling is enabled (MCAN_CCCR.PXHD = 0), this causes the operation state to change from Receiver (MCAN_PSR.ACT = 2) to Integrating (MCAN_PSR.ACT = 00) at the next sample point. In case Protocol Exception Handling is disabled (MCAN_CCCR.PXHD = 1), the MCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming CCCR.FDOE. In case CCCR.FDOE = '1', transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With CCCR.FDOE = '0', received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. CCCR.FDOE and CCCR.BRSE can only be changed while CCCR.INIT and CCCR.CCE are both set.

With MCAN_CCCR.FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MCAN_CCCR.FDOE = 1 and MCAN_CCCR.BRSE = 0, only bit FDF of a Tx Buffer element is evaluated. With MCAN_CCCR.FDOE = 1 and MCAN_CCCR.BRSE = 1, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

© 2026 Microchip Technology Inc. and its subsidiaries

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system start-up all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.
- End-of-line programming in case not all nodes are CAN FD-capable. Non-CAN FD nodes are held in Silent mode until programming has completed. Then all nodes revert to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to the table below.

Table 68.1. Coding of DLC in CAN FD

DLC	9	10	11	12	13	14	15
Number of Data Bytes	12	16	20	24	32	48	64

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the Nominal Bit Timing and Prescaler register (MCAN_NBTP). In the following CAN FD data phase, the data phase CAN bit timing is used as defined by the Data Bit Timing and Prescaler register (MCAN_DBTP). The bit timing reverts back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN core clock frequency. Example: with a CAN clock frequency of 20 MHz and the shortest configurable bit time of 4 t_q, the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD and CAN FD with bit rate switching, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

68.5.1.4.Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin CANTX the protocol controller receives the transmitted data from its local CAN transceiver via pin CANRX. The received data is delayed by the transmitter delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transmitter delay, the delay compensation is introduced. Without delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the delay.

68.5.1.4.1.Description

The MCAN protocol unit has implemented a delay compensation mechanism to compensate the delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the new ISO11898-1. It is enabled by setting bit MCAN_DBTP.TDC.

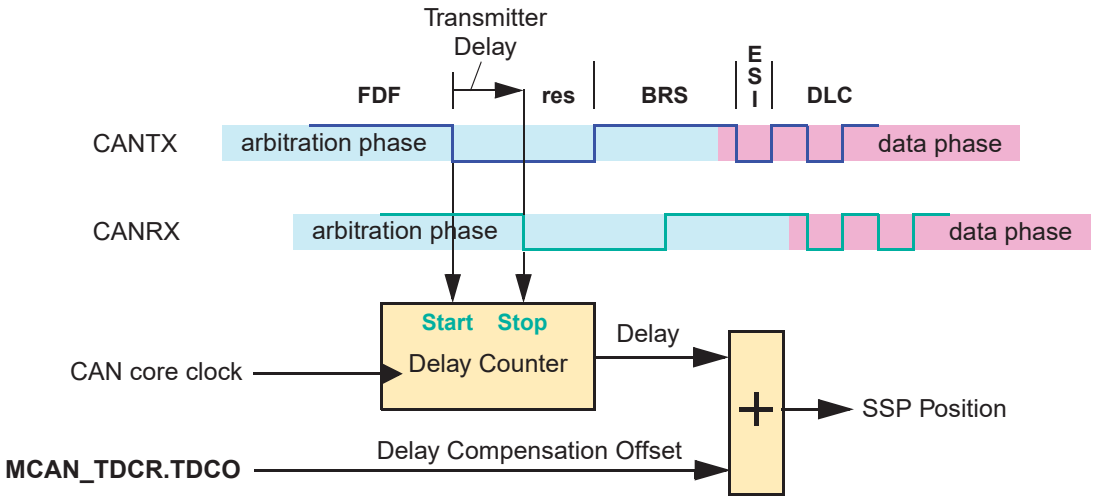
The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the MCAN's transmit output CANTX through the transceiver

© 2026 Microchip Technology Inc. and its subsidiaries

to the receive input CANRX plus the transmitter delay compensation offset as configured by MCAN_TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (for example, half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of CAN core clock periods.

MCAN_PSR.TDCV shows the actual transmitter delay compensation value. MCAN_PSR.TDCV is cleared when MCAN_CCCR.INIT is set and is updated at each transmission of an FD frame while MCAN_DBTP.TDC is set.

The following boundary conditions have to be considered for the delay compensation implemented in the MCAN:



- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN_TDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN_TDCR.TDCO has to be less or equal 127 CAN core clock periods. In case this sum exceeds 127 CAN core clock periods, the maximum value of 127 CAN core clock periods is used for delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs.

68.5.1.4.2.Transmitter Delay Measurement

If transmitter delay compensation is enabled by programming MCAN_DBTP.TDC = '1', the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input CANRX of the transmitter.

The resolution of this measurement is one mtq.

Figure 68.6. Transmitter Delay Measurement

To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a to early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MCAN_TDCR.TDCF.

This defines a minimum value for the SSP position. Dominant edges on CANRX, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCAN_TDCR.TDCF AND CANRX is low.

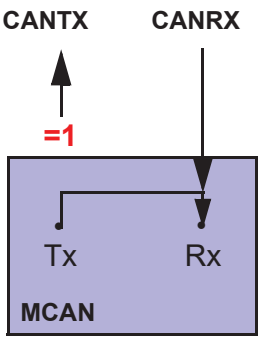
© 2026 Microchip Technology Inc. and its subsidiaries

68.5.1.5.Restricted Operation Mode

In Restricted Operation mode, the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. The processor can set the MCAN into Restricted Operation mode by setting bit MCAN_CCCR.ASM. The bit can only be set by the processor when both MCAN_CCCR.CCE and MCAN_CCCR.INIT are set to '1'. The bit can be reset by the processor at any time.

Restricted Operation mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation mode, the processor has to reset MCAN_CCCR.ASM.

The Restricted Operation mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation mode after it has received a valid frame.



Note: The Restricted Operation Mode must not be combined with the Loop Back mode (internal or external).

68.5.1.6.Bus Monitoring Mode

The MCAN is set in Bus Monitoring mode by setting MCAN_CCCR.MON. In Bus Monitoring mode (see ISO11898-1, 10.12 Bus monitoring), the MCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the MCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the MCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring mode, the Tx Buffer Request Pending register (MCAN_TXBRP) is held in reset state.

The Bus Monitoring mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. The figure below shows the connection of signals CANTX and CANRX to the MCAN in Bus Monitoring mode.

Figure 68.7. Pin Control in Bus Monitoring Mode

Bus Monitoring Mode

68.5.1.7.Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the MCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MCAN_CCCR.DAR.

© 2026 Microchip Technology Inc. and its subsidiaries

68.5.1.7.1.Frame Transmission in DAR Mode

In DAR mode, all transmissions are automatically cancelled after they start on the CAN bus. A Tx Buffer's Tx Request Pending bit TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:
  - Corresponding Tx Buffer Transmission Occurred bit MCAN_TXBTO.TOx set
  - Corresponding Tx Buffer Cancellation Finished bit MCAN_TXBCF.CFx not set
- Successful transmission in spite of cancellation:
  - Corresponding Tx Buffer Transmission Occurred bit MCAN_TXBTO.TOx set
  - Corresponding Tx Buffer Cancellation Finished bit MCAN_TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:
  - Corresponding Tx Buffer Transmission Occurred bit MCAN_TXBTO.TOx not set
  - Corresponding Tx Buffer Cancellation Finished bit MCAN_TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = "10" (transmission in spite of cancellation).

68.5.1.8.Power-down (Sleep Mode)

The MCAN can be set into Power-down mode via bit MCAN_CCCR.CSR.

When all pending transmission requests have completed, the MCAN waits until bus idle state is detected. Then the MCAN sets MCAN_CCCR.INIT to prevent any further CAN transfers. Now the MCAN acknowledges that it is ready for power down by setting to one the bit MCAN_CCCR.CSA. In this state, before the clocks are switched off, further register accesses can be made. A write access to MCAN_CCCR.INIT will have no effect. Now the bus clock (peripheral clock) and the CAN core clock may be switched off.

To leave Power-down mode, the application has to turn on the MCAN clocks before clearing CC Control Register flag MCAN_CCCR.CSR. The MCAN will acknowledge this by clearing MCAN_CCCR.CSA. The application can then restart CAN communication by clearing the bit CCCR.INIT.

68.5.1.9.Test Modes

To enable write access to the MCAN Test register (MCAN_TEST) (see Section 7.6), bit MCAN_CCCR.TEST must be set. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin CANTX by programming MCAN_TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the MCAN's bit timing and it can drive constant dominant or recessive values. The actual value at pin CANRX can be read from MCAN_TEST.RX. Both functions can be used to check the CAN bus' physical layer.

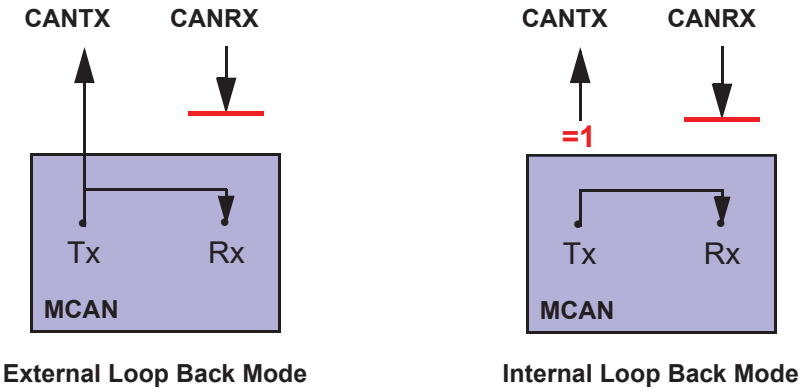
Due to the synchronization mechanism between CAN clock and system bus clock domain, there may be a delay of several system bus clock periods between writing to MCAN_TEST.TX until the new configuration is visible at output pin CANTX. This applies also when reading input pin CANRX via MCAN_TEST.RX.

Note: Test modes should be used for production tests or self-test only. The software control for pin CANTX interferes with all CAN protocol functions. It is not recommended to use test modes for application.

68.5.1.9.1.External Loop Back Mode

The MCAN can be set in External Loop Back mode by setting the bit MCAN_TEST.LBCK. In Loop Back mode, the MCAN treats its own transmitted messages as received messages and stores them (if they

© 2026 Microchip Technology Inc. and its subsidiaries



pass acceptance filtering) into an Rx Buffer or an Rx FIFO. The figure below shows the connection of signals CANTX and CANRX to the MCAN in External Loop Back mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the MCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back mode. In this mode, the MCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the CANRX input pin is disregarded by the MCAN. The transmitted messages can be monitored at the CANTX pin.

68.5.1.9.2.Internal Loop Back Mode

Internal Loop Back mode is entered by setting bits MCAN_TEST.LBCK and MCAN_CCCR.MON. This mode can be used for a “Hot Selftest”, meaning the MCAN can be tested without affecting a running CAN system connected to the pins CANTX and CANRX. In this mode, pin CANRX is disconnected from the MCAN, and pin CANTX is held recessive. The figure below shows the connection of CANTX and CANRX to the MCAN when Internal Loop Back mode is enabled.

Figure 68.8. Pin Control in Loop Back Modes

68.5.2. Timestamp Generation

- **Internal Timestamp Generation**

For internal timestamp generation, the MCAN supplies a 16-bit wrap-around counter. A prescaler (MCAN_TSCC.TCP) can be configured to clock the counter in multiples of CAN bit times (1...16). The counter is readable via MCAN_TSCV.TSC. A write access to the Timestamp Counter Value register (MCAN_TSCV) resets the counter to zero. When the timestamp counter wraps around, the interrupt flag MCAN_IR.TSW is set.

On start of frame (SOF) reception/transmission, the counter value is captured and stored in the timestamp section of an Rx Buffer/Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

MCAN_TSCC.TSS can be used to capture the external 16-bit timebase vector input of the MCAN as timestamp instead of the internal 16-bit counter.

- **Timestamp Generation Using an External TSU**

A timestamping unit (TSU) for generation of 32-bit timestamps according to CiA 603 is connected to the MCAN TSU interface. External timestamping is enabled when MCAN_CCCR.UTSU = 1.

To filter for Sync messages, a Standard or Extended Filter element must be configured with the Sync message ID and bit SSYNC resp. ESYNC set to 1.

At the end of frame (EOF) reception/transmission, the timestamp is captured by the TSU. The number of the TSU Timestamp register which holds the captured timestamp is sent to the MCAN by a timestamp pointer (TSP) and stored in the related Rx Buffer/Rx FIFO element (R1B.RXTSP[2:0]) resp. Tx Event FIFO element (E1B.TXTSP[2:0]).

© 2026 Microchip Technology Inc. and its subsidiaries

68.5.3. Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO, the MCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via the Timeout Counter Configuration register (MCAN_TOCC). The actual counter value can be read from MCAN_TOCV.TOC. The Timeout Counter can only be started while MCAN_CCCR.INIT = '0'. It is stopped when MCAN_CCCR.INIT = '1', for example, when the MCAN enters Bus_Off state.

The operating mode is selected by MCAN_TOCC.TOS. When operating in Continuous mode, the counter starts when MCAN_CCCR.INIT is reset. A write to MCAN_TOCV presets the counter to the value configured by MCAN_TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN_TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCAN_TOCV has no effect.

When the counter reaches zero, interrupt flag MCAN_IR.TOO is set. In Continuous mode, the counter is immediately restarted at MCAN_TOCC.TOP.

Note: The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the bit rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

68.5.4. Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

68.5.4.1. Acceptance Filtering

The MCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration (MCAN_GFC)
- Standard ID Filter Configuration (MCAN_SIDFC)
- Extended ID Filter Configuration (MCAN_XIDFC)
- Extended ID and Mask (MCAN_XIDAM)

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1

© 2026 Microchip Technology Inc. and its subsidiaries

- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag (MCAN_IR.HPM)
- Set High Priority Message interrupt flag (MCAN_IR.HPM) and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (for example, CRC error), this message is discarded with the following impact on the effected Rx Buffer or Rx FIFO:

- Rx Buffer
  New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type, see MCAN_PSR.LEC and MCAN_PSR.DLEC.
- Rx FIFO
  Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type, see MCAN_PSR.LEC and MCAN_PSR.DLEC. In case the matching Rx FIFO is operated in Overwrite mode, the boundary conditions described in Rx FIFO Overwrite Mode have to be considered.

Note: When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

68.5.4.1.1.Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

- EFT = “00”: The Message ID of received frames is ANDed with MCAN_XIDAM before the range filter is applied.
- EFT = “11”: MCAN_XIDAM is not used for range filtering.

68.5.4.1.2.Filter for Specific IDs

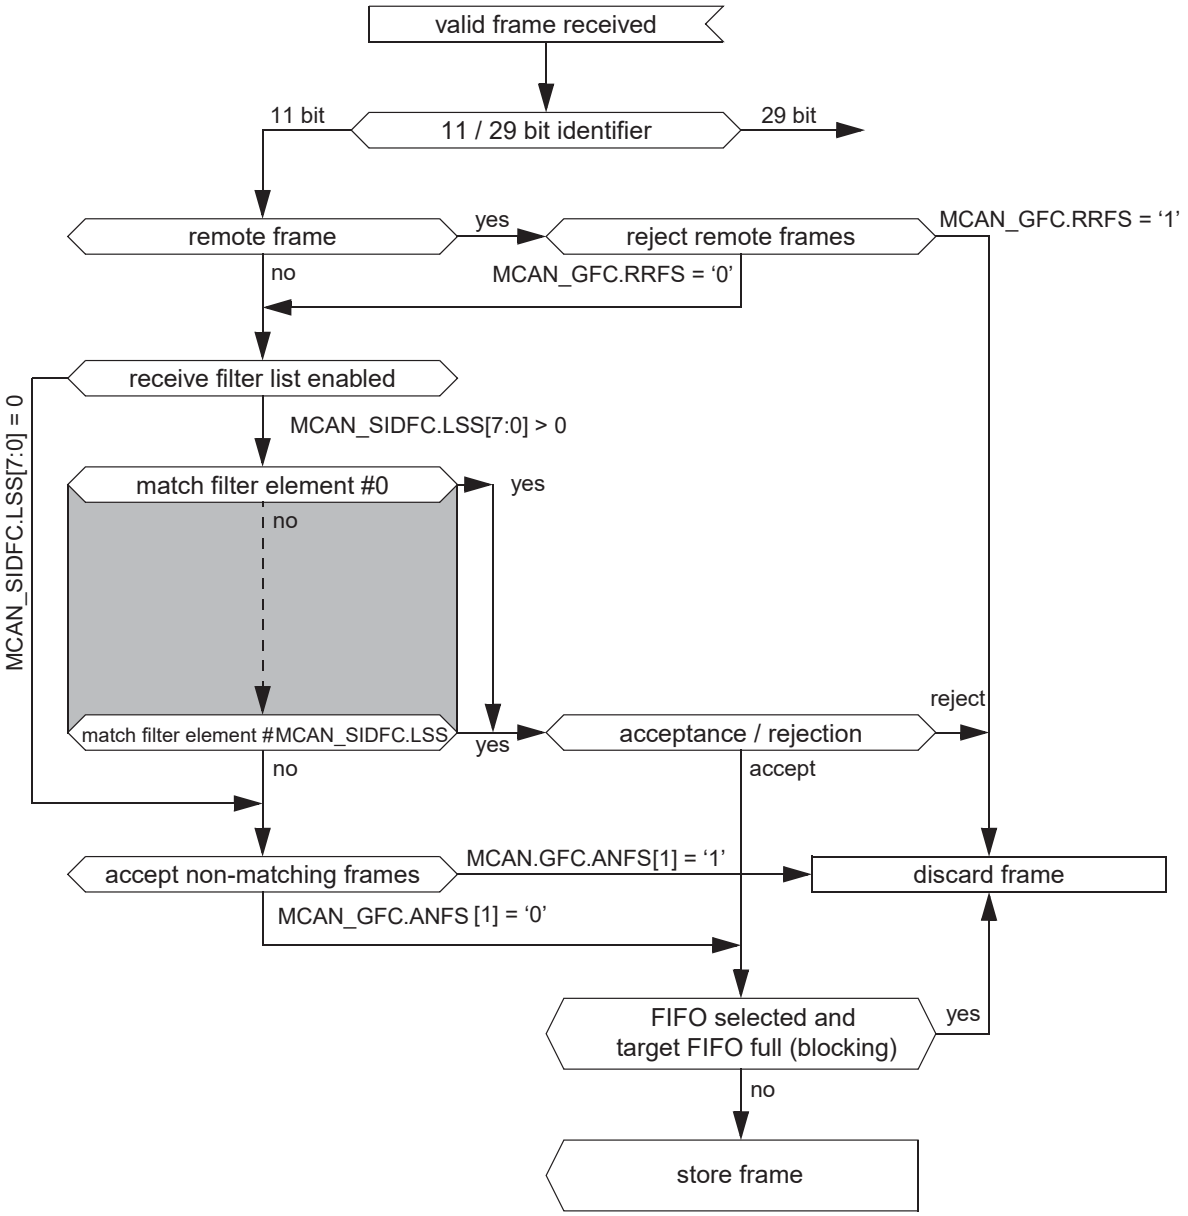
A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

68.5.4.1.3.Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, for example, the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.



68.5.4.1.4.Standard Message ID Filtering

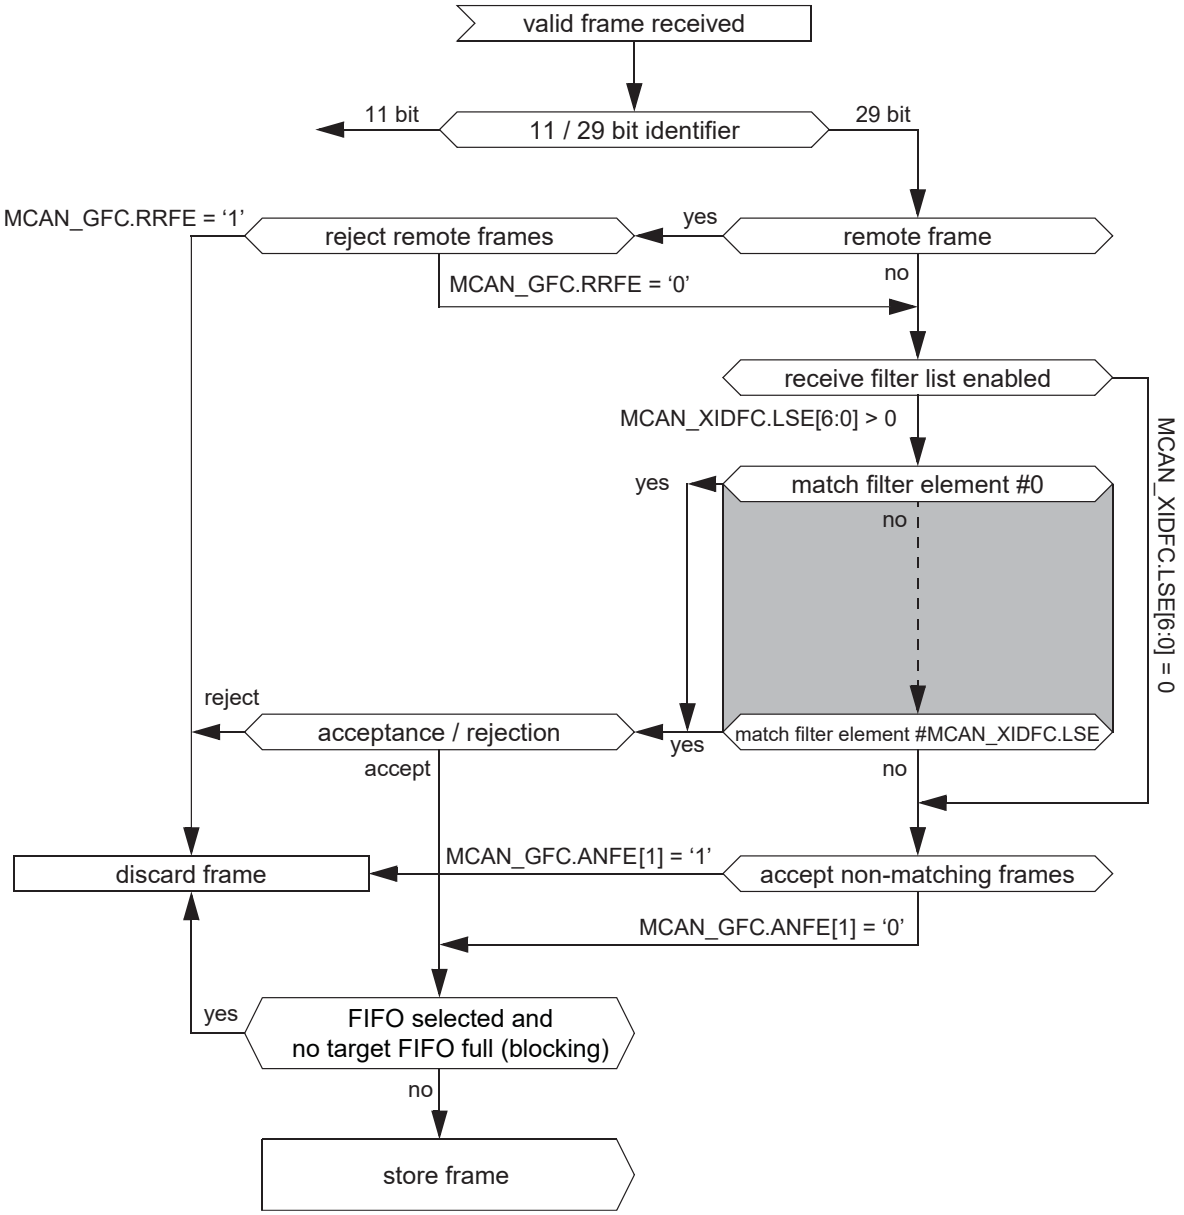
The figure below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in Standard Message ID Filter Element.

© 2026 Microchip Technology Inc. and its subsidiaries

Controlled by MCAN_GFC and MCAN_SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

Figure 68.9. Standard Message ID Filter Path

Extended Message ID Filtering



The figure below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in Extended Message ID Filter Element.

Controlled by MCAN_GFC and MCAN_XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

MCAN_XIDAM is ANDed with the received identifier before the filter list is executed.

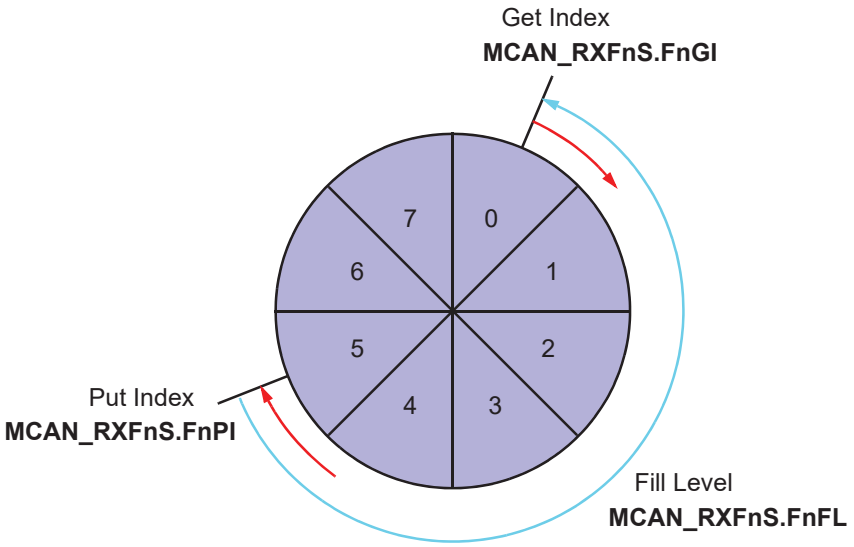
Figure 68.10. Extended Message ID Filter Path

68.5.4.2.Rx FIFOs



Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via the Rx FIFO 0 Configuration register (MCAN_RXF0C) and the Rx FIFO 1 Configuration register (MCAN_RXF1C).

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1, see Acceptance Filtering. The Rx FIFO element is described in Rx Buffer and FIFO Element.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by MCAN_RXFnC.FnWM, interrupt flag MCAN_IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index, an Rx FIFO Full condition is signalled by MCAN_RXFnS.FnF. In addition, the interrupt flag MCAN_IR.RFnF is set.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 68.11. Rx FIFO Status

When reading from an Rx FIFO, Rx FIFO Get Index MCAN_RXFnS.FnGI × FIFO Element Size has to be added to the corresponding Rx FIFO start address MCAN_RXFnC.FnSA.

Table 68.2. Rx Buffer / FIFO Element Size

MCAN_RXESC.RBDS[2:0] MCAN_RXESC.FnDS[2:0]	Data Field [bytes]	FIFO Element Size [RAM words]
0	8	4
1	12	5
2	16	6
3	20	7
4	24	8
5	32	10
6	48	14
7	64	18

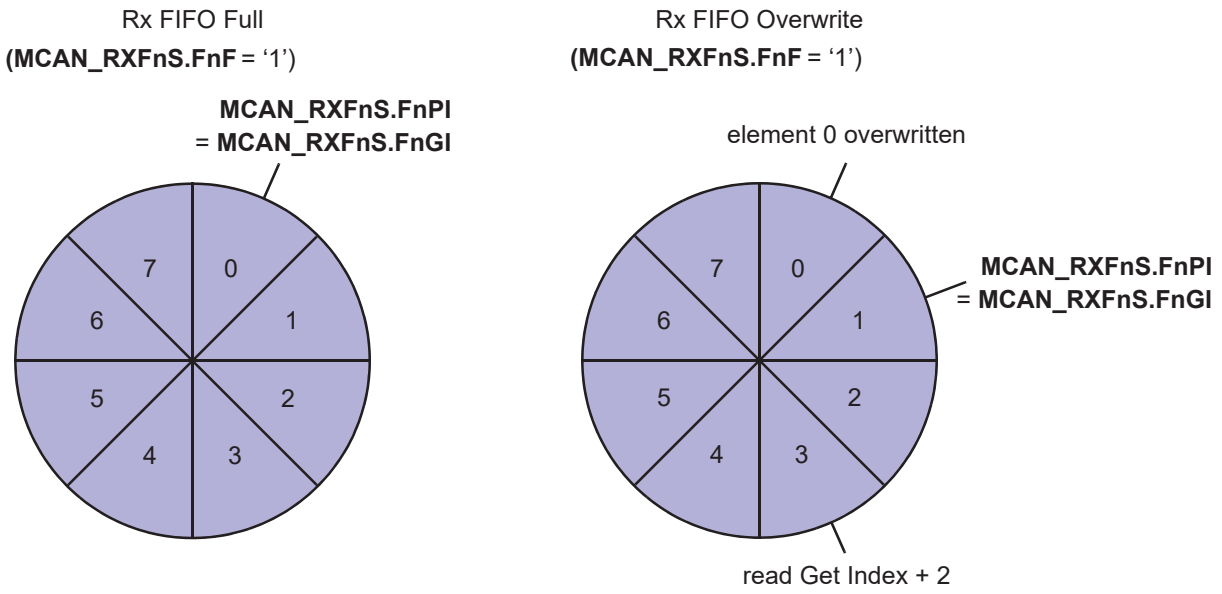
68.5.4.2.1.Rx FIFO Blocking Mode

The Rx FIFO Blocking mode is configured by MCAN_RXFnC.FnOM = '0'. This is the default operating mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (MCAN_RXFnS.FnPI = MCAN_RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by MCAN_RXFnS.FnF = '1'. In addition, the interrupt flag MCAN_IR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by MCAN_RXFnS.RFnL = '1'. In addition, the interrupt flag MCAN_IR.RFnL is set.

68.5.4.2.2.Rx FIFO Overwrite Mode



The Rx FIFO Overwrite mode is configured by MCAN_RXFnC.FnOM = '1'.

When an Rx FIFO full condition (MCAN_RXFnS.FnPI = MCAN_RXFnS.FnGI) is signalled by MCAN_RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

© 2026 Microchip Technology Inc. and its subsidiaries

When an Rx FIFO is operated in Overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the processor is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the processor accesses the Rx FIFO. The figure below shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

Figure 68.12. Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index MCAN_RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (MCAN_RXFnS.FnF = '0').

68.5.4.3.Dedicated Rx Buffers

The MCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MCAN_RXBC.RBSA.

For each Rx Buffer, a Standard or Extended Message ID Filter Element with SFEC / EFEC = 7 and SFID2 / EFID2[10:9] = 0 has to be configured.

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition, the flag MCAN_IR.DRX (Message stored in dedicated Rx Buffer) in MCAN_IR is set.

Table 68.3. Example Filter Configuration for Rx Buffers

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	0	0
1	ID message 2	0	1
2	ID message 3	0	2

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in the New Data 1 register (MCAN_NDAT1) and New Data 2 register

© 2026 Microchip Technology Inc. and its subsidiaries

(MCAN_NDAT2) is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the processor by writing a '1' to the respective bit position.

While an Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

68.5.4.3.1.Rx Buffer Handling

- Reset interrupt flag IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

68.5.4.4.Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (for example, #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see Rx Buffer and FIFO Element).

Advantage: Fixed start address for the DMA transfers (relative to MCAN_RXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = '111' have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m_can_dma_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the MCAN while m_can_dma_req is activated. The behavior is similar to that of an Rx Buffer with its New Data flag set.

After the DMA has completed, the MCAN is prepared to receive the next set of debug messages.

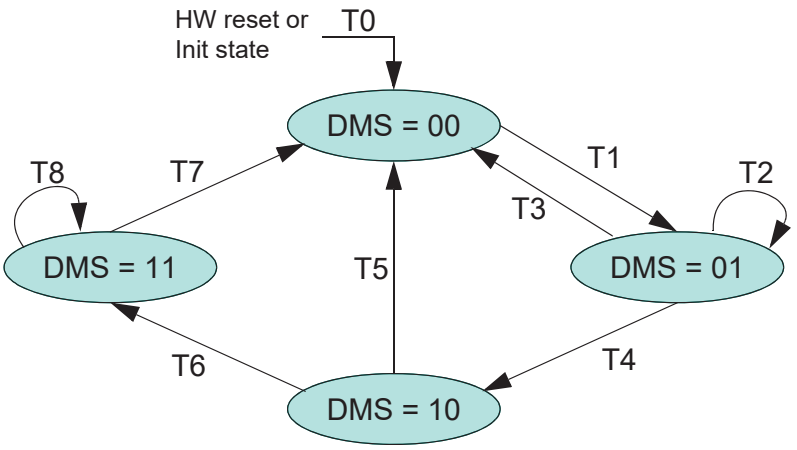
68.5.4.4.1.Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to "111". In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning. While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MCAN_IR.DRX are set. The reception of debug messages can be monitored via RXF1S.DMS.

Table 68.4. Example Filter Configuration for Debug Messages

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID debug message A	1	11 1101
1	ID debug message B	2	11 1110
2	ID debug message C	3	11 1111



68.5.4.4.2.Debug Message Handling

The debug message handling state machine ensures that debug messages are stored to three consecutive Rx Buffers in the correct order. If some messages are missing, the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in the correct order.

The status of the debug message handling state machine is signalled via MCAN_RXF1S.DMS.

T5: reception of debug messages A, B

T6: reception of debug message C

T7: DMA transfer completed

T8: reception of debug message A,B,C (message rejected)

68.5.5. Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx Buffer element is described in Tx Buffer Element. The following table describes the possible configurations for frame transmission.

Table 68.5. Possible Configurations for Frame Transmission

MCAN_CCCR		Tx Buffer Element		Frame Transmission
BRSE	FDOE	FDF	BRS	
ignored	0	ignored	ignored	Classic CAN
0	1	0	ignored	Classic CAN
0	1	1	ignored	FD without bit rate switching
1	1	0	ignored	Classic CAN
1	1	1	0	FD without bit rate switching
1	1	1	1	FD with bit rate switching

Note: AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation.

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when MCAN_TXBRP is updated, or when a transmission has been started.

© 2026 Microchip Technology Inc. and its subsidiaries

68.5.5.1. Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If, for example, CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCAN_CCCR.TXP. If the bit is set, the MCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCAN_CCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

68.5.5.2. Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the processor. Each dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first. These Tx Buffers shall be requested in ascending order, with the lowest buffer number first. Alternatively, all Tx Buffers configured with the same Message ID can be requested simultaneously by a single write access to TXBAR.

If the data section has been updated, a transmission is requested by an Add Request via MCAN_TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see the table below). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0...31) × Element Size to the Tx Buffer Start Address TXBC.TBSA.

Table 68.6. Tx Buffer/FIFO/Queue Element Size

TXESC.TBDS[2:0]	Data Field [bytes]	Element Size [RAM words]
0	8	4
1	12	5
2	16	6
3	20	7
4	24	8
5	32	10
6	48	14
7	64	18

© 2026 Microchip Technology Inc. and its subsidiaries

68.5.5.3.Tx FIFO

Tx FIFO operation is configured by programming MCAN_TXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCAN_TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The MCAN calculates the Tx FIFO Free Level MCAN_TXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN_TXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MCAN_TXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the TXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MCAN_TXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

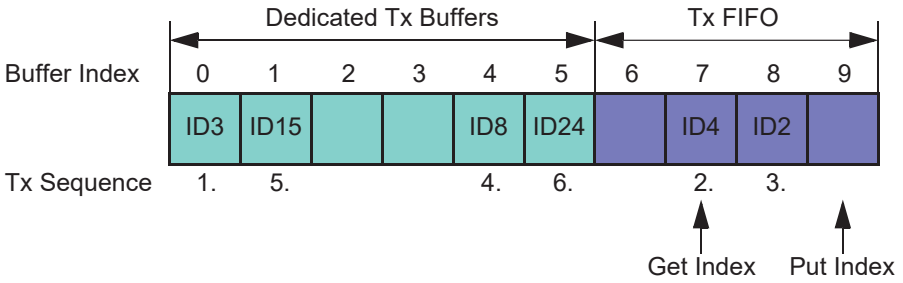
A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see the table Tx Buffer/FIFO/Queue Element Size). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN_TXBC.TBSA.

68.5.5.4.Tx Queue

Tx Queue operation is configured by programming MCAN_TXBC.TFQM to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Tx Queue buffers are configured with the same Message ID, the transmission order depends on numbers of buffers where messages were stored for transmission. As these buffer numbers depend on the then current states of the Put index, a prediction of the transmission order is not possible

New messages have to be written to the Tx Buffer referenced by the Put Index MCAN_TXFQS.TFQPI. The Put index always points to the free buffer of the Tx Queue with the lowest buffer number. In case that the Tx Queue is full (MCAN_TXFQS.TFQF = '1'), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MCAN_TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.



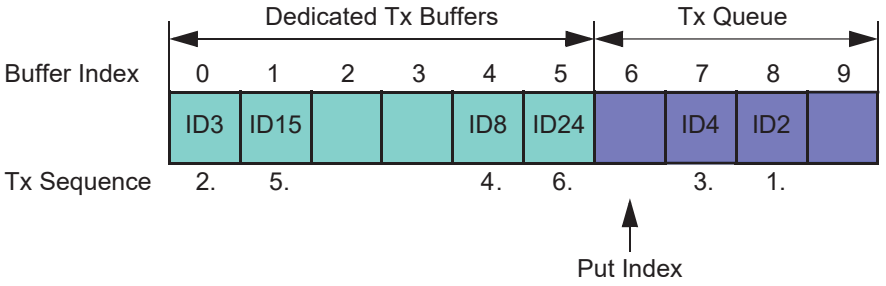
A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see the table Tx Buffer/FIFO/Queue Element Size). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN_TXBC.TBSA.

68.5.5.5.Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx FIFO. The number of dedicated Tx Buffers is configured by MCAN_TXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MCAN_TXBC.TFQS. In case MCAN_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 68.14. Example of Mixed Configuration Dedicated Tx Buffers / Tx FIFO



Tx prioritization:

- Scan dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by MCAN_TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

68.5.5.6. Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx Queue. The number of dedicated Tx Buffers is configured by MCAN_TXBC.NDTB. The number of Tx Queue Buffers is configured by MCAN_TXBC.TFQS. In case MCAN_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

Figure 68.15. Example of Mixed Configuration Dedicated Tx Buffers / Tx Queue

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

68.5.5.7. Transmit Cancellation

The MCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR-based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer, the processor has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MCAN_TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCAN_TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCAN_TXBTO and MCAN_TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCAN_TXBCF bit is set.

Note: In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

© 2026 Microchip Technology Inc. and its subsidiaries

68.5.5.8.Tx Event Handling

To support Tx event handling the MCAN has implemented a Tx Event FIFO. After the MCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in Debug on CAN Support.

When a Tx Event FIFO full condition is signalled by IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCAN_IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCAN_TXEFC.EFWM, interrupt flag MCAN_IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCAN_TXEFS.EFGI has to be added to the Tx Event FIFO start address MCAN_TXEFC.EFSA.

68.5.6. FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index in the registers MCAN_RXF0A, MCAN_RXF1A and MCAN_TXEFA. Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

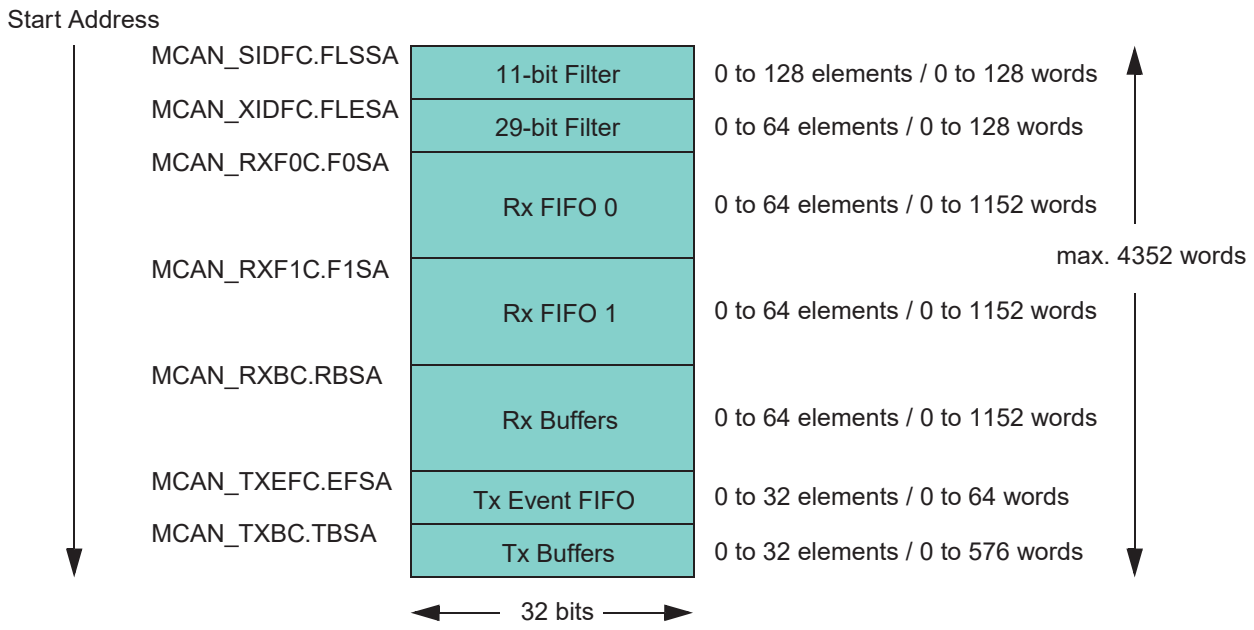
When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the processor has free access to the MCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

Note: The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The MCAN does not check for erroneous values.

68.5.7. Message RAM



68.5.7.1.Message RAM Configuration

The Message RAM has a width of 32 bits. The MCAN module can be configured to allocate up to 4352 words in the Message RAM. It is not necessary to configure each of the sections listed in the figure below, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode, the required Message RAM size depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MCAN_RXESC.F0DS, MCAN_RXESC.F1DS, MCAN_RXESC.RBDS, and MCAN_TXESC.TBDS.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 68.16. Message RAM Configuration

When the MCAN addresses the Message RAM, it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses; i.e., only bits 15 to 2 are evaluated, the two least significant bits are ignored.

Note: The MCAN does not check for erroneous configuration of the Message RAM. The configuration of the start addresses of the different sections and the number of elements of each section must be checked carefully to avoid falsification or loss of data.

68.5.7.2.Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in the table below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCAN_RXESC.

R1A: When no TSU is used (CCCR.UTSU = '0'), R1A.RXTS[15:0] holds the 16-bit timestamp generated by the MCAN internal timestamping logic.

R1B: When a TSU is used (CCCR.UTSU = '1') and when bit SSYNC/ESYNC of the matching filter element is set, R1B.TSC = '1' and R1B.RXTSP[3:0] holds the number of the TSU Timestamp register which holds the 32-bit timestamp captured by the TSU. Else R1B.TSC = '0' and R1B.RXTSP[3:0] is not valid.

Table 68.7. Rx Buffer and FIFO Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

- **R0 Bit 31 ESI:** Error State Indicator

0: Transmitting node is error active.

© 2026 Microchip Technology Inc. and its subsidiaries

1: Transmitting node is error passive.

• **R0 Bit 30 XTD:** Extended Identifier

Signals to the processor whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier.

1: 29-bit extended identifier.

• **R0 Bit 29 RTR:** Remote Transmission Request

Signals to the processor whether the received frame is a data frame or a remote frame.

0: Received frame is a data frame.

1: Received frame is a remote frame.

Note: There are no remote frames in CAN FD format. In case a CAN FD frame was received (FDF = 1), bit RTR reflects the state of the reserved bit r1.

• **R0 Bits 28:0 ID[28:0]:** Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

• **R1A/B Bit 31 ANMF:** Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MCAN_GFC.ANFS and MCAN_GFC.ANFE.

0: Received frame matching filter index FIDX.

1: Received frame did not match any Rx filter element.

• **R1A/B Bits 30:24 FIDX[6:0]:** Filter Index

0-127: Index of matching Rx acceptance filter element (invalid if ANMF = '1').
Range is 0 to MCAN_SIDFC.LSS - 1 resp. MCAN_XIDFC.LSE - 1.

• **R1A/B Bit 21 FDF:** FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

• **R1A/B Bit 20 BRS:** Bit Rate Switch

0: Frame received without bit rate switching.

1: Frame received with bit rate switching.

Note:
Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN_CCCR.BRSE = 1.

• **R1A/B Bits 19:16 DLC[3:0]:** Data Length Code

0-8: CAN + CAN FD: received frame has 0-8 data bytes.

9-15: CAN: received frame has 8 data bytes.

9-15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes.

• **R1A/B Bits 15:0 RXTS[15:0]:** Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC.TCP.

• **R1B Bits 3:0 RXTSP[3:0]: Rx Timestamp Pointer**

Number of the TSU Timestamp register (TS0..15) where the related timestamp is stored.

© 2026 Microchip Technology Inc. and its subsidiaries

- **R1B Bit 4 TSC: Timestamp Captured**

0: No timestamp captured.

1: Timestamp captured and stored in TSU Timestamp register referenced by R1B.RXTSP.

- **R2 Bits 31:24 DB3[7:0]:** Data Byte 3
- **R2 Bits 23:16 DB2[7:0]:** Data Byte 2
- **R2 Bits 15:8 DB1[7:0]:** Data Byte 1
- **R2 Bits 7:0 DB0[7:0]:** Data Byte 0
- **R3 Bits 31:24 DB7[7:0]:** Data Byte 7
- **R3 Bits 23:16 DB6[7:0]:** Data Byte 6
- **R3 Bits 15:8 DB5[7:0]:** Data Byte 5
- **R3 Bits 7:0 DB4[7:0]:** Data Byte 4

... ...

- **Rn Bits 31:24 DBm[7:0]:** Data Byte m
- **Rn Bits 23:16 DBm-1[7:0]:** Data Byte m-1
- **Rn Bits 15:8 DBm-2[7:0]:** Data Byte m-2
- **Rn Bits 7:0 DBm-3[7:0]:** Data Byte m-3

Note: Depending on the configuration of the element size (MCAN_RXESC), between two and sixteen 32-bit words (Rn = 3 ..17) are used for storage of a CAN message's data field.

68.5.7.3.Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration TXBC.TFQS and TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register TXESC.

Table 68.8. Tx Buffer Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T0	ESI	XTD	RTR	ID[28:0]																												
T1	MM[7:0]								EFC	TFCE	FDF	BRS	DLC[3:0]				MM[15:8]								reserved							
T2	DB3[7:0]								DB2[7:0]								DB1[7:0]								DB0[7:0]							
T3	DB7[7:0]								DB6[7:0]								DB5[7:0]								DB4[7:0]							
...	..								...								...								...							
Tn	DBm[7:0]								DBm-1[7:0]DBM[7:0]								DBm-2[7:0]DBM[7:0]								DBm-3[7:0]DBM[7:0]							

- **T0 Bit 30 ESI:** Error State Indicator

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

Note: The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive. This feature can be used in gateway applications when a message from an error passive node is routed to another CAN network.

© 2026 Microchip Technology Inc. and its subsidiaries

• **T0 Bit 30 XTD:** Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

• **T0 Bit 29 RTR:** Remote Transmission Request

0: Transmit data frame.

1: Transmit remote frame.

Note: When RTR = 1, the MCAN transmits a remote frame according to ISO11898-1, even if MCAN_CCCR.FDOE enables the transmission in CAN FD format.

• **T0 Bits 28:0 ID[28:0]:** Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

• **T1 Bits 31:24 MM[7:0]:** Message Marker

Written by processor during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

• **T1 Bit 23 EFC:** Event FIFO Control

0: Do not store Tx events.

1: Store Tx events.

• **T1 Bit 22 TSCE:** Timestamp Capture Enable for TSU

Only available when CCCR.UTSU = '1'. When this bit is set and the message is transmitted, a pulse is generated to signal the transmission of a Sync message to the Timestamping Unit (TSU) connected to the MCAN.

0: Timestamp Capture disabled

1: Timestamp Capture enabled

• **T1 Bit 21 FDF:** FD Format

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

• **T1 Bit 20 BRS:** Bit Rate Switching

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

Note:
Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN_CCCR.BRSE = 1.

• **T1 Bits 19:16 DLC[3:0]:** Data Length Code

0-8: CAN + CAN FD: transmit frame has 0-8 data bytes.

9-15: CAN: transmit frame has 8 data bytes.

9-15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes.

• **T1 Bits 15:8 MM[15:8]:** Message Marker

High byte of Wide Message Marker, written by CPU during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status. Available only when CCCR.WMM = '1' or when CCCR.UTSU = '1'.

© 2026 Microchip Technology Inc. and its subsidiaries

- **T2 Bits 31:24 DB3[7:0]:** Data Byte 3
- **T2 Bits 23:16 DB2[7:0]:** Data Byte 2
- **T2 Bits 15:8 DB1[7:0]:** Data Byte 1
- **T2 Bits 7:0 DB0[7:0]:** Data Byte 0
- **T3 Bits 31:24 DB7[7:0]:** Data Byte 7
- **T3 Bits 23:16 DB6[7:0]:** Data Byte 6
- **T3 Bits 15:8 DB5[7:0]:** Data Byte 5
- **T3 Bits 7:0 DB4[7:0]:** Data Byte 4

... ...

- **Tn Bits 31:24 DBm[7:0]:** Data Byte m
- **Tn Bits 23:16 DBm-1[7:0]:** Data Byte m-1
- **Tn Bits 15:8 DBm-2[7:0]:** Data Byte m-2
- **Tn Bits 7:0 DBm-3[7:0]:** Data Byte m-3

Note: Depending on the configuration of the element size (MCAN_TXESC), between two and sixteen 32-bit words (Tn = 3 ..17) are used for storage of a CAN message's data field.

68.5.7.4.Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the processor gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register TXEFS.

E1A: When CCCR.WMM = '0' and no TSU is used (CCCR.UTSU = '0'), E1A.TXTS[15:0] holds the 16-bit timestamp generated by the MCAN internal timestamping logic.

E1B: When 16-bit Message Markers are enabled (CCCR.WMM ='1') or when CCCR.UTSU = '1', E1B.MM[15:8] holds the upper 8 bit of the Wide Message Marker. When a TSU is used (CCCR.UTSU = '1') and when bit TSCE of the related Tx Buffer element is set, E1B.TSC = '1' and E1B.TXTSP[3:0] holds the number of the TSU Timestamp register which holds the 32-bit timestamp captured by the TSU. Else E1B.TSC = '0' and E1B.TXTSP[3:0] is not valid.

Table 68.9. Tx Event FIFO Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
E0	ESI	XTD	RTR	ID[28:0]																												
E1A	MM[7:0]								ET[1:0]		FDF	BRS	DLC[3:0]			TXTS[15:0]																
E1B	MM[7:0]								ET[1:0]		FDF	BRS	DLC[3:0]			MM[15:8]							–				TSC	TXTSP[3:0]			

- **E0 Bit 31 ESI:** Error State Indicator

0: Transmitting node is error active.

1: Transmitting node is error passive.

- **E0 Bit 30 XTD:** Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

- **E0 Bit 29 RTR:** Remote Transmission Request

0: Data frame transmitted.

1: Remote frame transmitted.

© 2026 Microchip Technology Inc. and its subsidiaries

• **E0 Bits 28:0 ID[28:0]:** Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

• **E1A/B Bits 31:24 MM[7:0]:** Message Marker

Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.

• **E1A/B Bit 23:22 ET[1:0]:** Event Type

0: Reserved

1: Tx event

2: Transmission in spite of cancellation (always set for transmissions in DAR mode)

3: Reserved

• **E1A/B Bit 21 FDF:** FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

• **E1A/B Bit 20 BRS:** Bit Rate Switch

0: Frame transmitted without bit rate switching.

1: Frame transmitted with bit rate switching.

• **E1A/B Bits 19:16 DLC[3:0]:** Data Length Code

0-8: CAN + CAN FD: frame with 0-8 data bytes transmitted.

9-15: CAN: frame with 8 data bytes transmitted.

9-15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted

• **E1A/B Bits 15:0 TXTS[15:0]:** Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC.TCP.

• **E1B Bit 4 TSC: Timestamp Captured**

0: No timestamp captured

1: Timestamp captured and stored in TSU Timestamp register referenced by E1B.TXTSP

• **E1B Bits 3:0 TXTSP[3:0]: Tx Timestamp Pointer**

Number of the TSU Timestamp register (TS0..15) where the related timestamp is stored.

68.5.7.5. Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCAN_SIDFC.FLSSA plus the index of the filter element (0...127).

Table 68.10. Standard Message ID Filter Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
S0	SFT[1:0]		SFEC[2:0]			SFID[10:0]											SSYNC	–				SFID[10:0]									

• **Bits 31:30 SFT[1:0]:** Standard Filter Type

Value	Description
0	Range filter from SF1ID to SF2ID (SF2ID ≥ SF1ID)
1	Dual ID filter for SF1ID or SF2ID
2	Classic filter: SF1ID = filter, SF2ID = mask

© 2026 Microchip Technology Inc. and its subsidiaries

Standard Message ID Filter Element (continued)	
Value	**Description**
3	Reserved

• **Bit 29:27 SFEC[2:0]:** Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MCAN_IR.HPM and, if enabled, an interrupt is generated. In this case register HPMS is updated with the status of the priority match.

Value	Description
0	Disable filter element
1	Store in Rx FIFO 0 if filter matches
2	Store in Rx FIFO 1 if filter matches
3	Reject ID if filter matches
4	Set priority if filter matches
5	Set priority and store in FIFO 0 if filter matches
6	Set priority and store in FIFO 1 if filter matches
7	Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

• **Bits 26:16 SFID1[10:0]:** Standard Filter ID 1

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

• **Bit 15 SSYNC: Standard Sync Message**

Only evaluated when CCCR.UTSU = ‘1’. When this bit is set and a matching message is received, a pulse is generated to signal the reception of a Sync message to the Timestamping Unit (TSU) connected to the MCAN.

Value	Description
0	Timestamping for the matching Sync message disabled
1	Timestamping for the matching Sync message enabled

• **Bits 10:0 SFID2[10:0]:** Standard Filter ID 2

This field has a different meaning depending on the configuration of SFEC:

- SFEC = “001”...“110”–Second ID of standard ID filter element
- SFEC = “111”–Filter for Rx Buffers or for debug messages

SFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

Value	Description
0	Store message in a Rx buffer
1	Debug Message A
2	Debug Message B
3	Debug Message C

SFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

© 2026 Microchip Technology Inc. and its subsidiaries

68.5.7.6. Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCAN_XIDFC.FLESA plus two times the index of the filter element (0...63).

Table 68.11. Extended Message ID Filter Elemen

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
F0	EFEC[2:0]			EFID[28:0]																												
F1	EFT[1:0]		ESYNC	EFID[28:0]																												

• **F0 Bit 31:29 EFEC[2:0]:** Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110”, a match sets the interrupt flag MCAN_IR.HPM and, if enabled, an interrupt is generated. In this case, register MCAN_HPMS is updated with the status of the priority match.

Value	Description
0	Disable filter element
1	Store in Rx FIFO 0 if filter matches
2	Store in Rx FIFO 1 if filter matches
3	Reject ID if filter matches
4	Set priority if filter matches
5	Set priority and store in FIFO 0 if filter matches
6	Set priority and store in FIFO 1 if filter matches
7	Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

• **F0 Bits 28:0 EFID1[28:0]:** Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MCAN_XIDAM masking mechanism (see Extended Message ID Filtering) is used.

• **F1 Bit 29 ESYNC: Extended Sync Message**

Only evaluated when CCCR.UTSU = ‘1’. When this bit is set and a matching message is received, a pulse is generated to signal the reception of a Sync message to the Timestamping Unit (TSU) connected to the MCAN.

Value	Description
0	Timestamping for the matching Sync message disabled
1	Timestamping for the matching Sync message enabled

• **F1 Bits 31:30 EFT[1:0]:** Extended Filter Type

Value	Description
0	Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)
1	Dual ID filter for EF1ID or EF2ID
2	Classic filter: EF1ID = filter, EF2ID = mask
3	Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID), MCAN_XIDAM mask not applied

• **F1 Bits 28:0 EFID2[28:0]:** Extended Filter ID 2

This field has a different meaning depending on the configuration of EFEC:

© 2026 Microchip Technology Inc. and its subsidiaries

- EFEC = “001”...“110”–Second ID of extended ID filter element
- EFEC = “111”–Filter for Rx Buffers or for debug messages

EFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

Value	Description
0	Store message in an Rx buffer
1	Debug Message A
2	Debug Message B
3	Debug Message C

EFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

68.5.8. Hardware Reset Description

After hardware reset, the registers of the MCAN hold the reset values listed in the register descriptions. Additionally the Bus_Off state is reset and the output CANTX is set to recessive (HIGH). The value 0x0001 (MCAN_CCCR.INIT = ‘1’) in the CC Control register enables software initialization. The MCAN does not influence the CAN bus until the processor resets MCAN_CCCR.INIT to ‘0’.

68.5.9. Access to Reserved Register Addresses

In case the application software accesses one of the reserved addresses in the MCAN register map (read or write access), interrupt flag MCAN_IR.ARA is set and, if enabled, the selected interrupt line is risen.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.2. MCAN Data Bit Timing and Prescaler Register

Name: MCAN_DBTP
Offset: 0x0C
Reset: 0x00000A33
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

The CAN bit time may be programmed in the range of 4 to 25 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 CAN core clock periods. t_q = (DBRP + 1) CAN core clock periods.

DTSEG1 is the sum of Prop_Seg and Phase_Seg1. DTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [DTSEG1 + DTSEG2 + 3] t_q or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] t_q.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x00000A33 configures the MCAN for a fast bit rate of 500 kbit/s.

The bit rate configured for the CAN FD data phase via MCAN_DBTP must be higher than or equal to the bit rate configured for the arbitration phase via MCAN_NBTP.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	1	1		0	1	1

Bit 23 – TDC Transmitter Delay Compensation
0 (DISABLED): Transmitter Delay Compensation disabled.
1 (ENABLED): Transmitter Delay Compensation enabled.

Bits 20:16 – DBRP[4:0] Data Bit Rate Prescaler
The value by which the peripheral clock is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 12:8 – DTSEG1[4:0] Data Time Segment Before Sample Point
0: Forbidden.
1 to 31: The duration of time segment is t_q x (DTSEG1 + 1).

Bits 7:4 – DTSEG2[3:0] Data Time Segment After Sample Point
The duration of time segment is t_q x (DTSEG2 + 1).

Bits 2:0 – DSJW[2:0] Data (Re) Synchronization Jump Width
The duration of a synchronization jump is t_q x (DSJW + 1).

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.3. MCAN Test Register

Name: MCAN_TEST
Offset: 0x10
Reset: 0x00000000
Property: Read/Write

To enable write access to the Test register, set bit MCAN_CCCR.TEST to 1.

All MCAN Test Register functions are set to their reset values when bit MCAN_CCCR.TEST is cleared.

Loop Back mode and software control of pin CANTX are hardware test modes. Programming of TX ≠ 0 disturbs the message transfer on the CAN bus.

The reset value for bit 7, MCAN_TEST.RX, is undefined. Bits 4 to 6 read 0. Bit 7 reads 1 when operating in CAN environments.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
			SVAL	TXBNS[4:0]				
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
			PVAL	TXBNP[4:0]				
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RX	TX[1:0]		LBCK				
Access	R	R/W	R/W	R/W				
Reset	x	0	0	0				

Bit 21 – SVAL Started Valid
Monitors the actual value of pin CANRX.
The reset value for this bit is undefined.

Value	Description
0 (DISABLED)	TXBNS value is not valid.
1 (ENABLED)	TXBNS value is valid.

Bits 20:16 – TXBNS[4:0] TX Buffer Number Started
In TX buffer, number of messages whose transmission was started last. Valid when SVAL is set. Valid values are 0 to 31.

Bit 13 – PVAL Prepared Valid
In TX buffer, number of messages whose transmission was started last. Valid when SVAL is set. Valid values are 0 to 31.

Value	Description
0 (DISABLED)	TXBNP value is not valid.
1 (ENABLED)	TXBNP value is valid.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 12:8 – TXBNP[4:0] TX Buffer Number Prepared

Five digits. In TX buffer, number of messages that are ready for transmission. Valid when PVAL is set. Valid values are 0 to 31.

Bit 7 – RX Receive Pin

Monitors the actual value of pin CANRX.
The reset value for this bit is undefined. The bit reads 1 when operating in CAN environments.

Value	Description
0	The CAN bus is dominant (CANRX = '0').
1	The CAN bus is recessive (CANRX = '1').

Bits 6:5 – TX[1:0] Control of Transmit Pin

Value	Name	Description
0	RESET	Reset value, CANTX controlled by the CAN Core, updated at the end of the CAN bit time.
1	SAMPLE_POINT_MONITORING	Sample Point can be monitored at pin CANTX.
2	DOMINANT	Dominant ('0') level at pin CANTX.
3	RECESSIVE	Recessive ('1') at pin CANTX.

Bit 4 – LBCK Loop Back Mode

0 (DISABLED): Reset value. Loop Back mode is disabled.
1 (ENABLED): Loop Back mode is enabled (see Test Modes).

68.6.4. MCAN RAM Watchdog Register

Name: MCAN_RWD
Offset: 0x14
Reset: 0x00000000
Property: Read/Write

The RAM Watchdog monitors the Message RAM response time. A Message RAM access via the MCAN's Generic Host Interface starts the Message RAM Watchdog Counter with the value configured by MCAN_RWD.WDC. The counter is reloaded with MCAN_RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCAN_IR.WDI is set. The RAM Watchdog Counter is clocked by the system bus clock (peripheral clock).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:8 – WDV[7:0] Watchdog Value (read-only)
Watchdog Counter Value for the current message located in RAM.

Bits 7:0 – WDC[7:0] Watchdog Configuration (read/write)
Start value of the Message RAM Watchdog Counter. The counter is disabled when WDC is cleared.

68.6.5. MCAN CC Control Register

Name: MCAN_CCCR
Offset: 0x18
Reset: 0x00000001
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	NISO	TXP	EFBI	PXHD	WMM	UTSU	BRSE	FDOE
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TEST	DAR	MON	CSR	CSA	ASM	CCE	INIT
Access	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1

Bit 15 – NISO Non-ISO Operation
If this bit is set, the MCAN uses the CAN FD frame format as specified by the Bosch CAN FD Specification V1.0.

Value	Description
0	CAN FD frame format according to ISO11898-1 (default).
1	CAN FD frame format according to Bosch CAN FD Specification V1.0.

Bit 14 – TXP Transmit Pause (write protection)
If this bit is set, the MCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see Tx Handling).

Value	Description
0	Transmit pause disabled.
1	Transmit pause enabled.

Bit 13 – EFBI Edge Filtering during Bus Integration (write protection)

Value	Description
0	Edge filtering is disabled.
1	Edge filtering is enabled. Two consecutive dominant tq required to detect an edge for hard synchronization.

Bit 12 – PXHD Protocol Exception Event Handling (write protection)

Value	Description
0	Protocol exception handling enabled.
1	Protocol exception handling disabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 11 – WMM Wide Message Marker (write protection)
0 (DISABLED): 8-bit message marker is used.
1 (ENABLED): 16-bit message marker is used, replacing 16-bit timestamps in TX Event FIFO.

Bit 10 – UTSU Use Timestamping Unit (write protection)
When UTSU is set, 16-bit Wide Message Marker (WMM) is also enabled regardless of the value of WMM.
0 (DISABLED): Internal timestamping.
1 (ENABLED): External timestamping by TSU.

Bit 9 – BRSE Bit Rate Switching Enable (write protection)
0 (DISABLED): Bit rate switching for transmissions disabled.
1 (ENABLED): Bit rate switching for transmissions enabled.

Bit 8 – FDOE CAN FD Operation Enable (write protection)
0 (DISABLED): FD operation disabled.
1 (ENABLED): FD operation enabled.

Bit 7 – TEST Test Mode Enable (write protection against '1')
0 (DISABLED): Normal operation, MCAN_TEST register holds reset values.
1 (ENABLED): Test mode, write access to MCAN_TEST register enabled.

Bit 6 – DAR Disable Automatic Retransmission (write protection)
0 (AUTO_RETX): Automatic retransmission of messages not transmitted successfully enabled.
1 (NO_AUTO_RETX): Automatic retransmission disabled.

Bit 5 – MON Bus Monitoring Mode (write protection against '1')
0 (DISABLED): Bus Monitoring mode is disabled.
1 (ENABLED): Bus Monitoring mode is enabled.

Bit 4 – CSR Clock Stop Request
0 (NO_CLOCK_STOP): No clock stop is requested.
1 (CLOCK_STOP): Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.

Bit 3 – CSA Clock Stop Acknowledge

Value	Description
0	No clock stop acknowledged.
1	MCAN may be set in power down by stopping the peripheral clock and the CAN core clock.

Bit 2 – ASM Restricted Operation Mode (write protection against '1')
For a description of the Restricted Operation mode see Restricted Operation Mode.
0 (NORMAL): Normal CAN operation.
1 (RESTRICTED): Restricted Operation mode active.

Bit 1 – CCE Configuration Change Enable (write protection)
0 (PROTECTED): The processor has no write access to the protected configuration registers.
1 (CONFIGURABLE): The processor has write access to the protected configuration registers (while MCAN_CCCR.INIT = '1').

Bit 0 – INIT Initialization
Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to ensure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

© 2026 Microchip Technology Inc. and its subsidiaries

0 (DISABLED): Normal operation.
1 (ENABLED): Initialization is started.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.6. MCAN Nominal Bit Timing and Prescaler Register

Name: MCAN_NBTP
Offset: 0x1C
Reset: 0x06000A03
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN_CCCR.

The CAN bit time may be programmed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 CAN core clock periods. $t_q = t_{core\ clock}$ x (NBRP + 1).

NTSEG1 is the sum of Prop_Seg and Phase_Seg1. NTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [NTSEG1 + NTSEG2 + 3] t_q or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] t_q.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x06000A03 configures the MCAN for a bit rate of 500 kbit/s.

Bit	31	30	29	28	27	26	25	24
	NSJW[6:0]							NBRP[8]
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	1	1	0

Bit	23	22	21	20	19	18	17	16
	NBRP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	NTSEG1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	1	0	1	0

Bit	7	6	5	4	3	2	1	0
		NTSEG2[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	1	1

Bits 31:25 – NSJW[6:0] Nominal (Re) Synchronization Jump Width
0 to 127: The duration of a synchronization jump is t_q x (NSJW + 1).

Bits 24:16 – NBRP[8:0] Nominal Bit Rate Prescaler
0 to 511: The value by which the oscillator frequency is divided for generating the CAN time quanta. The CAN time is built up from a multiple of this quanta. CAN time quantum (tq) = $t_{core\ clock}$ x (NBRP + 1)

Bits 15:8 – NTSEG1[7:0] Nominal Time Segment Before Sample Point

Value	Description
0	Reserved; do not use.
1 to 255	The duration of time segment is t_q x (NTSEG1 + 1).

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 6:0 – NTSEG2[6:0] Nominal Time Segment After Sample Point

Value	Description
0	Reserved; do not use.
1 to 127	The duration of time segment is t_q x (NTSEG2 + 1).

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.7. MCAN Timestamp Counter Configuration Register

Name: MCAN_TSCC
Offset: 0x20
Reset: 0x00000000
Property: Read/Write

For a description of the Timestamp Counter see Timestamp Generation.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					TCP[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							TSS[1:0]	
Access							R/W	R/W
Reset							0	0

Bits 19:16 – TCP[3:0] Timestamp Counter Prescaler
Configures the timestamp and timeout counters time unit in multiples of CAN bit times [1...16]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

Bits 1:0 – TSS[1:0] Timestamp Select
With CAN FD, an external counter is required for timestamp generation (TSS = 2).

Value	Name	Description
0	ALWAYS_0	Timestamp counter value always 0x0000
1	TCP_INC	Timestamp counter value incremented according to TCP
2	EXT_TIMESTAMP	External timestamp counter value used
3	ALWAYS_0	Timestamp counter value always 0x0000

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.8. MCAN Timestamp Counter Value Register

Name: MCAN_TSCV
Offset: 0x24
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	TSC[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TSC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – TSC[15:0] Timestamp Counter (cleared on write)
The internal/external Timestamp Counter value is captured on start of frame (both Receive and Transmit). When MCAN_TSCC.TSS = 1, the Timestamp Counter is incremented in multiples of CAN bit times [1...16] depending on the configuration of MCAN_TSCC.TCP. A wrap around sets interrupt flag MCAN_IR.TSW. Write access resets the counter to zero.
When MCAN_TSCC.TSS = 2, TSC reflects the external Timestamp Counter value. Thus a write access has no impact.
Note: A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MCAN_TSCV.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.9. MCAN Timeout Counter Configuration Register

Name: MCAN_TOCC
Offset: 0x28
Reset: 0xFFFF0000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

For a description of the Timeout Counter, see Timeout Counter.

Bit	31	30	29	28	27	26	25	24
	TOP[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit	23	22	21	20	19	18	17	16
	TOP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						TOS[1:0]		ETOC
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:16 – TOP[15:0] Timeout Period
Start value of the Timeout Counter (down-counter). Configures the Timeout Period.

Bits 2:1 – TOS[1:0] Timeout Select
When operating in Continuous mode, a write to MCAN_TOCV presets the counter to the value configured by MCAN_TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN_TOCC.TOP. Down-counting is started when the first FIFO element is stored.

Value	Name	Description
0	CONTINUOUS	Continuous operation.
1	TX_EV_TIMEOUT	Timeout controlled by Tx Event FIFO.
2	RX0_EV_TIMEOUT	Timeout controlled by Receive FIFO 0.
3	RX1_EV_TIMEOUT	Timeout controlled by Receive FIFO 1.

Bit 0 – ETOC Enable Timeout Counter
0 (NO_TIMEOUT): Timeout Counter disabled.
1 (TOS_CONTROLLED): Timeout Counter enabled.
For use of timeout function with CAN FD, see Timeout Counter.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.10. MCAN Timeout Counter Value Register

Name: MCAN_TOCV
Offset: 0x2C
Reset: 0x0000FFFF
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	TOC[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit	7	6	5	4	3	2	1	0
	TOC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bits 15:0 – TOC[15:0] Timeout Counter (cleared on write)
The Timeout Counter is decremented in multiples of CAN bit times [1...16] depending on the configuration of MCAN_TSCC.TCP. When decremented to zero, interrupt flag MCAN_IR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MCAN_TOCC.TOS.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.11. MCAN Error Counter Register

Name: MCAN_ECR
Offset: 0x40
Reset: 0x00000000
Property: Read-only

When MCAN_CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	CEL[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RP	REC[6:0]						
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TEC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 23:16 – CEL[7:0] CAN Error Logging (cleared on read)
The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag IR.ELO.

Bit 15 – RP Receive Error Passive

Value	Description
0	The Receive Error Counter is below the error passive level of 128.
1	The Receive Error Counter has reached the error passive level of 128.

Bits 14:8 – REC[6:0] Receive Error Counter
Actual state of the Receive Error Counter, values between 0 and 127.

Bits 7:0 – TEC[7:0] Transmit Error Counter
Actual state of the Transmit Error Counter, values between 0 and 255.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.12. MCAN Protocol Status Register

Name: MCAN_PSR
Offset: 0x44
Reset: 0x00000707
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
		TDCV[6:0]						
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
		PXE	RFDF	RBRS	RESI	DLEC[2:0]		
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	1	1	1

Bit	7	6	5	4	3	2	1	0
	BO	EW	EP	ACT[1:0]		LEC[2:0]		
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	1	1	1

Bits 22:16 – TDCV[6:0] Transmitter Delay Compensation Value
0 to 127: Position of the secondary sample point, in CAN core clock periods, defined by the sum of the measured delay from CANTX to CANRX and MCAN_TDCR.TDCO.

Bit 14 – PXE Protocol Exception Event (cleared on read)

Value	Description
0	No protocol exception event occurred since last read access
1	Protocol exception event occurred

Bit 13 – RFDF Received a CAN FD Message (cleared on read)
This bit is set independently from acceptance filtering.

Value	Description
0	Since this bit was reset by the CPU, no CAN FD message has been received
1	Message in CAN FD format with FDF flag set has been received

Bit 12 – RBRS BRS Flag of Last Received CAN FD Message (cleared on read)
This bit is set together with RFDF, independently from acceptance filtering.

Value	Description
0	Last received CAN FD message did not have its BRS flag set.
1	Last received CAN FD message had its BRS flag set.

Bit 11 – RESI ESI Flag of Last Received CAN FD Message (cleared on read)
This bit is set together with RFDF, independently from acceptance filtering.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Last received CAN FD message did not have its ESI flag set.
1	Last received CAN FD message had its ESI flag set.

Bits 10:8 – DLEC[2:0] Data Phase Last Error Code (set to 111 on read)
Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.

Bit 7 – BO Bus_Off Status

Value	Description
0	The MCAN is not Bus_Off.
1	The MCAN is in Bus_Off state.

Bit 6 – EW Warning Status

Value	Description
0	Both error counters are below the Error_Warning limit of 96.
1	At least one of error counter has reached the Error_Warning limit of 96.

Bit 5 – EP Error Passive

Value	Description
0	The MCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected.
1	The MCAN is in the Error_Passive state.

Bits 4:3 – ACT[1:0] Activity
Monitors the CAN communication state of the CAN module.

Value	Name	Description
0	SYNCHRONIZING	Node is synchronizing on CAN communication
1	IDLE	Node is neither receiver nor transmitter
2	RECEIVER	Node is operating as receiver
3	TRANSMITTER	Node is operating as transmitter

Bits 2:0 – LEC[2:0] Last Error Code (set to 111 on read)
The LEC indicates the type of the last error to occur on the CAN bus. This field is cleared when a message has been transferred (reception or transmission) without error.

Value	Name	Description
0	NO_ERROR	No error occurred since LEC has been reset by successful reception or transmission.
1	STUFF_ERROR	More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.
2	FORM_ERROR	A fixed format part of a received frame has the wrong format.
3	ACK_ERROR	The message transmitted by the MCAN was not acknowledged by another node.
4	BIT1_ERROR	During transmission of a message (with the exception of the arbitration field), the device tried to send a recessive level (bit of logical value ‘1’), but the monitored bus value was dominant.
5	BIT0_ERROR	During transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device tried to send a dominant level (data or identifier bit logical value ‘0’), but the monitored bus value was recessive. During Bus_Off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the processor to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).
6	CRC_ERROR	The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match the CRC calculated from the received data.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
7	NO_CHANGE	Any read access to the Protocol Status Register re-initializes the LEC to ‘7’. When the LEC shows value ‘7’, no CAN bus event was detected since the last processor read access to the Protocol Status Register.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.13. MCAN Transmitter Delay Compensation Register

Name: MCAN_TDCR
Offset: 0x48
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
		TDCO[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
		TDCF[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bits 14:8 – TDCO[6:0] Transmitter Delay Compensation Offset
0 to 127: Offset value, in CAN core clock periods, defining the distance between the measured delay from CANTX to CANRX and the secondary sample point.

Bits 6:0 – TDCF[6:0] Transmitter Delay Compensation Filter
0 to 127: defines the minimum value for the SSP position, in CAN core clock periods. Dominant edges on CANRX that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.14. MCAN Interrupt Register

Name: MCAN_IR
Offset: 0x50
Reset: 0x00000000
Property: Read/Write

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of IE controls whether an interrupt is generated. The configuration of ILS controls on which interrupt line an interrupt is signalled.

Bit	31	30	29	28	27	26	25	24
			ARA	PED	PEA	WDI	BO	EW
Access			R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

Bit 29 – ARA Access to Reserved Address

Value	Description
0	No access to reserved address occurred
1	Access to reserved address occurred

Bit 28 – PED Protocol Error in Data Phase

Value	Description
0	No protocol error in data phase
1	Protocol error in data phase detected (MCAN_PSR.DLEC differs from 0 or 7)

Bit 27 – PEA Protocol Error in Arbitration Phase

Value	Description
0	No protocol error in arbitration phase
1	Protocol error in arbitration phase detected (MCAN_PSR.LEC differs from 0 or 7)

Bit 26 – WDI Watchdog Interrupt

Value	Description
0	No Message RAM Watchdog event occurred.
1	Message RAM Watchdog event due to missing READY.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 25 – BO Bus_Off Status

Value	Description
0	Bus_Off status unchanged.
1	Bus_Off status changed.

Bit 24 – EW Warning Status

Value	Description
0	Error_Warning status unchanged.
1	Error_Warning status changed.

Bit 23 – EP Error Passive

Value	Description
0	Error_Passive status unchanged.
1	Error_Passive status changed.

Bit 22 – ELO Error Logging Overflow

Value	Description
0	CAN Error Logging Counter did not overflow.
1	Overflow of CAN Error Logging Counter occurred.

Bit 19 – DRX Message stored to Dedicated Receive Buffer
The flag is set whenever a received message has been stored into a dedicated Receive Buffer.

Value	Description
0	No Receive Buffer updated.
1	At least one received message stored into a Receive Buffer.

Bit 18 – TOO Timeout Occurred

Value	Description
0	No timeout.
1	Timeout reached.

Bit 17 – MRAF Message RAM Access Failure
The flag is set, when the Rx Handler

- has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message.
- was not able to write a message to the Message RAM. In this case message storage is aborted.

In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Receive Buffer is not set, a partly stored message is overwritten when the next message is stored to this location.
The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the MCAN is switched into Restricted Operation mode (see Restricted Operation Mode). To leave Restricted Operation mode, the processor has to reset MCAN_CCCR.ASM.

Value	Description
0	No Message RAM access failure occurred.
1	Message RAM access failure occurred.

Bit 16 – TSW Timestamp Wraparound

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No timestamp counter wrap-around.
1	Timestamp counter wrapped around.

Bit 15 – TEFL Tx Event FIFO Element Lost

Value	Description
0	No Tx Event FIFO element lost.
1	Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero.

Bit 14 – TEFF Tx Event FIFO Full

Value	Description
0	Tx Event FIFO not full.
1	Tx Event FIFO full.

Bit 13 – TEFW Tx Event FIFO Watermark Reached

Value	Description
0	Tx Event FIFO fill level below watermark.
1	Tx Event FIFO fill level reached watermark.

Bit 12 – TEFN Tx Event FIFO New Entry

Value	Description
0	Tx Event FIFO unchanged.
1	Tx Handler wrote Tx Event FIFO element.

Bit 11 – TFE Tx FIFO Empty

Value	Description
0	Tx FIFO non-empty.
1	Tx FIFO empty.

Bit 10 – TCF Transmission Cancellation Finished

Value	Description
0	No transmission cancellation finished.
1	Transmission cancellation finished.

Bit 9 – TC Transmission Completed

Value	Description
0	No transmission completed.
1	Transmission completed.

Bit 8 – HPM High Priority Message

Value	Description
0	No high priority message received.
1	High priority message received.

Bit 7 – RF1L Receive FIFO 1 Message Lost

Value	Description
0	No Receive FIFO 1 message lost.
1	Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero.

Bit 6 – RF1F Receive FIFO 1 Full

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Receive FIFO 1 not full.
1	Receive FIFO 1 full.

Bit 5 – RF1W Receive FIFO 1 Watermark Reached

Value	Description
0	Receive FIFO 1 fill level below watermark.
1	Receive FIFO 1 fill level reached watermark.

Bit 4 – RF1N Receive FIFO 1 New Message

Value	Description
0	No new message written to Receive FIFO 1.
1	New message written to Receive FIFO 1.

Bit 3 – RF0L Receive FIFO 0 Message Lost

Value	Description
0	No Receive FIFO 0 message lost.
1	Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero.

Bit 2 – RF0F Receive FIFO 0 Full

Value	Description
0	Receive FIFO 0 not full.
1	Receive FIFO 0 full.

Bit 1 – RF0W Receive FIFO 0 Watermark Reached

Value	Description
0	Receive FIFO 0 fill level below watermark.
1	Receive FIFO 0 fill level reached watermark.

Bit 0 – RF0N Receive FIFO 0 New Message

Value	Description
0	No new message written to Receive FIFO 0.
1	New message written to Receive FIFO 0.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.15. MCAN Interrupt Enable Register

Name: MCAN_IE
Offset: 0x54
Reset: 0x00000000
Property: Read/Write

The following configuration values are valid for all listed bit names of this register:

0: Disables the corresponding interrupt.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

68.6.16. MCAN Interrupt Line Select Register

Name: MCAN_ILS
Offset: 0x58
Reset: 0x00000000
Property: Read/Write

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines.

0: Interrupt assigned to interrupt line MCAN_INT0.

1: Interrupt assigned to interrupt line MCAN_INT1.

Bit	31	30	29	28	27	26	25	24

68.6.17. MCAN Interrupt Line Enable

Name: MCAN_ILE
Offset: 0x5C
Reset: 0x00000000
Property: Read/Write

Each of the two interrupt lines to the processor can be enabled/disabled separately by programming bits EINT0 and EINT1.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

68.6.18. MCAN Global Filter Configuration

Name: MCAN_GFC
Offset: 0x80
Reset: 0x00000000
Property: Read/Write

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages as illustrated in Standard Message ID Filter Path and Extended Message ID Filter Path.

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 5:4 – ANFS[1:0] Accept Non-matching Frames Standard
Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated.

Value	Name	Description
0	RX_FIFO_0	Accept in Rx FIFO 0
1	RX_FIFO_1	Accept in Rx FIFO 1
2-3	REJECTED	Message rejected

Bits 3:2 – ANFE[1:0] Accept Non-matching Frames Extended
Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated.

Value	Name	Description
0	RX_FIFO_0	Accept in Rx FIFO 0
1	RX_FIFO_1	Accept in Rx FIFO 1
2-3	REJECTED	Message rejected

Bit 1 – RRFS Reject Remote Frames Standard
0 (FILTER): Filter remote frames with 11-bit standard IDs.
1 (REJECT): Reject all remote frames with 11-bit standard IDs.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 0 – RRFE Reject Remote Frames Extended
0 (FILTER): Filter remote frames with 29-bit extended IDs.
1 (REJECT): Reject all remote frames with 29-bit extended IDs.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.19. MCAN Standard ID Filter Configuration

Name: MCAN_SIDFC
Offset: 0x84
Reset: 0x00000000
Property: Read/Write

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as illustrated in Standard Message ID Filter Path.

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

	FLSSA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bits 23:16 – LSS[7:0] List Size Standard
>128: Values greater than 128 are interpreted as 128.

Value	Description
0	No standard Message ID filter.
1-128	Number of standard Message ID filter elements.

Bits 15:2 – FLSSA[13:0] Filter List Standard Start Address
Start address of standard Message ID filter list (32-bit word address, see Message RAM Configuration).
Write FLSSA with the bits [15:2] of the 32-bit address.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.20. MCAN Extended ID Filter Configuration

Name: MCAN_XIDFC
Offset: 0x88
Reset: 0x00000000
Property: Read/Write

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in Extended Message ID Filter Path.

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0		

Bits 22:16 – LSE[6:0] List Size Extended

Value	Description
0	No extended Message ID filter.
1-64	Number of extended Message ID filter elements.
>64	Values greater than 64 are interpreted as 64.

Bits 15:2 – FLESA[13:0] Filter List Extended Start Address
Start address of extended Message ID filter list (32-bit word address, see Message RAM Configuration).
Write FLESA with the bits [15:2] of the 32-bit address.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.21. MCAN Extended ID AND Mask

Name: MCAN_XIDAM
Offset: 0x90
Reset: 0x1FFFFFFF
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
				EIDM[28:24]				
Access				R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bits 28:0 – EIDM[28:0] Extended ID Mask
For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.22. MCAN High Priority Message Status

Name: MCAN_HPMS
Offset: 0x94
Reset: 0x00000000
Property: Read-only

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8

	MSI[1:0]		BIDX[5:0]					
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 15 – FLST Filter List
Indicates the filter list of the matching filter element.

Value	Description
0	Standard filter list
1	Extended filter list

Bits 14:8 – FIDX[6:0] Filter Index
Index of matching filter element. Range is 0 to MCAN_SIDFC.LSS - 1 resp. MCAN_XIDFC.LSE - 1.

Bits 7:6 – MSI[1:0] Message Storage Indicator

Value	Name	Description
0	NO_FIFO_SEL	No FIFO selected.
1	LOST	FIFO message lost.
2	FIFO_0	Message stored in FIFO 0.
3	FIFO_1	Message stored in FIFO 1.

Bits 5:0 – BIDX[5:0] Buffer Index
Index of Receive FIFO element to which the message was stored. Only valid when MSI[1] = '1'.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.23. MCAN New Data 1

Name: MCAN_NDAT1
Offset: 0x98
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	ND31	ND30	ND29	ND28	ND27	ND26	ND25	ND24
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx New Data

The register holds the New Data flags of Receive Buffers 0 to 31. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

Value	Description
0	Receive Buffer not updated
1	Receive Buffer updated from new message

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.24. MCAN New Data 2

Name: MCAN_NDAT2
Offset: 0x9C
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx New Data

The register holds the New Data flags of Receive Buffers 32 to 63. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

Value	Description
0	Receive Buffer not updated.
1	Receive Buffer updated from new message.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.25. MCAN Receive FIFO 0 Configuration

Name: MCAN_RXF0C
Offset: 0xA0
Reset: 0x00000000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
	F0OM	F0WM[6:0]						
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
		F0S[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	F0SA[13:6]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	F0SA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bit 31 – F0OM FIFO 0 Operation Mode
FIFO 0 can be operated in Blocking or in Overwrite mode (see Rx FIFOs).

Value	Description
0	FIFO 0 Blocking mode.
1	FIFO 0 Overwrite mode.

Bits 30:24 – F0WM[6:0] Receive FIFO 0 Watermark

Value	Description
0	Watermark interrupt disabled.
1-64	Level for Receive FIFO 0 watermark interrupt (MCAN_IR.RF0W).
>64	Watermark interrupt disabled.

Bits 22:16 – F0S[6:0] Receive FIFO 0 Size
The Receive FIFO 0 elements are indexed from 0 to F0S-1.

Value	Description
0	No Receive FIFO 0
1-64	Number of Receive FIFO 0 elements.
>64	Values greater than 64 are interpreted as 64.

Bits 15:2 – F0SA[13:0] Receive FIFO 0 Start Address
Start address of Receive FIFO 0 in Message RAM (32-bit word address, see Message RAM Configuration).
Write F0SA with the bits [15:2] of the 32-bit address.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.26. MCAN Receive FIFO 0 Status

Name: MCAN_RXF0S
Offset: 0xA4
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
							RF0L	F0F
Access							R	R
Reset							0	0

Bit	23	22	21	20	19	18	17	16
			F0PI[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
			F0GI[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

		F0FL[6:0]						
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bit 25 – RF0L Receive FIFO 0 Message Lost
This bit is a copy of interrupt flag MCAN_IR.RF0L. When MCAN_IR.RF0L is reset, this bit is also reset. Overwriting the oldest message when MCAN_RXF0C.F0OM = '1' will not set this flag.

Value	Description
0	No Receive FIFO 0 message lost
1	Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero

Bit 24 – F0F Receive FIFO 0 Full

Value	Description
0	Receive FIFO 0 not full.
1	Receive FIFO 0 full.

Bits 21:16 – F0PI[5:0] Receive FIFO 0 Put Index
Receive FIFO 0 write index pointer, range 0 to 63.

Bits 13:8 – F0GI[5:0] Receive FIFO 0 Get Index
Receive FIFO 0 read index pointer, range 0 to 63.

Bits 6:0 – F0FL[6:0] Receive FIFO 0 Fill Level
Number of elements stored in Receive FIFO 0, range 0 to 64.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.27. MCAN Receive FIFO 0 Acknowledge

Name: MCAN_RXF0A

68.6.29. MCAN Receive FIFO 1 Configuration

Name: MCAN_RXF1C
Offset: 0xB0
Reset: 0x00000000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
	F1OM	F1WM[6:0]						
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
		F1S[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	F1SA[13:6]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	F1SA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bit 31 – F1OM FIFO 1 Operation Mode
FIFO 1 can be operated in Blocking or in Overwrite mode (see Rx FIFOs).

Value	Description
0	FIFO 1 Blocking mode.
1	FIFO 1 Overwrite mode.

Bits 30:24 – F1WM[6:0] Receive FIFO 1 Watermark

Value	Description
0	Watermark interrupt disabled
1-64	Level for Receive FIFO 1 watermark interrupt (MCAN_IR.RF1W).
>64	Watermark interrupt disabled.

Bits 22:16 – F1S[6:0] Receive FIFO 1 Size
The elements in Receive FIFO 1 are indexed from 0 to F1S - 1.

Value	Description
0	No Receive FIFO 1
1-64	Number of elements in Receive FIFO 1.
>64	Values greater than 64 are interpreted as 64.

Bits 15:2 – F1SA[13:0] Receive FIFO 1 Start Address
Start address of Receive FIFO 1 in Message RAM (32-bit word address, see Message RAM Configuration).
Write F1SA with the bits [15:2] of the 32-bit address.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.30. MCAN Receive FIFO 1 Status

Name: MCAN_RXF1S
Offset: 0xB4
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	DMS[1:0]						RF1L	F1F
Access	R	R					R	R
Reset	0	0					0	0

Bit	23	22	21	20	19	18	17	16
			F1PI[5:0]					
Access			R	R	R	R	R	R

		F1FL[6:0]						
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bits 31:30 – DMS[1:0] Debug Message Status

Value	Name	Description
0	IDLE	Idle state, wait for reception of debug messages, DMA request is cleared.
1	MSG_A	Debug message A received.
2	MSG_AB	Debug messages A, B received.
3	MSG_ABC	Debug messages A, B, C received, DMA request is set.

Bit 25 – RF1L Receive FIFO 1 Message Lost
This bit is a copy of interrupt flag IR.RF1L. When IR.RF1L is reset, this bit is also reset.
Overwriting the oldest message when MCAN_RXF1C.F1OM = '1' will not set this flag.

Value	Description
0	No Receive FIFO 1 message lost.
1	Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero.

Bit 24 – F1F Receive FIFO 1 Full

Value	Description
0	Receive FIFO 1 not full.
1	Receive FIFO 1 full.

Bits 21:16 – F1PI[5:0] Receive FIFO 1 Put Index
Receive FIFO 1 write index pointer, range 0 to 63.

Bits 13:8 – F1GI[5:0] Receive FIFO 1 Get Index
Receive FIFO 1 read index pointer, range 0 to 63.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 6:0 – F1FL[6:0] Receive FIFO 1 Fill Level
Number of elements stored in Receive FIFO 1, range 0 to 64.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.31. MCAN Receive FIFO 1 Acknowledge

Name: MCAN_RXF1A
Offset: 0xB8
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

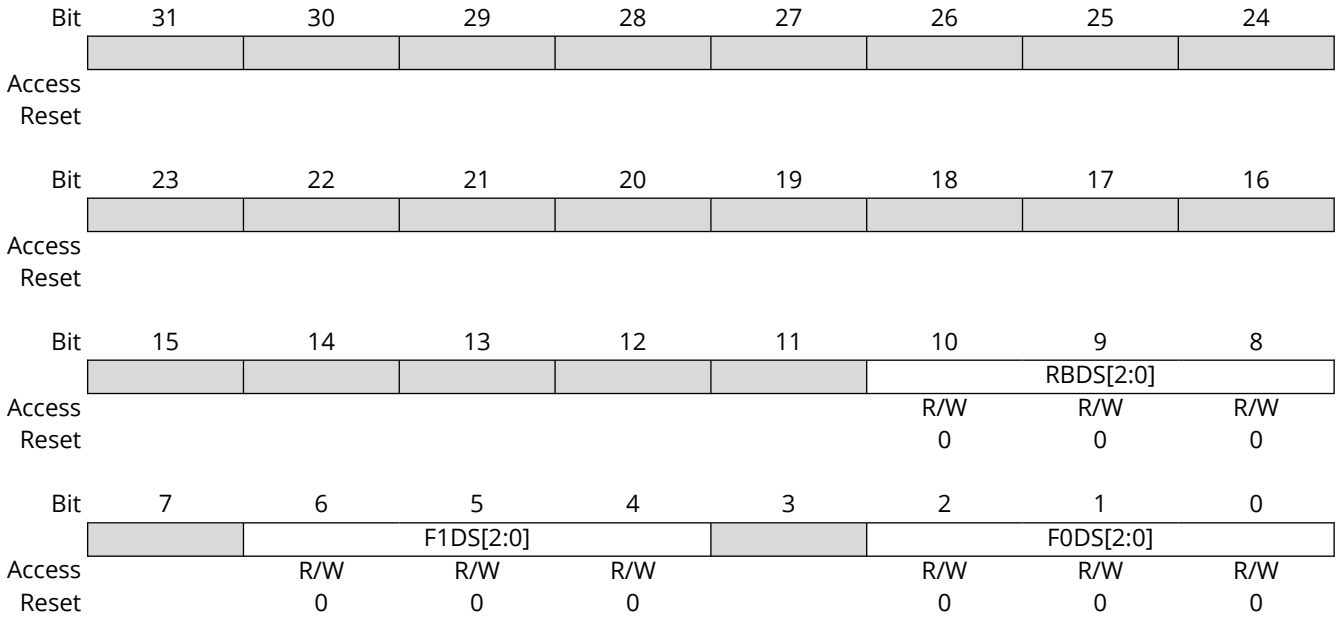
			F1AI[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 5:0 – F1AI[5:0] Receive FIFO 1 Acknowledge Index
After the processor has read a message or a sequence of messages from Receive FIFO 1 it has to write the buffer index of the last element read from Receive FIFO 1 to F1AI. This will set the Receive FIFO 1 Get Index MCAN_RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MCAN_RXF1S.F1FL.

© 2026 Microchip Technology Inc. and its subsidiaries



68.6.32. MCAN Receive Buffer / FIFO Element Size Configuration

Name: MCAN_RXESC
Offset: 0xBC
Reset: 0x00000000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Configures the number of data bytes belonging to a Receive Buffer / Receive FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Receive Buffer or Receive FIFO, only the number of bytes as configured by MCAN_RXESC are stored to the Receive Buffer resp. Receive FIFO element. The rest of the frame's data field is ignored.

Bits 10:8 – RBDS[2:0] Receive Buffer Data Field Size

Value	Name	Description
0	8_BYTE	8-byte data field
1	12_BYTE	12-byte data field
2	16_BYTE	16-byte data field
3	20_BYTE	20-byte data field
4	24_BYTE	24-byte data field
5	32_BYTE	32-byte data field
6	48_BYTE	48-byte data field
7	64_BYTE	64-byte data field

Bits 6:4 – F1DS[2:0] Receive FIFO 1 Data Field Size

Value	Name	Description
0	8_BYTE	8-byte data field
1	12_BYTE	12-byte data field
2	16_BYTE	16-byte data field
3	20_BYTE	20-byte data field

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
4	24_BYTE	24-byte data field
5	32_BYTE	32-byte data field
6	48_BYTE	48-byte data field
7	64_BYTE	64-byte data field

Bits 2:0 – F0DS[2:0] Receive FIFO 0 Data Field Size

Value	Name	Description
0	8_BYTE	8-byte data field
1	12_BYTE	12-byte data field
2	16_BYTE	16-byte data field
3	20_BYTE	20-byte data field
4	24_BYTE	24-byte data field
5	32_BYTE	32-byte data field
6	48_BYTE	48-byte data field
7	64_BYTE	64-byte data field

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.33. MCAN Tx Buffer Configuration

Name: MCAN_TXBC
Offset: 0xC0
Reset: 0x00000000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

The sum of TFQS and NDTB may not exceed 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

Bit	31	30	29	28	27	26	25	24
		TFQM	TFQS[5:0]					
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W

	TBSA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bit 30 – TFQM Tx FIFO/Queue Mode

Value	Description
0	Tx FIFO operation.
1	Tx Queue operation.

Bits 29:24 – TFQS[5:0] Transmit FIFO/Queue Size

Value	Description
0	No Tx FIFO/Queue.
1-32	Number of Tx Buffers used for Tx FIFO/Queue.
>32	Values greater than 32 are interpreted as 32.

Bits 21:16 – NDTB[5:0] Number of Dedicated Transmit Buffers

Value	Description
0	No dedicated Tx Buffers.
1-32	Number of dedicated Tx Buffers.
>32	Values greater than 32 are interpreted as 32.

Bits 15:2 – TBSA[13:0] Tx Buffers Start Address
Start address of Tx Buffers section in Message RAM (32-bit word address, see Message RAM Configuration).
Write TBSA with the bits [15:2] of the 32-bit address.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.34. MCAN Tx FIFO/Queue Status

Name: MCAN_TXFQS
Offset: 0xC4
Reset: 0x00000000
Property: Read-only

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MCAN_TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MCAN_TXBRP not yet updated).

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.
Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

Reset				0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
			TFFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit 21 – TFQF Tx FIFO/Queue Full

Value	Description
0	Tx FIFO/Queue not full.
1	Tx FIFO/Queue full.

Bits 20:16 – TFQPI[4:0] Tx FIFO/Queue Put Index
Tx FIFO/Queue write index pointer, range 0 to 31.

Bits 12:8 – TFGI[4:0] Tx FIFO Get Index
Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MCAN_TXBC.TFQM = ‘1’).

Bits 5:0 – TFFL[5:0] Tx FIFO Free Level
Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MCAN_TXBC.TFQM = ‘1’).

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.35. MCAN Tx Buffer Element Size Configuration

Name: MCAN_TXESC
Offset: 0xC8
Reset: 0x00000000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MCAN_TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as “0xCC” (padding bytes).

68.6.36. MCAN Transmit Buffer Request Pending

Name: MCAN_TXBRP
Offset: 0xCC
Reset: 0x00000000
Property: Read-only

MCAN_TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCAN_TXBRP bit is reset.

Bit	31	30	29	28	27	26	25	24

	TRP7	TRP6	TRP5	TRP4	TRP3	TRP2	TRP1	TRP0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – TRPx Transmission Request Pending for Buffer x

Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MCAN_TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MCAN_TXBCR.
TXBRP bits are set only for those Tx Buffers configured via MCAN_TXBC. After a MCAN_TXBRP bit has been set, a Tx scan (see Tx Handling) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).
A cancellation request resets the corresponding transmission request pending bit of register MCAN_TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding TXBRP bit has been reset.
After a cancellation has been requested, a finished cancellation is signalled via MCAN_TXBCF.
• after successful transmission together with the corresponding MCAN_TXBTO bit.
• when the transmission has not yet been started at the point of cancellation.
• when the transmission has been aborted due to lost arbitration.
• when an error occurred during frame transmission.
In DAR mode, all transmissions are automatically cancelled if they are not successful. The corresponding MCAN_TXBCF bit is set for all unsuccessful transmissions.

Value	Description
0	No transmission request pending
1	Transmission request pending

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.37. MCAN Transmit Buffer Add Request

Name: MCAN_TXBAR
Offset: 0xD0
Reset: 0x00000000
Property: Read/Write

If an add request is applied for a Transmit Buffer with pending transmission request (corresponding MCAN_TXBRP bit already set), this Add Request is ignored.

Bit	31	30	29	28	27	26	25	24
	AR31	AR30	AR29	AR28	AR27	AR26	AR25	AR24

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – ARx Add Request for Transmit Buffer x

Each Transmit Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the processor to set transmission requests for multiple Transmit Buffers with one write to MCAN_TXBAR. MCAN_TXBAR bits are set only for those Transmit Buffers configured via TXBC. When no Transmit scan is running, the bits are reset immediately, else the bits remain set until the Transmit scan process has completed.

Value	Description
0	No transmission request added.
1	Transmission requested added.

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – CFx Cancellation Finished for Transmit Buffer x

Each Transmit Buffer has its own Cancellation Finished bit. The bits are set when the corresponding MCAN_TXBRP bit is cleared after a cancellation was requested via MCAN_TXBCR. In case the corresponding MCAN_TXBRP bit was not set at the point of cancellation, CF is set immediately.
The bits are reset when a new transmission is requested by writing a '1' to the corresponding bit of register MCAN_TXBAR.

Value	Description
0	No transmit buffer cancellation.
1	Transmit buffer cancellation finished.

Reset	0	0	0	0	0	0		

Bits 29:24 – EFWM[5:0] Event FIFO Watermark

Value	Description
0	Watermark interrupt disabled.
1-32	Level for Tx Event FIFO watermark interrupt (MCAN_IR.TEFW).
>32	Watermark interrupt disabled.

Bits 21:16 – EFS[5:0] Event FIFO Size
The Tx Event FIFO elements are indexed from 0 to EFS - 1.

Value	Description
0	Tx Event FIFO disabled.
1-32	Number of Tx Event FIFO elements.
>32	Values greater than 32 are interpreted as 32.

Bits 15:2 – EFSA[13:0] Event FIFO Start Address
Start address of Tx Event FIFO in Message RAM (32-bit word address, see Message RAM Configuration).
Write EFSA with the bits [15:2] of the 32-bit address.

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.44. MCAN Tx Event FIFO Status

Name: MCAN_TXEFS
Offset: 0xF4
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24

Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit 25 – TEFL Tx Event FIFO Element Lost
This bit is a copy of interrupt flag MCAN_IR.TEFL. When MCAN_IR.TEFL is reset, this bit is also reset.

Value	Description
0	No Tx Event FIFO element lost.
1	Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero.

Bit 24 – EFF Event FIFO Full

Value	Description
0	Tx Event FIFO not full.
1	Tx Event FIFO full.

Bits 20:16 – EFPI[4:0] Event FIFO Put Index
Tx Event FIFO write index pointer, range 0 to 31.

Bits 12:8 – EFGI[4:0] Event FIFO Get Index
Tx Event FIFO read index pointer, range 0 to 31.

Bits 5:0 – EFFL[5:0] Event FIFO Fill Level
Number of elements stored in Tx Event FIFO, range 0 to 32.

						SCP	TBCS	TSUE
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 15:8 – TBPRE[7:0] Timebase Prescaler

The value by which the oscillator frequency is divided to generate the timebase counter clock. Valid values for the timebase prescaler are 0 to 255. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. Affects only the TSU internal timebase.

Bit 2 – SCP Select Capturing Position

Value	Description
0	Timestamp captured at EOF
1	Timestamp captured at SOF

Bit 1 – TBCS Timebase Counter Select

Value	Description
0	Timestamp value captured from internal timebase counter (32 bits)
1	Timestamp value captured from external timebase counter (32 bits)

Bit 0 – TSUE Timestamp Unit Enable

Value	Description
0	TSU disabled
1	TSU enabled

© 2026 Microchip Technology Inc. and its subsidiaries

68.6.47. MCAN TSU Timestamp Status 1

Name: MCAN_TSU_TSS1
Offset: 0x168
Reset: 0x00000000
Property: Read-only

69. Timer Counter (TC)

69.1. Description

A Timer Counter (TC) module includes three identical TC channels. The number of implemented TC modules is device-specific.

Each TC channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

Each channel has three external clock inputs, five internal clock inputs and two multipurpose input/output signals which can be configured by the user. Each channel drives an internal interrupt signal which can be programmed to generate processor interrupts.

The TC embeds a quadrature decoder (QDEC) connected in front of the timers and driven by TIOA0, TIOB0 and TIOB1 inputs. When enabled, the QDEC performs the input lines filtering, decoding of quadrature signals and connects to the timers/counters in order to read the position and speed of the motor through the user interface.

The TC block has two global registers which act upon all TC channels:

- Block Control register (TC_BCR)—allows channels to be started simultaneously with the same instruction
- Block Mode register (TC_BMR)—defines the external clock inputs for each channel, allowing them to be chained

69.2. Embedded Characteristics

- Total of Six Channels
- 32-bit Channel Size
- Wide Range of Functions Including:
  - Frequency measurement
  - Event counting
  - Interval measurement
  - Pulse generation
  - Delay timing
  - Pulse width modulation
  - Up/down capabilities
  - Quadrature decoder with real time filtering reports
  - 2-bit Gray up/down count for stepper motor
- Each Channel is User-Configurable and Contains:
  - Three external clock inputs
  - Five internal clock inputs
  - Two multipurpose input/output signals acting as trigger event
  - Trigger/capture events can be directly synchronized by PWM signals
- Interrupt Line
- Read of the Capture Registers by the DMAC
- Register Write Protection
- Safety/Security Reports

© 2026 Microchip Technology Inc. and its subsidiaries

69.3. Block Diagram

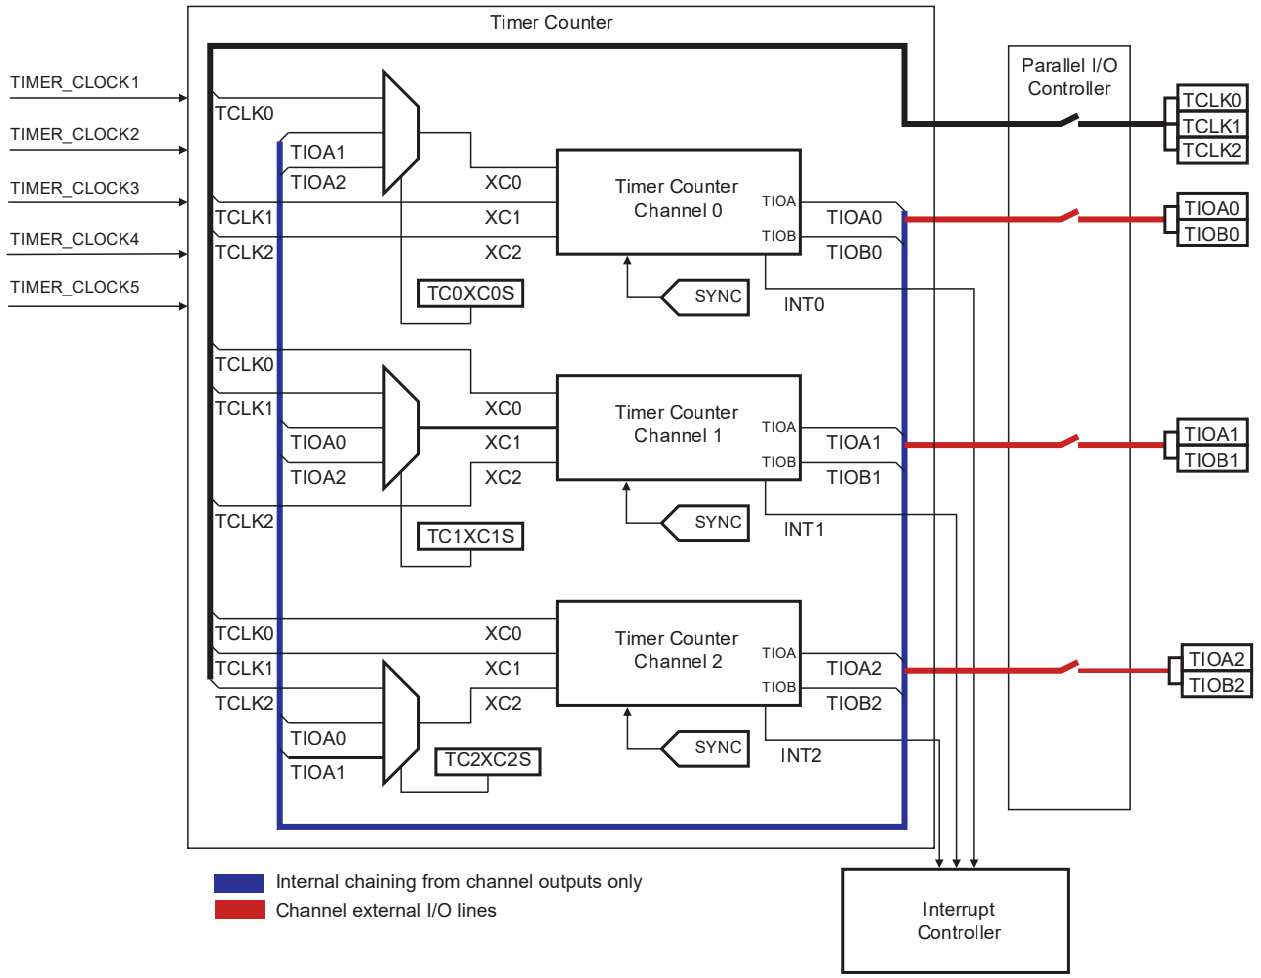

Table 69.1. Timer Counter Clock Assignment

Name	Definition
TIMER_CLOCK1	GCLK [17], GCLK[45]
TIMER_CLOCK2	MCK/8
TIMER_CLOCK3	MCK/32
TIMER_CLOCK4	MCK/128
TIMER_CLOCK5 (1)	MD_SLCK

Note:

1. The GCLK [TC_ID] frequency must be at least three times lower than peripheral clock frequency.

Figure 69.1. TC Block Diagram

Notes:

1. The above figure provides pin names of a first instance of a Timer Counter module (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, “TCLK3-TCLK5”, "TIOA3-TIOA5” and "TIOB3-TIOB5” are the external I/O pins of a second Timer Counter module (i.e., instance TC1).
2. QDEC connections are detailed in Figure 69.17.

© 2026 Microchip Technology Inc. and its subsidiaries

Table 69.2. Channel Signal Description

Signal Name	Description
XC0, XC1, XC2	Channel clock source that can be connected to TIOAx, TIOBx, TCLKx
TIMER_CLOCK1-5	Channel clock source from system clocks
TIOAx	Capture mode: Timer Counter input Waveform mode: Timer Counter output
TIOBx	Capture mode: Timer Counter input Waveform mode: Timer Counter input/output
INT	Interrupt signal output (internal signal)
SYNC	Synchronization input signal (from Configuration register)

69.4. Pin List

Table 69.3. Pin List

Pin Name	Description	Type
TCLK0–TCLK2	External clock input	Input
TIOA0–TIOA2	I/O line A	I/O
TIOB0–TIOB2	I/O line B	I/O

Note: This table provides pin names of a first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, “TCLK3-TCLK5”, "TIOA3-TIOA5” and "TIOB3-TIOB5” are the external I/O pins of a second Timer Counter block (i.e., instance TC1).

69.5. Product Dependencies

69.5.1. I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the TC pins to their peripheral functions.

69.5.2. Power Management

The TC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the Timer Counter clock.

69.5.3. Interrupt Sources

The TC has an interrupt line connected to the interrupt controller. Handling the TC interrupt requires programming the interrupt controller before configuring the TC.

69.5.4. Synchronization Inputs from PWM

The TC has trigger/capture inputs internally connected to the PWM. See Synchronization with PWM and refer to the implementation of the Pulse Width Modulation (PWM) in this product.

69.6. Functional Description

69.6.1. Description

All channels of the Timer Counter are independent and identical in operation except when the QDEC is enabled. The registers for channel programming are listed in Register Summary.

© 2026 Microchip Technology Inc. and its subsidiaries

69.6.2. 32-bit Counter

Each 32-bit channel is organized around a 32-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value 2^{32}-1 and passes to zero, an overflow occurs and the COVFS bit in the Interrupt Status register (TC_SR) is set.

The current value of the counter is accessible in real time by reading the Counter Value register (TC_CV). The counter can be reset by a trigger. In this case, the counter value passes to zero on the next valid edge of the selected clock.

69.6.3. Clock Selection

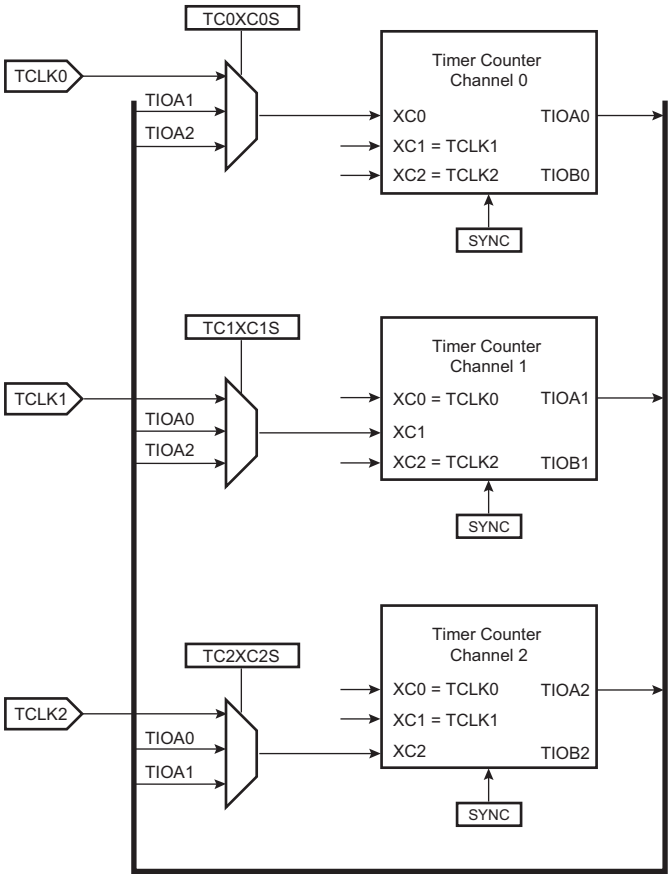
Input clock signals of each channel can be connected either to the external inputs TCLKx, or to the internal I/O signals TIOAx for chaining[(1)] by programming the Block Mode register (TC_BMR). See the figure Clock Chaining Selection.

Each channel can independently select a source for its counter[(2)]:

- Signals from other channels: XC0, XC1 or XC2
- Signals from the system: GCLK [17], GCLK[45], MCK/8, MCK/32, MCK/128, MD_SLCK

This selection is made by the TCCLKS bits in the Channel Mode register (TC_CMRx).

The selected clock can be inverted with TC_CMRx.CLKI. This allows counting on the opposite edges of the clock.



The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the TC_CMRx defines this signal (none, XC0, XC1, XC2). See the figure Clock Selection.

Notes:

1. In Waveform mode, to chain two timers, it is mandatory to initialize some parameters:
   - Configure TIOx outputs to 1 or 0 by writing the required value to TC_CMRx.ASWTRG.
   - Bit TC_BCR.SYNC must be written to 1 to start the channels at the same time.
2. In all cases, if an external clock or asynchronous internal clock GCLK [TC_ID] is used, the duration of each of its levels must be longer than the peripheral clock period, so the clock frequency will be at least 2.5 times lower than the peripheral clock.

© 2026 Microchip Technology Inc. and its subsidiaries

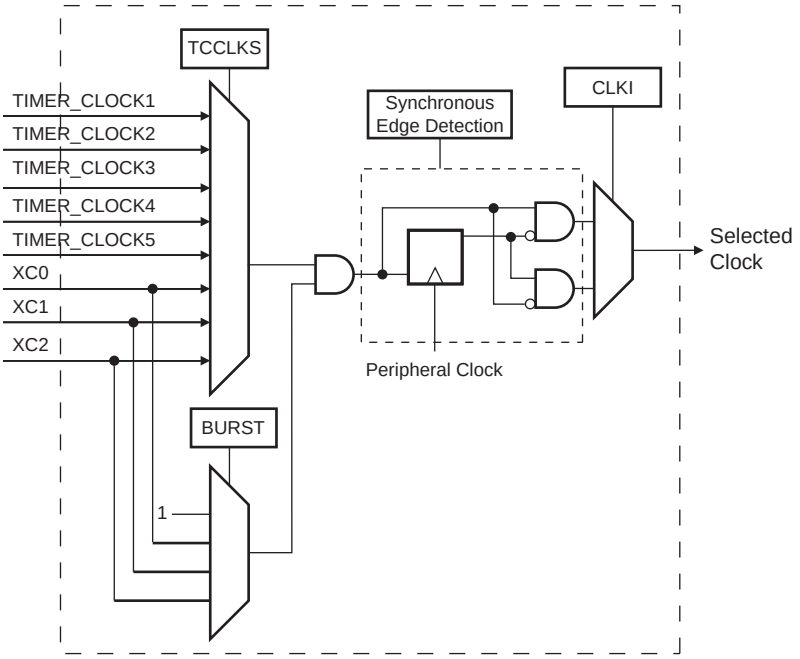


Figure 69.2. Clock Chaining Selection

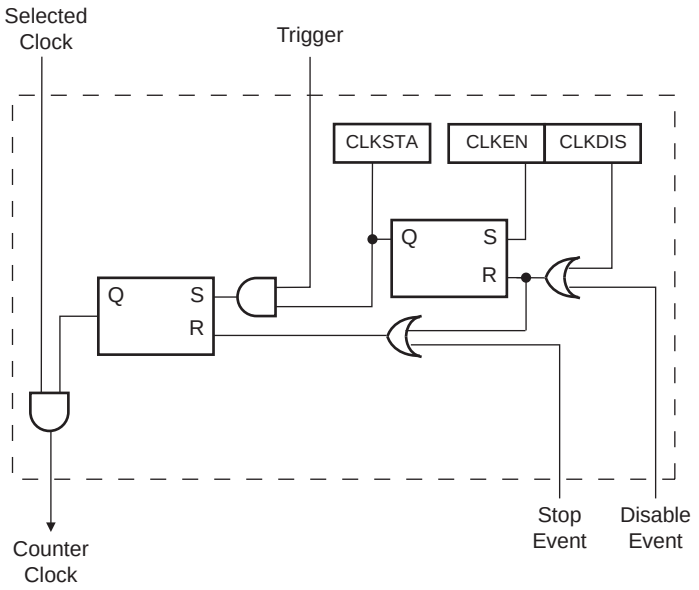
Note: The above figure provides pin names of a first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, “TCLK3-TCLK5”, "TIOA3-TIOA5” and "TIOB3-TIOB5” are the external I/O pins of a second Timer Counter block (i.e., instance TC1).

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.3. Clock Selection



69.6.4. Clock Control

The clock of each counter can be controlled in two different ways: it can be enabled/disabled and started/stopped, as shown in the following figure.

- The clock can be enabled or disabled by the user with the CLKEN and the CLKDIS commands in the Channel Control register (TC_CCR). In Capture mode it can be disabled by an RB load event if TC_CMRx.LDBDIS is set to ‘1’. In Waveform mode, it can be disabled by an RC Compare event if TC_CMRx.CPCDIS is set to ‘1’. When disabled, the start or the stop actions have no effect: only a CLKEN command in the TC_CCR can reenable the clock. When the clock is enabled, TC_SR.CLKSTA is set.
- The clock can also be started or stopped: a trigger (software, synchro, external or compare) always starts the clock. The clock can be stopped by an RB load event in Capture mode (TC_CMRx.LDBSTOP = 1) or an RC compare event in Waveform mode (TC_CMRx.CPCSTOP = 1). The start and the stop commands are effective only if the clock is enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.4. Clock Control

69.6.5. Operating Modes

Each channel can operate independently in two different modes:

- Capture mode provides measurement on signals.
- Waveform mode provides wave generation.

The TC operating mode is programmed with TC_CMRx.WAVE.

In Capture mode, TIOAx and TIOBx are configured as inputs.

In Waveform mode, TIOAx is always configured to be an output and TIOBx is an output if it is not selected to be the external trigger.

69.6.6. Trigger Events

An input trigger event resets the internal counter value and starts the counter clock. Three types of trigger are common to both modes, and an external trigger is available to each mode (Capture or Waveform).

Regardless of the input trigger event used, it will be taken into account at the following active edge of the selected clock. This means that the counter value can be read differently from zero just after a trigger event, especially when a low frequency signal is selected as the clock.

The following input trigger events are common to both modes:

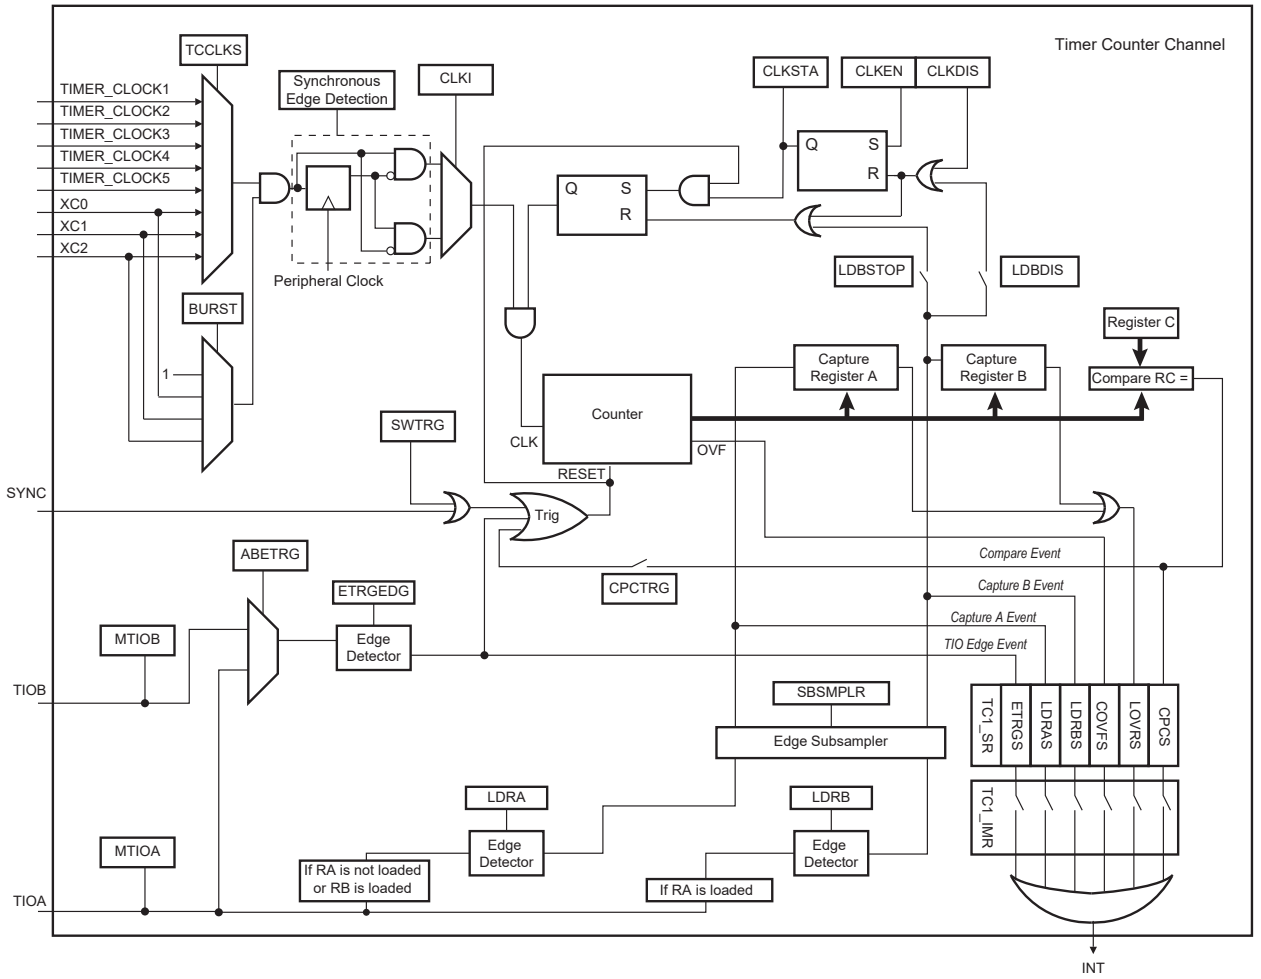
- Software trigger: Each channel has a software trigger, available by setting TC_CCR.SWTRG.
- SYNC: Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC_BCR with SYNC set.
- Compare RC trigger: RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if TC_CMRx.CPCTRG is set.

The timer channel can also be configured to be triggered by an external event.

In Capture mode, the external trigger signal can be selected between TIOAx and TIOBx.

In Waveform mode, an external event can be programmed on one of the following signals: TIOBx, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting TC_CMRx.ENETRG.

© 2026 Microchip Technology Inc. and its subsidiaries



If an external trigger event is used, the duration of the pulses must be longer than the peripheral clock period to be detected.

69.6.7. Trigger Conditions

In addition to the SYNC signal, the software trigger and the RC compare trigger, an external trigger can be defined.

The ABETRG bit in the TC_CMR selects TIOAx or TIOBx input signal as an external trigger or the trigger signal from the output comparator of the PWM module. The External Trigger Edge Selection parameter (ETRGEDG field in TC_CMR) defines the edge (rising, falling, or both) detected to generate an external trigger. If ETRGEDG = 0 (none), the external trigger is disabled.

Figure 69.5. Capture Mode

69.6.8. Capture Mode

Capture mode is entered by clearing TC_CMRx.WAVE.

Capture mode allows the TC channel to perform measurements such as pulse timing, frequency, period, duty cycle and phase on TIOAx and TIOBx signals which are considered as inputs.

The figure Capture Mode shows the configuration of the TC channel when programmed in Capture mode.

© 2026 Microchip Technology Inc. and its subsidiaries

69.6.9. Capture Registers A and B

Registers A and B (TC_RA and TC_RB) are used as capture registers. They can be loaded with the counter value when a programmable event occurs on the signal TIOAx.

TC_CMRx.LDRA defines the TIOAx selected edge for the loading of TC_RA, and TC_CMRx.LDRB defines the TIOAx selected edge for the loading of TC_RB.

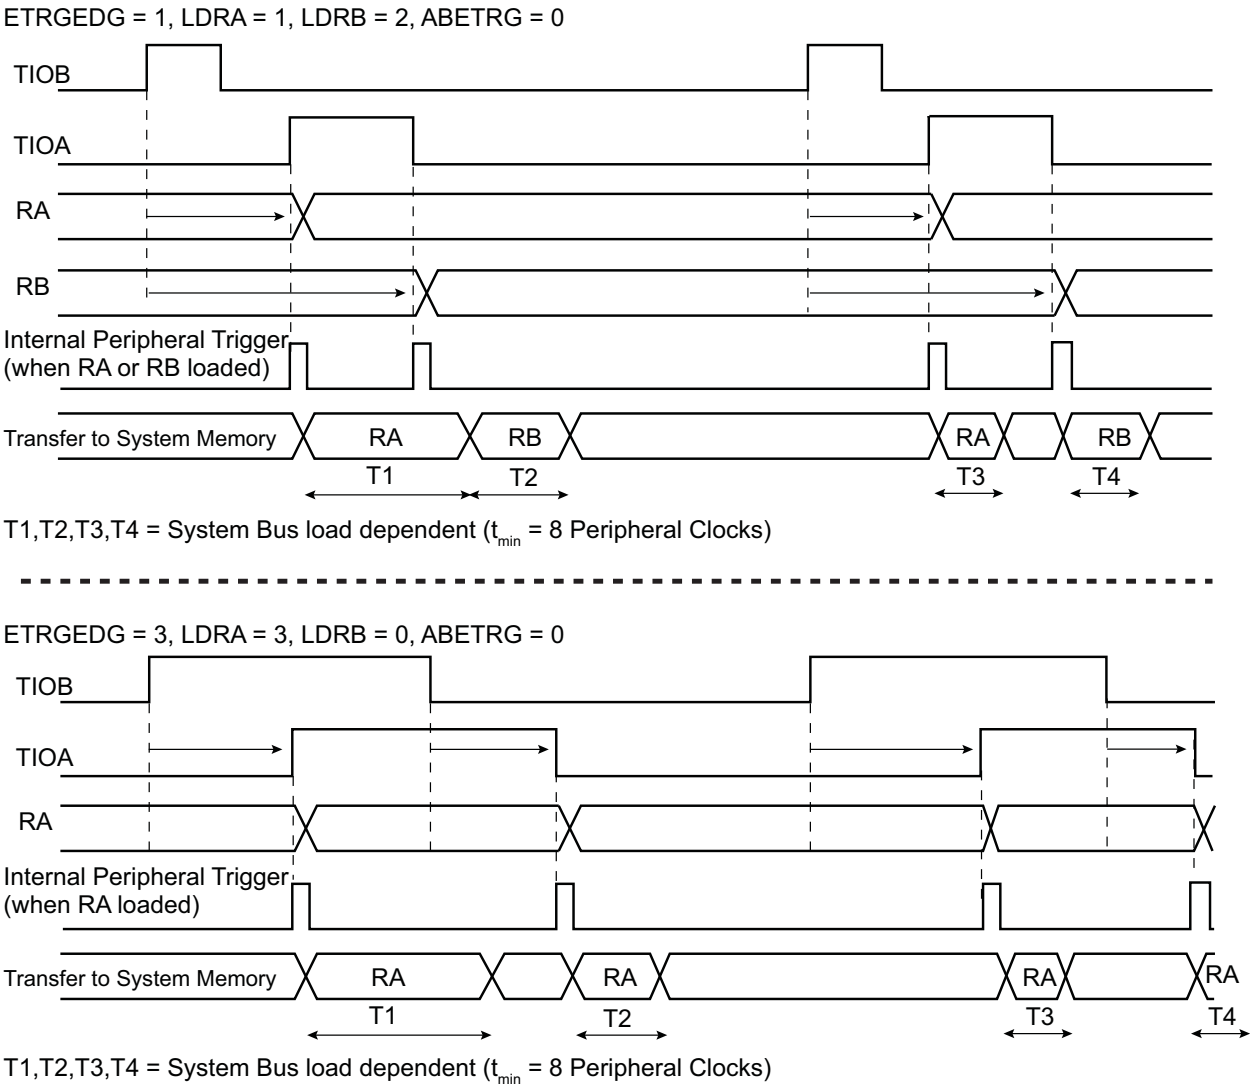
The subsampling ratio defined by TC_CMRx.SBSMPLR is applied to these selected edges, so that the loading of Register A and Register B occurs once every 1, 2, 4, 8 or 16 selected edges.

TC_RA is loaded only if it has not been loaded since the last trigger or if TC_RB has been loaded since the last loading of TC_RA.

TC_RB is loaded only if TC_RA has been loaded since the last trigger or the last loading of TC_RB.

Loading TC_RA or TC_RB before the read of the last value loaded sets TC_SR.LOVRS. In this case, the old value is overwritten.

When DMA is used, the Register AB (TC_RAB) address must be configured as source address of the transfer. TC_RAB provides the next unread value from TC_RA and TC_RB. It may be read by the DMA after a request has been triggered upon loading TC_RA or TC_RB.



69.6.10. Transferring Timer Values with DMAC in Capture Mode

The DMAC can perform access from the TC to system memory in Capture mode only.

The following figure illustrates how TC_RA and TC_RB can be loaded in the system memory without processor intervention.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.6. Example of Transfer with DMAC in Capture Mode

69.6.11. Waveform Mode

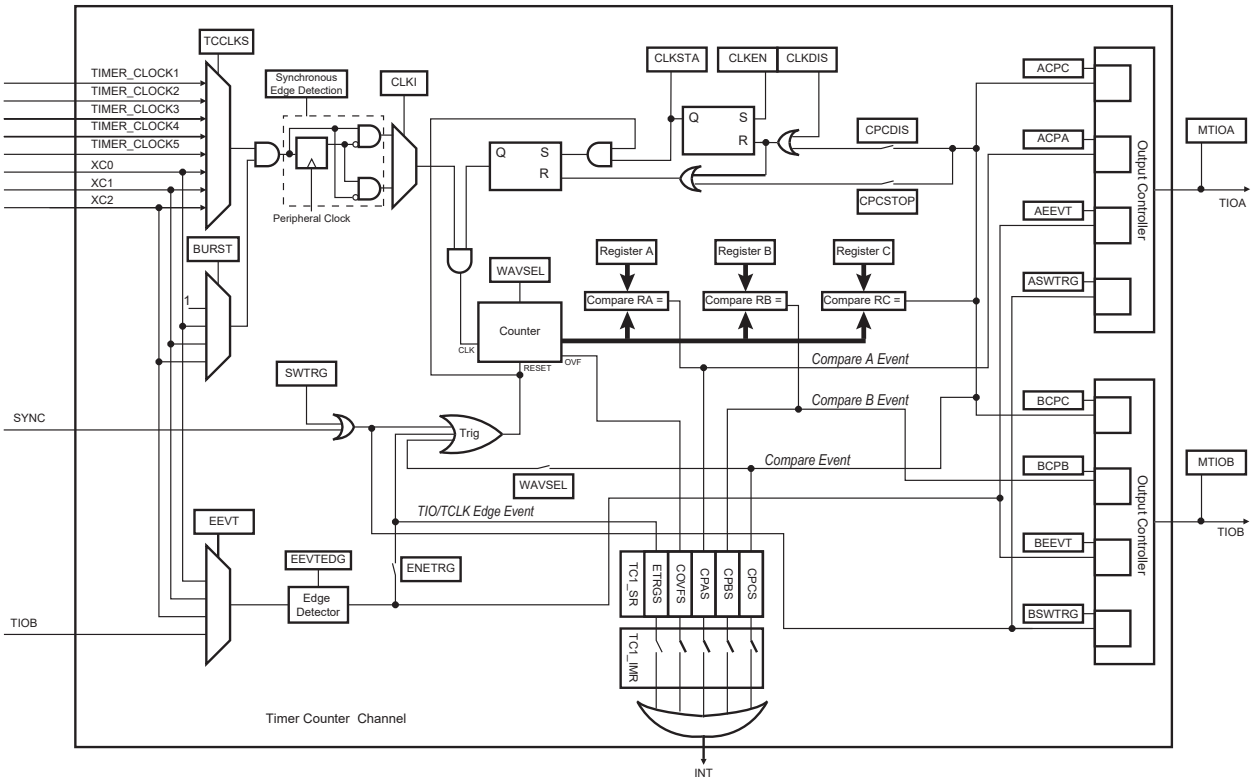
Waveform mode is entered by setting the TC_CMRx.WAVE bit.

In Waveform mode, the TC channel generates one or two PWM signals with the same frequency and independently programmable duty cycles, or generates different types of one-shot or repetitive pulses.

In this mode, TIOAx is configured as an output and TIOBx is defined as an output if it is not used as an external event (EEVT parameter in TC_CMR).

The figure Waveform Mode shows the configuration of the TC channel when programmed in Waveform operating mode.

69.6.12. Waveform Selection



Depending on the WAVSEL parameter in TC_CMR, the behavior of TC_CV varies.

With any selection, TC_RA, TC_RB and TC_RC can all be used as compare registers.

RA Compare is used to control the TIOAx output, RB Compare is used to control the TIOBx output (if correctly configured) and RC Compare is used to control TIOAx and/or TIOBx outputs.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.7. Waveform Mode

69.6.12.1.WAVSEL = 00

When WAVSEL = 00, the value of TC_CV is incremented from 0 to 2^{32}-1. Once 2^{32}-1 has been reached, the value of TC_CV is reset. Incrementation of TC_CV starts again and the cycle continues.

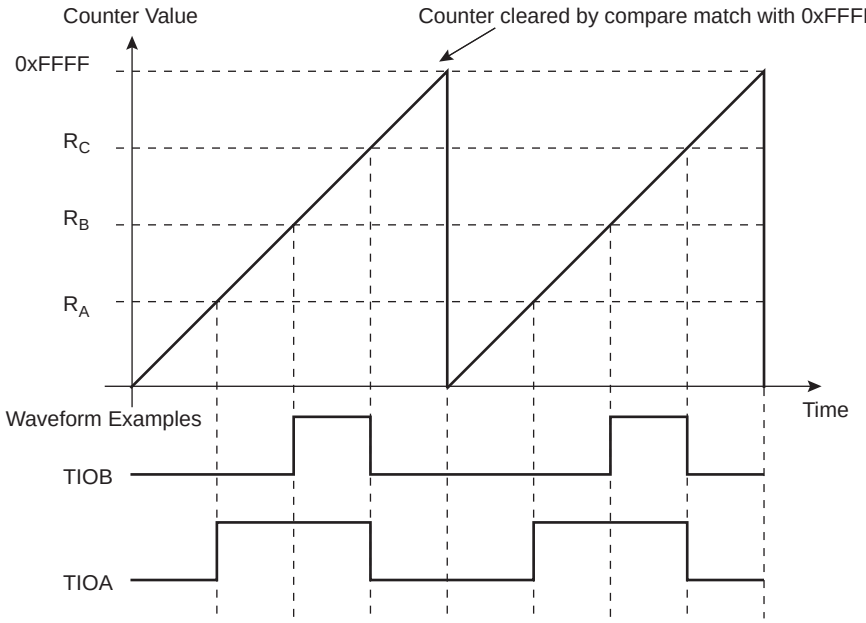
An external event trigger or a software trigger can reset the value of TC_CV. It is important to note that the trigger may occur at any time.

See the following figures.

RC Compare cannot be programmed to generate a trigger in this configuration. At the same time, RC Compare can stop the counter clock (CPCSTOP = 1 in TC_CMR) and/or disable the counter clock (CPCDIS = 1 in TC_CMR).

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.8. WAVSEL = 00 without Trigger



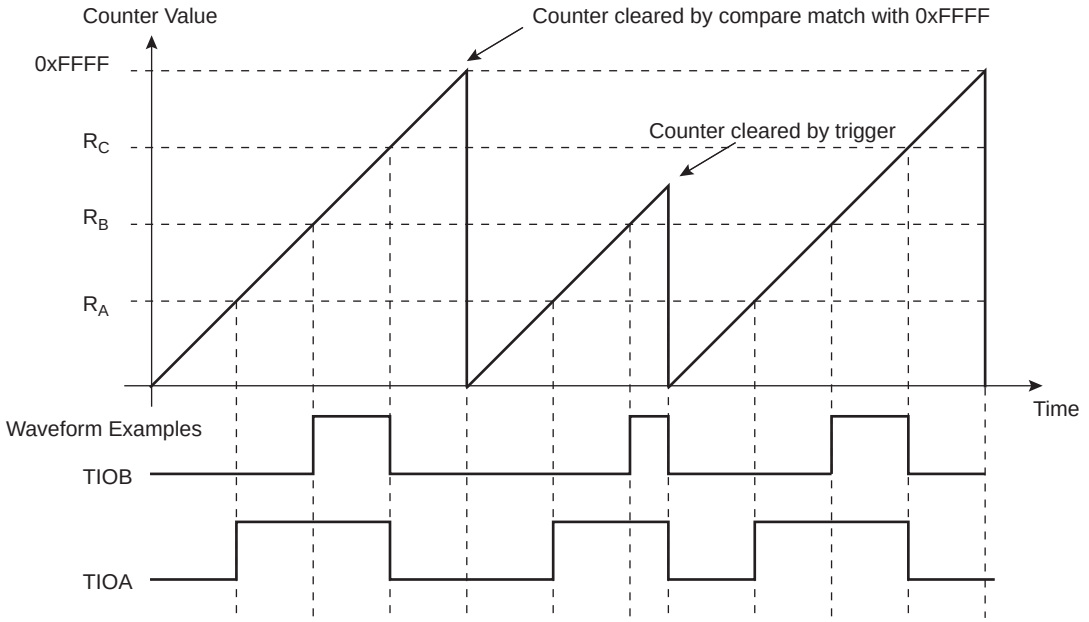


Figure 69.9. WAVSEL = 00 with Trigger

69.6.12.2.WAVSEL = 10

When WAVSEL = 10, the value of TC_CV is incremented from 0 to the value of RC, then automatically reset on a RC Compare. Once the value of TC_CV has been reset, it is then incremented and so on.

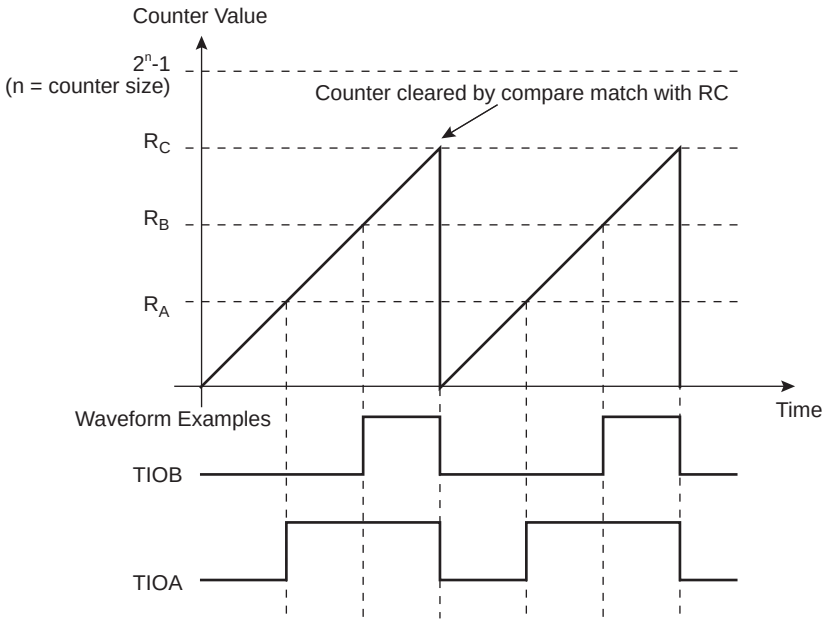
It is important to note that TC_CV can be reset at any time by an external event or a software trigger if both are programmed correctly.

See the following figures.

In addition, RC Compare can stop the counter clock (CPCSTOP = 1 in TC_CMR) and/or disable the counter clock (CPCDIS = 1 in TC_CMR).

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.10. WAVSEL = 10 without Trigger



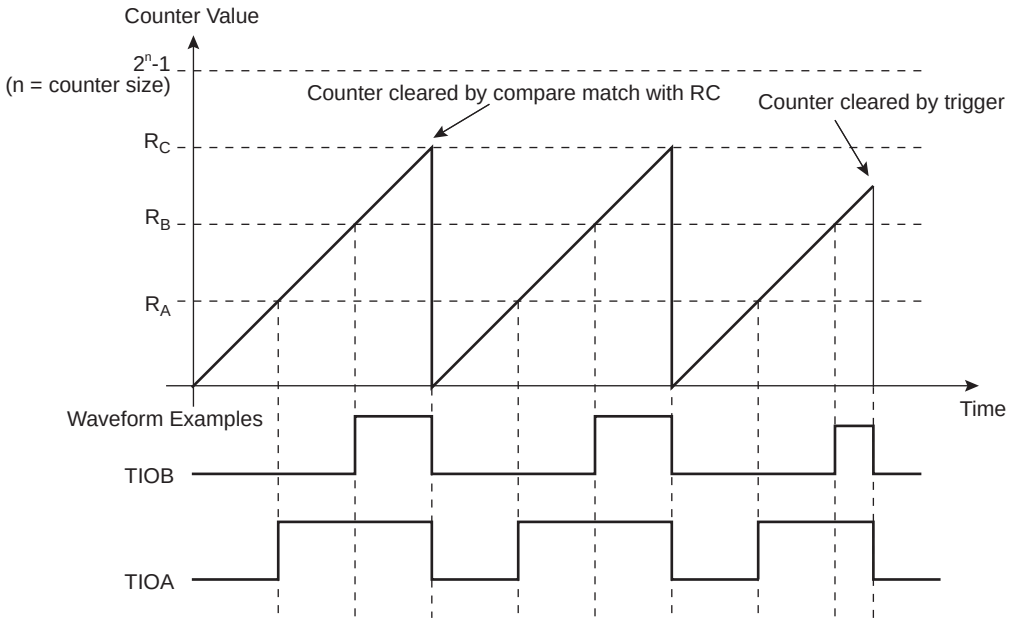


Figure 69.11. WAVSEL = 10 with Trigger

69.6.12.3.WAVSEL = 01

When WAVSEL = 01, the value of TC_CV is incremented from 0 to 2^{32}-1 . Once 2^{32}-1 is reached, the value of TC_CV is decremented to 0, then reincremented to 2^{32}-1 and so on.

A trigger such as an external event or a software trigger can modify TC_CV at any time. If a trigger occurs while TC_CV is incrementing, TC_CV then decrements. If a trigger is received while TC_CV is decrementing, TC_CV then increments.

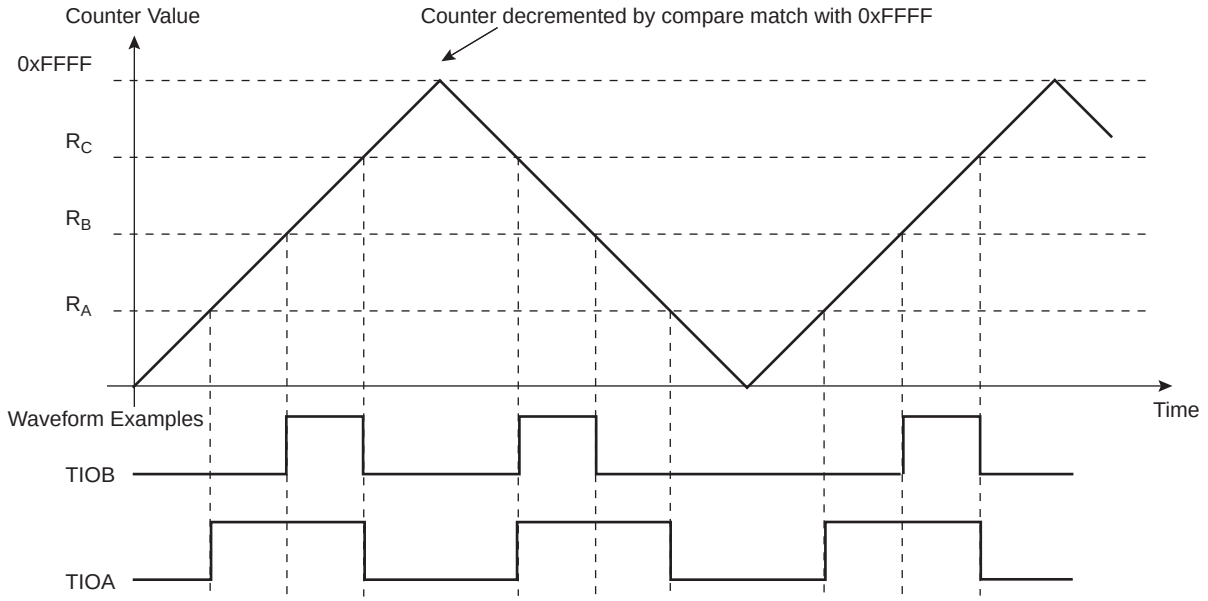
See the following figures.

RC Compare cannot be programmed to generate a trigger in this configuration.

© 2026 Microchip Technology Inc. and its subsidiaries

At the same time, RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

Figure 69.12. WAVSEL = 01 without Trigger



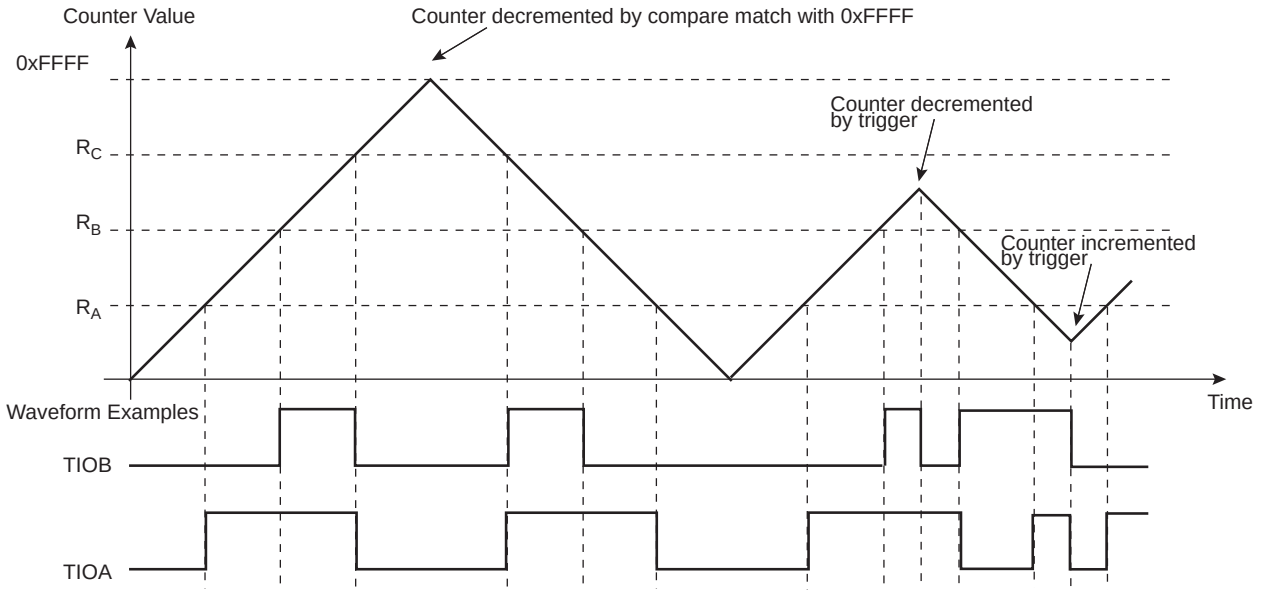


Figure 69.13. WAVSEL = 01 with Trigger

69.6.12.4.WAVSEL = 11

When WAVSEL = 11, the value of TC_CV is incremented from 0 to RC. Once RC is reached, the value of TC_CV is decremented to 0, then reincremented to RC and so on.

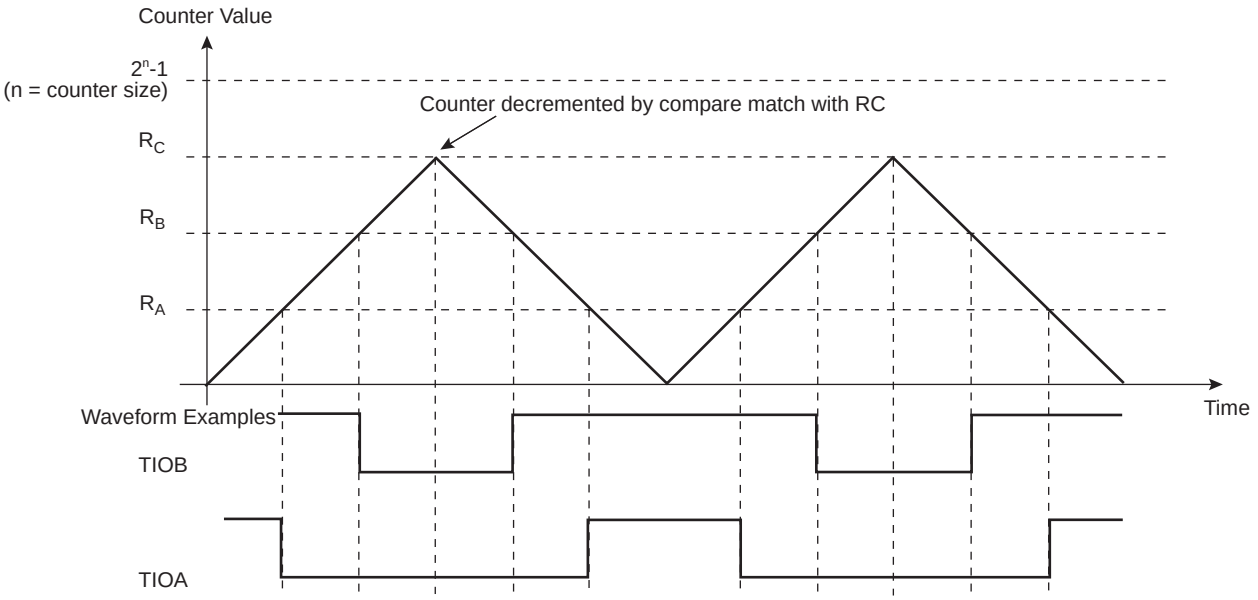
A trigger such as an external event or a software trigger can modify TC_CV at any time. If a trigger occurs while TC_CV is incrementing, TC_CV then decrements. If a trigger is received while TC_CV is decrementing, TC_CV then increments.

See the following figures.

RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.14. WAVSEL = 11 without Trigger



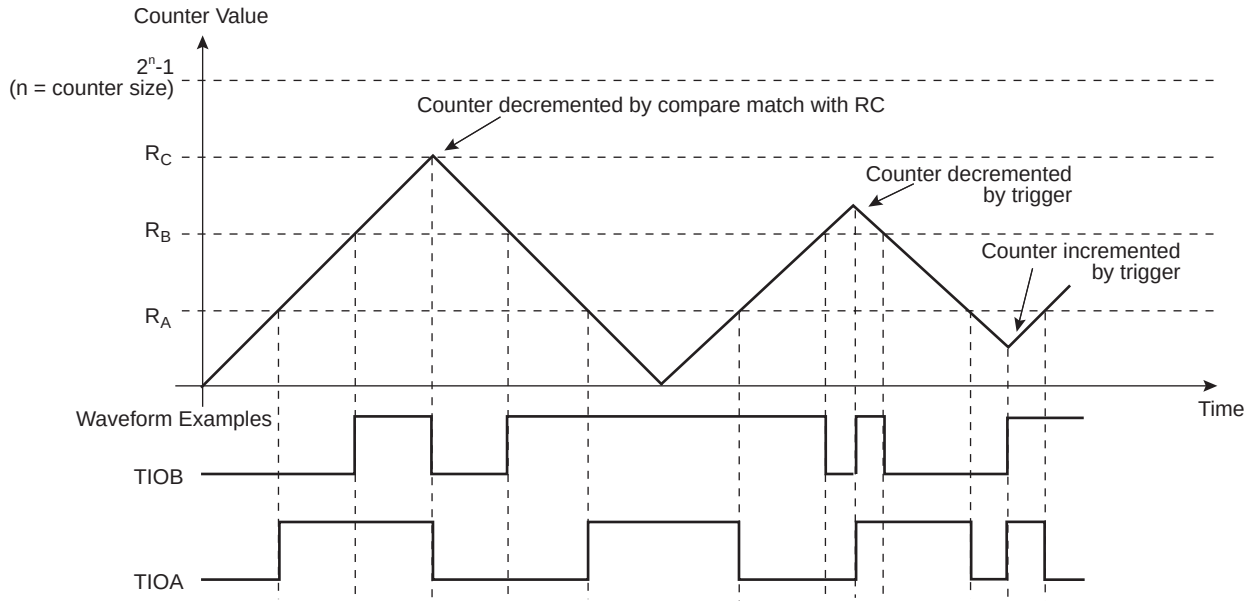


Figure 69.15. WAVSEL = 11 with Trigger

69.6.13. External Event/Trigger Conditions

An external event can be programmed to be detected on one of the clock sources (XC0, XC1, XC2) or TIOBx. The external event selected can then be used as a trigger.

The event trigger is selected using TC_CMR.EEVT. The trigger edge (rising, falling or both) for each of the possible external triggers is defined in TC_CMR.EEVTEDG. If EEVTEDG is cleared (none), no external event is defined.

If TIOBx is defined as an external event signal (EEVT = 0), TIOBx is no longer used as an output and the compare register B is not used to generate waveforms and subsequently no IRQs. In this case, the TC channel can only generate a waveform on TIOAx.

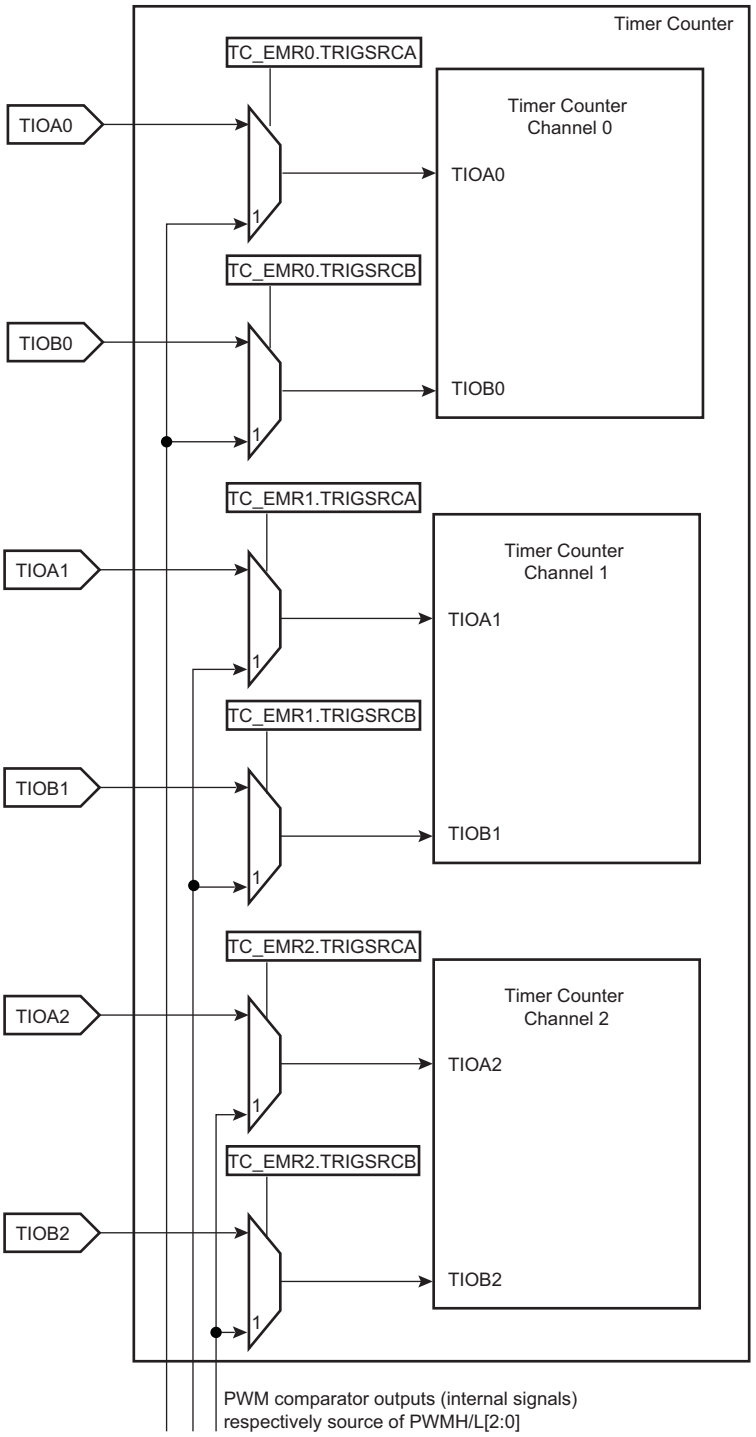
When an external event is defined, it can be used as a trigger by setting TC_CMR.ENETRG.

© 2026 Microchip Technology Inc. and its subsidiaries

As in Capture mode, the SYNC signal and the software trigger are also available as triggers. RC Compare can also be used as a trigger depending on the parameter WAVSEL.

69.6.14. Synchronization with PWM

The inputs TIOAx/TIOBx can be bypassed, and thus channel trigger/capture events can be directly driven by the independent PWM module.



PWM comparator outputs (internal signals without dead-time insertion - OCx), respectively source of the PWMH/L[2:0] outputs, are routed to the internal TC inputs. These specific TC inputs are multiplexed with TIOA/B input signal to drive the internal trigger/capture events.

The selection is made in the Extended Mode register (TC_EMR) fields TRIGSRCA and TRIGSRCB (see TC_EMRx).

Each channel of the TC module can be synchronized by a different PWM channel as described in the following figure.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.16. Synchronization with PWM

Note: This figure provides pin names of the first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external IO pins of a second Timer Counter block (i.e., instance TC1).

69.6.15. Output Controller

The output controller defines the output level changes on TIOAx and TIOBx following an event. TIOBx control is used only if TIOBx is defined as output (not as an external event).

© 2026 Microchip Technology Inc. and its subsidiaries

The following events control TIOAx and TIOBx:

- Software trigger
- External event
- RC compare

RA Compare controls TIOAx, and RB Compare controls TIOBx. Each of these events can be programmed to set, clear or toggle the output as defined in the corresponding parameter in TC_CMR.

69.6.16. Quadrature Decoder

69.6.16.1.Description

The quadrature decoder (QDEC) is driven by TIOA0, TIOB0 and TIOB1 input pins and drives the timer counter of channel 0 and 1. Channel 2 can be used as a time base in case of speed measurement requirements (see the following figure).

When writing a '0' to TC_BMR.QDEN, the QDEC is bypassed and the IO pins are directly routed to the timer counter function.

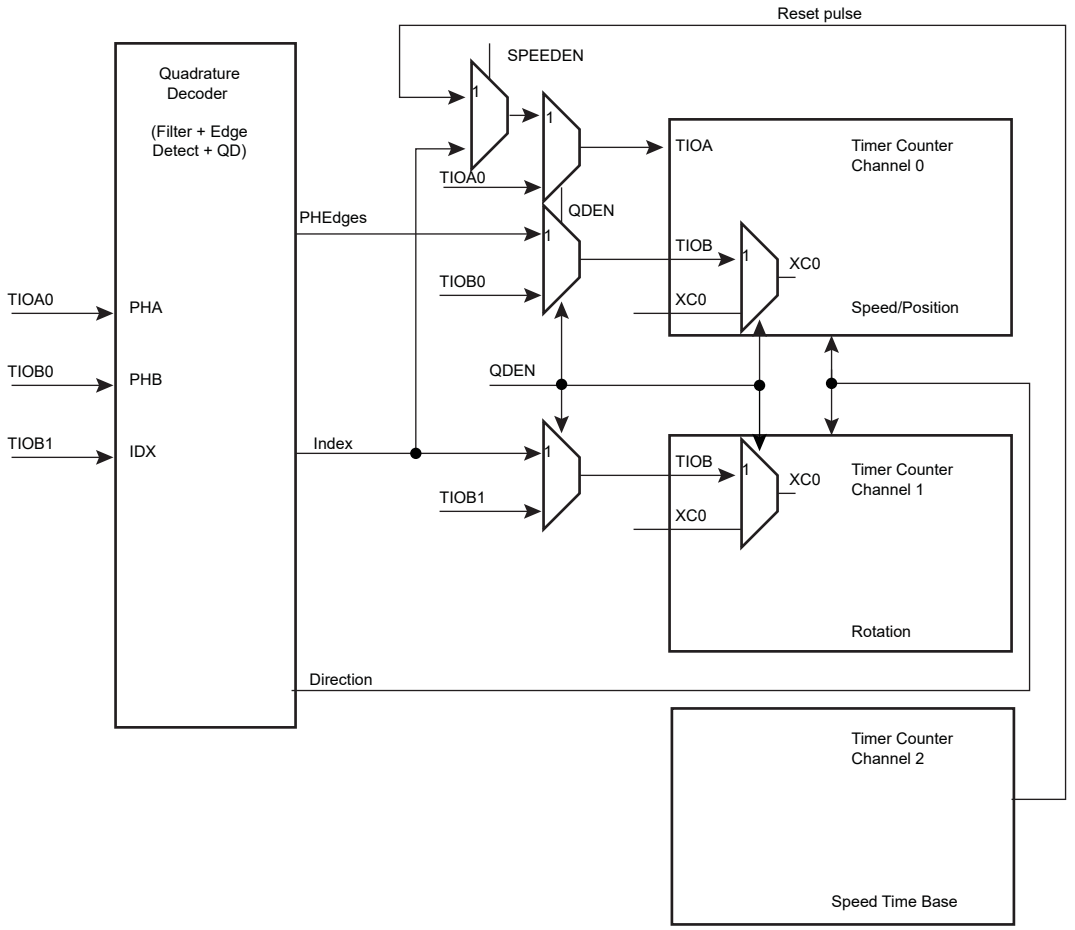
TIOA0 and TIOB0 are to be driven by the two dedicated quadrature signals from a rotary sensor mounted on the shaft of the off-chip motor.

A third signal from the rotary sensor can be processed through pin TIOB1 and is typically dedicated to be driven by an index signal if it is provided by the sensor. This signal is not required to decode the quadrature signals PHA, PHB.

TC_CMRx.TCCLKS must be configured to select XC0 input (i.e., 0x101). Field TC0XC0S has no effect as soon as the QDEC is enabled.

Either speed or position/revolution can be measured. Position channel 0 accumulates the edges of PHA, PHB input signals giving a high accuracy on motor position whereas channel 1 accumulates the index pulses of the sensor, therefore the number of rotations. Concatenation of both values provides a high level of precision on motion system position.

In Speed mode, position cannot be measured but revolution can be measured.



Inputs from the rotary sensor can be filtered prior to downstream processing. Accommodation of input polarity, phase definition and other factors are configurable.

Interruptions can be generated on different events.

A compare function (using TC_RC) is available on channel 0 (speed/position) or channel 1 (rotation) and can generate an interrupt by means of TC_SRx.CPCS.

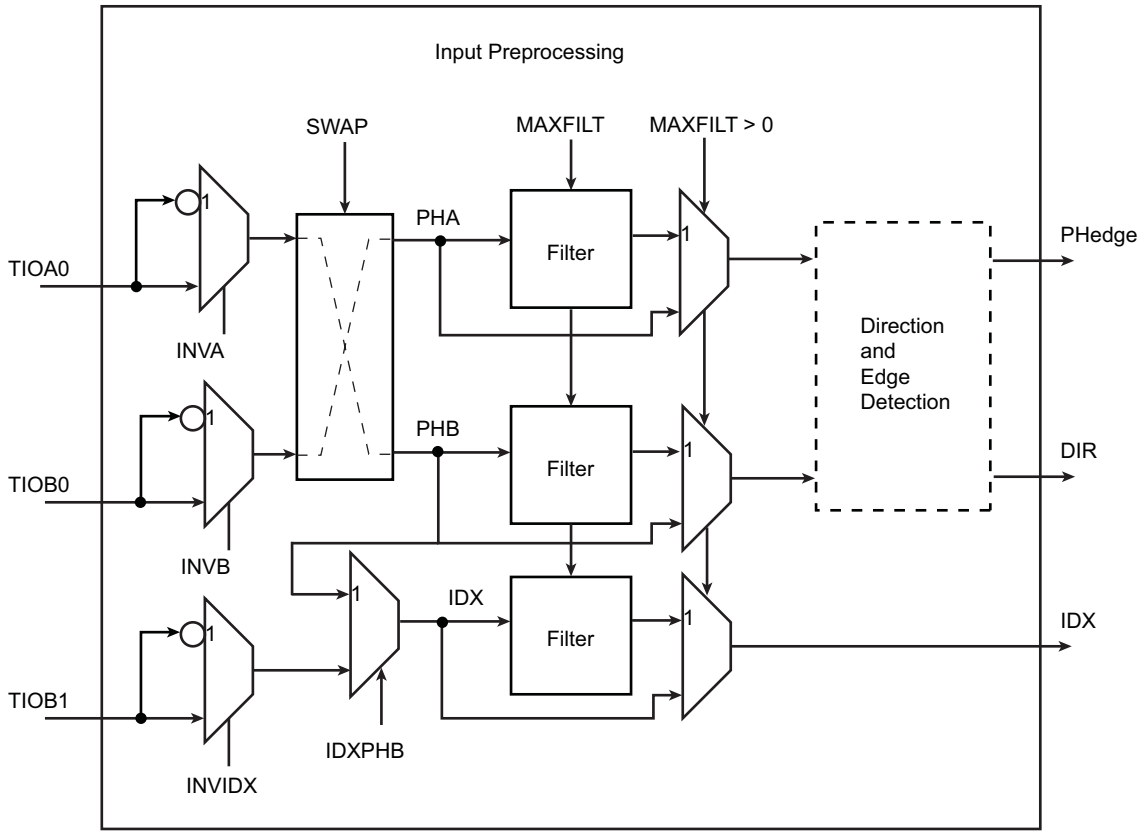
© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.17. Predefined Connection of the Quadrature Decoder with Timer Counters

Note: This figure provides pin names of the first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external IO pins of a second Timer Counter block (i.e., instance TC1).

69.6.16.2.Input Preprocessing

Input preprocessing consists of capabilities to take into account rotary sensor factors such as polarities and phase definition followed by configurable digital filtering.



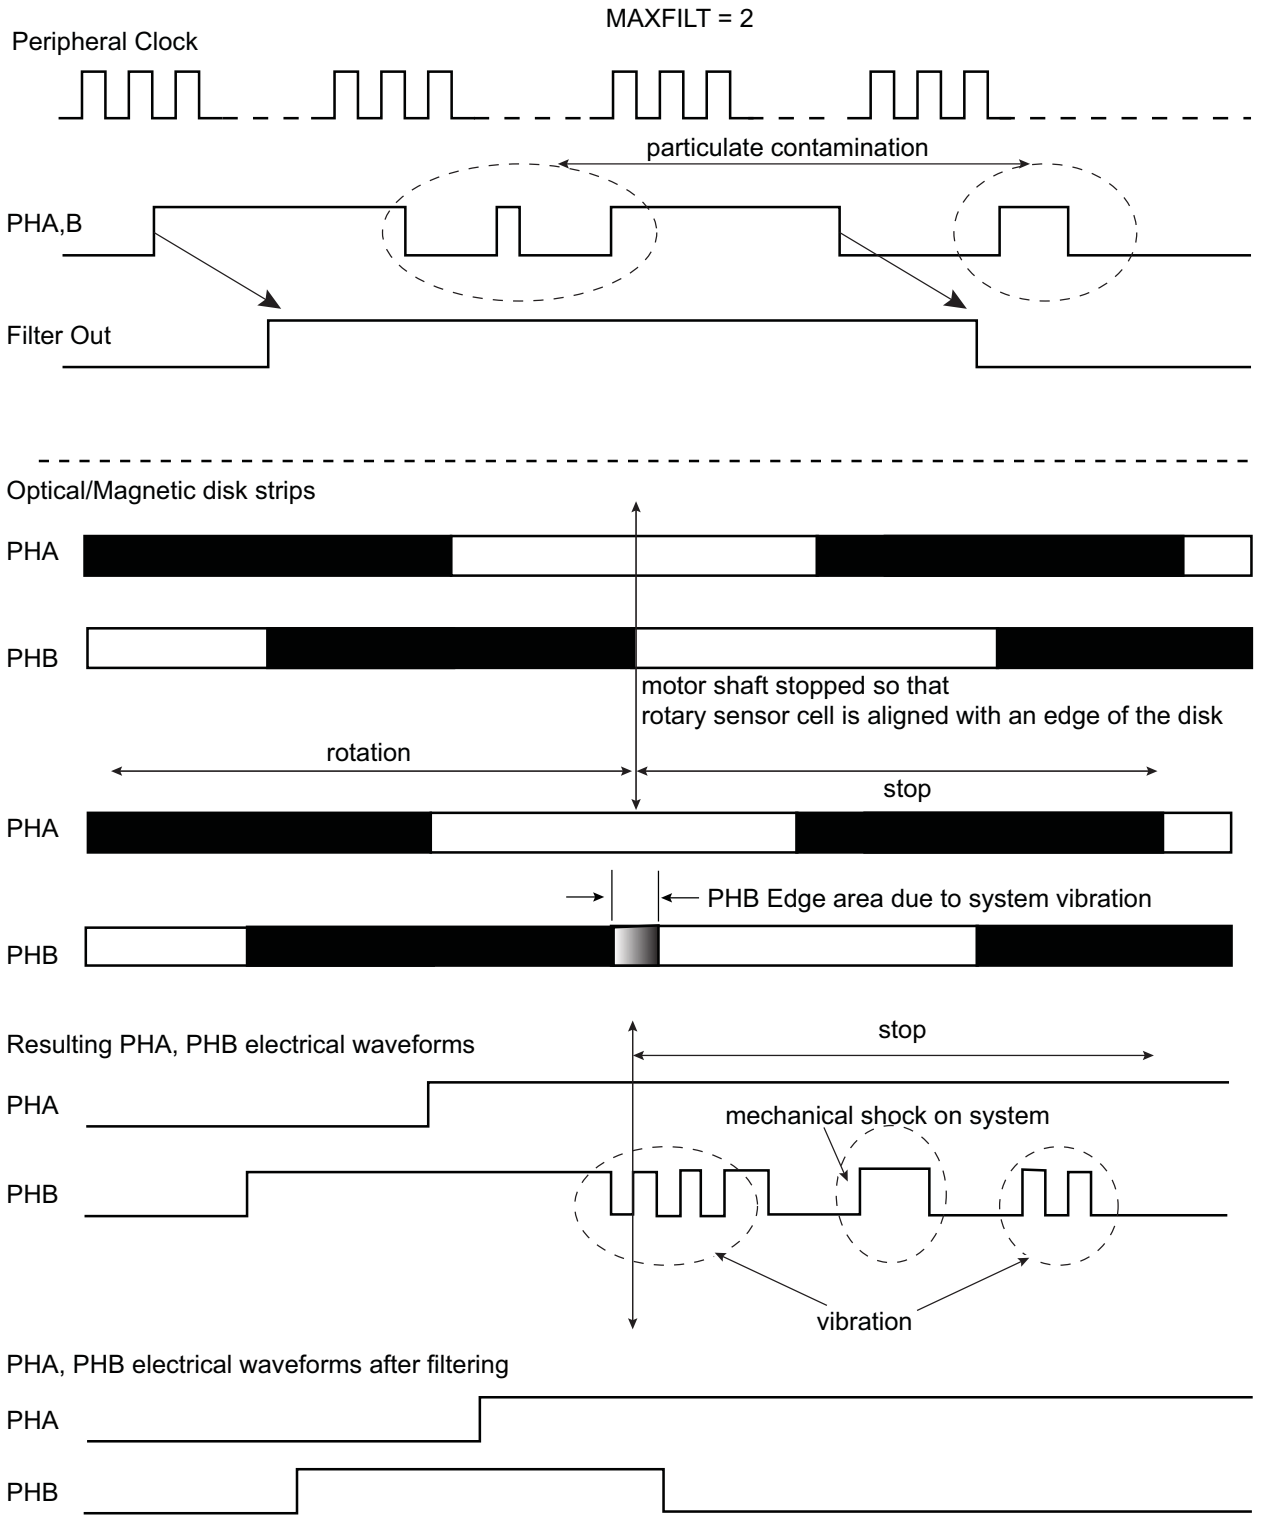
Each input can be negated and swapping PHA, PHB is also configurable.

TC_BMR. MAXFILT is used to configure a minimum duration for which the pulse is stated as valid. When the filter is active, pulses with a duration lower than (MAXFILT +1) × $t_{peripheral\ clock}$ are not passed to downstream logic.

The value of (MAXFILT +1) × $t_{peripheral\ clock}$ must not be greater than 10% of the minimum pulse on PHA, PHB or index when the rotary encoder speed is at its maximum. This speed depends on the application.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.18. Input Stage



Input filtering can efficiently remove spurious pulses that might be generated by the presence of particulate contamination on the optical or magnetic disk of the rotary sensor.

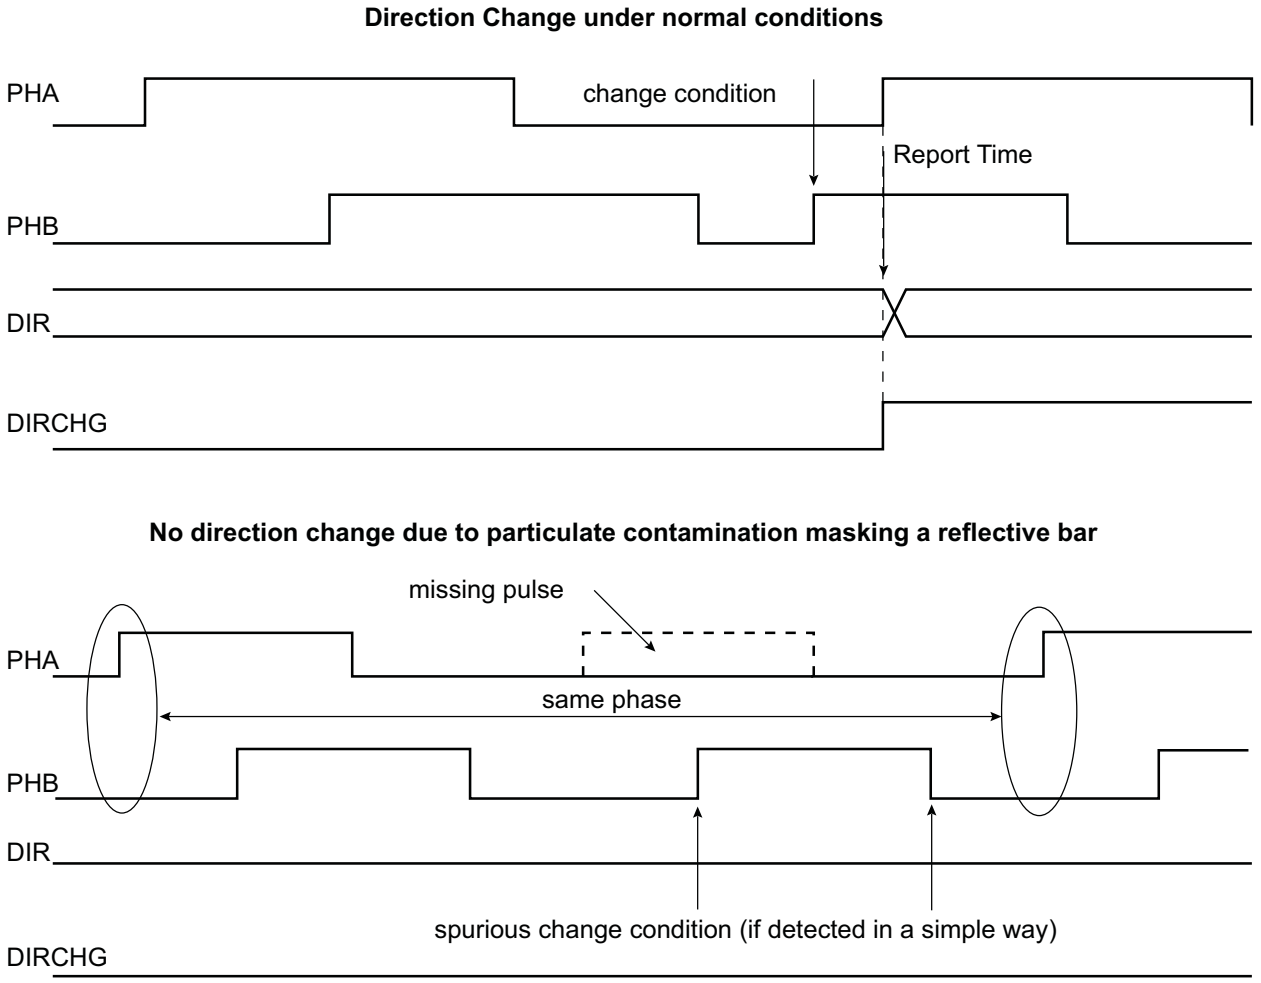
Spurious pulses can also occur in environments with high levels of electromagnetic interference. Or, simply if vibration occurs even when rotation is fully stopped and the shaft of the motor is in such a position that the beginning of one of the reflective or magnetic bars on the rotary sensor disk is aligned with the light or magnetic (Hall) receiver cell of the rotary sensor. Any vibration can make the PHA, PHB signals toggle for a short duration.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.19. Filtering Examples

69.6.16.3.Direction Status and Change Detection

After filtering, the quadrature signals are analyzed to extract the rotation direction and edges of the two quadrature signals detected in order to be counted by TC logic downstream.



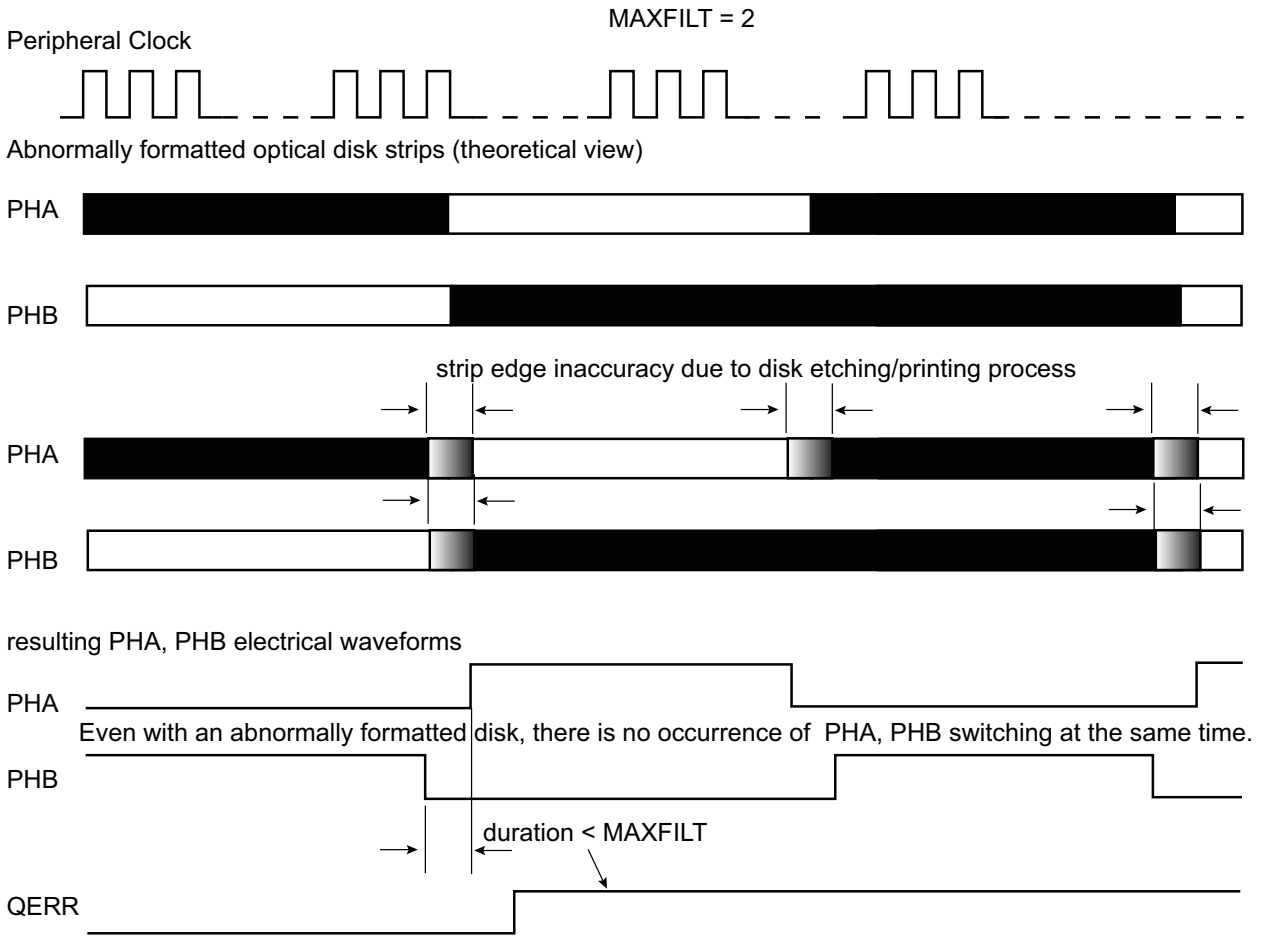
© 2026 Microchip Technology Inc. and its subsidiaries

The direction status can be directly read at anytime in the TC_QISR. The polarity of the direction flag status depends on the configuration written in TC_BMR. INVA, INVB, INVIDX, SWAP modify the polarity of DIR flag.

Any change in rotation direction is reported in the TC_QISR and can generate an interrupt.

The direction change condition is reported as soon as two consecutive edges on a phase signal have sampled the same value on the other phase signal and there is an edge on the other signal. The two consecutive edges of one phase signal sampling the same value on other phase signal is not sufficient to declare a direction change, as particulate contamination may mask one or more reflective bars on the optical or magnetic disk of the sensor. See the following figure for waveforms.

Figure 69.20. Rotation Change Detection



The direction change detection is disabled when TC_BMR.QDTRANS is set. In this case, the DIR flag report must not be used.

A quadrature error is also reported by the QDEC via TC_QISR.QERR. This error is reported if the time difference between two edges on PHA, PHB is lower than a predefined value. This predefined value is configurable and corresponds to (TC_BMR.MAXFILT + 1) × $t_{peripheral\ clock}$ ns. After being filtered, there is no reason to have two edges closer than (TC_BMR.MAXFILT + 1) × $t_{peripheral\ clock}$ ns under normal mode of operation.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 69.21. Quadrature Error Detection

MAXFILT must be tuned according to several factors such as the peripheral clock frequency, type of rotary sensor and rotation speed to be achieved.

69.6.16.4.Position and Rotation Measurement

When TC_BMR.POSEN is set, the motor axis position is processed on channel 0 (by means of the PHA, PHB edge detections) and the number of motor revolutions are recorded on channel 1 if the IDX signal is provided on the TIOB1 input. If no IDX signal is available, the internal counter can be cleared for each revolution if the number of counts per revolution is configured in TC_RC0.RC and the TC_CMR.CPCTRG bit is written to '1'. The position measurement can be read in the TC_CV0 register and the rotation measurement can be read in the TC_CV1 register.

Channel 0 and 1 must be configured in Capture mode (TC_CMR0.WAVE = 0). 'Rising edge' must be selected as the External Trigger Edge (TC_CMR.ETRGEDG = 0x01) and 'TIOAx' must be selected as the External Trigger (TC_CMR.ABETRG = 0x1). The process must be started by configuring TC_CCR.CLKEN and TC_CCR.SWTRG.

In parallel, the number of edges are accumulated on TC channel 0 and can be read on the TC_CV0 register.

Therefore, the accurate position can be read on both TC_CV registers and concatenated to form a 32-bit word.

The TC channel 0 is cleared for each increment of IDX count value.

Depending on the quadrature signals, the direction is decoded and allows to count up or down in TC channels 0 and 1. The direction status is reported on TC_QISR.

© 2026 Microchip Technology Inc. and its subsidiaries

69.6.16.5.Speed Measurement

When TC_BMR.SPEEDEN is set, the speed measure is enabled on channel 0.

A time base must be defined on channel 2 by writing the TC_RC2 period register. Channel 2 must be configured in Waveform mode (WAVE bit set) in TC_CMR2. The WAVSEL field must be defined with 0x10 to clear the counter by comparison and matching with TC_RC value. Field ACPC must be defined at 0x11 to toggle TIOAx output.

This time base is automatically fed back to TIOAx of channel 0 when QDEN and SPEEDEN are set.

Channel 0 must be configured in Capture mode (WAVE = 0 in TC_CMR0). TC_CMR0.ABETRG must be configured at 1 to select TIOAx as a trigger for this channel.

EDGTRG must be set to 0x01, to clear the counter on a rising edge of the TIOAx signal and field LDRA must be set accordingly to 0x01, to load TC_RA0 at the same time as the counter is cleared (LDRB must be set to 0x01). As a consequence, at the end of each time base period the differentiation required for the speed calculation is performed.

The process must be started by configuring bits CLKEN and SWTRG in the TC_CCR.

The speed can be read on field RA in TC_RA0.

Channel 1 can still be used to count the number of revolutions of the motor.

69.6.16.6.Detecting a Missing Index Pulse

To detect a missing index pulse due contamination, dust, etc., the TC_SR0.CPCS flag can be used. It is also possible to assert the interrupt line if the TC_SR0.CPCS flag is enabled as a source of the interrupt by writing a '1' to TC_IER0.CPCS.

The TC_RC0.RC field must be written with the nominal number of counts per revolution provided by the rotary encoder, plus a margin to eliminate potential noise (ex: if the nominal count per revolution is 1024, then TC_RC0.RC=1026).

If the index pulse is missing, the timer value is not cleared and the nominal value is exceeded, then the comparator on the RC triggers an event, TC_SR0.CPCS=1, and the interrupt line is asserted if TC_IER0.CPCS=1.

The missing index pulse detection is only valid if the bit TC_QISR.DIRCHG=0.

69.6.16.7.Detecting a Badly Located Index

The digital filter reduces effects of dust, scratches or contamination on the index line. If the contamination creates a pulse surpassing the filter capacity (in particular at low speed), this can be interpreted as an index pulse, even if it is badly placed.

An on-the-fly detection of a badly-placed index is enabled when TC_BMR.BIDXCE=1. TC_RC0.RC must be written with the nominal number of counts per revolution provided by the rotary encoder + 2. For example, if the nominal count per revolution is 1024, then TC_RC0.RC=1026. This margin of 2 eliminates potential noise.

If the pulse is processed while the current value of the counter (TC_CV0) is outside the value programmed in TC_RC0.RC ±2, the TC_SR0.LDRAS flag is written to '1' and the location of the pulse is written in TC_RA0.

This detection circuitry does not prevent a rotary encoder integrity check before use.

69.6.16.8.Detecting Contamination/Dust at Rotary Encoder Low Speed

The contamination/dust that can be filtered when the rotary encoder speed is high may not be filtered at low speed, thus creating unsollicited direction change, etc.

At low speed, even a minor contamination may appear as a long pulse, and thus not filtered and processed as a standard quadrature encoder pulse.

This contamination can be detected by using the similar method as the missing index detection.

© 2026 Microchip Technology Inc. and its subsidiaries

A contamination exists on a phase line if TC_SR.CPCS = 1 and TC_QISR.DIRCHG = 1 when there is no sollicited change of direction.

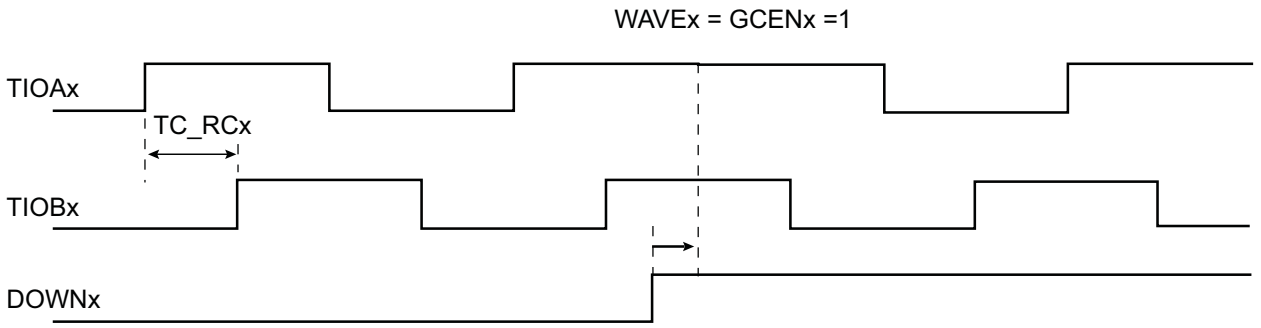
69.6.16.9.Report of Filtered Pulses due to Contamination/Dust

When the digital filter removes pulses created by contamination/dust, a report is provided in the TC QDEC Interrupt Status Register. A separate flag is provided for each line (PHA, PHB, Index) and one flag is provided when a missing pulse is corrected (a '1' must be written to TC_BMR.AUTOC). If TC_QISR.FPHA=1, a pulse has been filtered on PHA line. If TC_QISR.FPHB=1, a pulse has been filtered on PHB line. If TC_QISR.FIDX=1, a pulse has been filtered on Index line. If TC_QISR.FMP=1, a missing pulse has been corrected by the missing pulse detection logic.

The on-the-fly detection and associated flags can be used to anticipate further effects of contamination/dust, in particular if the flag is written to '1' when the rotary encoder speed is high. This may cause abnormal behavior when the rotary encoder slows down if the abnormal pulse is no longer filtered (surpassing digital filter capabilities).

This detection circuitry does not prevent rotary encoder integrity check before use.

69.6.17. 2-bit Gray Up/Down Counter for Stepper Motor



Each channel can be independently configured to generate a 2-bit Gray count waveform on corresponding TIOAx, TIOBx outputs by means of TC_SMMRx.GCEN.

Up or Down count can be defined by writing TC_SMMRx.DOWN.

It is mandatory to configure the channel in Waveform mode in the TC_CMR.

The period of the counters can be programmed in TC_RCx.

Figure 69.22. 2-bit Gray Up/Down Counter

69.6.18. Register Write Protection

To prevent any single software error from corrupting TC behavior, certain registers in the address space can be write-protected by setting the WPEN bit , WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) in the TC Write Protection Mode Register (TC_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the "TC Safety Status Register" (TC_SSRx) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The Timer Counter clock of the first channel must be enabled to access TC_WPMR.

The following registers can be write-protected when WPEN is set:

- TC Block Mode Register
- TC Channel Mode Register Capture Mode
- TC Channel Mode Register Waveform Mode

© 2026 Microchip Technology Inc. and its subsidiaries

- TC Stepper Motor Mode Register
- TC Register A
- TC Register B
- TC Register C
- TC Extended Mode Register

The following registers can be write-protected when WPITEN is set:

- TC Interrupt Enable Register
- TC Interrupt Disable Register
- TC QDEC Interrupt Enable Register
- TC QDEC Interrupt Disable Register

The following register can be write-protected when WPCREN is set:

- TC Channel Control Register
- TC Block Control Register

69.6.19. Security and Safety Analysis and Reports

Several type of checks are performed when a TC channel is enabled.

The peripheral clock of the TC is monitored by a specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the TDES. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the flag TC_SSRx.CGD is set, an abnormal condition occurred on the internal clock net. This flag is not set under normal operating conditions.

The internal counter of a TC channel is also monitored and if an abnormal state is detected, the flag TC_SSRx.SEQE is set. This flag cannot be set under normal operating conditions.

The software accesses to the TC are monitored and if an incorrect access is performed, the flag TC_SSRx.SWE is set. The type of incorrect/abnormal software access is reported in TC_SSRx.SWETYP (see TC_CSRx for details). As an example, when the TC channel is configured in Capture mode, reading TC_RAx when TC_SRx.LDRAS=0 asserts the SWE flags. TC_SSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE, WPVS are automatically cleared when TC_SSRx is read.

If one of these flags is set, the flag TC_SRx.SECE is set and triggers an interrupt if the TC_IMRx.SECE bit is ‘1’. SECE is cleared by reading TC_SRx.

69.7.1. TC Channel Control Register

Name: TC_CCRx
Offset: 0x00 + x*0x40 [x=0..2]
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						SWTRG	CLKDIS	CLKEN
Access						W	W	W
Reset						–	–	–

Bit 2 – SWTRG Software Trigger Command

Value	Description
0	No effect.
1	A software trigger is performed: the counter is reset and the clock is started.

Bit 1 – CLKDIS Counter Clock Disable Command

Value	Description
0	No effect.
1	Disables the clock.

Bit 0 – CLKEN Counter Clock Enable Command

Value	Description
0	No effect.
1	Enables the clock if CLKDIS is not 1.

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.2. TC Channel Mode Register (CAPTURE_MODE)

Name: TC_CMRx (CAPTURE_MODE)
Offset: 0x04 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read/Write

This register can be written only if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

	LDBDIS	LDBSTOP	BURST[1:0]		CLKI	TCCLKS[2:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 22:20 – SBSMPLR[2:0] Loading Edge Subsampling Ratio

Value	Name	Description
0	ONE	Load a Capture register each selected edge.
1	HALF	Load a Capture register every 2 selected edges.
2	FOURTH	Load a Capture register every 4 selected edges.
3	EIGHTH	Load a Capture register every 8 selected edges.
4	SIXTEENTH	Load a Capture register every 16 selected edges.

Bits 19:18 – LDRB[1:0] RB Loading Edge Selection

Value	Name	Description
0	NONE	None
1	RISING	Rising edge of TIOAx
2	FALLING	Falling edge of TIOAx
3	EDGE	Each edge of TIOAx

Bits 17:16 – LDRA[1:0] RA Loading Edge Selection

Value	Name	Description
0	NONE	None
1	RISING	Rising edge of TIOAx
2	FALLING	Falling edge of TIOAx
3	EDGE	Each edge of TIOAx

Bit 15 – WAVE Waveform Mode

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Capture mode is enabled.
1	Capture mode is disabled (Waveform mode is enabled).

Bit 14 – CPCTRG RC Compare Trigger Enable

Value	Description
0	RC Compare has no effect on the counter and its clock.
1	RC Compare resets the counter and starts the counter clock.

Bit 10 – ABETRG TIOAx or TIOBx External Trigger Selection

Value	Description
0	TIOBx is used as an external trigger.
1	TIOAx is used as an external trigger.

Bits 9:8 – ETRGEDG[1:0] External Trigger Edge Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	RISING	Rising edge
2	FALLING	Falling edge
3	EDGE	Each edge

Bit 7 – LDBDIS Counter Clock Disable with RB Loading

Value	Description
0	Counter clock is not disabled when RB loading occurs.
1	Counter clock is disabled when RB loading occurs.

Bit 6 – LDBSTOP Counter Clock Stopped with RB Loading

Value	Description
0	Counter clock is not stopped when RB loading occurs.
1	Counter clock is stopped when RB loading occurs.

Bits 5:4 – BURST[1:0] Burst Signal Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	XC0	XC0 is ANDed with the selected clock.
2	XC1	XC1 is ANDed with the selected clock.
3	XC2	XC2 is ANDed with the selected clock.

Bit 3 – CLKI Clock Invert

Value	Description
0	Counter is incremented on rising edge of the clock.
1	Counter is incremented on falling edge of the clock.

Bits 2:0 – TCCLKS[2:0] Clock Selection
To operate at maximum peripheral clock frequency, see TC_EMRx.

Value	Name	Description
0	TIMER_CLOCK1	Clock selected: internal GCLK [17], GCLK[45] clock signal (from PMC)
1	TIMER_CLOCK2	Clock selected: internal MCK/8 clock signal (from PMC)
2	TIMER_CLOCK3	Clock selected: internal MCK/32 clock signal (from PMC)
3	TIMER_CLOCK4	Clock selected: internal MCK/128 clock signal (from PMC)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
4	TIMER_CLOCK5	Clock selected: internal MD_SLCK clock signal (from PMC)
5	XC0	Clock selected: XC0
6	XC1	Clock selected: XC1
7	XC2	Clock selected: XC2

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.3. TC Channel Mode Register (WAVEFORM_MODE)

Name: TC_CMRx (WAVEFORM_MODE)
Offset: 0x04 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	BSWTRG[1:0]		BEEVT[1:0]		BCPC[1:0]		BCPB[1:0]

2	CLEAR	Clear
3	TOGGLE	Toggle

Bit 15 – WAVE Waveform Mode

Value	Description
0	Waveform mode is disabled (Capture mode is enabled).
1	Waveform mode is enabled.

Bits 14:13 – WAVSEL[1:0] Waveform Selection

Value	Name	Description
0	UP	UP mode without automatic trigger on RC Compare
1	UPDOWN	UPDOWN mode without automatic trigger on RC Compare
2	UP_RC	UP mode with automatic trigger on RC Compare
3	UPDOWN_RC	UPDOWN mode with automatic trigger on RC Compare

Bit 12 – ENETRG External Event Trigger Enable

Whatever the value programmed in ENETRG, the selected external event only controls the TIOAx output and TIOBx if not used as input (trigger event input or other input used).

Value	Description
0	The external event has no effect on the counter and its clock.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	The external event resets the counter and starts the counter clock.

Bits 11:10 – EEVT[1:0] External Event Selection
Signal selected as external event.

Value	Name	Description	TIOB Direction
0	TIOB	TIOB	Input
1	XC0	XC0	Output
2	XC1	XC1	Output
3	XC2	XC2	Output

Note: If TIOB is chosen as the external event signal, it is configured as an input and no longer generates waveforms and subsequently no IRQs.

Bits 9:8 – EEVTEDG[1:0] External Event Edge Selection

Value	Name	Description
0	NONE	None
1	RISING	Rising edge
2	FALLING	Falling edge
3	EDGE	Each edge

Bit 7 – CPCDIS Counter Clock Disable with RC Compare

Value	Description
0	Counter clock is not disabled when counter reaches RC.
1	Counter clock is disabled when counter reaches RC.

Bit 6 – CPCSTOP Counter Clock Stopped with RC Compare

Value	Description
0	Counter clock is not stopped when counter reaches RC.
1	Counter clock is stopped when counter reaches RC.

Bits 5:4 – BURST[1:0] Burst Signal Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	XC0	XC0 is ANDed with the selected clock.
2	XC1	XC1 is ANDed with the selected clock.
3	XC2	XC2 is ANDed with the selected clock.

Bit 3 – CLKI Clock Invert

Value	Description
0	Counter is incremented on rising edge of the clock.
1	Counter is incremented on falling edge of the clock.

Bits 2:0 – TCCLKS[2:0] Clock Selection
To operate at maximum peripheral clock frequency, see TC_EMRx.

Value	Name	Description
0	TIMER_CLOCK1	Clock selected: internal GCLK [17], GCLK[45] clock signal (from PMC)
1	TIMER_CLOCK2	Clock selected: internal MCK/8 clock signal (from PMC)
2	TIMER_CLOCK3	Clock selected: internal MCK/32 clock signal (from PMC)
3	TIMER_CLOCK4	Clock selected: internal MCK/128 clock signal (from PMC)
4	TIMER_CLOCK5	Clock selected: internal MD_SLCK clock signal (from PMC)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
5	XC0	Clock selected: XC0
6	XC1	Clock selected: XC1
7	XC2	Clock selected: XC2

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.4. TC Stepper Motor Mode Register

Name: TC_SMMRx
Offset: 0x08 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: R/W

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							DOWN	GCEN
Access							R/W	R/W
Reset							0	0

Bit 1 – DOWN Down Count

Value	Description
0	Up counter.
1	Down counter.

Bit 0 – GCEN Gray Count Enable

Value	Description
0	TIOAx [x=0..2] and TIOBx [x=0..2] are driven by internal counter of channel x.
1	TIOAx [x=0..2] and TIOBx [x=0..2] are driven by a 2-bit Gray counter.

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.5. TC Register AB

Name: TC_RABx
Offset: 0x0C + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	RAB[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	RAB[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RAB[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RAB[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – RAB[31:0] Register A or Register B
RAB contains the next unread capture Register A or Register B value in real time. It is usually read by the DMA after a request due to a valid load edge on TIOAx.
When DMA is used, the RAB register address must be configured as source address of the transfer.

69.7.7. TC Register A

Name: TC_RAx
Offset: 0x14 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read/Write

This register has access Read-only if TC_CMRx.WAVE = 0, Read/Write if TC_CMRx.WAVE = 1.
This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

Bits 31:0 – RA[31:0] Register A
RA contains the Register A value in real time.

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.8. TC Register B

Name: TC_RBx
Offset: 0x18 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read/Write

This register has access Read-only if TC_CMRx.WAVE = 0, Read/Write if TC_CMRx.WAVE = 1.
This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24

69.7.10. TC Interrupt Status Register

Name: TC_SRx
Offset: 0x20 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						MTIOB	MTIOA	CLKSTA
Access						R	R	R
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8
								SECE
Access								R
Reset								0

Bit	7	6	5	4	3	2	1	0
	ETRGS	LDRBS	LDRAS	CPCS	CPBS	CPAS	LOVRS	COVFS
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 18 – MTIOB TIOBx Mirror

Value	Description
0	TIOBx is low. If TC_CMRx.WAVE = 0, TIOBx pin is low. If TC_CMRx.WAVE = 1, TIOBx is driven low.
1	TIOBx is high. If TC_CMRx.WAVE = 0, TIOBx pin is high. If TC_CMRx.WAVE = 1, TIOBx is driven high.

Bit 17 – MTIOA TIOAx Mirror

Value	Description
0	TIOAx is low. If TC_CMRx.WAVE = 0, TIOAx pin is low. If TC_CMRx.WAVE = 1, TIOAx is driven low.
1	TIOAx is high. If TC_CMRx.WAVE = 0, TIOAx pin is high. If TC_CMRx.WAVE = 1, TIOAx is driven high.

Bit 16 – CLKSTA Clock Enabling Status

Value	Description
0	The clock is disabled.
1	The clock is enabled.

Bit 8 – SECE Security and/or Safety Event (cleared on read)

Value	Description
0	No security or safety event occurred.
1	One or more safety or security event occurred since the last read of TC_SRx. For details on the event, see TC_SSRx.

Bit 7 – ETRGS External Trigger Status (cleared on read)

Value	Description
0	External trigger has not occurred since the last read of the Status register.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	External trigger has occurred since the last read of the Status register.

Bit 6 – LDRBS RB Loading Status (cleared on read)

Value	Description
0	RB Load has not occurred since the last read of the Status register or TC_CMRx.WAVE = 1.
1	RB Load has occurred since the last read of the Status register, if TC_CMRx.WAVE = 0.

Bit 5 – LDRAS RA Loading Status (cleared on read)

Value	Description
0	RA Load has not occurred since the last read of the Status register or TC_CMRx.WAVE = 1.
1	RA Load has occurred since the last read of the Status register, if TC_CMRx.WAVE = 0.

Bit 4 – CPCS RC Compare Status (cleared on read)

Value	Description
0	RC Compare has not occurred since the last read of the Status register.
1	RC Compare has occurred since the last read of the Status register.

Bit 3 – CPBS RB Compare Status (cleared on read)

Value	Description
0	RB Compare has not occurred since the last read of the Status register or TC_CMRx.WAVE = 0.
1	RB Compare has occurred since the last read of the Status register, if TC_CMRx.WAVE = 1.

Bit 2 – CPAS RA Compare Status (cleared on read)

Value	Description
0	RA Compare has not occurred since the last read of the Status register or TC_CMRx.WAVE = 0.
1	RA Compare has occurred since the last read of the Status register, if TC_CMRx.WAVE = 1.

Bit 1 – LOVRS Load Overrun Status (cleared on read)

Value	Description
0	Load overrun has not occurred since the last read of the Status register or TC_CMRx.WAVE = 1.
1	RA or RB have been loaded at least twice without any read of the corresponding register since the last read of the Status register, if TC_CMRx.WAVE = 0.

Bit 0 – COVFS Counter Overflow Status (cleared on read)

Value	Description
0	No counter overflow has occurred since the last read of the Status register.
1	A counter overflow has occurred since the last read of the Status register.

69.7.11. TC Interrupt Enable Register

Name: TC_IERx
Offset: 0x24 + x*0x40 [x=0..2]
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TC Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

69.7.12. TC Interrupt Disable Register

Name: TC_IDRx
Offset: 0x28 + x*0x40 [x=0..2]
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TC Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access

Bit	15	14	13	12	11	10	9	8
								NODIVCLK
Access								R/W
Reset								0

Bit	7	6	5	4	3	2	1	0
			TRIGSRCB[1:0]				TRIGSRCA[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

Bit 8 – NODIVCLK No Divided Clock

Value	Description
0	The selected clock is defined by field TCCLKS in TC_CMRx.
1	The selected clock is peripheral clock and TCCLKS field (TC_CMRx) has no effect.

Bits 5:4 – TRIGSRCB[1:0] Trigger Source for Input B

Value	Name	Description
0	EXTERNAL_TIOBx	The trigger/capture input B is driven by external pin TIOBx
1	PWMx	For all channels: The trigger/capture input B is driven internally by the comparator output (see Synchronization with PWM) of the PWMx.

Bits 1:0 – TRIGSRCA[1:0] Trigger Source for Input A

Value	Name	Description
0	EXTERNAL_TIOAx	The trigger/capture input A is driven by external pin TIOAx
1	PWMx	For TC0, TC1.TIOA0, TC1.TIOA2: The trigger/capture input A is driven internally by PWMx. For TC1.TIOA1: The trigger/capture input A is driven internally by the GTSUCOMP signal of the Ethernet MAC (GMAC).

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.15. TC Channel Status Register

Name: TC_CSRx
Offset: 0x34 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read-only

Note: The flags in this register are a copy of the similar flags in the TC_SRx register. Reading the TC_CSRx does not perform a clear-on-read of TC_SRx flags.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access						R	R	R
Reset						0	0	0

Access								
Reset								

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

Bit 18 – MTIOB TIOBx Mirror

Value	Description
0	TIOBx is low. If TC_CMRx.WAVE = 0, TIOBx is low. If TC_CMRx.WAVE = 1, TIOBx is driven low.
1	TIOBx is high. If TC_CMRx.WAVE = 0, TIOBx is high. If TC_CMRx.WAVE = 1, TIOBx is driven high.

Bit 17 – MTIOA TIOAx Mirror

Value	Description
0	TIOAx is low. If TC_CMRx.WAVE = 0, TIOAx is low. If TC_CMRx.WAVE = 1, TIOAx is driven low.
1	TIOAx is high. If TC_CMRx.WAVE = 0, TIOAx is high. If TC_CMRx.WAVE = 1, TIOAx is driven high.

Bit 16 – CLKSTA Clock Enabling Status

Value	Description
0	Clock is disabled.
1	Clock is enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.16. TC Safety Status Register

Name: TC_SSRx
Offset: 0x38 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS				SWETYP[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0

Bit	23	22	21	20	19	18	17	16
	WPVSRC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPVS
Access					R	R	R	R
Reset					0	0	0	0

Bit 31 – ECLASS Software Error Class

Value	Name	Description
0	WARNING	An abnormal access that does not have any impact.
1	ERROR	An abnormal access that may have an impact.

Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	TC Channel x is enabled and a write-only register has been read (Warning).
1	WRITE_RO	TC Channel x is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address of the TC (Warning).
3	W_RARB_CAPT	TC_RAx or TC_RBx are written while channel is enabled and configured in capture mode (Error).

Bits 23:8 – WPVSRC[15:0] Write Protection Violation Source (cleared on read)
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

Bit 3 – SWE Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of TC_SSRx.
1	A software error has occurred since the last read of TC_SSRx. The field SWETYP details the type of software error encountered.

Bit 2 – SEQE Internal Sequencer Error (cleared on read)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No internal counter error has occurred since the last read of TC_SSRx. In normal operating conditions, SEQE is cleared.
1	An internal counter error has occurred since the last read of TC_SSRx. This flag can be set only under abnormal operating conditions resulting in clock glitch, etc. The detection is enabled if TC_CSRx.CLKSTA=1, TC_CMRx.WAVE=1, TC_CMRx.CPCTRG=1 and flag is set if TC_CVx > TC_RCx.

Bit 1 – CGD Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring has not been corrupted since the last read of TC_SSRx.
1	The clock monitoring has been corrupted since the last read of TC_SSRx. This flag can be set under abnormal operating conditions.

Bit 0 – WPVS Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of TC_SSRx.
1	A write protection violation has occurred since the last read of TC_SSRx. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.17. TC Block Control Register

Name: TC_BCR
Offset: 0xC0
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								SYNC
Access								W
Reset								–

Bit 0 – SYNC Synchro Command

Value	Description
0	No effect.
1	Asserts the SYNC signal which generates a software trigger simultaneously for each of the channels.

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.18. TC Block Mode Register

Name: TC_BMR
Offset: 0xC4
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

The External Clock Signal x Selection (TCxXCxS) bit field mentions pin names of the first Timer Counter module (TC0). For any subsequent instances, the signal numbering increments. For example, "TCLK3-TCLK5", "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external I/O pins of the second Timer Counter module (TC1).

Bit	31	30	29	28	27	26	25	24
							MAXFILT[5:4]	
Access							R/W	R/W
Reset							0	0

Bit	23	22	21	20	19	18	17	16
	MAXFILT[3:0]						IDXPHB	SWAP
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0

Bit	15	14	13	12	11	10	9	8
	INVIDX	INVB	INVA	EDGPHA	QDTRANS	SPEEDEN	POSEN	QDEN
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
			TC2XC2S[1:0]		TC1XC1S[1:0]		TC0XC0S[1:0]	
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 25:20 – MAXFILT[5:0] Maximum Filter
Pulses with a period shorter than MAXFILT+1 peripheral clock cycles are discarded. For more details on MAXFILT constraints, see Input Preprocessing.

Value	Description
1–63	Defines the filtering capabilities.

Bit 17 – IDXPHB Index Pin is PHB Pin

Value	Description
0	IDX pin of the rotary sensor must drive TIOA1.
1	IDX pin of the rotary sensor must drive TIOB0.

Bit 16 – SWAP Swap PHA and PHB

Value	Description
0	No swap between PHA and PHB.
1	Swap PHA and PHB internally, prior to driving the QDEC.

Bit 15 – INVIDX Inverted Index

Value	Description
0	IDX (TIOA1) is directly driving the QDEC.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	IDX is inverted before driving the QDEC.

Bit 14 – INVB Inverted PHB

Value	Description
0	PHB (TIOB0) is directly driving the QDEC.
1	PHB is inverted before driving the QDEC.

Bit 13 – INVA Inverted PHA

Value	Description
0	PHA (TIOA0) is directly driving the QDEC.
1	PHA is inverted before driving the QDEC.

Bit 12 – EDGPHA Edge on PHA Count Mode

Value	Description
0	Edges are detected on PHA only.
1	Edges are detected on both PHA and PHB.

Bit 11 – QDTRANS Quadrature Decoding Transparent

Value	Description
0	Full quadrature decoding logic is active (direction change detected).
1	Quadrature decoding logic is inactive (direction change inactive) but input filtering and edge detection are performed.

Bit 10 – SPEEDEN Speed Enabled

Value	Description
0	Disabled.
1	Enables the speed measure on channel 0, the time base being provided by channel 2.

Bit 9 – POSEN Position Enabled

Value	Description
0	Disable position.
1	Enables the position measure on channel 0 and 1.

Bit 8 – QDEN Quadrature Decoder Enabled

Quadrature decoding (direction change) can be disabled using QDTRANS bit.
One of the POSEN or SPEEDEN bits must be also enabled.

Value	Description
0	Disabled.
1	Enables the QDEC (filter, edge detection and quadrature decoding).

Bits 5:4 – TC2XC2S[1:0] External Clock Signal 2 (XC2) Selection

See Clock Selection for more details.

Value	Name	Description
0	TCLK2	Signal connected to XC2: TCLK2
1	–	Reserved
2	TIOA0	Signal connected to XC2: internal TIOA0 for chaining
3	TIOA1	Signal connected to XC2: internal TIOA1 for chaining

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 3:2 – TC1XC1S[1:0] External Clock Signal 1 (XC1) Selection
See Clock Selection for more details.

Value	Name	Description
0	TCLK1	Signal connected to XC1: TCLK1
1	–	Reserved
2	TIOA0	Signal connected to XC1: internal TIOA0 for chaining
3	TIOA2	Signal connected to XC1: internal TIOA2 for chaining

Bits 1:0 – TC0XC0S[1:0] External Clock Signal 0 (XC0) Selection
See Clock Selection for more details.

Value	Name	Description
0	TCLK0	Signal connected to XC0: TCLK0
1	–	Reserved
2	TIOA1	Signal connected to XC0: internal TIOA1 for chaining
3	TIOA2	Signal connected to XC0: internal TIOA2 for chaining

Reset	–	–	–	–		–	–	–

Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	No effect.
1	Enables the interrupt when phase A or phase B has a corrected missing pulse.

Bit 6 – FIDX Filtered Index Line

Value	Description
0	No effect.
1	Enables the interrupt when index line has a filtered contamination.

Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	No effect.
1	Enables the interrupt when phase B line has a filtered contamination.

Bit 4 – FPHA Filtered Phase A Line

Value	Description
0	No effect.
1	Enables the interrupt when phase A line has a filtered contamination.

Bit 2 – QERR Quadrature Error

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Enables the interrupt when a quadrature error occurs on PHA, PHB.

Bit 1 – DIRCHG Direction Change

Value	Description
0	No effect.
1	Enables the interrupt when a change on rotation direction is detected.

Bit 0 – IDX Index

Value	Description
0	No effect.
1	Enables the interrupt when a rising edge occurs on IDX input.

Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	The interrupt on auto-corrected missing pulse is disabled.
1	The interrupt on auto-corrected missing pulse is enabled.

Bit 6 – FIDX Filtered Index Line

Value	Description
0	The interrupt on index line filtered contamination is disabled.
1	The interrupt on index line filtered contamination is enabled.

Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	The interrupt on phase B line filtered contamination is disabled.
1	The interrupt on phase B line filtered contamination is enabled.

Bit 4 – FPHA Filtered Phase A Line

Value	Description
0	The interrupt on phase A line filtered contamination is disabled.
1	The interrupt on phase A line filtered contamination is enabled.

Bit 2 – QERR Quadrature Error

Value	Description
0	The interrupt on quadrature error is disabled.
1	The interrupt on quadrature error is enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 1 – DIRCHG Direction Change

Value	Description
0	The interrupt on rotation direction change is disabled.
1	The interrupt on rotation direction change is enabled.

Bit 0 – IDX Index

Value	Description
0	The interrupt on IDX input is disabled.
1	The interrupt on IDX input is enabled.

Access	R	R	R	R		R	R	R
Reset	0	0	0	0		0	0	0

Bit 8 – DIR Direction
Returns an image of the current rotation direction.

Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	No correction of missing pulse on phase A or B lines occurred since the last read of TC_QISR.
1	A correction of missing pulse on phase A or B lines occurred since the last read of TC_QISR.

Bit 6 – FIDX Filtered Index Line

Value	Description
0	No filtered contamination on index line since the last read of TC_QISR.
1	A contamination has been successfully on index line since the last read of TC_QISR.

Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	No filtered contamination on phase B line since the last read of TC_QISR.
1	A contamination has been successfully on phase B line since the last read of TC_QISR.

Bit 4 – FPHA Filtered Phase A Line

Value	Description
0	No filtered contamination on phase A line since the last read of TC_QISR.
1	A contamination has been successfully on phase A line since the last read of TC_QISR.

Bit 2 – QERR Quadrature Error

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No quadrature error since the last read of TC_QISR.
1	A quadrature error occurred since the last read of TC_QISR.

Bit 1 – DIRCHG Direction Change

Value	Description
0	No change on rotation direction since the last read of TC_QISR.
1	The rotation direction changed since the last read of TC_QISR.

Bit 0 – IDX Index

Value	Description
0	No Index input change since the last read of TC_QISR.
1	The IDX input has changed since the last read of TC_QISR.

© 2026 Microchip Technology Inc. and its subsidiaries

69.7.23. TC QDEC Status Register

Name: TC_QSR
Offset: 0xDC
Reset: 0x00000000
Property: Read-only

Note: The flag in this register is a copy of the similar flag in the TC_QISR register. Reading the TC_QSR does not perform a clear-on-read of TC_QISR flags.

				FIRSTE		WPCREN	WPITEN	WPEN
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x54494D	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in TC_SSRx.WPVSRC and the last software control error type is reported in TC_SSRx.SWETYP. The TC_SRx.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in TC_SSRx.WPVSRC and only the first software control error type is reported in TC_SSRx.SWETYP. The TC_SRx.SECE flag is set at the first error occurrence within a series.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x54494D (“TIM” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x54494D (“TIM” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x54494D (“TIM” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x54494D (“TIM” in ASCII).

Bit 0 – WPEN Write Protection Enable
The Timer Counter clock of the first channel must be enabled to access this register.

© 2026 Microchip Technology Inc. and its subsidiaries

See Register Write Protection for a list of registers that can be write-protected and Timer Counter clock conditions.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII).

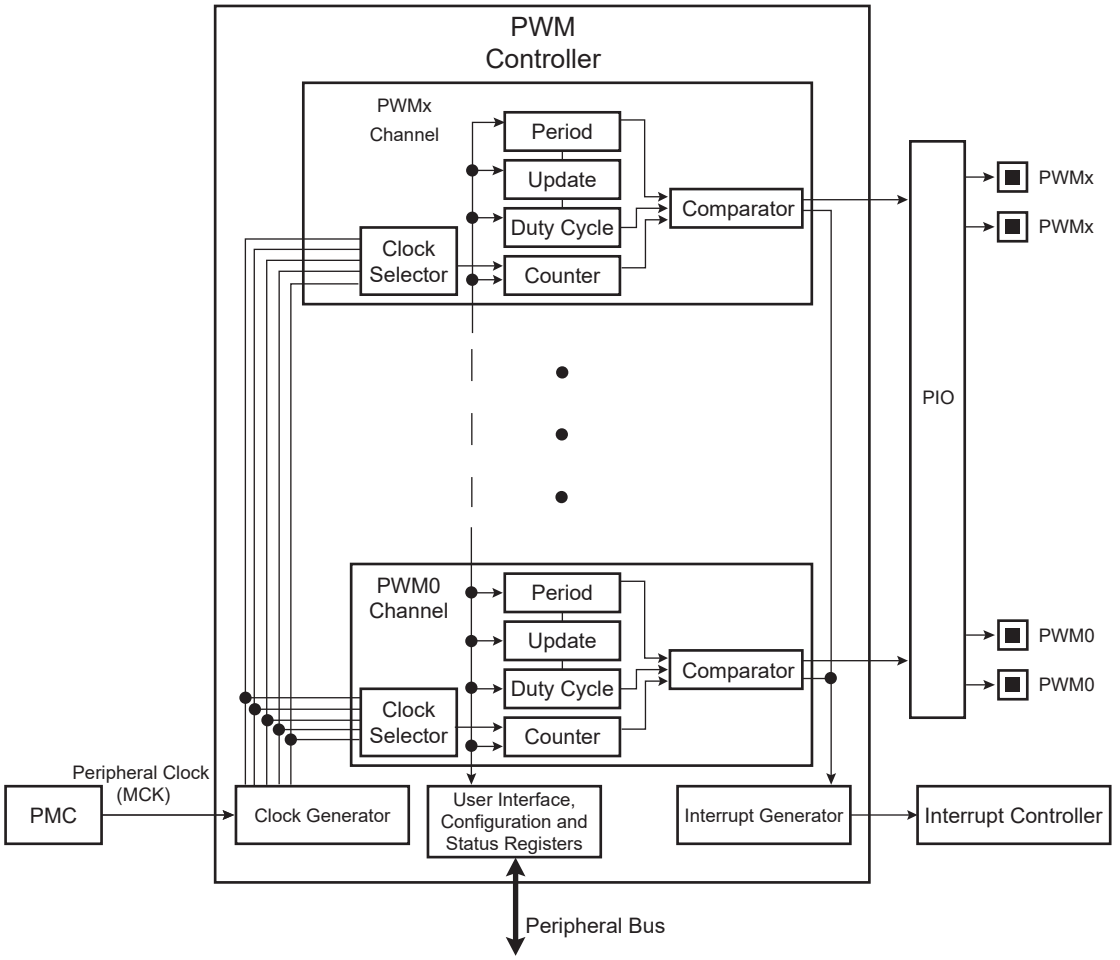
70. Pulse Width Modulation Controller (PWM)

70.1. Description

The Pulse Width Modulation Controller (PWM) controls several channels independently. Each channel controls one square output waveform. Characteristics of the output waveform such as period, duty cycle and polarity are configurable through the user interface. Each channel selects and uses one of the clocks provided by the clock generator. The clock generator provides several clocks resulting from the division of the PWM peripheral clock.

Channels can be synchronized, to generate non overlapped waveforms. All channels integrate a double buffering system in order to prevent an unexpected output waveform while modifying the period or the duty cycle.



70.2. Embedded Characteristics

- 4 Channels
- One 16-bit Counter Per Channel
- Common Clock Generator Providing Thirteen Different Clocks
  - A Modulo n Counter Providing Eleven Clocks
  - Two Independent Linear Dividers Working on Modulo n Counter Outputs
- Independent Channels
  - Independent Enable Disable Command for Each Channel
  - Independent Clock Selection for Each Channel
  - Independent Period and Duty Cycle for Each Channel
  - Double Buffering of Period or Duty Cycle for Each Channel
  - Programmable Selection of The Output Waveform Polarity for Each Channel
  - Programmable Center or Left Aligned Output Waveform for Each Channel Block Diagram

© 2026 Microchip Technology Inc. and its subsidiaries

70.3. Block Diagram

Figure 70.1. PWM Block Diagram

70.4. I/O Lines Description

Each channel outputs one waveform on one external I/O line.

Table 70.1. I/O Line Description

Name	Description	Type
PWMx	PWM Waveform Output for channel x	Output

70.5. Product Dependencies

70.5.1. I/O Lines

The pins used for interfacing the PWM controller may be multiplexed with PIO lines. The programmer must first program the PIO controller to assign the desired PWM pins to their peripheral function. If I/O lines of the PWM controller are not used by the application, they can be used for other purposes by the PIO controller.

All of the PWM outputs may or may not be enabled. If an application requires only four channels, then only four PIO lines will be assigned to PWM outputs.

© 2026 Microchip Technology Inc. and its subsidiaries

70.5.2. Power Management

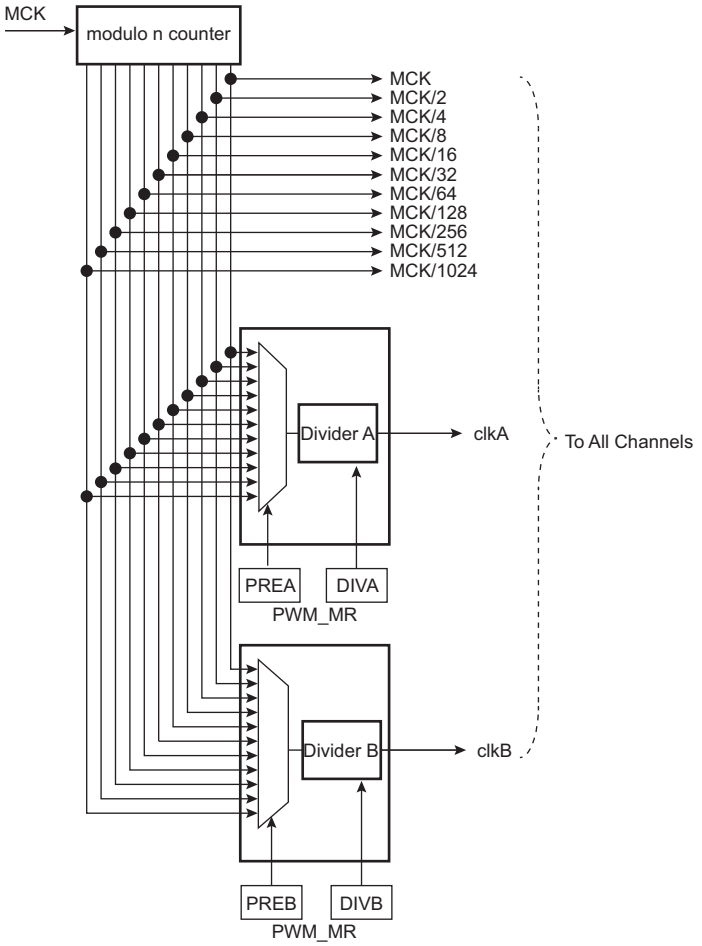
The PWM controller is not continuously clocked. The programmer must first enable the PWM clock in the Power Management Controller (PMC) before using the PWM. However, if the application does not require PWM operations, the PWM clock can be stopped when not needed and be restarted later. In this case, the PWM controller will resume its operations where it left off.

All the PWM registers except the Channel Duty Cycle (PWM_CDTYx) and Channel Period (PWM_CPRDx) registers can be read without the PWM peripheral clock enabled. All the registers can be written without the peripheral clock enabled.

70.5.3. Interrupt Sources

The PWM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PWM interrupt requires the Interrupt Controller to be programmed first. Note that it is not recommended to use the PWM interrupt line in Edge Sensitive mode.

70.6. Functional Description



The PWM controller is primarily composed of a clock generator module and 4 channels.

- Clocked by the system clock, MCK, the clock generator module provides 13 clocks.
- Each channel can independently choose one of the clock generator outputs.
- Each channel generates an output waveform with attributes that can be defined independently for each channel through the user interface registers.

© 2026 Microchip Technology Inc. and its subsidiaries

70.6.1. PWM Clock Generator

Figure 70.2. Functional View of the Clock Generator

CAUTION Before using the PWM controller, the programmer must first enable the PWM clock in the Power Management Controller (PMC).

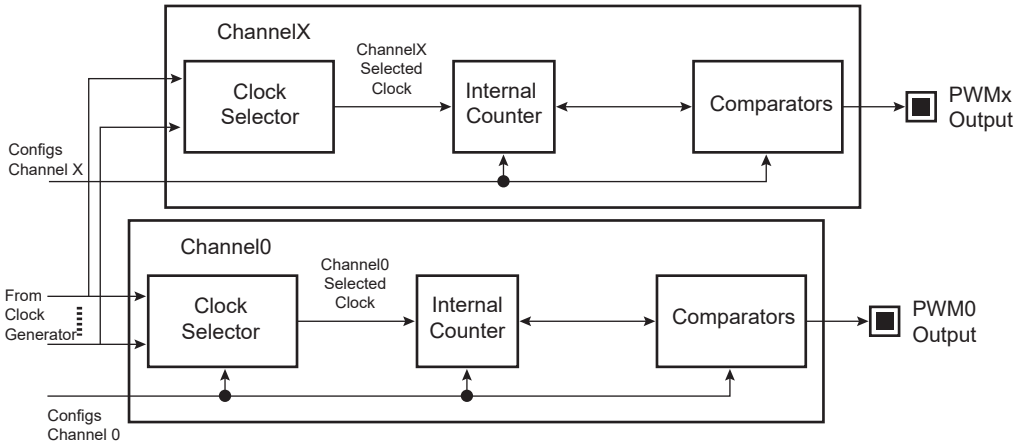
The PWM peripheral clock, MCK, is divided in the clock generator module to provide different clocks available for all channels. Each channel can independently select one of the divided clocks.

The clock generator is divided in three blocks:

- a modulo n counter which provides 11 clocks: f_{MCK}, $f_{MCK}/2$, $f_{MCK}/4$, $f_{MCK}/8$, $f_{MCK}/16$, $f_{MCK}/32$, $f_{MCK}/64$, $f_{MCK}/128$, $f_{MCK}/256$, $f_{MCK}/512$, $f_{MCK}/1024$
- two linear dividers (1, 1/2, 1/3,... 1/255) that provide two separate clocks: clkA and clkB

Each linear divider can independently divide one of the clocks of the modulo n counter. The selection of the clock to be divided is made according to the PREA (PREB) field of the Mode register (PWM_MR). The resulting clock clkA (clkB) is the clock selected divided by DIVA (DIVB) field value in PWM_MR.

After a reset of the PWM controller, DIVA (DIVB) and PREA (PREB) in PWM_MR are set to 0. This implies that after reset clkA (clkB) are turned off.



At reset, all clocks provided by the modulo n counter are turned off except clock “clk”. This situation is also true when the PWM peripheral clock is turned off through the Power Management Controller.

© 2026 Microchip Technology Inc. and its subsidiaries

70.6.2. PWM Channel

70.6.2.1. Channel Processing Overview

Figure 70.3. Channel Processing Overview

Each of the 4 channels is composed of three blocks:

- A clock selector which selects one of the clocks provided by the clock generator described in the section "PWM Clock Generator".
- An internal counter clocked by the output of the clock selector. This internal counter is incremented or decremented according to the channel configuration and comparators events. The size of the internal counter is 16 bits.
- A comparator used to generate events according to the internal counter value. It also computes the PWMx output waveform according to the configuration.

70.6.2.2. Waveform Properties

The different properties of output waveforms are:

- the ***internal clock selection***. The internal channel counter is clocked by one of the clocks provided by the clock generator described in the previous section. This channel parameter is defined in the CPRE field of the Channel Mode register (PWM_CMRx) This field is reset at 0.
- ***the waveform period***. This channel parameter is defined in the PWM_CPRDx.CPRD field.
  - If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:
    - By using the peripheral clock (MCK) divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024), the resulting period formula will be:

      $$\frac{(X \times \mathrm{CPRD})}{\mathrm{MCK}}$$

    - By using a peripheral clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

      $$\frac{(X*\mathrm{CPRD}*\mathrm{DIVA})}{\mathrm{MCK}} \text{ or } \frac{(X*\mathrm{CPRD}*\mathrm{DIVB})}{\mathrm{MCK}}$$

© 2026 Microchip Technology Inc. and its subsidiaries

  - If the waveform is center-aligned then the output waveform period depends on the counter source clock and can be calculated:
    - By using the peripheral clock divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula will be:

      $$\frac{(2 \times X \times \text{CPRD})}{\text{MCK}}$$

    - By using a peripheral clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

      $$\frac{(2*X*\text{CPRD}*\text{DIVA})}{\text{MCK}} \text{ or } \frac{(2*X*\text{CPRD}*\text{DIVB})}{\text{MCK}}$$

- ***the waveform duty cycle***. This channel parameter is defined in the PWM_CDTYx.CDTY field. If the waveform is left-aligned, then:

  $$\text{duty cycle} = \frac{(\text{PWM_period} - (\text{CDTY} \times \text{SRC_period}))}{\text{PWM_period}}$$

  If the waveform is center-aligned, then:

  $$\text{duty cycle} = \frac{\left(\left(\frac{PWM_period}{2}\right) - \left(\text{CDTY} \times \text{SRC_period}\right)\right)}{\left(\frac{PWM_period}{2}\right)}$$

  where:

  "PWM_period" is the PWM output period and "SRC_period" is the PWM source clock period. "SRC_period" depends on the peripheral clock period and on PWM_CMRx.CPRE, PWM_CLK.(PREA, PREB, DIVA, DIVB), PWM_CPRDx.CPRD and PWM_CMRx.CPRE as per previous formulas.
- ***the waveform polarity***. At the beginning of the period, the signal can be at high or low level. This property is defined in the PWM_CMRx.CPOL field. By default the signal starts by a low level.
- ***the waveform alignment***. The output waveform can be left or center-aligned. Center-aligned waveforms can be used to generate non overlapped waveforms. This property is defined in the PWM_CMRx.CALG field. The default mode is left-aligned.

Figure 70.4. Non Overlapped Center-aligned Waveforms

Note: See the figure below for a detailed description of center-aligned waveforms.

When center-aligned, the internal channel counter increases up to CPRD and decreases down to 0. This ends the period.

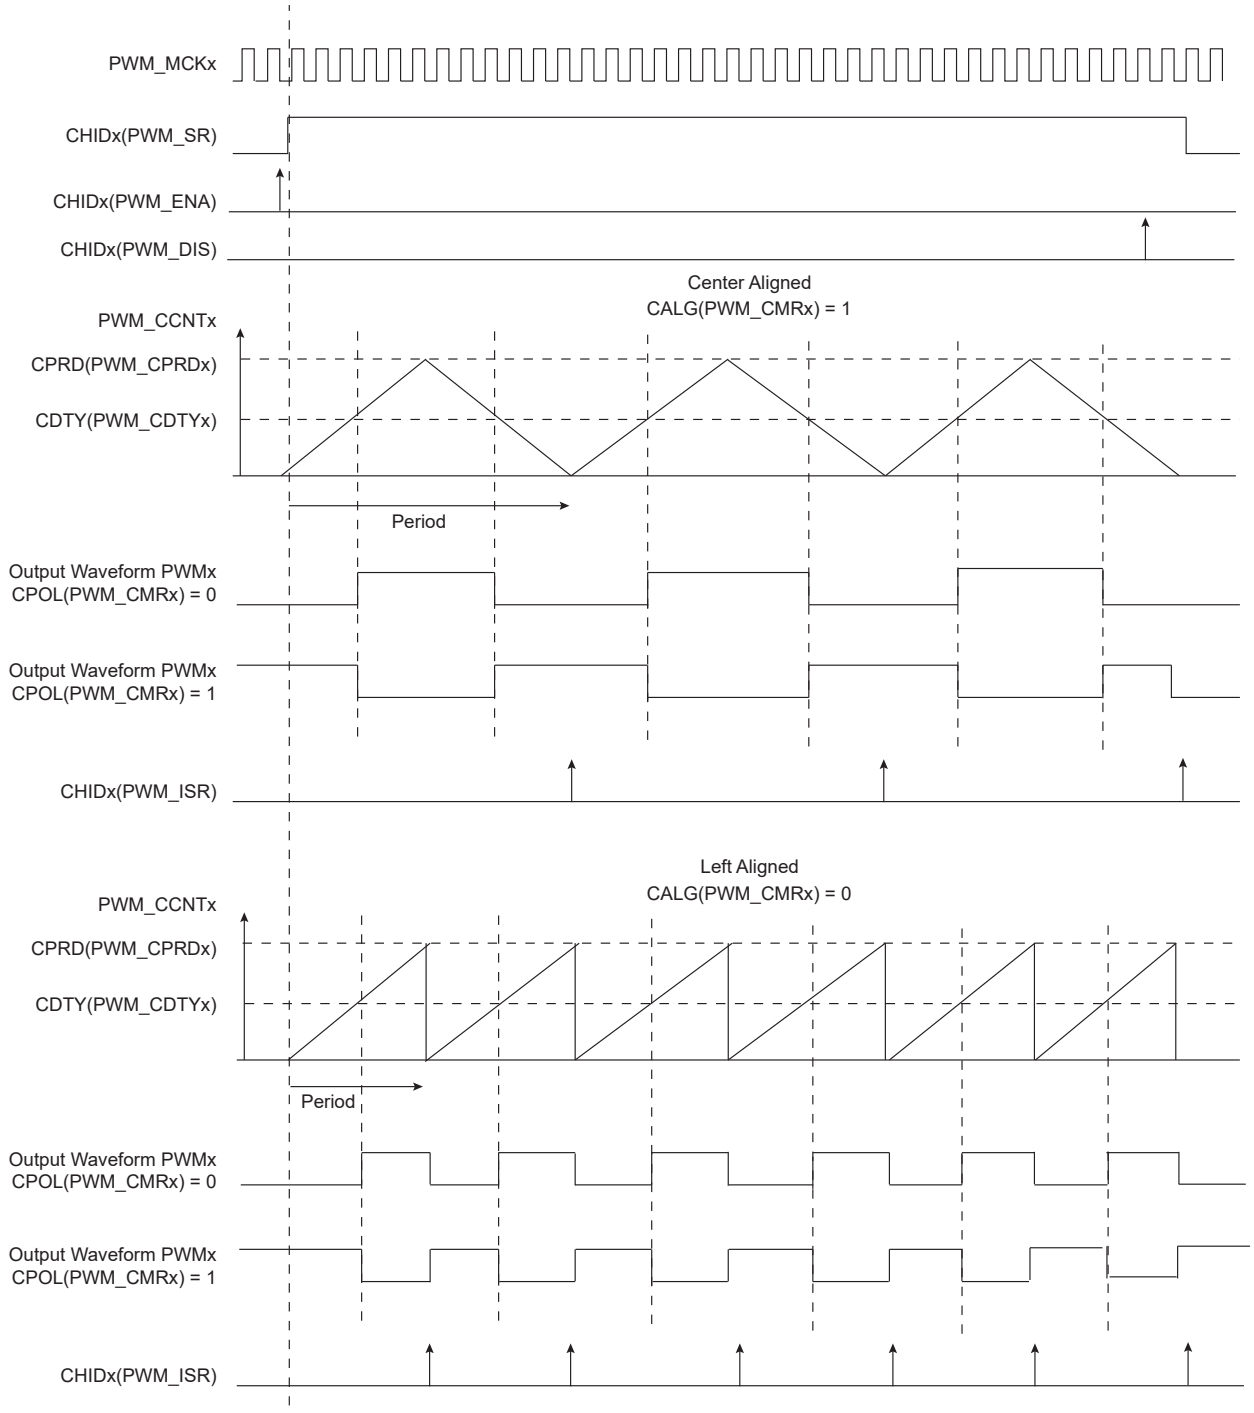
© 2026 Microchip Technology Inc. and its subsidiaries

When left-aligned, the internal channel counter increases up to CPRD and is reset. This ends the period.

Thus, for the same CPRD value, the period for a center-aligned channel is twice the period for a left-aligned channel.

Waveforms are fixed at 0 when:

- CDTY = CPRD and CPOL = 0
- CDTY = 0 and CPOL = 1



Waveforms are fixed at 1 (once the channel is enabled) when:

- CDTY = 0 and CPOL = 0
- CDTY = CPRD and CPOL = 1

The waveform polarity must be set before enabling the channel. This immediately affects the channel output level. Changes on channel polarity are not taken into account while the channel is enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 70.5. Waveform Properties

70.6.3. PWM Controller Operations

70.6.3.1. Initialization

Before enabling the output channel, this channel must have been configured by the software application:

- Configuration of the clock generator if DIVA and DIVB are required
- Selection of the clock for each channel (PWM_CMRx.CPRE)

© 2026 Microchip Technology Inc. and its subsidiaries

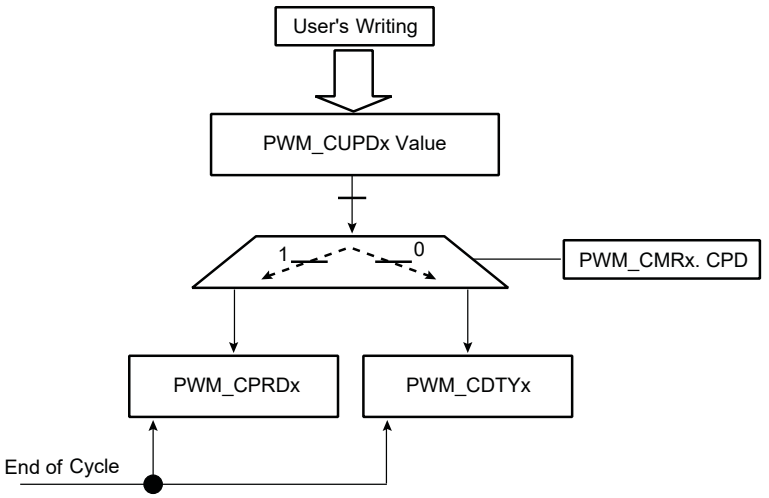
- Configuration of the waveform alignment for each channel (PWM_CMRx.CALG)
- Configuration of the period for each channel (PWM_CPRDx.CPRD). Writing in PWM_CPRDx is possible while the channel is disabled. After validation of the channel, the user must use the Channel Update register (PWM_CUPDx) to update PWM_CPRDx as explained below.
- Configuration of the duty cycle for each channel (PWM_CDTYx.CDTY). Writing in PWM_CDTYx is possible while the channel is disabled. After validation of the channel, the user must use PWM_CUPDx to update PWM_CDTYx as explained below.
- Configuration of the output waveform polarity for each channel (PWM_CMRx.CPOL)
- Enable Interrupts (set CHIDx in the Interrupt Enable register (PWM_IER))
- Enable the PWM channel (set CHIDx in the Enable register (PWM_ENA))

It is possible to synchronize different channels by enabling them at the same time by means of simultaneously setting several CHIDx bits in PWM_ENA.

- In such a situation, all channels may have the same clock selector configuration and the same period specified.

70.6.3.2. Source Clock Selection Criteria

The large number of source clocks can make selection difficult. The relationship between the value in the Channel Period register (PWM_CPRDx) and the Channel Duty Cycle register (PWM_CDTYx) can help the user in choosing. The event number written in PWM_CPRDx gives the PWM accuracy. The Duty Cycle quantum cannot be lower than 1/PWM_CPRDx value. The higher the value of PWM_CPRDx, the greater the PWM accuracy.



For example, if the user sets 15 (in decimal) in PWM_CPRDx, the user is able to set a value between 1 up to 14 in PWM_CDTYx. The resulting duty cycle quantum cannot be lower than 1/15 of the PWM period.

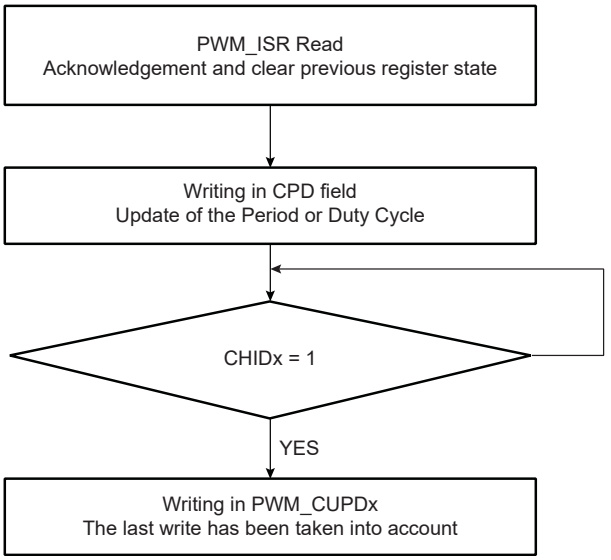
70.6.3.3. Changing the Duty Cycle or the Period

It is possible to modulate the output waveform duty cycle or period.

To prevent unexpected output waveform, the user must use PWM_CUPDx to change waveform parameters while the channel is still enabled. The user can write a new period value or duty cycle value in PWM_CUPDx. This register holds the new value until the end of the current cycle and updates the value for the next cycle. Depending on the PWM_CMRx.CPD field, PWM_CUPDx either updates PWM_CPRDx or PWM_CDTYx. Note that even if the update register is used, the period must not be smaller than the duty cycle.

Figure 70.6. Synchronized Period or Duty Cycle Update

© 2026 Microchip Technology Inc. and its subsidiaries



To prevent overwriting the PWM_CUPDx by software, the user can use status events in order to synchronize his software. Two methods are possible. In both, the user must enable the dedicated interrupt in PWM_IER at PWM controller level.

The first method (polling method) consists of reading the relevant status bit in the Interrupt Status register (PWM_ISR) according to the enabled channel(s). See the figure below.

The second method uses an Interrupt Service Routine associated with the PWM channel.

Note: Reading PWM_ISR automatically clears the CHIDx flags.

Figure 70.7. Polling Method

Note: Polarity and alignment can be modified only when the channel is disabled.

Bit	7	6	5	4	3	2	1	0
					CPRE[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit 10 – CPD Channel Update Period

Value	Description
0	Writing to PWM_CUPDx will modify the duty cycle at the next period start event.
1	Writing to PWM_CUPDx will modify the period at the next period start event.

Bit 9 – CPOL Channel Polarity

Value	Description
0	The output waveform starts at a low level.
1	The output waveform starts at a high level.

Bit 8 – CALG Channel Alignment

Value	Description
0	The period is left-aligned.
1	The period is center-aligned.

Bits 3:0 – CPRE[3:0] Channel Prescaler

Value	Name	Description
0000	MCK	Peripheral clock
0001	MCKDIV2	Peripheral clock divided by 2
0010	MCKDIV4	Peripheral clock divided by 4
0011	MCKDIV8	Peripheral clock divided by 8

Reset	0	0	0	0	0	0	0	0

Bits 31:0 – CDTY[31:0] Channel Duty Cycle
Defines the waveform duty cycle. This value must be defined between 0 and CPRD (PWM_CPRx).

© 2026 Microchip Technology Inc. and its subsidiaries

70.7.11. PWM Channel Period Register

Name: PWM_CPRDx
Offset: 0x0208 + x*0x04 [x=0..3]
Reset: 0x00000000
Property: Read/Write

Only the first 16 bits (internal channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
	CPRD[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	CPRD[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	CPRD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CPRD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – CPRD[31:0] Channel Period

If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:
– By using the peripheral clock (MCK) divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula will be:

$$\frac{(X \times \mathrm{CPRD})}{\mathrm{MCK}}$$

– By using a peripheral clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(\mathrm{CPRD} \times \mathrm{DIVA})}{\mathrm{MCK}} \text{ or } \frac{(\mathrm{CPRD} \times \mathrm{DIVB})}{\mathrm{MCK}}$$

If the waveform is center-aligned, then the output waveform period depends on the counter source clock and can be calculated:
– By using the peripheral clock divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula will be:

$$\frac{(2 \times X \times \mathrm{CPRD})}{\mathrm{MCK}}$$

– By using a peripheral clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(2 \times \mathrm{CPRD} \times \mathrm{DIVA})}{\mathrm{MCK}} \text{ or } \frac{(2 \times \mathrm{CPRD} \times \mathrm{DIVB})}{\mathrm{MCK}}$$

	CNT[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – CNT[31:0] Channel Counter Register
Internal counter value. This register is reset when:

- the channel is enabled (PWM_ENA.CHIDx = 1)
- the counter reaches CPRD value defined in PWM_CPRDx if the waveform is left aligned.

© 2026 Microchip Technology Inc. and its subsidiaries

70.7.13. PWM Channel Update Register x

Name: PWM_CUPDx
Offset: 0x0210 + x*0x04 [x=0..3]
Reset: –
Property: Write-only

Bit	31	30	29	28	27	26	25	24

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	CUPD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 31:0 – CUPD[31:0] Channel Update Register

This register acts as a double buffer for the period or the duty cycle. This prevents an unexpected waveform when modifying the waveform period or duty cycle.
Only the first 16 bits (internal channel counter size) are significant.
When PWM_CMRx.CPD = 0, the duty cycle (CDTY of PWM_CDTYx) is updated with the CUPD value at the beginning of the next period.
When PWM_CMRx.CPD = 1, the period (CPRD of PWM_CPRDx) is updated with the CUPD value at the beginning of the next period.

USB Subsystem

71. Overview

71.1. Block Diagram

Figure 71.1. USB Subsystem Block Diagram

71.2. Components

- 1x high-speed host (EHCI) and one full-speed host (OHCI) with three ports (PA, PB and PC) (UHPHS)
- 1x high-speed device shared with PA and PB (UDPHS)
- 3x USB 2.0 PHYs

71.3. Product Dependencies

71.3.1. Clocks

To generate USB frequencies with high accuracy, the device embeds a dedicated USB PLL.

71.3.2. Interrupts

Refer to the table Peripheral Identifiers.

71.3.3. Reset

USB peripherals are connected to the processor and peripherals reset line.

71.3.4. I/Os

USB I/Os are dedicated I/Os powered by VDDIN33/GND.

© 2026 Microchip Technology Inc. and its subsidiaries

71.4. Special Functions in SFR

- SFR_OHCIICR.SUSPx controls suspend for each port. These bits must be set to reduce power consumption on VDDIN33 in Low-power mode.
- SFR_OHCIICR.ARIE enables OHCI asynchronous resume interrupt.
- SFR_OHCIISR.RISx indicates the Port Resume status of each port.

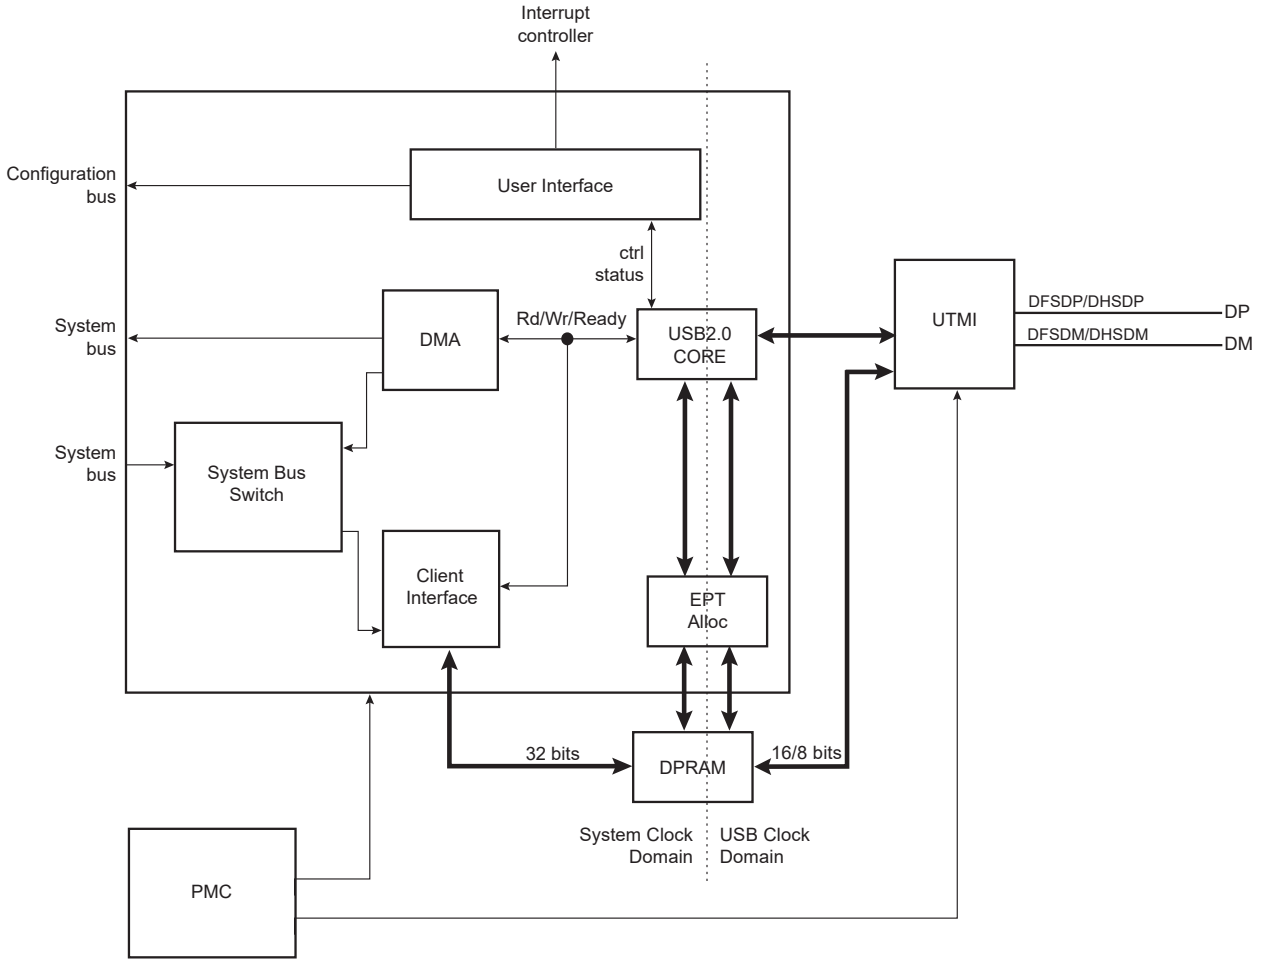
© 2026 Microchip Technology Inc. and its subsidiaries

72. USB Device High Speed Port (UDPHS)

72.1. Description

The USB Device High Speed Port (UDPHS) is compliant with the Universal Serial Bus (USB), rev 2.0 High Speed device specification.

Each endpoint can be configured in one of several USB transfer types. It can be associated with one, two or three banks of a Dual-port RAM used to store the current data payload. If two or three banks are used, one DPR bank is read or written by the processor, while the other is read or written by the USB device peripheral. This feature is mandatory for isochronous endpoints.



72.2. Embedded Characteristics

- 1 High-Speed Device
- 1 UTMI Transceiver Shared Between Host and Device
- USB v2.0 High Speed (480 Mbits/s) Compliant
- 7 Endpoints up to 1024 Bytes
- Embedded Dual-port RAM for Endpoints
- Suspend/Resume Logic (Command of UTMI)
- Up to Three Memory Banks for Endpoints (Not for Control Endpoint)
- 16448 bytes of DPRAM

72.4. Typical Connection

Figure 72.2. Board Schematic

Notes:

1. The values shown on the 22 kΩ and 15 kΩ resistors are only valid with 3.3V-supplied PIOs.
2. C_{RPB}: Upstream Facing Port Bypass Capacitance of 1 µF to 10 µF (refer to "DC Electrical Characteristics" in Universal Serial Bus Specification Rev. 2)
3. 10 pF capacitor on VBG is a provision and may not be populated.

72.5. Product Dependencies

72.5.1. Power Management

The UDPHS is not continuously clocked.

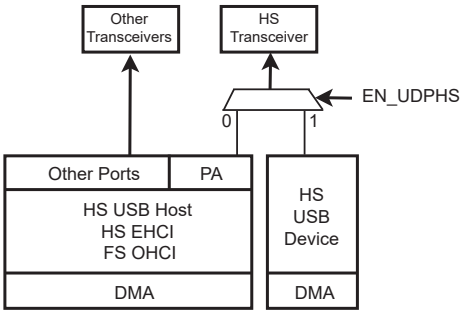
To use the UDPHS, assuming the UTMI USB PLL is off and the UDPHS is disabled:

1. Enable the UDPHS clock in the Power Management Controller (PMC).
2. Enable the UDPHS in the UDPHS_CTRL register (EN_UDPHS bit).
3. Enable the UTMI (PLL and transceiver) by enabling the bandgap and then the voltage regulator in the PMC (UTMIBG and UTMIVR bits in the PMC_PLL_ACR register).

Note: If the application does not require UDPHS operations, the UDPHS clock can be stopped when not needed and restarted later.

72.5.2. Interrupt Sources

The UDPHS interrupt line is connected on one of the internal sources of the interrupt controller. Using the UDPHS interrupt requires the interrupt controller to be programmed first.



72.6. Functional Description

72.6.1. UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN_UDPHS) located in the UDPHS_CTRL register.

Figure 72.3. USB Selection

72.6.2. USB V2.0 High Speed Device Port Introduction

The USB V2.0 High Speed Device Port provides communication services between host and attached USB devices. Each device is offered with a collection of communication flows (pipes) associated with each endpoint. Software on the host communicates with a USB Device through a set of communication flows.

72.6.3. USB V2.0 High Speed Transfer Types

A communication flow is carried over one of four transfer types defined by the USB device.

A device provides several logical communication pipes with the host. To each logical pipe is associated an endpoint. Transfer through a pipe belongs to one of the four transfer types:

- Control Transfers: Used to configure a device at attach time and can be used for other device-specific purposes, including control of other pipes on the device.
- Bulk Data Transfers: Generated or consumed in relatively large burst quantities and have wide dynamic latitude in transmission constraints.
- Interrupt Data Transfers: Used for timely but reliable delivery of data, for example, characters or coordinates with human-perceptible echo or feedback response characteristics.
- Isochronous Data Transfers: Occupy a prenegotiated amount of USB bandwidth with a prenegotiated delivery latency. (Also called streaming real time transfers.)

As indicated below, transfers are sequential events carried out on the USB bus.

Endpoints must be configured according to the transfer type they handle.

Table 72.1. USB Communication Flow

Transfer	Direction	Bandwidth	Endpoint Size	Error Detection	Retrying
Control	Bidirectional	Not ensured	8, 16, 32, 64	Yes	Automatic
Isochronous	Unidirectional	Ensured	8–1024	Yes	No
Interrupt	Unidirectional	Not ensured	8–1024	Yes	Yes
Bulk	Unidirectional	Not ensured	8–512	Yes	Yes

72.6.4. USB Transfer Event Definitions

A transfer is composed of one or several transactions as shown in the table below.

Table 72.2. USB Transfer Events

Transfer		Transaction
Direction	Type	
CONTROL (bidirectional)	Control Transfer (1)	• Setup transaction → Data IN transactions → Status OUT transaction • Setup transaction → Data OUT transactions → Status IN transaction • Setup transaction → Status IN transaction

© 2026 Microchip Technology Inc. and its subsidiaries

Table 72.2. USB Transfer Events (continued)

Transfer		Transaction
Direction	Type	
IN (device toward host)	Bulk IN Transfer	• Data IN transaction → Data IN transaction
	Interrupt IN Transfer	• Data IN transaction → Data IN transaction
	Isochronous IN Transfer (2)	• Data IN transaction → Data IN transaction
OUT (host toward device)	Bulk OUT Transfer	• Data OUT transaction → Data OUT transaction
	Interrupt OUT Transfer	• Data OUT transaction → Data OUT transaction
	Isochronous OUT Transfer (2)	• Data OUT transaction → Data OUT transaction

Notes:

1. Control transfer must use endpoints with one bank and can be aborted using a stall handshake.
2. Isochronous transfers must use endpoints configured with two or three banks.

An endpoint handles all transactions related to the type of transfer for which it has been configured.

Table 72.3. UDPHS Endpoint Description

Endpoint #	Mnemonic	Nb Banks	DMA	High Bandwidth	Max. Endpoint Size	Endpoint Type
0	EPT_0	1	N	N	64	Control
1	EPT_1	2	Y	N	1024	Ctrl/Bulk/Iso(1)/Interrupt
2	EPT_2	2	Y	N	1024	Ctrl/Bulk/Iso(1)/Interrupt
3	EPT_3	3	Y	Y	1024	Ctrl/Bulk/Iso(1)/Interrupt
4	EPT_4	3	Y	Y	1024	Ctrl/Bulk/Iso(1)/Interrupt
5	EPT_5	3	Y	Y	1024	Ctrl/Bulk/Iso(1)/Interrupt
6	EPT_6	3	Y	Y	1024	Ctrl/Bulk/Iso(1)/Interrupt

Note:

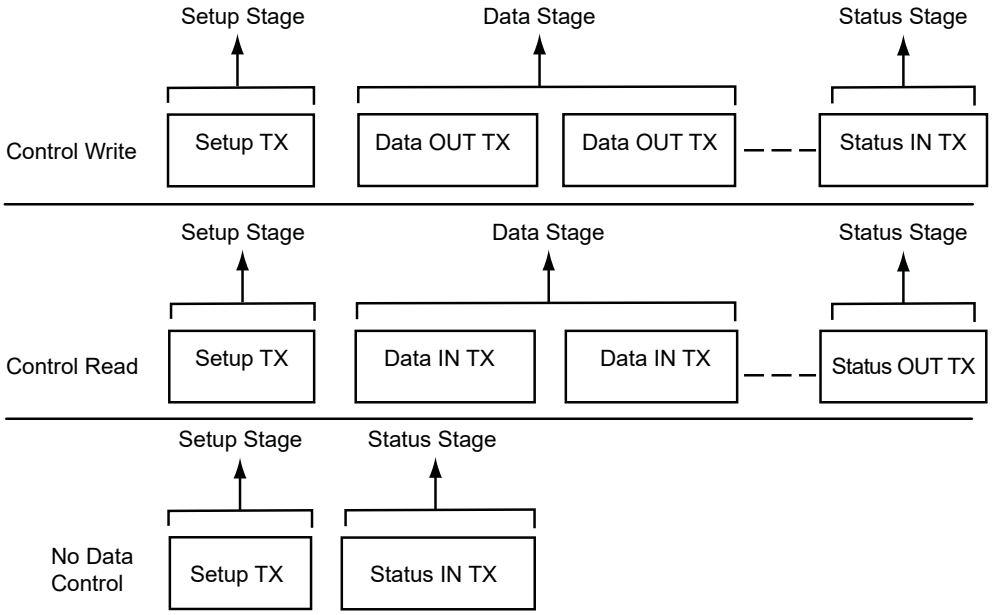
1. In Isochronous (Iso) mode, it is preferable that the high bandwidth capability is available.

The size of the internal DPRAM is 16448 bytes, covering the memory need for the endpoints, hence enabling static allocation of the memory for all endpoints.

Suspend and resume are automatically detected by the UDPHS device, which notifies the processor by raising an interrupt.

72.6.5. USB V2.0 High Speed BUS Transactions

Each transfer results in one or more transactions over the USB bus.



Five types of transaction flow across the bus in packets:

1. Setup Transaction
2. Data IN Transaction
3. Data OUT Transaction
4. Status IN Transaction
5. Status OUT Transaction

A status IN or OUT transaction is identical to a data IN or OUT transaction.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 72.4. Control Read and Write Sequences

72.6.6. Endpoint Configuration

The endpoint 0 is always a control endpoint, it must be programmed and active in order to be enabled when the End Of Reset interrupt occurs.

To configure the endpoints:

- Fill the configuration register (UDPHS_EPTCFG) with the endpoint size, direction (IN or OUT), type (CTRL, Bulk, IT, ISO) and the number of banks.
- Fill the number of transactions (NB_TRANS) for isochronous endpoints.

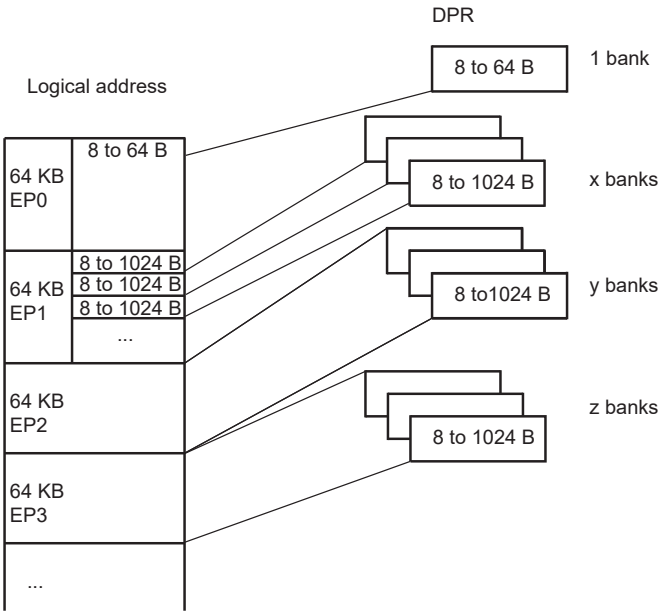
Note: For control endpoints the direction has no effect.

- Verify that the EPT_MAPD flag is set. This flag is set if the endpoint size and the number of banks are correct for this endpoint.
- Configure the endpoint control flags and enable them in UDPHS_EPTCTLENBx as described in UDPHS_EPTCTLDISx.

Control endpoints can generate interrupts and use only 1 bank.

All endpoints (except endpoint 0) can be configured either as Bulk, Interrupt or Isochronous. See the table USB Transfer Events.

The maximum packet size they can accept corresponds to the maximum endpoint size.



Note: The endpoint size of 1024 is reserved for isochronous endpoints.

The application has access to the physical block of DPR reserved for the endpoint through a 64-Kbyte logical address space.

The physical block of DPR reserved for the endpoint is remapped all along the 64-Kbyte logical address space. The application can write a 64-Kbyte buffer linearly.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 72.5. Logical Address Space for DPR Access

Configuration examples of UDPHS_EPTCTLDISx for Bulk IN endpoint type follow below.

- With DMA
  - AUTO_VALID: Automatically validate the packet and switch to the next bank.
  - EPT_ENABL: Enable endpoint.
- Without DMA:
  - TXRDY: An interrupt is generated after each transmission.
  - EPT_ENABL: Enable endpoint.

Configuration examples of Bulk OUT endpoint type follow below.

- With DMA
  - AUTO_VALID: Automatically validate the packet and switch to the next bank.
  - EPT_ENABL: Enable endpoint.
- Without DMA
  - RXRDY_TXKL: An interrupt is sent after a new packet has been stored in the endpoint FIFO.
  - EPT_ENABL: Enable endpoint.

72.6.7. DPRAM Management

Endpoints can be configured in any order.

Disabling an endpoint, by writing a one to the Endpoint Disable bit in the UDPHS Endpoint Control Disable Register (UDPHS_EPTCTLDISx.EPT_DISABL), does not reset its configuration:

- Endpoint Banks (UDPHS_EPTCFGx.BK_NUMBER)
- Endpoint Size (UDPHS_EPTCFGx.EPT_SIZE)
- Endpoint Direction (UDPHS_EPTCFGx.EPT_DIR)
- Endpoint Type (UDPHS_EPTCFGx.EPT_TYPE)

© 2026 Microchip Technology Inc. and its subsidiaries

Notes:

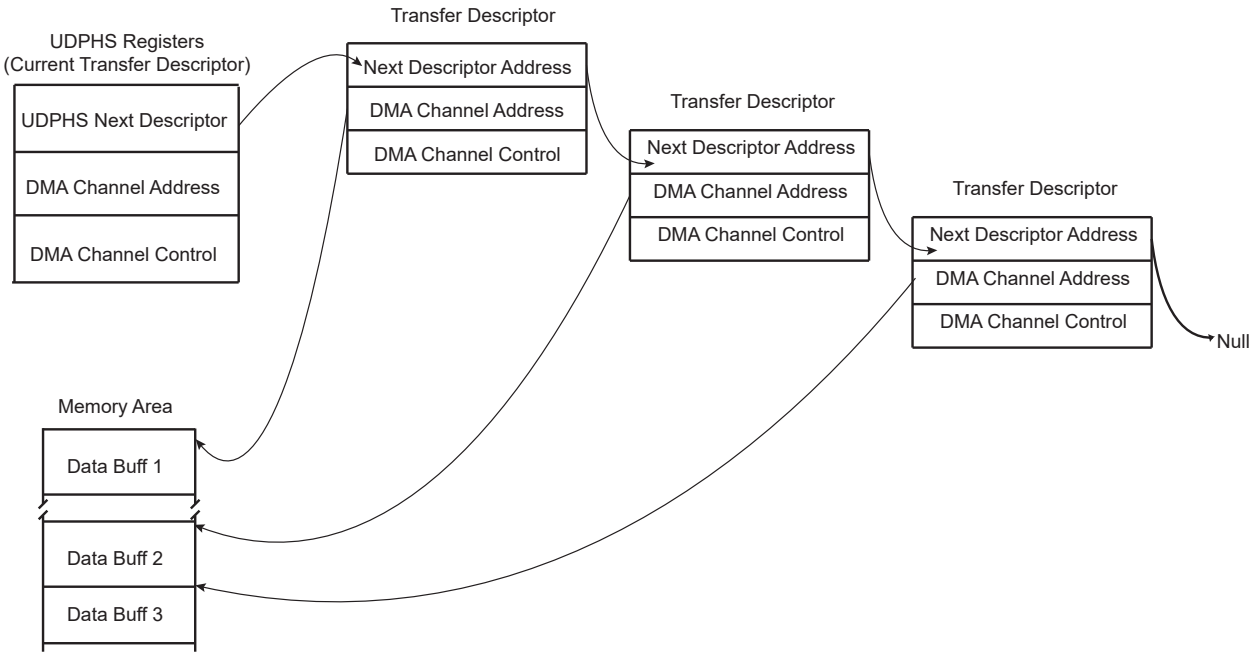
1. There is no way the data of the endpoint 0 can be lost (except if it is de-allocated) as the memory allocation and de-allocation may affect only higher endpoints.
2. Deactivating then reactivating the same endpoint with the same configuration only modifies temporarily the controller DPRAM pointer and size for this endpoint. Nothing changes in the DPRAM, higher endpoints seem not to have been moved and their data is preserved as far as nothing has been written or received into them while changing the allocation state of the first endpoint.
3. When the user writes a value different from zero to the UDPHS_EPTCFGx.BK_NUMBER field, the Endpoint Mapped bit (UDPHS_EPTCFGx.EPT_MAPD) is set only if the configured size and number of banks are correct as compared to the endpoint maximal allowed values and to the maximal FIFO size (i.e., the DPRAM size). The UDPHS_EPTCFGx.EPT_MAPD value does not consider memory allocation conflicts.

72.6.8. Transfer With DMA

USB packets of any length may be transferred when required by the UDPHS device. These transfers always feature sequential addressing.

Packet data system bus bursts may be locked on a DMA buffer basis for drastic overall system bus bandwidth performance boost with paged memories. These clock-cycle consuming memory row (or bank) changes will then likely not occur, or occur only once instead of several times, during a single big USB packet DMA transfer in case another system bus host addresses the memory. The locked bursts result in up to 128-word single-cycle unbroken system bus bursts for bulk endpoints and 256-word single-cycle unbroken bursts for isochronous endpoints.

This maximum burst length is then controlled by the lowest programmed USB endpoint size (EPT_SIZE field in the UDPHS_EPTCFGx register) and DMA Size (BUFF_LENGTH field in the UDPHS_DMACONTROLx register).



The USB 2.0 device average throughput may be up to nearly 60 Mbyte/s. Its internal client average access latency decreases as burst length increases due to the 0 wait-state side effect of unchanged endpoints. If at least 0 wait-state word burst capability is also provided by the external DMA system bus clients, each of both DMA system busses need less than 50% bandwidth allocation for full USB 2.0 bandwidth usage at 30 MHz, and less than 25% at 60 MHz.

The UDPHS DMA Channel Transfer Descriptor is described in the section UDPHS DMA Channel Transfer Descriptor.

Note: When debugging, make sure to address the DMA to an SRAM address even if a remap is done.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 72.6. Example of DMA Chained List

72.6.9. Transfer Without DMA

Important: When not used, the DMA should be disabled to make sure it cannot be left enabled by a previous USB transfer session. If this occurred, the DMA could process data before an interrupt without the user's knowledge.

The recommended procedure to disable the DMA is as follows:

```
// Reset IP UDPHS
  BASE_UDPHS->UDPHS_CTRL &= ~UDPHS_EN_UDPHS;
  BASE_UDPHS->UDPHS_CTRL |= UDPHS_EN_UDPHS;//
With OR without DMA !!!
  for( i=1; i<=DMA_CHANNEL_NBR); i++ )
// RESET endpoint canal DMA:
    // DMA stop channel command
   BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Disable endpoint
  BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLDIS |= 0XFFFFFFFF;
// Reset endpoint config
  BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLCFG = 0;
// Reset DMA channel (Buff count and Control field)
  BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0x02; // NON
STOP command
// Reset DMA channel 0 (STOP)
  BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Clear DMA channel status (read the register for clear it)
  BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS =
  BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS;
}
```

72.6.10. Handling Transactions with USB V2.0 Device Peripheral

72.6.10.1. Setup Transaction

The setup packet is valid in the DPR while RX_SETUP is set. Once RX_SETUP is cleared by the application, the UDPHS accepts the next packets sent over the device endpoint.

© 2026 Microchip Technology Inc. and its subsidiaries

When a valid setup packet is accepted by the UDPHS:

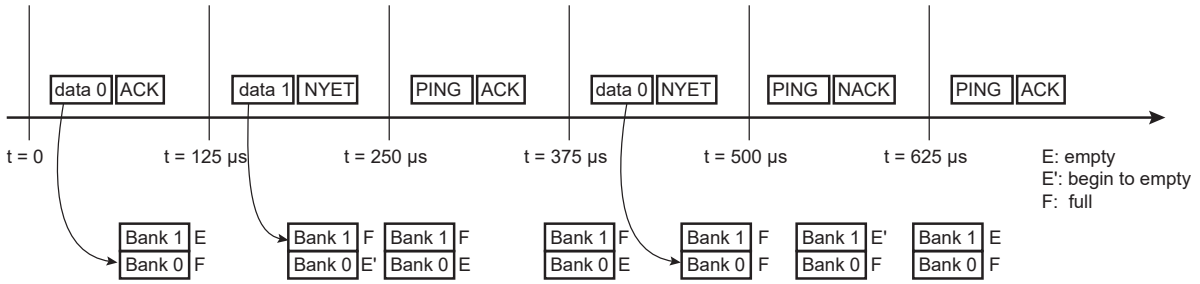
- The UDPHS device automatically acknowledges the setup packet (sends an ACK response)
- Payload data is written in the endpoint
- Sets the RX_SETUP interrupt
- The BYTE_COUNT field in the UDPHS_EPTSTAx register is updated

An endpoint interrupt is generated while RX_SETUP in the UDPHS_EPTSTAx register is not cleared. This interrupt is carried out to the microcontroller if interrupts are enabled for this endpoint.

Thus, firmware must detect RX_SETUP polling UDPHS_EPTSTAx or catching an interrupt, read the setup packet in the FIFO, then clear the RX_SETUP bit in the UDPHS_EPTCLRSTA register to acknowledge the setup stage.

If STALL_SNT was set to 1, then this bit is automatically reset when a setup token is detected by the device. Then, the device still accepts the setup stage (see STALL).

72.6.10.2.NYET



NYET is a High Speed only handshake. It is returned by a High Speed endpoint as part of the PING protocol.

High Speed devices must support an improved NAK mechanism for Bulk OUT and control endpoints (except setup stage). This mechanism allows the device to tell the host whether it has sufficient endpoint space for the next OUT transfer (refer to USB 2.0 spec 8.5.1 NAK Limiting via Ping Flow Control).

The NYET/ACK response to a High Speed Bulk OUT transfer and the PING response are automatically handled by hardware in the UDPHS_EPTCTLx register (except when the user wants to force a NAK response by using the NYET_DIS bit).

If the endpoint responds instead to the OUT/DATA transaction with an NYET handshake, this means that the endpoint accepted the data but does not have room for another data payload. The host controller must return to using a PING token until the endpoint indicates it has space available.

Figure 72.7. NYET Example with Two Endpoint Banks

72.6.10.3.Data IN

- Bulk IN or Interrupt IN
  Data IN packets are sent by the device during the data or the status stage of a control transfer or during an (interrupt/bulk/isochronous) IN transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.
  There are three ways for an application to transfer a buffer in several packets over the USB:
  - packet by packet (see Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host) below)
  - 64 Kbytes (see Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host) below)
  - DMA (see Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host) below)

© 2026 Microchip Technology Inc. and its subsidiaries

- Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host)
  The application can write one or several banks.

  A simple algorithm can be used by the application to send packets regardless of the number of banks associated to the endpoint.

  Algorithm description for each packet:
  - The application waits for the TXRDY flag to be cleared in the UDPHS_EPTSTAx register before it can perform a write access to the DPR.
  - The application writes one USB packet of data in the DPR through the 64 Kbytes endpoint logical memory window.
  - The application sets TXRDY flag in the UDPHS_EPTSETSTAx register.

  The application is notified that it is possible to write a new packet to the DPR by the TXRDY interrupt. This interrupt can be enabled or masked by setting the TXRDY bit in the UDPHS_EPTCTLENB/UDPHS_EPTCTLDIS register.

  Algorithm description to fill several packets:

  Using the previous algorithm, the application is interrupted for each packet. It is possible to reduce the application overhead by writing linearly several banks at the same time. The AUTO_VALID bit in the UDPHS_EPTCTLx must be set by writing the AUTO_VALID bit in the UDPHS_EPTCTLENBx register.

  The auto-valid-bank mechanism allows the transfer of data (IN and OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear the RXRDY_TXKL bit) is done by hardware.
  - The application checks the BUSY_BANK_STA field in the UDPHS_EPTSTAx register. The application must wait that at least one bank is free.
  - The application writes a number of bytes inferior to the number of free DPR banks for the endpoint. Each time the application writes the last byte of a bank, the TXRDY signal is automatically set by the UDPHS.
  - If the last packet is incomplete (i.e., the last byte of the bank has not been written) the application must set the TXRDY bit in the UDPHS_EPTSETSTAx register.

  The application is notified that all banks are free, so that it is possible to write another burst of packets by the BUSY_BANK interrupt. This interrupt can be enabled or masked by setting the BUSY_BANK flag in the UDPHS_EPTCTLENB and UDPHS_EPTCTLDIS registers.

  This algorithm must not be used for isochronous transfer. In this case, the ping-pong mechanism does not operate.

  A Zero Length Packet can be sent by setting just the TXRDY flag in the UDPHS_EPTSETSTAx register.

- Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host)
  The UDPHS integrates a DMA host controller. This DMA controller can be used to transfer a buffer from the memory to the DPR or from the DPR to the processor memory under the UDPHS control. The DMA can be used for all transfer types except control transfer.

  Example DMA configuration:
  - 1. Program UDPHS_DMAADDRESS x with the address of the buffer that should be transferred.
  - 2. Enable the interrupt of the DMA in UDPHS_IEN.
  - 3. Program UDPHS_ DMACONTROLx:
    - Size of buffer to send: size of the buffer to be sent to the host.
    - END_B_EN: the endpoint can validate the packet (according to the values programmed in the AUTO_VALID and SHRT_PCKT fields of UDPHS_EPTCTLx) (see UDPHS_EPTCTLDISx and the figure Autovalid with DMA).

© 2026 Microchip Technology Inc. and its subsidiaries

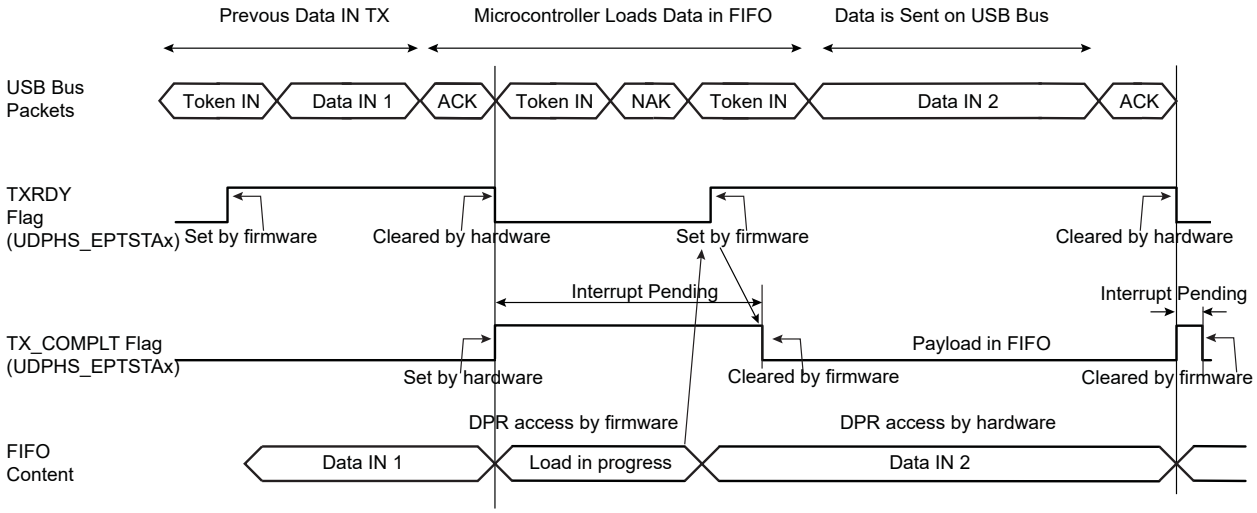
- END_BUFFIT: generate an interrupt when the BUFF_COUNT field in the UDPHS DMA Channel Status register (UDPHS_DMASTATUSx) reaches 0.
- CHANN_ENB: run and stop at end of buffer.

The auto-valid-bank mechanism allows the transfer of data (IN & OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear RXRDY_TXKL) is done by hardware.

A transfer descriptor can be used. Instead of programming the register directly, a descriptor should be programmed and the address of this descriptor is then provided to UDPHS_DMANXTDSC to be processed after setting the LDNXT_DSC field (Load Next Descriptor Now) in UDPHS_DMACONTROLx register.

The structure that defines this transfer descriptor must be aligned.

Each buffer to be transferred must be described by a DMA Transfer descriptor (see UDPHS DMA Channel Transfer Descriptor). Transfer descriptors are chained. Before executing transfer of the buffer, the UDPHS may fetch a new transfer descriptor from the memory address pointed by the UDPHS_DMANXTDSCx register. Once the transfer is complete, the transfer status is updated in the UDPHS_DMASTATUSx register.



To chain a new transfer descriptor with the current DMA transfer, the DMA channel must be stopped. To do so, INTDIS_DMA and TXRDY may be set in the UDPHS_EPTCTLENBx register. It is also possible for the application to wait for the completion of all transfers. In this case the LDNXT_DSC bit in the last transfer descriptor UDPHS_DMACONTROLx register must be set to 0 and the CHANN_ENB bit set to 1.

Then the application can chain a new transfer descriptor.

The INTDIS_DMA can be used to stop the current DMA transfer if an enabled interrupt is triggered. This can be used to stop DMA transfers in case of errors.

The application can be notified at the end of any buffer transfer (via UDPHS_DMACONTROLx.ENB_BUFFIT).

Figure 72.8. Data IN Transfer for Endpoint with One Bank

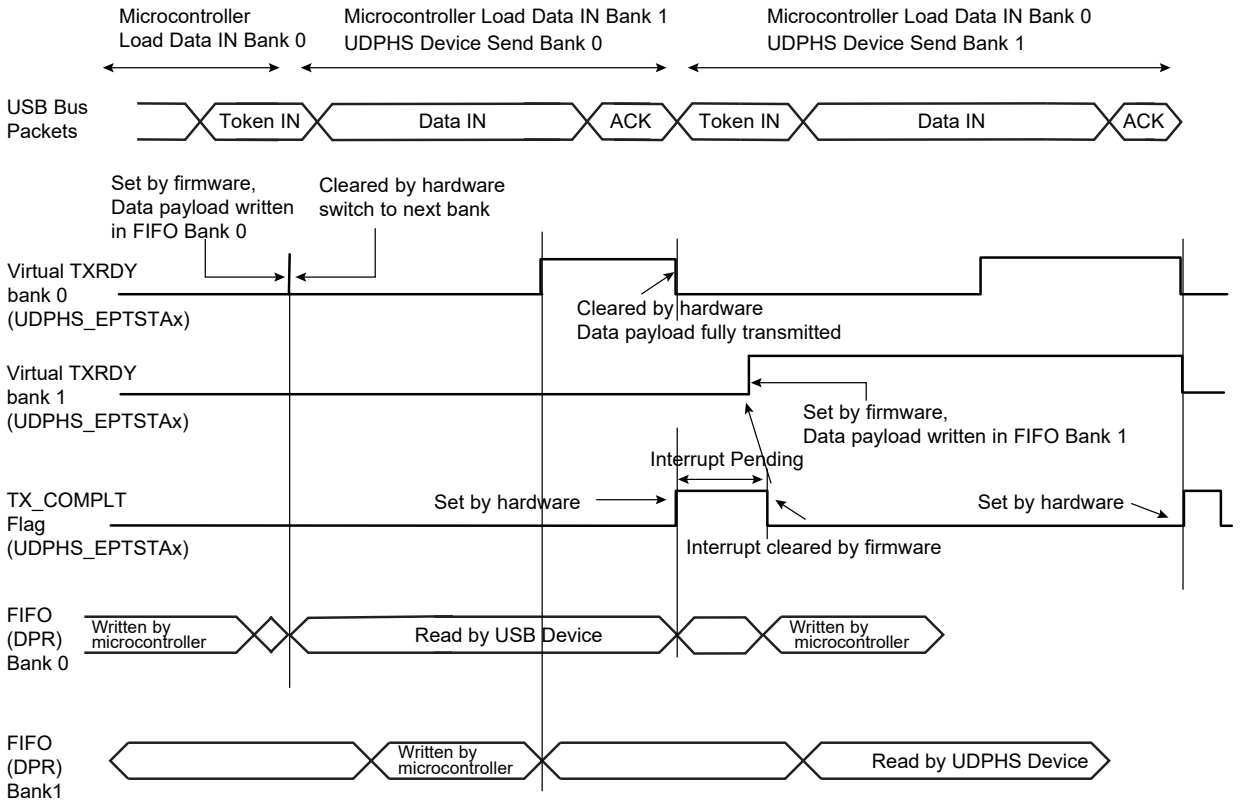
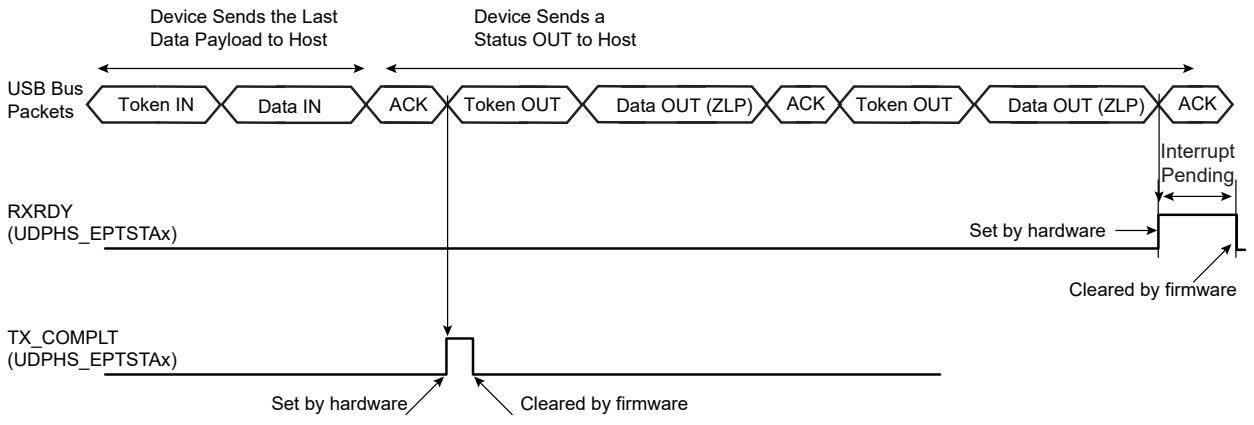
Figure 72.9. Data IN Transfer for Endpoint with Two Banks





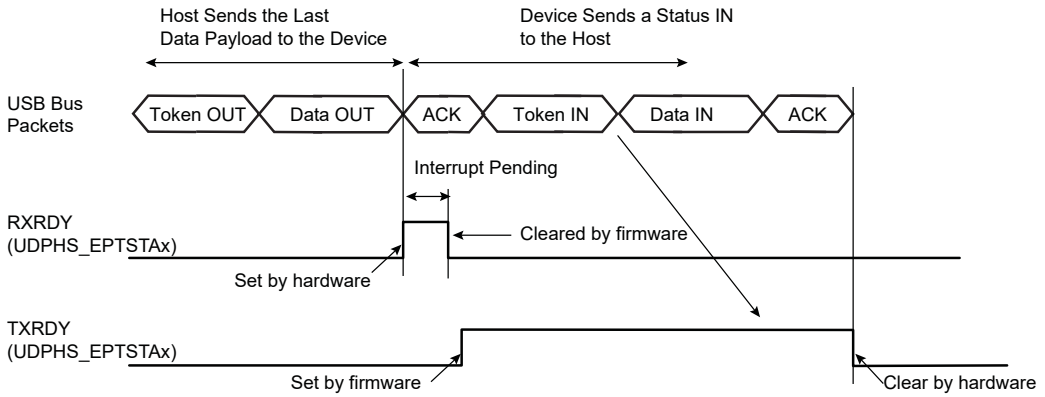


Figure 72.10. Data IN Followed By Status OUT Transfer at the End of a Control Transfer

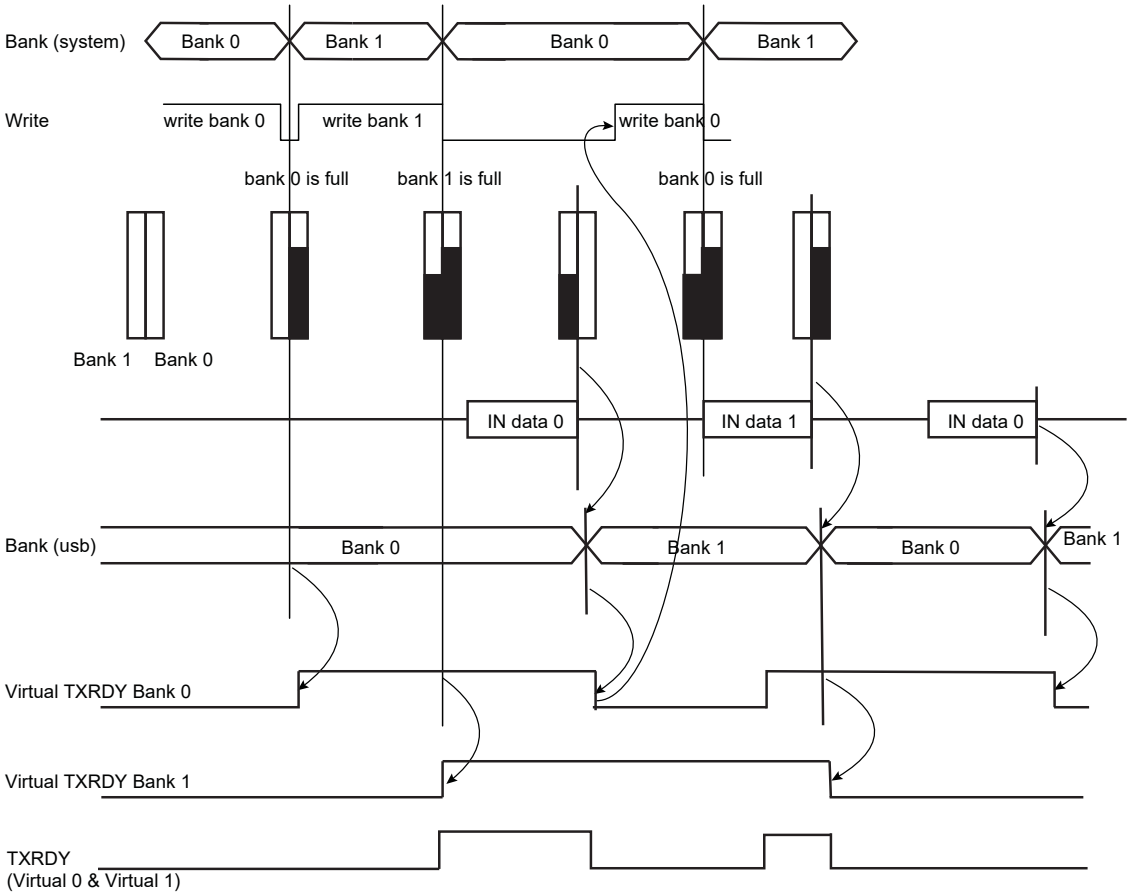
Note: A NAK handshake is always generated at the first status stage token.



© 2026 Microchip Technology Inc. and its subsidiaries

Figure 72.11. Data OUT Followed by Status IN Transfer

Note: Before proceeding to the status stage, the software should determine that there is no risk of extra data from the host (data stage). If not certain (non-predictable data stage length), then the software should wait for a NAK-IN interrupt before proceeding to the status stage. This precaution should be taken to avoid collision in the FIFO.

Figure 72.12. Autovalid with DMA

Note: In the illustration above, Autovalid validates a bank as full, although this might not be the case, in order to continue processing data and to send to DMA.

- Isochronous IN

© 2026 Microchip Technology Inc. and its subsidiaries

Isochronous-IN is used to transmit a stream of data whose timing is implied by the delivery rate. Isochronous transfer provides periodic, continuous communication between host and device.

It ensures bandwidth and low latencies appropriate for telephony, audio, video, etc.

If the endpoint is not available (TXRDY_TRER = 0), then the device does not answer the host. An ERR_FL_ISO interrupt is generated in the UDPHS_EPTSTAx register and, once enabled, sent to the CPU.

The STALL_SNT command bit is not used for an ISO-IN endpoint.

- High Bandwidth Isochronous Endpoint Handling: IN Example
  For high bandwidth isochronous endpoints, the DMA can be programmed with the number of transactions (UDPHS_DMACONTROLx.BUFF_LENGTH) and the system should provide the required number of packets per microframe, otherwise, the host will notice a sequencing problem.

  A response should be made to the first token IN recognized inside a microframe under the following conditions:
  - If at least one bank has been validated, the correct DATAx corresponding to the programmed Number Of Transactions per Microframe (NB_TRANS) should be answered. In case of a subsequent missed or corrupted token IN inside the microframe, the USB 2.0 Core available data bank(s) that should normally have been transmitted during that microframe shall be flushed at its end. If this flush occurs, an error condition is flagged (UDPHS_EPTSTAx.ERR_FLUSH is set).
  - If no bank is validated yet, the default DATA0 ZLP is answered and underflow is flagged (UDPHS_EPTSTAx.ERR_FL_ISO is set). Then, no data bank is flushed at the microframe end.
  - If no data bank has been validated at the time when a response should be made for the second transaction of NB_TRANS = 3 transactions microframe, a DATA1 ZLP is answered and underflow is flagged (UDPHS_EPTSTAx.ERR_FL_ISO is set). If and only if remaining untransmitted banks for that microframe are available at its end, they are flushed and an error condition is flagged (UDPHS_EPTSTAx.ERR_FLUSH is set).
  - If no data bank has been validated at the time when a response should be made for the last programmed transaction of a microframe, a DATA0 ZLP is answered and underflow is flagged (UDPHS_EPTSTAx.ERR_FL_ISO is set). If and only if the remaining untransmitted data bank for that microframe is available at its end, it is flushed and an error condition is flagged (UDPHS_EPTSTAx.ERR_FLUSH is set).

If at the end of a microframe no valid token IN has been recognized, no data bank is flushed and no error condition is reported.

At the end of a microframe in which at least one data bank has been transmitted, if less than NB_TRANS banks have been validated for that microframe, an error condition is flagged (UDPHS_EPTSTAx.ERR_TRANS is set).

Error cases (in UDPHS_EPTSTAx):

- ERR_FL_ISO: There was no data to transmit inside a microframe, so a ZLP is answered by default.
- ERR_FLUSH: At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of transactions actually validated (TXRDY_TRER) and likewise with the NB_TRANS programmed.
- ERR_TRANS: At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of programmed NB_TRANS transactions and the packets not requested were not validated.
- ERR_FL_ISO + ERR_FLUSH: At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs.

© 2026 Microchip Technology Inc. and its subsidiaries

- ERR_FL_ISO + ERR_TRANS: At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs and the data can be discarded at the microframe end.
- ERR_FLUSH + ERR_TRANS: The first token IN has been answered and it was the only one received, a second bank has been validated but not the third, whereas NB_TRANS was waiting for three transactions.
- ERR_FL_ISO + ERR_FLUSH + ERR_TRANS: The first token IN has been treated, the data for the second Token IN was not available in time, but the second bank has been validated before the end of the microframe. The third bank has not been validated, but three transactions have been set in NB_TRANS.

72.6.10.4.Data OUT

- Bulk OUT or Interrupt OUT
  Like data IN, data OUT packets are sent by the host during the data or the status stage of control transfer or during an interrupt/bulk/isochronous OUT transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.
- Bulk OUT or Interrupt OUT: Receiving a Packet Under Application Control (Host to Device)
  Algorithm Description for Each Packet:
  - The application enables an interrupt on RXRDY_TXKL.
  - When an interrupt on RXRDY_TXKL is received, the application knows that UDPHS_EPTSTAx register BYTE_COUNT bytes have been received.
  - The application reads the BYTE_COUNT bytes from the endpoint.
  - The application clears RXRDY_TXKL.
    Note: If the application does not know the size of the transfer, it may not be a good option to use AUTO_VALID. Because if a zero-length-packet is received, the RXRDY_TXKL is automatically cleared by the AUTO_VALID hardware and if the endpoint interrupt is triggered, the software will not find its originating flag when reading the UDPHS_EPTSTAx register.

  Algorithm to Fill Several Packets
  - The application enables the interrupts of BUSY_BANK and AUTO_VALID.
  - When a BUSY_BANK interrupt is received, the application knows that all banks available for the endpoint have been filled. Thus, the application can read all banks available.

  If the application does not know the size of the receive buffer, instead of using the BUSY_BANK interrupt, the application must use RXRDY_TXKL.
- Bulk OUT or Interrupt OUT: Sending a Buffer Using DMA (Host To Device)

To use the DMA setting, the AUTO_VALID field is mandatory.

See Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host) for more information.

DMA Configuration Example:

1. First program UDPHS_DMAADDRESSx with the address of the buffer that should be transferred.
2. Enable the interrupt of the DMA in the Interrupt Enable register (UDPHS_IEN).
3. Program the DMA Channelx Control Register:
   - Size of buffer to be sent.
   - END_B_EN: Can be used for OUT packet truncation (discarding of unbuffered packet data) at the end of DMA buffer.
   - END_BUFFIT: Generate an interrupt when UDPHS_DMASTATUSx.BUFF_COUNT reaches 0.
   - END_TR_EN: End of transfer enable, the UDPHS device can put an end to the current DMA transfer, in case of a short packet.

© 2026 Microchip Technology Inc. and its subsidiaries

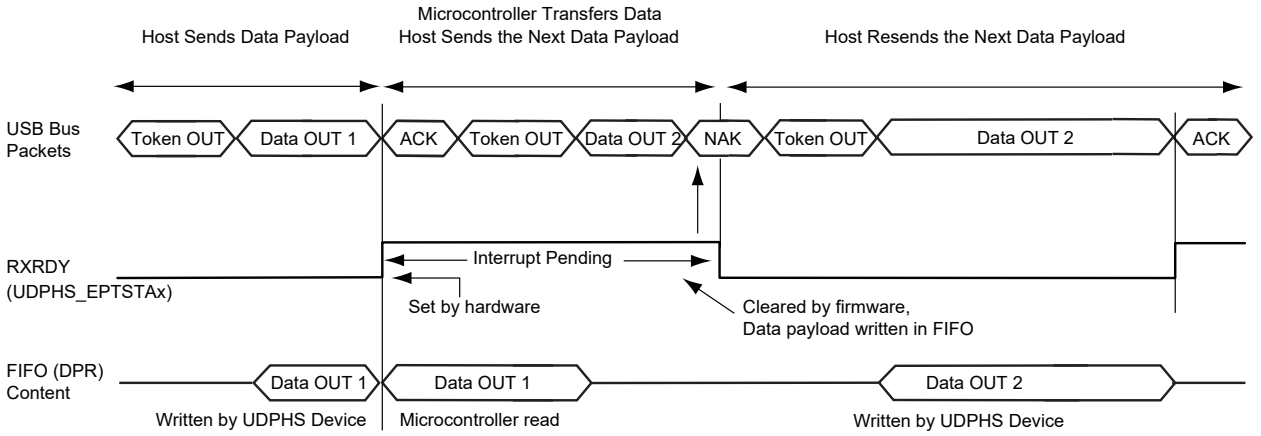
- END_TR_IT: End of transfer interrupt enable, an interrupt is sent after the last USB packet has been transferred by the DMA, if the USB transfer ended with a short packet. (Beneficial when the receive size is unknown.)
- CHANN_ENB: Run and stop at end of buffer.

For OUT transfer, the bank will be automatically cleared by hardware when the application has read all the bytes in the bank (the bank is empty).

Notes:

1. When a zero-length-packet is received, UDPHS_EPTSTAx.RXRDY_TXKL is cleared automatically by AUTO_VALID, and the application knows of the end of buffer by the presence of the END_TR_IT.
2. If the host sends a zero-length packet, and the endpoint is free, then the device sends an ACK. No data is written in the endpoint, the RXRDY_TXKL interrupt is generated, and the UDPHS_EPTSTAx.BYTE_COUNT field is null.

Figure 72.13. Data OUT Transfer for Endpoint with One Bank



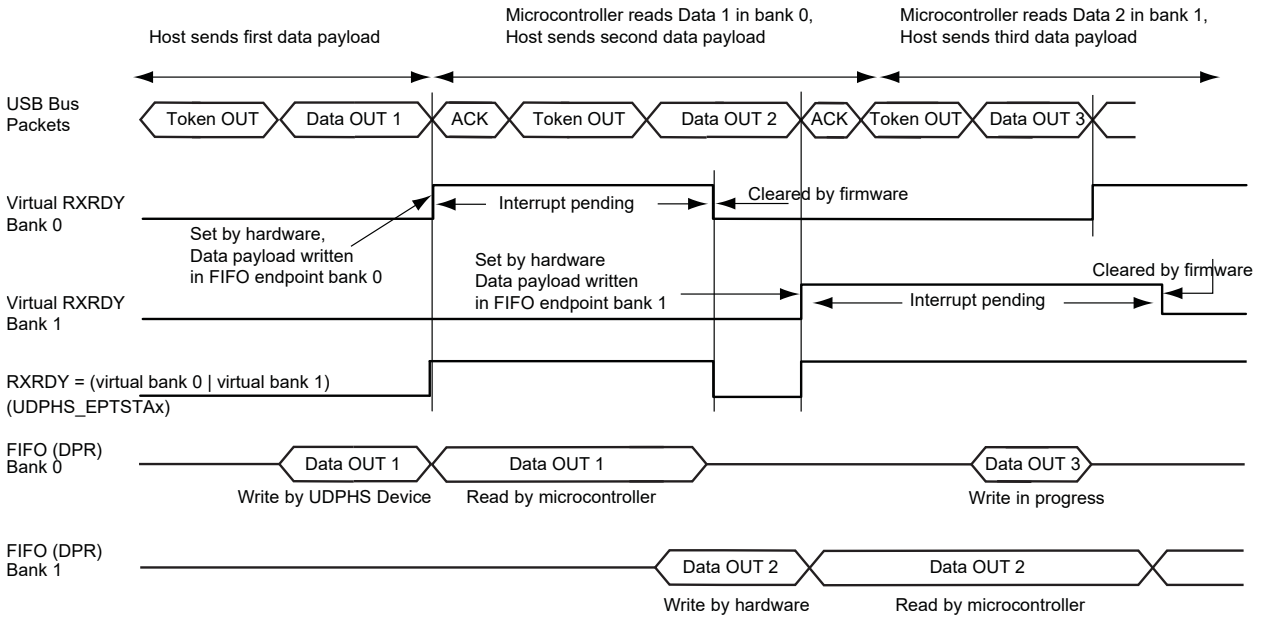


Figure 72.14. Data OUT Transfer for an Endpoint with Two Banks

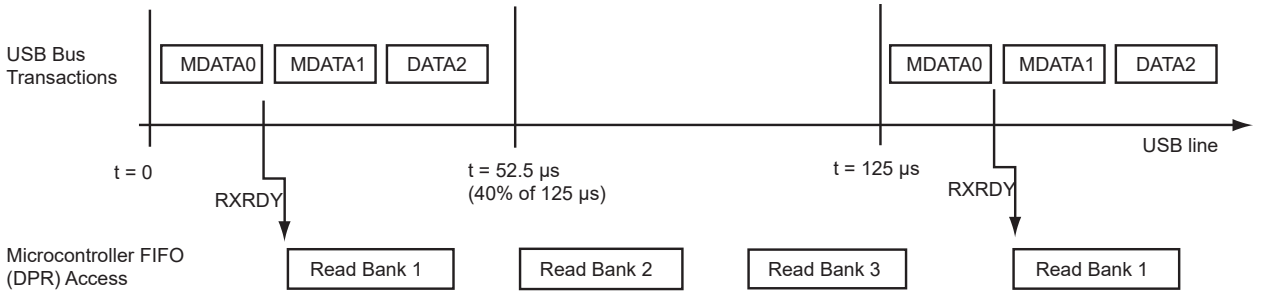
- High Bandwidth Isochronous Endpoint OUT

© 2026 Microchip Technology Inc. and its subsidiaries

USB 2.0 supports individual High Speed isochronous endpoints that require data rates up to 192 Mb/s (24 MB/s): 3x1024 data bytes per microframe.

To support such a rate, two or three banks may be used to buffer the three consecutive data packets. The microcontroller (or the DMA) should be able to empty the banks very rapidly (at least 24 MB/s on average).



NB_TRANS field in UDPHS_EPTCFGx register = Number Of Transactions per Microframe.

If NB_TRANS > 1 then it is High Bandwidth.

Example:

- If NB_TRANS = 3, the sequence should be either one of the following:
  - MData0
  - MData0/Data1
  - MData0/Data1/Data2
- If NB_TRANS = 2, the sequence should be either one of the following:
  - MData0
  - MData0/Data1
- If NB_TRANS = 1, the sequence should be:
  - Data0

Figure 72.15. Bank Management, Example of Three Transactions per Microframe

- Isochronous Endpoint Handling: OUT Example
  The user can ascertain the bank status (free or busy), and the toggle sequencing of the data packet for each bank with the UDPHS_EPTSTAx register in the three fields as follows:
  - TOGGLESQ_STA: PID of the data stored in the current bank.
  - CURBK: Number of the bank currently being accessed by the microcontroller.
  - BUSY_BANK_STA: Number of busy bank.

  This is particularly useful in case of a missing data packet.

  If the inter-packet delay between the OUT token and the Data is greater than the USB standard, then the ISO-OUT transaction is ignored. (Payload data is not written, no interrupt is generated to the CPU.)

  If there is a data CRC (Cyclic Redundancy Check) error, the payload is, none the less, written in the endpoint. The UDPHS_EPTSTAx.ERR_CRC_NTR flag is set.

  If the endpoint is already full, the packet is not written in the DPRAM. The UDPHS_EPTSTAx.ERR_FL_ISO flag is set.

  If the payload data is greater than the maximum size of the endpoint, then the ERR_OVFLW flag is set. It is the task of the CPU to manage this error. The data packet is written in the endpoint (except the extra data).

© 2026 Microchip Technology Inc. and its subsidiaries

If the host sends a Zero Length Packet, and the endpoint is free, no data is written in the endpoint, the RXRDY_TXKL flag is set, and the UDPHS_EPTSTAx.BYTE_COUNT field is null.

The FRCESTALL command bit is unused for an isochronous endpoint.

Otherwise, payload data is written in the endpoint, the RXRDY_TXKL interrupt is generated and BYTE_COUNT is updated.

72.6.10.5.STALL

STALL is returned by a function in response to an IN token or after the data phase of an OUT or in response to a PING transaction. STALL indicates that a function is unable to transmit or receive data, or that a control pipe request is not supported.

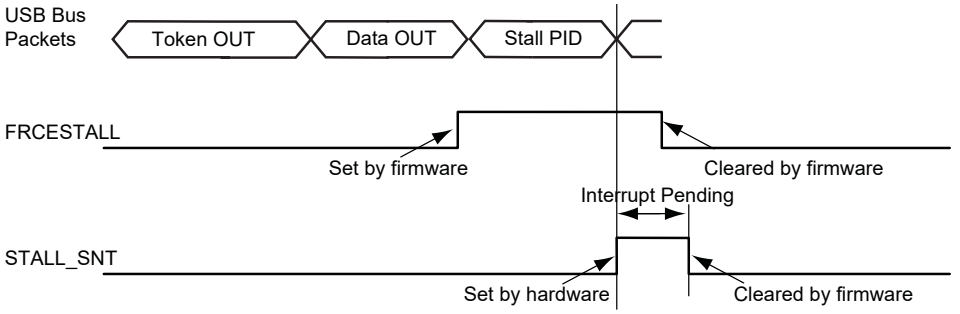
- OUT

To stall an endpoint, set the FRCESTALL bit in UDPHS_EPTSETSTAx register and after the STALL_SNT flag has been set, set the TOGGLE_SEG bit in the UDPHS_EPTCLRSTAx register.

- IN

Set the FRCESTALL bit in UDPHS_EPTSETSTAx register.

Figure 72.16. Stall Handshake Data OUT Transfer



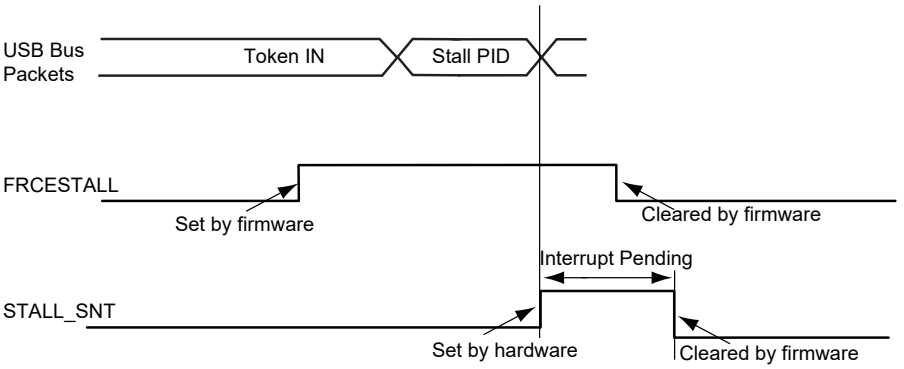


Figure 72.17. Stall Handshake Data IN Transfer

72.6.11. Speed Identification

The high speed reset is managed by hardware.

At the connection, the host makes a reset which could be a classic reset (full speed) or a high speed reset.

At the end of the reset process (full or high), the ENDRESET interrupt is generated.

Then the CPU should read the SPEED bit in UDPHS_INTSTAx to ascertain the speed mode of the device.

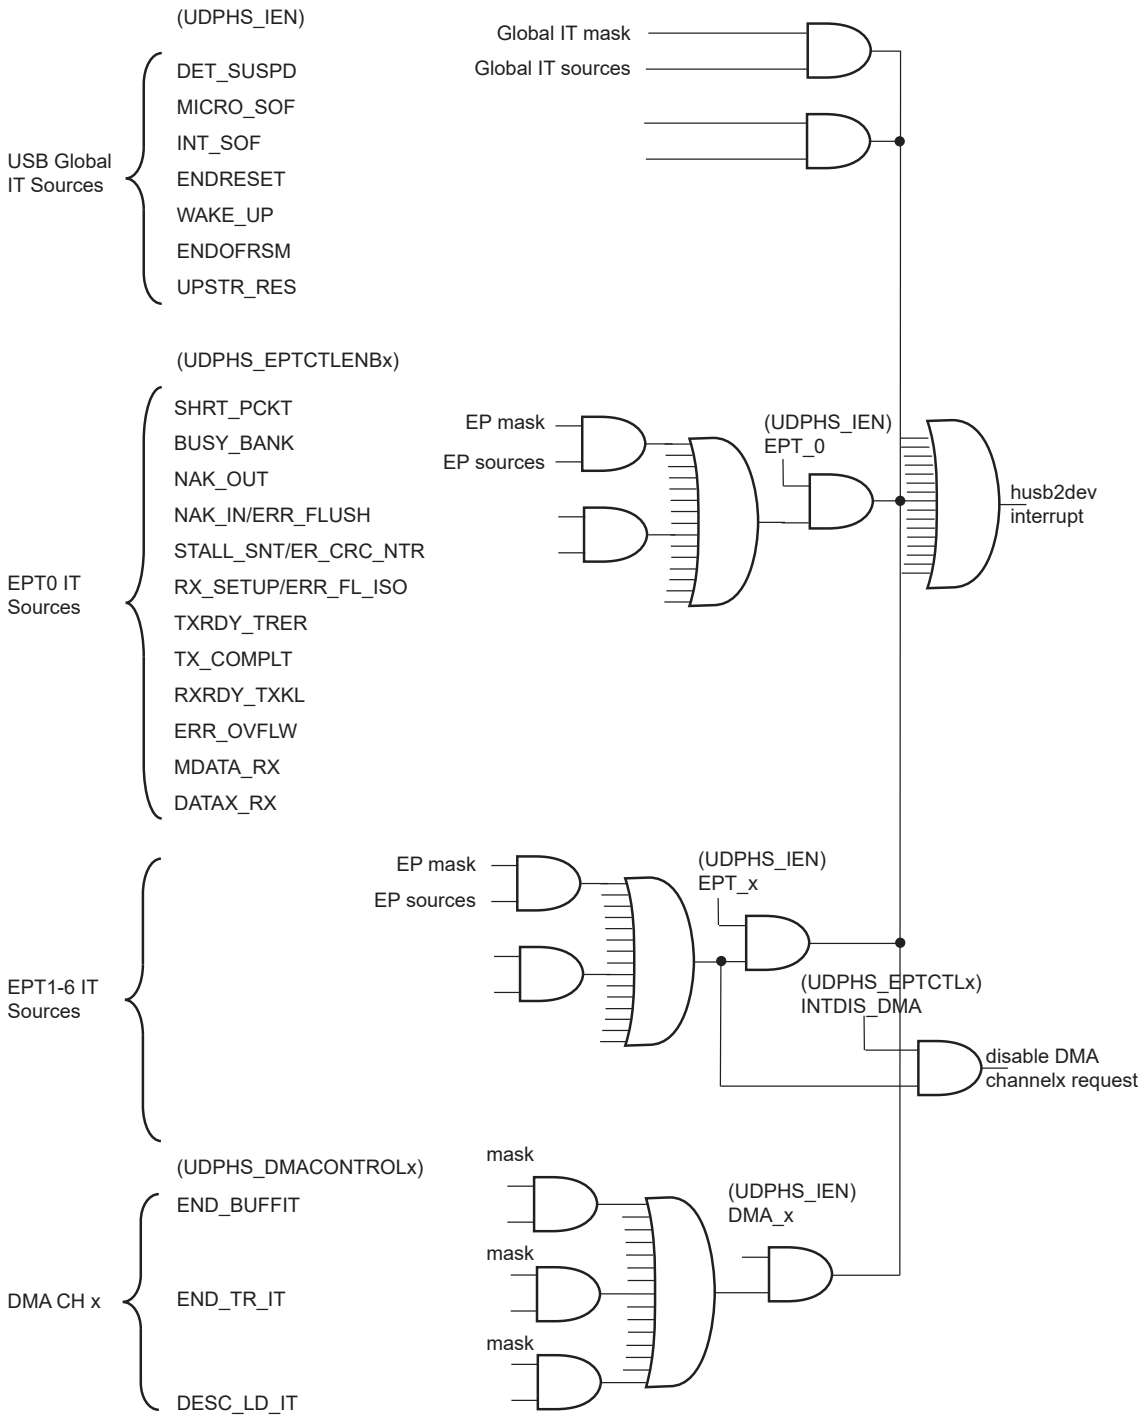
72.6.12. USB V2.0 High Speed Global Interrupt

Interrupts are defined in UDPHS_IEN and in UDPHS_INTSTA (Interrupt Status register).

72.6.13. Endpoint Interrupts



Interrupts are enabled in UDPHS_IEN and individually masked in UDPHS_EPTCTLENBx.

Table 72.4. Endpoint Interrupt Source Masks

Acronym	Description
SHRT_PCKT	Short packet interrupt
BUSY_BANK	Busy bank interrupt
NAK_OUT	NAKOUT interrupt
NAK_IN/ERR_FLUSH	NAKIN/error flush interrupt
STALL_SNT/ERR_CRC_NTR	Stall sent/CRC error/number of transaction error interrupt
RX_SETUP/ERR_FL_ISO	Received SETUP/error flow interrupt
TXRDY_TRER	TX packet read/transaction error interrupt
TX_COMPLT	Transmitted IN data complete interrupt
RXRDY_TXKL	Received OUT data interrupt
ERR_OVFLW	Overflow error interrupt
MDATA_RX	MDATA interrupt
DATAX_RX	DATAx interrupt

72.6.14. Power Modes

72.6.14.1.Controlling Device States

A USB device has several possible states. Refer to Chapter 9 (USB Device Framework) of the Universal Serial Bus Specification, Rev 2.0.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 72.19. UDPHS Device State Diagram

Movement from one state to another depends on the USB bus state or on standard requests sent through control transactions via the default endpoint (endpoint 0).

After a period of bus inactivity, the USB device enters Suspend mode. Accepting Suspend/Resume requests from the USB host is mandatory. Constraints in Suspend mode are very strict for bus-powered applications; devices may not consume more than 500 µA on the USB bus.

While in Suspend mode, the host may wake up a device by sending a resume signal (bus activity) or a USB device may send a wake-up request to the host (waking up a PC by moving a USB mouse, for example).

The wake-up feature is not mandatory for all devices and must be negotiated with the host.

72.6.14.2.Not Powered State

Self powered devices can detect 5V VBUS using a PIO. When the device is not connected to a host, device power consumption can be reduced by the DETACH bit in UDPHS_CTRL. Disabling the transceiver is automatically done. HSDM, HSDP, FSDP and FSDP lines are tied to GND pulldowns integrated in the hub downstream ports.

72.6.14.3.Entering Attached State

When no device is connected, the USB FSDP and FSDM signals are tied to GND by 15 KΩ pulldowns integrated in the hub downstream ports. When a device is attached to an hub downstream port, the device connects a 1.5 KΩ pullup on FSDP. The USB bus line goes into Idle state, FSDP is pulled up by the device 1.5 KΩ resistor to 3.3V and FSDM is pulled down by the 15 KΩ resistor to GND of the host.

© 2026 Microchip Technology Inc. and its subsidiaries

After pullup connection, the device enters the Powered state. The transceiver remains disabled until bus activity is detected.

In case of low power consumption need, the device can be stopped. When the device detects the VBUS, the software must enable the USB transceiver by enabling the EN_UDPHS bit in UDPHS_CTRL register.

The software can detach the pullup by setting DETACH bit in UDPHS_CTRL register.

72.6.14.4.From Powered State to Default State (Reset)

After its connection to a USB host, the USB device waits for an end-of-bus reset. The unmasked flag ENDRESET is set in the UDPHS_IEN register and an interrupt is triggered.

Once the ENDRESET interrupt has been triggered, the device enters Default state. In this state, the UDPHS software must:

- Enable the default endpoint, setting the EPT_ENABL flag in the UDPHS_EPTCTLENB[0] register and, optionally, enabling the interrupt for endpoint 0 by writing 1 in EPT_0 of the UDPHS_IEN register. The enumeration then begins by a control transfer.
- Configure the Interrupt Mask Register which has been reset by the USB reset detection
- Enable the transceiver.

In this state, the EN_UDPHS bit in UDPHS_CTRL register must be enabled.

72.6.14.5.From Default State to Address State (Address Assigned)

After a Set Address standard device request, the USB host peripheral enters the Address state.

WARNING Before the device enters Address state, it must achieve the Status IN transaction of the control transfer, i.e., the UDPHS device sets its new address once the TX_COMPLT flag in the UDPHS_EPTCTL[0] register has been received and cleared.

To move to the Address state, the driver software sets the DEV_ADDR field and the FADDR_EN flag in the UDPHS_CTRL register.

72.6.14.6.From Address State to Configured State (Device Configured)

Once a valid Set Configuration standard request has been received and acknowledged, the device enables endpoints corresponding to the current configuration. This is done by setting the BK_NUMBER, EPT_TYPE, EPT_DIR and EPT_SIZE fields in the UDPHS_EPTCFGx registers and enabling them by setting the EPT_ENABL flag in the UDPHS_EPTCTLENBx registers, and, optionally, enabling corresponding interrupts in the UDPHS_IEN register.

72.6.14.7.Entering Suspend State (Bus Activity)

When a Suspend (no bus activity on the USB bus) is detected, the DET_SUSPD signal in the UDPHS_STA register is set. This triggers an interrupt if the corresponding bit is set in the UDPHS_IEN register. This flag is cleared by writing to the UDPHS_CLRINT register. Then the device enters Suspend mode.

In this state bus powered devices must drain less than 500 µA from the 5V VBUS. As an example, the microcontroller switches to slow clock, disables the PLL and main oscillator, and goes into Idle mode. It may also switch off other devices on the board.

The UDPHS device peripheral clocks can be switched off. Resume event is asynchronously detected.

72.6.14.8.Receiving a Host Resume

In Suspend mode, a resume event on the USB bus line is detected asynchronously, transceiver and clocks disabled (however, the pullup should not be removed).

© 2026 Microchip Technology Inc. and its subsidiaries

Once the resume is detected on the bus, the signal WAKE_UP in the UDPHS_INTSTA is set. It may generate an interrupt if the corresponding bit in the UDPHS_IEN register is set. This interrupt may be used to wake up the core, enable PLL and main oscillators and configure clocks.

72.6.14.9.Sending an External Resume

In Suspend State it is possible to wake up the host by sending an external resume.

The device waits at least 5 ms after being entered in Suspend State before sending an external resume.

The device must force a K state from 1 to 15 ms to resume the host.

72.6.14.10.Detach Procedure (Software Disconnect)

The user can detach the device from the USB bus under software control by setting the UDPHS_CTRL.DETACH bit.

If the device is currently operating at high speed, software will first force the device to Full-Speed mode by writing UDPHS_TST.SPEED_CFG = 3 (FULL_SPEED).

Note: Setting DETACH directly from High Speed operation is not supported and is not reliably observed by the host as a disconnect.

To detach the device:

1. Write UDPHS_TST.SPEED_CFG = 3 (FULL_SPEED).
2. Write UDPHS_CTRL.DETACH = 1.

No software delay between the two writes is required.

On re-attach, the writes must occur in the reverse order:

1. Write UDPHS_TST.SPEED_CFG = 0 (NORMAL).
2. Write UDPHS_CTRL.DETACH = 0.

Note: The same sequence can be applied regardless of the current speed.

Pseudo-code:

```
/* Detach */
UDPHS_TST  = (UDPHS_TST & ~0x3) | 0x3;   /* SPEED_CFG = FULL_SPEED */
UDPHS_CTRL = UDPHS_CTRL | UDPHS_DETACH;  /* DETACH = 1 */

/* Re-attach */
UDPHS_TST  = UDPHS_TST  & ~0x3;          /* SPEED_CFG = NORMAL */
UDPHS_CTRL = UDPHS_CTRL & ~UDPHS_DETACH; /* DETACH = 0 */
```

72.6.15. Test Mode

A device must support the TEST_MODE feature when in the Default, Address or Configured High Speed device states.

TEST_MODE can be:

- Test_J
- Test_K
- Test_Packet
- Test_SEO_NAK

(See UDPHS Test Register for definitions of each test mode.)

```
const char test_packet_buffer[] = {
0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,                // JKJKJKJK * 9
0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,                     // JJKKJJKK * 8
0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,                     // JJKKJJKK * 8
0xFE,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF, // JJJJJJJKKKKKKK * 8
0x7F,0xBF,0xDF,0xEF,0xF7,0xFB,0xFD,                          // JJJJJJJK * 8
```

© 2026 Microchip Technology Inc. and its subsidiaries

```
0xFC,0x7E,0xBF,0xDF,0xEF,0xF7,0xFB,0xFD,0x7E                    // {JKKKKKKK * 10}, JK
};
```

72.7. Register Summary

Notes: The registers below have two modes: Control, Bulk, Interrupt Endpoints mode and Isochronous Endpoints mode. In this register summary, both modes are displayed at the same offset.

- UDPHS_EPTCTLENB
- UDPHS_EPTCTLDIS
- UDPHS_EPTCTL
- UDPHS_EPTSETSTA
- UDPHS_EPTCLRSTA
- UDPHS_EPTSTA

72.7.1. UDPHS Control Register

Name: UDPHS_CTRL
Offset: 0x00
Reset: 0x00000200
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
					PULLD_DIS	REWAKEUP	DETACH	EN_UDPHS
Access					R/W	R/W	R/W	R/W
Reset					0	0	1	0

Bit	7	6	5	4	3	2	1	0
	FADDR_EN	DEV_ADDR[6:0]						
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 11 – PULLD_DIS Pulldown Disable (cleared upon USB reset)
When set, there is no pulldown on DP & DM. (DM Pulldown = DP Pulldown = 0).
Note: If the DETACH bit is also set, device DP & DM are left in High Impedance state.

See description of bit “DETACH”.

DETACH	PULLD_DIS	DP	DM	Condition
0	0	Pullup	Pulldown	Not recommended
0	1	Pullup	High Impedance state	VBUS present
1	0	Pulldown	Pulldown	No VBUS
1	1	High Impedance state	High Impedance state	VBUS present & software disconnect

Bit 10 – REWAKEUP Send Remote Wake-Up (cleared upon USB reset)
An Upstream Resume is sent only after the UDPHS bus has been in Suspend state for at least 5 ms.
This bit is automatically cleared by hardware at the end of the Upstream Resume.

Value	Description
0	Remote Wake-Up is disabled (read), or this bit has no effect (write).
1	Remote Wake-Up is enabled (read), or this bit forces an external interrupt on the UDPHS controller for Remote Wake-Up purposes.

Bit 9 – DETACH Detach Command
See description of bit “PULLD_DIS”.
Prior to writing DETACH = 1, write the UDPHS_TST register to 0x3 (Force Full Speed operation).

Value	Description
0	UDPHS is attached (read), or this bit pulls up the DP line (attach command) (write).

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	UDPHS is detached, UTMI transceiver is suspended (read), or this bit simulates a detach on the UDPHS line and forces the UTMI transceiver into Suspend state (Suspend M = 0) (write).

Bit 8 – EN_UDPHS UDPHS Enable

Value	Description
0	UDPHS is disabled (read), or this bit disables and resets the UDPHS controller (write). Switch the UHPHS to UTMI.
1	UDPHS is enabled (read), or this bit enables the UDPHS controller (write). Switch the UDPHS to UTMI.

Bit 7 – FADDR_EN Function Address Enable (cleared upon USB reset)

Value	Description
0	The device is not in Address state (read), or only the default function address is used (write).
1	The device is in Address state (read), or this bit is set by the device firmware after a successful status phase of a SET_ADDRESS transaction (write). When set, the only address accepted by the UDPHS controller is the one stored in the UDPHS Address field. It will not be cleared afterwards by the device firmware. It is cleared by hardware on hardware reset, or when UDPHS bus reset is received.

Bits 6:0 – DEV_ADDR[6:0] UDPHS Address (cleared upon USB reset)

This field contains the default address (0) after power-up or UDPHS bus reset (read), or it is written with the value set by a SET_ADDRESS request received by the device firmware (write).

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.2. UDPHS Frame Number Register

Name: UDPHS_FNUM
Offset: 0x04
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	FNUM_ERR							
Access	R							
Reset	0							

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
			FRAME_NUMBER[10:5]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	FRAME_NUMBER[4:0]					MICRO_FRAME_NUM[2:0]		
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 31 – FNUM_ERR Frame Number CRC Error (cleared upon USB reset)
This bit is set by hardware when a corrupted Frame Number in Start of Frame packet (or Micro SOF) is received.
This bit and the INT_SOF (or MICRO_SOF) interrupt are updated at the same time.

Bits 13:3 – FRAME_NUMBER[10:0] Frame Number as defined in the Packet Field Formats (cleared upon USB reset)
This field is provided in the last received SOF packet (see UDPHS_IEN.INT_SOF).

Bits 2:0 – MICRO_FRAME_NUM[2:0] Microframe Number (cleared upon USB reset)
Number of the received microframe (0 to 7) in one frame.This field is reset at the beginning of each new frame (1 ms).
One microframe is received each 125 microseconds (1 ms/8).

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.3. UDPHS Interrupt Enable Register

Name: UDPHS_IEN
Offset: 0x10
Reset: 0x00000010
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
		DMA_6	DMA_5	DMA_4	DMA_3	DMA_2	DMA_1	
Access		R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
		EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	1	0	0	0	

Bits 25, 26, 27, 28, 29, 30 – DMA_x DMA Channel x Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable the interrupts for this channel.
1	Enable the interrupts for this channel.

Bits 8, 9, 10, 11, 12, 13, 14 – EPT_x Endpoint x Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable the interrupts for this endpoint.
1	Enable the interrupts for this endpoint.

Bit 7 – UPSTR_RES Upstream Resume Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Upstream Resume Interrupt.
1	Enable Upstream Resume Interrupt.

Bit 6 – ENDOFRSM End Of Resume Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Resume Interrupt.
1	Enable Resume Interrupt.

Bit 5 – WAKE_UP Wake Up CPU Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Wake-up CPU Interrupt.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Enable Wake-up CPU Interrupt.

Bit 4 – ENDRESET End Of Reset Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable End Of Reset Interrupt.
1	Enable End Of Reset Interrupt. Automatically enabled after USB reset.

Bit 3 – INT_SOF SOF Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable SOF Interrupt.
1	Enable SOF Interrupt.

Bit 2 – MICRO_SOF Micro-SOF Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Micro-SOF Interrupt.
1	Enable Micro-SOF Interrupt.

Bit 1 – DET_SUSPD Suspend Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Suspend Interrupt.
1	Enable Suspend Interrupt.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.4. UDPHS Interrupt Status Register

Name: UDPHS_INTSTA
Offset: 0x14
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
		DMA_6	DMA_5	DMA_4	DMA_3	DMA_2	DMA_1	
Access		R	R	R	R	R	R	
Reset		0	0	0	0	0	0	

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
		EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	SPEED
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 25, 26, 27, 28, 29, 30 – DMA_x DMA Channel x Interrupt

Value	Description
0	Reset when the UDPHS_DMASTATUSx interrupt source is cleared.
1	Set by hardware when an interrupt is triggered by the DMA Channelx and this endpoint interrupt is enabled by the DMA_x bit in UDPHS_IEN.

Bits 8, 9, 10, 11, 12, 13, 14 – EPT_x Endpoint x Interrupt (cleared upon USB reset)

Value	Description
0	Reset when the UDPHS_EPTSTAx interrupt source is cleared.
1	Set by hardware when an interrupt is triggered by the UDPHS_EPTSTAx register and this endpoint interrupt is enabled by the EPT_x bit in UDPHS_IEN.

Bit 7 – UPSTR_RES Upstream Resume Interrupt

Value	Description
0	Cleared by setting the UPSTR_RES bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller is sending a resume signal called “upstream resume”. This triggers a UDPHS interrupt when the UPSTR_RES bit is set in UDPHS_IEN.

Bit 6 – ENDOFRSM End Of Resume Interrupt

Value	Description
0	Cleared by setting the ENDOFRSM bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller detects a good end of resume signal initiated by the host. This triggers a UDPHS interrupt when the ENDOFRSM bit is set in UDPHS_IEN.

Bit 5 – WAKE_UP Wake Up CPU Interrupt

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Cleared by setting the WAKE_UP bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller is in Suspend state and is re-activated by a filtered non-idle signal from the UDPHS line (not by an upstream resume). This triggers a UDPHS interrupt when the WAKE_UP bit is set in UDPHS_IEN register. When receiving this interrupt, the user has to enable the device controller clock prior to operation. **Note:** this interrupt is generated even if the device controller clock is disabled.

Bit 4 – ENDRESET End Of Reset Interrupt

Value	Description
0	Cleared by setting the ENDRESET bit in UDPHS_CLRINT.
1	Set by hardware when an End Of Reset has been detected by the UDPHS controller. This triggers a UDPHS interrupt when the ENDRESET bit is set in UDPHS_IEN.

Bit 3 – INT_SOF Start Of Frame Interrupt

Note: The Micro Start Of Frame Interrupt (MICRO_SOF), and the Start Of Frame Interrupt (INT_SOF) are not generated at the same time.

Value	Description
0	Cleared by setting the INT_SOF bit in UDPHS_CLRINT.
1	Set by hardware when an UDPHS Start Of Frame PID (SOF) has been detected (every 1 ms) or synthesized by UDPHS. This triggers a UDPHS interrupt when the INT_SOF bit is set in UDPHS_IEN register. In case of detected SOF, in High Speed mode, the MICRO_FRAME_NUMBER field is cleared in UDPHS_FNUM register and the FRAME_NUMBER field is updated.

Bit 2 – MICRO_SOF Micro Start Of Frame Interrupt

Note: The Micro Start Of Frame Interrupt (MICRO_SOF), and the Start Of Frame Interrupt (INT_SOF) are not generated at the same time.

Value	Description
0	Cleared by setting the MICRO_SOF bit in UDPHS_CLRINT register.
1	Set by hardware when an UDPHS micro start of frame PID (SOF) has been detected (every 125 us) or synthesized by UDPHS. This triggers a UDPHS interrupt when the MICRO_SOF bit is set in UDPHS_IEN. In case of detected SOF, the MICRO_FRAME_NUM field in UDPHS_FNUM register is incremented and the FRAME_NUMBER field does not change.

Bit 1 – DET_SUSPD Suspend Interrupt

Value	Description
0	Cleared by setting the DET_SUSPD bit in UDPHS_CLRINT register.
1	Set by hardware when a UDPHS Suspend (Idle bus for three frame periods, a J state for 3 ms) is detected. This triggers a UDPHS interrupt when the DET_SUSPD bit is set in UDPHS_IEN register.

Bit 0 – SPEED Speed Status

Value	Description
0	Reset by hardware when the hardware is in Full Speed mode.
1	Set by hardware when the hardware is in High Speed mode.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.5. UDPHS Clear Interrupt Register

Name: UDPHS_CLRINT
Offset: 0x18
Reset: –
Property: Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	
Access	W	W	W	W	W	W	W	
Reset	–	–	–	–	–	–	–	

Bit 7 – UPSTR_RES Upstream Resume Interrupt Clear

Value	Description
0	No effect.
1	Clear the UPSTR_RES bit in UDPHS_INTSTA.

Bit 6 – ENDOFRSM End Of Resume Interrupt Clear

Value	Description
0	No effect.
1	Clear the ENDOFRSM bit in UDPHS_INTSTA.

Bit 5 – WAKE_UP Wake Up CPU Interrupt Clear

Value	Description
0	No effect.
1	Clear the WAKE_UP bit in UDPHS_INTSTA.

Bit 4 – ENDRESET End Of Reset Interrupt Clear

Value	Description
0	No effect.
1	Clear the ENDRESET bit in UDPHS_INTSTA.

Bit 3 – INT_SOF Start Of Frame Interrupt Clear

Value	Description
0	No effect.
1	Clear the INT_SOF bit in UDPHS_INTSTA.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 2 – MICRO_SOF Micro Start Of Frame Interrupt Clear

Value	Description
0	No effect.
1	Clear the MICRO_SOF bit in UDPHS_INTSTA.

Bit 1 – DET_SUSPD Suspend Interrupt Clear

Value	Description
0	No effect.
1	Clear the DET_SUSPD bit in UDPHS_INTSTA.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.6. UDPHS Endpoints Reset Register

Name: UDPHS_EPTRST
Offset: 0x1C
Reset: –
Property: Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
		EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access		W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–

Bits 0, 1, 2, 3, 4, 5, 6 – EPT_x Endpoint x Reset
Setting this bit clears all bits in Endpoint Status register (UDPHS_EPTSTAx), except the TOGGLESQ_STA field.

Value	Description
0	No effect.
1	Reset the Endpointx state.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.7. UDPHS Test Register

Name: UDPHS_TST
Offset: 0xE0
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			OPMODE2	TST_PKT	TST_K	TST_J	SPEED_CFG[1:0]	
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 5 – OPMODE2 OpMode2

Note: For the Test mode, Test_SE0_NAK (refer to Universal Serial Bus Specification, Revision 2.0: 7.1.20, Test Mode Support). Force the device in High Speed mode, and configure a bulk-type endpoint. Do not fill this endpoint for sending NAK to the host.
Upon command, a port's transceiver must enter the High Speed Receive mode and remain in that mode until the exit action is taken. This enables the testing of output impedance, low level output voltage and loading characteristics. In addition, while in this mode, upstream facing ports (and only upstream facing ports) must respond to any IN token packet with a NAK handshake (only if the packet CRC is determined to be correct) within the normal allowed device response time. This enables testing of the device squelch level circuitry and, additionally, provides a general purpose stimulus/response test for basic functional testing.

Value	Description
0	No effect.
1	Set to force the OpMode signal (UTMI interface) to "10", to disable the bit-stuffing and the NRZI encoding.

Bit 4 – TST_PKT Test Packet Mode

Value	Description
0	No effect.
1	Set to repetitively transmit the packet stored in the current bank. This enables the testing of rise and fall times, eye patterns, jitter, and any other dynamic waveform specifications.

Bit 3 – TST_K Test K Mode

Value	Description
0	No effect.
1	Set to send the K state on the UDPHS line. This enables the testing of the high output drive level on the D- line.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 2 – TST_J Test J Mode

Value	Description
0	No effect.
1	Set to send the J state on the UDPHS line. This enables the testing of the high output drive level on the D+ line.

Bits 1:0 – SPEED_CFG[1:0] Speed Configuration

Value	Name	Description
0	NORMAL	Normal mode: The macro is in Full Speed mode, ready to make a High Speed identification if the host supports it and then to automatically switch to High Speed mode.
1	–	Reserved
2	HIGH_SPEED	Force High Speed: Set this value to force the hardware to work in High Speed mode. Only for debug or test purposes.
3	FULL_SPEED	Force Full Speed: Set this value to force the hardware to work only in Full Speed mode. In this configuration, UDPHS does not respond to a High Speed reset handshake. This value is also used as the first step of the documented software detach procedure. See Detach Procedure (Software Disconnect).

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.8. UDPHS Endpoint Configuration Register

Name: UDPHS_EPTCFG
Offset: 0x0100 + n*0x04 [n=0..6]
Reset: 0x00000000
Property: Read/Write

Reset							0	0

Bit	7	6	5	4	3	2	1	0
	BK_NUMBER[1:0]		EPT_TYPE[1:0]		EPT_DIR	EPT_SIZE[2:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 31 – EPT_MAPD Endpoint Mapped (cleared upon USB reset)

Value	Description
0	The user should reprogram the register with correct values.
1	Set by hardware when the endpoint size (EPT_SIZE) and the number of banks (BK_NUMBER) are correct regarding: – The max endpoint size for this endpoint – The number of allowed banks for this endpoint

Bits 9:8 – NB_TRANS[1:0] Number Of Transactions per Microframe (cleared upon USB reset)
The number of transactions per microframe is set by software.
Note: Meaningful for high bandwidth isochronous endpoint only.

Bits 7:6 – BK_NUMBER[1:0] Number of Banks (cleared upon USB reset)
Set this field according to the endpoint's number of banks (see Endpoint Configuration).

Value	Name	Description
0	0	Zero bank, the endpoint is not mapped in memory
1	1	One bank (bank 0)
2	2	Double bank (Ping-Pong: bank0/bank1)
3	3	Triple bank (bank0/bank1/bank2)

Bits 5:4 – EPT_TYPE[1:0] Endpoint Type (cleared upon USB reset)
Set this field according to the endpoint type (see Endpoint Configuration).
(Endpoint 0 should always be configured as control).

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	CTRL8	Control endpoint
1	ISO	Isochronous endpoint
2	BULK	Bulk endpoint
3	INT	Interrupt endpoint

Bit 3 – EPT_DIR Endpoint Direction (cleared upon USB reset)
For Control endpoints this bit has no effect and should be left at zero.

Value	Description
0	Clear this bit to configure OUT direction for Bulk, Interrupt and Isochronous endpoints.
1	Set this bit to configure IN direction for Bulk, Interrupt and Isochronous endpoints.

Bits 2:0 – EPT_SIZE[2:0] Endpoint Size (cleared upon USB reset)
Set this field according to the endpoint size in bytes (see Endpoint Configuration). Note that 1024 bytes is only for isochronous endpoints.

Value	Name	Description
0	8	8 bytes
1	16	16 bytes
2	32	32 bytes
3	64	64 bytes
4	128	128 bytes
5	256	256 bytes
6	512	512 bytes
7	1024	1024 bytes

				NYET_DIS	INTDIS_DMA		AUTO_VALID	EPT_ENABL
Access				W	W		W	W
Reset				–	–		–	–

Bit 31 – SHRT_PCKT Short Packet Send/Short Packet Interrupt Enable
For IN endpoints: Ensures short packet at end of DMA Transfer if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTOVALID bits are also set.
For OUT endpoints:

Value	Description
0	No effect.
1	Enable Short Packet Interrupt.

Bit 18 – BUSY_BANK Busy Bank Interrupt Enable

Value	Description
0	No effect.
1	Enable Busy Bank Interrupt.

Bit 15 – NAK_OUT NAKOUT Interrupt Enable

Value	Description
0	No effect.
1	Enable NAKOUT Interrupt.

Bit 14 – NAK_IN NAKIN Interrupt Enable

Value	Description
0	No effect.
1	Enable NAKIN Interrupt.

Bit 13 – STALL_SNT Stall Sent Interrupt Enable

Value	Description
0	No effect.
1	Enable Stall Sent Interrupt.

Bit 12 – RX_SETUP Received SETUP

Value	Description
0	No effect.
1	Enable RX_SETUP Interrupt.

Bit 11 – TXRDY TX Packet Ready Interrupt Enable

Value	Description
0	No effect.
1	Enable TX Packet Ready/Transaction Error Interrupt.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Enable

Value	Description
0	No effect.
1	Enable Transmitted IN Data Complete Interrupt.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Enable

Value	Description
0	No effect.
1	Enable Received OUT Data Interrupt.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Overflow Error Interrupt.

Bit 4 – NYET_DIS NYET Disable (Only for High Speed Bulk OUT endpoints)

Value	Description
0	No effect.
1	Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

Bit 3 – INTDIS_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

Bit 1 – AUTO_VALID Packet Auto-Valid Enable

Value	Description
0	No effect.
1	Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

Bit 0 – EPT_ENABL Endpoint Enable

Value	Description
0	No effect.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Enable endpoint according to the device configuration.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.10. UDPHS Endpoint Control Enable Register (Isochronous Endpoints)

Name: UDPHS_EPTCTLENB (ISOENDPT)
Offset: 0x0104 + n*0x04 [n=0..6]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

For additional information, see UDPHS_EPTCTLx.

Bit	31	30	29	28	27	26	25	24

Access	W	W			W		W	W
Reset	–	–			–		–	–

Bit 31 – SHRT_PCKT Short Packet Send/Short Packet Interrupt Enable
For IN endpoints: Ensures short packet at end of DMA Transfer if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTOVALID bits are also set.
For OUT endpoints:

Value	Description
0	No effect.
1	Enable Short Packet Interrupt.

Bit 18 – BUSY_BANK Busy Bank Interrupt Enable

Value	Description
0	No effect.
1	Enable Busy Bank Interrupt.

Bit 14 – ERR_FLUSH Bank Flush Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Bank Flush Error Interrupt.

Bit 13 – ERR_CRC_NTR ISO CRC Error/Number of Transaction Error Interrupt Enable

Value	Description
0	No effect.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Enable Error CRC ISO/Error Number of Transaction Interrupt.

Bit 12 – ERR_FL_ISO Error Flow Interrupt Enable

Value	Description
0	No effect.
1	Enable Error Flow ISO Interrupt.

Bit 11 – TXRDY_TRER TX Packet Ready/Transaction Error Interrupt Enable

Value	Description
0	No effect.
1	Enable TX Packet Ready/Transaction Error Interrupt.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Enable

Value	Description
0	No effect.
1	Enable Transmitted IN Data Complete Interrupt.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Enable

Value	Description
0	No effect.
1	Enable Received OUT Data Interrupt.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Overflow Error Interrupt.

Bit 7 – MDATA_RX MDATA Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Enable MDATA Interrupt.

Bit 6 – DATAX_RX DATAx Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Enable DATAx Interrupt.

Bit 3 – INTDIS_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

Bit 1 – AUTO_VALID Packet Auto-Valid Enable

Value	Description
0	No effect.
1	Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

Bit 0 – EPT_ENABL Endpoint Enable

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Enable endpoint according to the device configuration.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.11. UDPHS Endpoint Control Disable Register (Control, Bulk, Interrupt Endpoints) (Default Mode)

Name: UDPHS_EPTCTLDIS (DEFAULT_MODE)
Offset: 0x0108 + n*0x04 [n=0..6]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x0, 0x2 or 0x3.

For additional information, see UDPHS_EPTCTLx.

Bit	31	30	29	28	27	26	25	24

Access				W	W		W	W
Reset				–	–		–	–

Bit 31 – SHRT_PCKT Short Packet Interrupt Disable
For IN endpoints: Never automatically add a zero length packet at end of DMA transfer.
For OUT endpoints, the configuration is:

Value	Description
0	No effect.
1	Disable Short Packet Interrupt.

Bit 18 – BUSY_BANK Busy Bank Interrupt Disable

Value	Description
0	No effect.
1	Disable Busy Bank Interrupt.

Bit 15 – NAK_OUT NAKOUT Interrupt Disable

Value	Description
0	No effect.
1	Disable NAKOUT Interrupt.

Bit 14 – NAK_IN NAKIN Interrupt Disable

Value	Description
0	No effect.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Disable NAKIN Interrupt.

Bit 13 – STALL_SNT Stall Sent Interrupt Disable

Value	Description
0	No effect.
1	Disable Stall Sent Interrupt.

Bit 12 – RX_SETUP Received SETUP Interrupt Disable

Value	Description
0	No effect.
1	Disable RX_SETUP Interrupt.

Bit 11 – TXRDY TX Packet Ready Interrupt Disable

Value	Description
0	No effect.
1	Disable TX Packet Ready/Transaction Error Interrupt.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Disable

Value	Description
0	No effect.
1	Disable Transmitted IN Data Complete Interrupt.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Disable

Value	Description
0	No effect.
1	Disable Received OUT Data Interrupt.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Overflow Error Interrupt.

Bit 4 – NYET_DIS NYET Enable (Only for High Speed Bulk OUT endpoints)

Value	Description
0	No effect.
1	Let the hardware handle the handshake response for the High Speed Bulk OUT transfer.

Bit 3 – INTDIS_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	Disable the “Interrupts Disable DMA”.

Bit 1 – AUTO_VALID Packet Auto-Valid Disable

Value	Description
0	No effect.
1	Disable this bit to not automatically validate the current packet.

Bit 0 – EPT_DISABL Endpoint Disable

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Disable endpoint.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.12. UDPHS Endpoint Control Disable Register (Isochronous Endpoint)

Name: UDPHS_EPTCTLDIS (ISOENDPT)
Offset: 0x0108 + n*0x04 [n=0..6]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

Value	Description
0	No effect.
1	Disable TX Packet Ready/Transaction Error Interrupt.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Disable

Value	Description
0	No effect.
1	Disable Transmitted IN Data Complete Interrupt.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Disable

Value	Description
0	No effect.
1	Disable Received OUT Data Interrupt.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Overflow Error Interrupt.

Bit 7 – MDATA_RX MDATA Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Disable MDATA Interrupt.

Bit 6 – DATAX_RX DATAx Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Disable DATAx Interrupt.

Bit 3 – INTDIS_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	Disable the “Interrupts Disable DMA”.

Bit 1 – AUTO_VALID Packet Auto-Valid Disable

Value	Description
0	No effect.
1	Disable this bit to not automatically validate the current packet.

Bit 0 – EPT_DISABL Endpoint Disable

Value	Description
0	No effect.
1	Disable endpoint.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.13. UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints) (Default Mode)

Name: UDPHS_EPTCTL (DEFAULT_MODE)
Offset: 0x010C + n*0x04 [n=0..6]
Reset: 0x00000000
Property: Read-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x0, 0x2 or 0x3.

The reset value for UDPHS_EPTCTL0 is 0x00000001.

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT							
Access	R							
Reset	0							

Bit	23	22	21	20	19	18	17	16
						BUSY_BANK		
Access						R		
Reset						0		

Bit	15	14	13	12	11	10	9	8
	NAK_OUT	NAK_IN	STALL_SNT	RX_SETUP	TXRDY	TX_COMPLT	RXRDY_TXKL	ERR_OVFLW
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
				NYET_DIS	INTDIS_DMA		AUTO_VALID	EPT_ENABL
Access				R	R		R	R
Reset				0	0		0	0

Bit 31 – SHRT_PCKT Short Packet Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: sends an Interrupt when a Short Packet has been received.
For IN endpoints: a Short Packet transmission is ensured upon end of the DMA Transfer, thus signaling a BULK or INTERRUPT end of transfer, but only if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTO_VALID bits are also set.

Value	Description
0	Short Packet Interrupt is masked.
1	Short Packet Interrupt is enabled.

Bit 18 – BUSY_BANK Busy Bank Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: an interrupt is sent when all banks are busy.
For IN endpoints: an interrupt is sent when all banks are free.

Value	Description
0	BUSY_BANK Interrupt is masked.
1	BUSY_BANK Interrupt is enabled.

Bit 15 – NAK_OUT NAKOUT Interrupt Enabled (cleared upon USB reset)

Value	Description
0	NAKOUT Interrupt is masked.
1	NAKOUT Interrupt is enabled.

Bit 14 – NAK_IN NAKIN Interrupt Enabled (cleared upon USB reset)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	NAKIN Interrupt is masked.
1	NAKIN Interrupt is enabled.

Bit 13 – STALL_SNT Stall Sent Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Stall Sent Interrupt is masked.
1	Stall Sent Interrupt is enabled.

Bit 12 – RX_SETUP Received SETUP Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received SETUP is masked.
1	Received SETUP is enabled.

Bit 11 – TXRDY TX Packet Ready Interrupt Enabled (cleared upon USB reset)

CAUTION Interrupt source is active as long as the corresponding UDPHS_EPTSTAx register TXRDY flag remains low. If there are no more banks available for transmitting after the software has set UDPHS_EPTSTAx/TXRDY for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS_EPTSTAx/TXRDY hardware clear.

Value	Description
0	TX Packet Ready Interrupt is masked.
1	TX Packet Ready Interrupt is enabled.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Transmitted IN Data Complete Interrupt is masked.
1	Transmitted IN Data Complete Interrupt is enabled.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received OUT Data Interrupt is masked.
1	Received OUT Data Interrupt is enabled.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Overflow Error Interrupt is masked.
1	Overflow Error Interrupt is enabled.

Bit 4 – NYET_DIS NYET Disable (Only for High Speed Bulk OUT Endpoints) (cleared upon USB reset)

Note: According to the Universal Serial Bus Specification, Rev 2.0 (8.5.1.1 NAK Responses to OUT/DATA During PING Protocol), a NAK response to an HS Bulk OUT transfer is expected to be an unusual occurrence.

Value	Description
0	Lets the hardware handle the handshake response for the High Speed Bulk OUT transfer.
1	Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 3 – INTDIS_DMA Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS_IEN register EPT_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.
If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).
If the exception raised is not associated to a new system bank packet (NAK_IN, NAK_OUT, etc.), then the request cancellation may happen at any time and may immediately stop the current DMA transfer.
This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet.

Bit 1 – AUTO_VALID Packet Auto-Valid Enabled (Not for CONTROL Endpoints) (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.
For IN Transfer:
If this bit is set, the UDPHS_EPTSTAx register TXRDY bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set.
The user may still set the UDPHS_EPTSTAx register TXRDY bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.
For OUT Transfer:
If this bit is set, the UDPHS_EPTSTAx register RXRDY_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set, for example to truncate a padded data packet when the actual data transfer size is reached.
The user may still clear the UDPHS_EPTSTAx register RXRDY_TXKL bit, for example, after completing a DMA buffer by software if UDPHS_DMACONTROLx register END_B_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

Bit 0 – EPT_ENABL Endpoint Enable (cleared upon USB reset)

Value	Description
0	The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.
1	The endpoint is enabled according to the device configuration.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.14. UDPHS Endpoint Control Register (Isochronous Endpoint)

Name: UDPHS_EPTCTL (ISOENDPT)
Offset: 0x010C + n*0x04 [n=0..6]
Reset: 0x00000000
Property: Read-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

The reset value for UDPHS_EPTCTL0 is 0x00000001.

Bit	31	30	29	28	27	26	25	24

Access	R	R			R		R	R
Reset	0	0			0		0	0

Bit 31 – SHRT_PCKT Short Packet Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: Send an Interrupt when a Short Packet has been received.
For IN endpoints: A Short Packet transmission is ensured upon end of the DMA Transfer, thus signaling an end of isochronous (micro-)frame data, but only if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTO_VALID bits are also set.

Value	Description
0	Short Packet Interrupt is masked.
1	Short Packet Interrupt is enabled.

Bit 18 – BUSY_BANK Busy Bank Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: An interrupt is sent when all banks are busy.
For IN endpoints: An interrupt is sent when all banks are free.

Value	Description
0	BUSY_BANK Interrupt is masked.
1	BUSY_BANK Interrupt is enabled.

Bit 14 – ERR_FLUSH Bank Flush Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Bank Flush Error Interrupt is masked.
1	Bank Flush Error Interrupt is enabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 13 – ERR_CRC_NTR ISO CRC Error/Number of Transaction Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	ISO CRC error/number of Transaction Error Interrupt is masked.
1	ISO CRC error/number of Transaction Error Interrupt is enabled.

Bit 12 – ERR_FL_ISO Error Flow Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Error Flow Interrupt is masked.
1	Error Flow Interrupt is enabled.

Bit 11 – TXRDY_TRER TX Packet Ready/Transaction Error Interrupt Enabled (cleared upon USB reset)

CAUTION Interrupt source is active as long as the corresponding UDPHS_EPTSTAx register TXRDY_TRER flag remains low. If there are no more banks available for transmitting after the software has set UDPHS_EPTSTAx/TXRDY_TRER for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS_EPTSTAx/TXRDY_TRER hardware clear.

Value	Description
0	TX Packet Ready/Transaction Error Interrupt is masked.
1	TX Packet Ready/Transaction Error Interrupt is enabled.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Transmitted IN Data Complete Interrupt is masked.
1	Transmitted IN Data Complete Interrupt is enabled.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received OUT Data Interrupt is masked.
1	Received OUT Data Interrupt is enabled.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Overflow Error Interrupt is masked.
1	Overflow Error Interrupt is enabled.

Bit 7 – MDATA_RX MDATA Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

Value	Description
0	No effect.
1	Send an interrupt when an MDATA packet has been received and so at least one packet of the microframe data payload has been received.

Bit 6 – DATAX_RX DATAx Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

Value	Description
0	No effect.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Send an interrupt when a DATA2, DATA1 or DATA0 packet has been received meaning the whole microframe data payload has been received.

Bit 3 – INTDIS_DMA Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS_IEN register EPT_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.
If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).
If the exception raised is not associated to a new system bank packet (ex: ERR_FL_ISO), then the request cancellation may happen at any time and may immediately stop the current DMA transfer. This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet, or to perform buffer truncation on ERR_FL_ISO interrupt for adaptive rate.

Bit 1 – AUTO_VALID Packet Auto-Valid Enabled (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.
For IN Transfer:
If this bit is set, the UDPHS_EPTSTAx register TXRDY_TRER bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set. The user may still set the UDPHS_EPTSTAx register TXRDY_TRER bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.
For OUT Transfer:
If this bit is set, the UDPHS_EPTSTAx register RXRDY_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set. For example, to truncate a padded data packet when the actual data transfer size is reached.
The user may still clear the UDPHS_EPTSTAx register RXRDY_TXKL bit, for example, after completing a DMA buffer by software if UDPHS_DMACONTROLx register END_B_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

Bit 0 – EPT_ENABL Endpoint Enable (cleared upon USB reset)

Value	Description
0	The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.
1	The endpoint is enabled according to the device configuration.

			FRCESTALL					
Access			W					
Reset			–					

Bit 11 – TXRDY TX Packet Ready Set

Value	Description
0	No effect.
1	Set this bit after a packet has been written into the endpoint FIFO for IN data transfers – This flag is used to generate a Data IN transaction (device to host). – Device firmware checks that it can write a data payload in the FIFO, checking that TXRDY is cleared. – Transfer to the FIFO is done by writing in the “Buffer Address” register. – Once the data payload has been transferred to the FIFO, the firmware notifies the UDPHS device setting TXRDY to one. – UDPHS bus transactions can start. – TXCOMP is set once the data payload has been received by the host. – Data should be written into the endpoint FIFO only after this bit has been cleared. – Set this bit without writing data to the endpoint FIFO to send a Zero Length Packet.

Bit 9 – RXRDY_TXKL KILL Bank Set (for IN Endpoint)

Value	Description
0	No effect.
1	Kill the last written bank.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 5 – FRCESTALL Stall Handshake Request Set

Refer to chapters 8.4.5 (Handshake Packets) and 9.4.5 (Get Status) of the Universal Serial Bus Specification, Rev 2.0 for more information on the STALL handshake.

Value	Description
0	No effect.
1	Set this bit to request a STALL answer to the host for the next handshake

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.16. UDPHS Endpoint Set Status Register (Isochronous Endpoint)

Name: UDPHS_EPTSETSTA (ISOENDPT)
Offset: 0x0114 + n*0x04 [n=0..6]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

For additional information, see UDPHS_EPTSTAx.

1	Clear the STALL_SNT flags of UDPHS_EPTSTAx.

Bit 12 – RX_SETUP Received SETUP Clear

Value	Description
0	No effect.
1	Clear the RX_SETUP flags of UDPHS_EPTSTAx.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Clear

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Clear the TX_COMPLT flag of UDPHS_EPTSTAx.

Bit 9 – RXRDY_TXKL Received OUT Data Clear

Value	Description
0	No effect.
1	Clear the RXRDY_TXKL flag of UDPHS_EPTSTAx.

Bit 6 – TOGGLESQ Data Toggle Clear

For OUT endpoints, the next received packet should be a DATA0.
For IN endpoints, the next packet will be sent with a DATA0 PID.

Value	Description
0	No effect.
1	Clear the PID data of the current bank

Bit 5 – FRCESTALL Stall Handshake Request Clear

Value	Description
0	No effect.
1	Clear the STALL request. The next packets from host will not be STALLed.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.18. UDPHS Endpoint Clear Status Register (Isochronous Endpoint)

Name: UDPHS_EPTCLRSTA (ISOENDPT)
Offset: 0x0118 + n*0x04 [n=0..6]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

	TOGGLESQ_STA[1:0]		FRCESTALL					
Access	R	R	R					
Reset	0	1	0					

Bit 31 – SHRT_PCKT Short Packet (cleared upon USB reset)
An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS_EPTCFGx register EPT_Size.
This bit is updated at the same time as the BYTE_COUNT field.
It is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bits 30:20 – BYTE_COUNT[10:0] UDPHS Byte Count (cleared upon USB reset)
Byte count of a received data packet.
This field is incremented after each write into the endpoint (to prepare an IN transfer). It is decremented after each reading into the endpoint (OUT transfer).
This field is also updated at RXRDY_TXKL flag clear with the next bank, and at TXRDY flag set with the next bank.
This field is reset by UDPHS_EPTRST.EPT_x.

Bits 19:18 – BUSY_BANK_STA[1:0] Busy Bank Number (cleared upon USB reset)
These bits are set by hardware to indicate the number of busy banks.
IN endpoint: Indicates the number of busy banks filled by the user, ready for IN transfer.
OUT endpoint: Indicates the number of busy banks filled by OUT transaction from the Host.

Value	Name	Description
0	0BUSYBANK	All banks are free
1	1BUSYBANK	1 busy bank
2	2BUSYBANKS	2 busy banks
3	3BUSYBANKS	3 busy banks

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 17:16 – CURBK_CTLDIR[1:0] Current Bank/Control Direction (cleared upon USB reset)

Control Direction (for Control endpoint only):

0: A Control Write is requested by the Host.
1: A Control Read is requested by the Host.

Notes:

1. Corresponds to the the 7th bit of the bmRequestType (Byte 0 of the Setup Data).
2. Updated after receiving new setup data.

Current Bank (not relevant for Control endpoint):

- Set by hardware to indicate the number of the current bank.
- Reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).
- The current bank is updated each time the user:
  - Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
  - Clears the received OUT data bit to access the next bank.

Value	Name	Description
0	BANK0	Bank 0 (or single bank)
1	BANK1	Bank 1
2	BANK2	Bank 2

Bit 15 – NAK_OUT NAK OUT (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an OUT or PING request from the Host.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by EPT_CTL_DISx (disable endpoint).

Bit 14 – NAK_IN NAK IN (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an IN request from the Host.
This bit is cleared by software.

Bit 13 – STALL_SNT Stall Sent (cleared upon USB reset)

For Control, Bulk and Interrupt endpoints.
This bit is set by hardware after a STALL handshake has been sent as requested by the UDPHS_EPTSTAx register FRCESTALL bit.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 12 – RX_SETUP Received SETUP (cleared upon USB reset)

For Control endpoint only.
This bit is set by hardware when a valid SETUP packet has been received from the host.
It is cleared by the device firmware after reading the SETUP data from the endpoint FIFO.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 11 – TXRDY TX Packet Ready (cleared upon USB reset)

This bit is cleared by hardware after the host has acknowledged the packet.
For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.
Hardware clear of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register TXRDY bit.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 10 – TX_COMPLT Transmitted IN Data Complete (cleared upon USB reset)
This bit is set by hardware after an IN packet has been accepted (ACK'ed) by the host.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 9 – RXRDY_TXKL Received OUT Data/KILL Bank (cleared upon USB reset)
Received OUT Data (for OUT endpoint or Control endpoint):

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register RXRDY_TXKL bit.
- This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

KILL Bank (for IN endpoint):

- The bank is really cleared or the bank is sent, BUSY_BANK_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.
  Note: "Kill a packet" may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

Bit 8 – ERR_OVFLW Overflow Error (cleared upon USB reset)
This bit is set by hardware when a new too-long packet is received.
Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.
This bit is updated at the same time as the BYTE_COUNT field.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bits 7:6 – TOGGLESQ_STA[1:0] Toggle Sequencing (cleared upon USB reset)
In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).
This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

This field is reset to DATA1 by the UDPHS_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS_EPTCTLDISx (disable endpoint).
Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- CONTROL and OUT endpoints: Set by hardware to indicate the PID data of the current bank.

Value	Name	Description
0	DATA0	DATA0
1	DATA1	DATA1
2	DATA2	Reserved for High Bandwidth Isochronous Endpoint

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
3	MDATA	Reserved for High Bandwidth Isochronous Endpoint

Bit 5 – FRCESTALL Stall Handshake Request (cleared upon USB reset)
This bit is reset by hardware upon received SETUP.

Value	Description
0	No effect.
1	If set a STALL answer will be done to the host for the next handshake.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.20. UDPHS Endpoint Status Register (Isochronous Endpoint)

Name: UDPHS_EPTSTA (ISOENDPT)
Offset: 0x011C + n*0x04 [n=0..6]
Reset: 0x00000040
Property: Read-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

Reset	0	1						

Bit 31 – SHRT_PCKT Short Packet (cleared upon USB reset)
An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS_EPTCFGx register EPT_Size.
This bit is updated at the same time as the BYTE_COUNT field.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bits 30:20 – BYTE_COUNT[10:0] UDPHS Byte Count (cleared upon USB reset)
Byte count of a received data packet.
This field is incremented after each write into the endpoint (to prepare an IN transfer).
This field is decremented after each reading into the endpoint (OUT transfer).
This field is also updated at RXRDY_TXKL flag clear with the next bank.
This field is also updated at TXRDY_TRER flag set with the next bank.
This field is reset by EPT_x of UDPHS_EPTRST register.

Bits 19:18 – BUSY_BANK_STA[1:0] Busy Bank Number (cleared upon USB reset)
These bits are set by hardware to indicate the number of busy banks.
IN endpoint: It indicates the number of busy banks filled by the user, ready for IN transfer.
OUT endpoint: It indicates the number of busy banks filled by OUT transaction from the Host.

Value	Name	Description
0	0BUSYBANK	All banks are free
1	1BUSYBANK	1 busy bank
2	2BUSYBANKS	2 busy banks
3	3BUSYBANKS	3 busy banks

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 17:16 – CURBK[1:0] Current Bank (cleared upon USB reset)

These bits are set by hardware to indicate the number of the current bank.
The current bank is updated each time the user:

- Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
- Clears the received OUT data bit to access the next bank.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Value	Name	Description
0	BANK0	Bank 0 (or single bank)
1	BANK1	Bank 1
2	BANK2	Bank 2

Bit 14 – ERR_FLUSH Bank Flush Error (cleared upon USB reset)

For High Bandwidth Isochronous IN endpoints.
This bit is set when flushing unsent banks at the end of a microframe.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by EPT_CTL_DISx (disable endpoint).

Bit 13 – ERR_CRC_NTR CRC ISO Error/Number of Transaction Error (cleared upon USB reset)

CRC ISO Error (for Isochronous OUT endpoints) (Read-only):
This bit is set by hardware if the last received data is corrupted (CRC error on data).
This bit is updated by hardware when new data is received (Received OUT Data bit).
Number of Transaction Error (for High Bandwidth Isochronous IN endpoints):
This bit is set at the end of a microframe in which at least one data bank has been transmitted, if less than the number of transactions per micro-frame banks (UDPHS_EPTCFGx register NB_TRANS) have been validated for transmission inside this microframe.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 12 – ERR_FL_ISO Error Flow (cleared upon USB reset)

This bit is set by hardware when a transaction error occurs.

- Isochronous IN transaction is missed, the micro has no time to fill the endpoint (underflow).
- Isochronous OUT data is dropped because the bank is busy (overflow).

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 11 – TXRDY_TRER TX Packet Ready/Transaction Error (cleared upon USB reset)

TX Packet Ready
This bit is cleared by hardware, as soon as the packet has been sent.
For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.
Hardware clear of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register TXRDY_TRER bit.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).
Transaction Error (for high bandwidth isochronous OUT endpoints) (Read-Only):
This bit is set by hardware when a transaction error occurs inside one microframe.
If one toggle sequencing problem occurs among the n-transactions (n = 1, 2 or 3) inside a microframe, then this bit is still set as long as the current bank contains one “bad” n-transaction (see CURBK field description). As soon as the current bank is relative to a new “good” n-transactions, then this bit is reset.

© 2026 Microchip Technology Inc. and its subsidiaries

Notes:

1. A transaction error occurs when the toggle sequencing does not comply with the Universal Serial Bus Specification, Rev 2.0 (5.9.2 High Bandwidth Isochronous endpoints) (Bad PID, missing data, etc.)
2. When a transaction error occurs, the user may empty all the “bad” transactions by clearing the Received OUT Data flag (RXRDY_TXKL).

If this bit is reset, then the user should consider that a new n-transaction is coming.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 10 – TX_COMPLT Transmitted IN Data Complete (cleared upon USB reset)
This bit is set by hardware after an IN packet has been sent.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 9 – RXRDY_TXKL Received OUT Data/KILL Bank (cleared upon USB reset)

Received OUT Data (for OUT endpoint or Control endpoint):

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register RXRDY_TXKL bit.
- This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

KILL Bank (for IN endpoint):

- The bank is really cleared or the bank is sent, BUSY_BANK_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.
  Note: “Kill a packet” may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

Bit 8 – ERR_OVFLW Overflow Error (cleared upon USB reset)
This bit is set by hardware when a new too-long packet is received.
Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.
This bit is updated at the same time as the BYTE_COUNT field.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bits 7:6 – TOGGLESQ_STA[1:0] Toggle Sequencing (cleared upon USB reset)
In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).
This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

© 2026 Microchip Technology Inc. and its subsidiaries

For High Bandwidth Isochronous Out endpoint, it is recommended to check the UDPHS_EPTSTAx/TXRDY_TRER bit to know if the toggle sequencing is correct or not.
This field is reset to DATA1 by the UDPHS_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS_EPTCTLDISx (disable endpoint).
Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- OUT endpoint: Set by hardware to indicate the PID data of the current bank:

Value	Name	Description
0	DATA0	DATA0
1	DATA1	DATA1
2	DATA2	Data2 (only for High Bandwidth Isochronous Endpoint)
3	MDATA	MData (only for High Bandwidth Isochronous Endpoint)

72.7.21. UDPHS DMA Channel Transfer Descriptor

The DMA channel transfer descriptor is loaded from the memory. Be careful with the alignment of this buffer. The structure of the DMA channel transfer descriptor is defined by three parameters as described below:

- Offset 0:
  - The address must be aligned: 0xXXXX0
  - Next Descriptor Address Register: UDPHS_DMANXTDSCx
- Offset 4:
  - The address must be aligned: 0xXXXX4
  - DMA Channelx Address Register: UDPHS_DMAADDRESSx
- Offset 8:
  - The address must be aligned: 0xXXXX8
  - DMA Channelx Control Register: UDPHS_DMACONTROLx

To use the DMA channel transfer descriptor, fill the structures with the correct value (as described in the following pages). Then write directly in UDPHS_DMANXTDSCx the address of the descriptor to be used first. Then write '1' in the LDNXT_DSC bit of UDPHS_DMACONTROLx (load next channel transfer descriptor). The descriptor is automatically loaded upon Endpointx request for packet transfer.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.22. UDPHS DMA Next Descriptor Address Register

Name: UDPHS_DMANXTDSC
Offset: 0x0310 + (n-1)*0x04 [n=1..6]
Reset: 0x00000000
Property: Read/Write

Channel 0 is not used.

Bit	31	30	29	28	27	26	25	24
	NXT_DSC_ADD[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – NXT_DSC_ADD[31:0] Next Descriptor Address
This field points to the next channel descriptor to be processed. This channel descriptor must be aligned, so bits 0 to 3 of the address must be equal to zero.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.23. UDPHS DMA Channel Address Register

Name: UDPHS_DMAADDRESS
Offset: 0x0314 + (n-1)*0x04 [n=1..6]
Reset: 0x00000000
Property: Read/Write

Channel 0 is not used.

Bit	31	30	29	28	27	26	25	24
	BUFF_ADD[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	BUFF_ADD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – BUFF_ADD[31:0] Buffer Address
This field determines the system bus starting address of a DMA channel transfer.
Channel start and end addresses may be aligned on any byte boundary.
The firmware may write this field only when the UDPHS_DMASTATUS.CHANN_ENB bit is clear.
This field is updated at the end of the address phase of the current access to the system bus. It is incrementing of the access byte width. The access width is 4 bytes (or less) at packet start or end, if the start or end address is not aligned on a word boundary.
The packet start address is either the channel start address or the next channel address to be accessed in the channel buffer.
The packet end address is either the channel end address or the latest channel address accessed in the channel buffer.
The channel start address is written by software or loaded from the descriptor, whereas the channel end address is either determined by the end of buffer or the UDPHS device, USB end of transfer if the UDPHS_DMACONTROL.END_TR_EN bit is set.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.24. UDPHS DMA Channel Control Register

Name: UDPHS_DMACONTROL
Offset: 0x0318 + (n-1)*0x04 [n=1..6]
Reset: 0x00000000
Property: Read/Write

Channel 0 is not used.

Bits [31:2] are only writable when issuing a channel Control Command other than “Stop Now”.

For reliability it is highly recommended to wait for both UDPHS_DMASTATUS.CHAN_ACT and CHAN_ENB flags at 0, thus ensuring the channel has been stopped before issuing a command other than “Stop Now”.

Bit	31	30	29	28	27	26	25	24
	BUFF_LENGTH[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	BUFF_LENGTH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	BURST_LCK	DESC_LD_IT	END_BUFFIT	END_TR_IT	END_B_EN	END_TR_EN	LDNXT_DSC	CHANN_ENB
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:16 – BUFF_LENGTH[15:0] Buffer Byte Length (Write-only)
This field determines the number of bytes to be transferred until end of buffer. The maximum channel transfer size (64 Kbytes) is reached when this field is 0 (default value). If the transfer size is unknown, this field should be set to 0, but the transfer end may occur earlier under UDPHS device control.
When this field is written, the UDPHS_DMASTATUS.BUFF_COUNT field is updated with the write value.

Bit 7 – BURST_LCK Burst Lock Enable

Value	Description
0	The DMA never locks bus access.
1	USB packets system data bursts are locked for maximum optimization of the bus bandwidth usage and maximization of fly-by system bus burst duration.

Bit 6 – DESC_LD_IT Descriptor Loaded Interrupt Enable

Value	Description
0	UDPHS_DMASTATUS.DESC_LDST rising will not trigger any interrupt.
1	An interrupt is generated when a descriptor has been loaded from the bus.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 5 – END_BUFFIT End of Buffer Interrupt Enable

Value	Description
0	UDPHS_DMASTATUS.END_BF_ST rising will not trigger any interrupt.
1	An interrupt is generated when the UDPHS_DMASTATUS.BUFF_COUNT reaches zero.

Bit 4 – END_TR_IT End of Transfer Interrupt Enable

Value	Description
0	UDPHS device initiated buffer transfer completion will not trigger any interrupt at UDPHS_STATUS.END_TR_ST rising.
1	An interrupt is sent after the buffer transfer is complete, if the UDPHS device has ended the buffer transfer. Use when the receive size is unknown.

Bit 3 – END_B_EN End of Buffer Enable (Control)

Value	Description
0	DMA Buffer End has no impact on USB packet transfer.
1	Endpoint can validate the packet (according to the values programmed in the UDPHS_EPTCTL.AUTO_VALID and SHRT_PCKT fields) at DMA Buffer End, i.e., when the UDPHS_DMASTATUS.BUFF_COUNT reaches 0. This is mainly for short packet IN validation initiated by the DMA reaching end of buffer, but could be used for OUT packet truncation (discarding of unwanted packet data) at the end of DMA buffer.

Bit 2 – END_TR_EN End of Transfer Enable (Control)
Used for OUT transfers only.

Value	Description
0	USB end of transfer is ignored.
1	UDPHS device can put an end to the current buffer transfer. When set, a BULK or INTERRUPT short packet or the last packet of an ISOCHRONOUS (micro) frame (DATAX) will close the current buffer and the UDPHS_DMASTATUS.END_TR_ST flag will be raised. This is intended for UDPHS non-prenegotiated end of transfer (BULK or INTERRUPT) or ISOCHRONOUS microframe data buffer closure.

Bit 1 – LDNXT_DSC Load Next Channel Transfer Descriptor Enable (Command)
If the CHANN_ENB bit is cleared, the next descriptor is immediately loaded upon transfer request.
DMA Channel Control Command Summary:

LDNXT_DSC	CHANN_ENB	Description
0	0	Stop now
0	1	Run and stop at end of buffer
1	0	Load next descriptor now
1	1	Run and link at end of buffer

Value	Description
0	No channel register is loaded after the end of the channel transfer.
1	The channel controller loads the next descriptor after the end of the current transfer, i.e., when the UDPHS_DMASTATUS.CHANN_ENB bit is reset.

Bit 0 – CHANN_ENB (Channel Enable Command)

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	DMA channel is disabled at and no transfer will occur upon request. This bit is also cleared by hardware when the channel source bus is disabled at end of buffer. If the UDPHS_DMACONTROL.LDNXT_DSC bit has been cleared by descriptor loading, the firmware will have to set the corresponding CHANN_ENB bit to start the described transfer, if needed. If the LDNXT_DSC bit is cleared, the channel is frozen and the channel registers may then be read and/or written reliably as soon as both UDPHS_DMASTATUS.CHANN_ENB and CHANN_ACT flags read as 0. If a channel request is currently serviced when this bit is cleared, the DMA FIFO buffer is drained until it is empty, then the UDPHS_DMASTATUS.CHANN_ENB bit is cleared. If the LDNXT_DSC bit is set at or after this bit clearing, then the currently loaded descriptor is skipped (no data transfer occurs) and the next descriptor is immediately loaded.
1	The UDPHS_DMASTATUS.CHANN_ENB bit will be set, thus enabling DMA channel data transfer. Then, any pending request will start the transfer. This may be used to start or resume any requested transfer.

© 2026 Microchip Technology Inc. and its subsidiaries

72.7.25. UDPHS DMA Channel Status Register

Name: UDPHS_DMASTATUS
Offset: 0x031C + (n-1)*0x04 [n=1..6]
Reset: 0x00000000
Property: Read/Write

Channel 0 is not used.

Bit	31	30	29	28	27	26	25	24
	BUFF_COUNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	BUFF_COUNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
		DESC_LDST	END_BF_ST	END_TR_ST			CHANN_ACT	CHANN_ENB
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0

Bits 31:16 – BUFF_COUNT[15:0] Buffer Byte Count
This field determines the current number of bytes still to be transferred for this buffer. It is decremented from the source system bus access byte width at the end of this bus address phase. The access byte width is 4 by default, or less, at DMA start or end, if the start or end address is not aligned on a word boundary.
At the end of buffer, the DMA accesses the UDPHS device only for the number of bytes needed to complete it.
This field value is reliable (stable) only if the channel has been stopped or frozen (the UDPHS_EPTCTLx.NT_DIS_DMA bit is used to disable the channel request) and the channel is no longer active (CHANN_ACT flag is 0).
Note: For OUT endpoints, if the receive buffer byte length (BUFF_LENGTH) has been defaulted to zero because the USB transfer length is unknown, the actual buffer byte length received is 0x10000-BUFF_COUNT.

Bit 6 – DESC_LDST Descriptor Loaded Status
Valid until the CHANN_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.
1	Set by hardware when a descriptor has been loaded from the system bus.

Bit 5 – END_BF_ST End of Channel Buffer Status
Valid until the CHANN_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Set by hardware when the BUFF_COUNT countdown reaches zero.

Bit 4 – END_TR_ST End of Channel Transfer Status

Valid until the CHANN_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.
1	Set by hardware when the last packet transfer is complete, if the UDPHS device has ended the transfer.

Bit 1 – CHANN_ACT Channel Active Status

When a packet transfer is ended, this bit is automatically reset.
When a packet transfer cannot be completed due to an END_BF_ST, this flag stays set during the next channel descriptor load (if any) and potentially until UDPHS packet transfer completion, if allowed by the new descriptor.

Value	Description
0	The DMA channel is no longer trying to source the packet data.
1	The DMA channel is currently trying to source packet data, i.e., selected as the highest-priority requesting channel.

Bit 0 – CHANN_ENB Channel Enable Status

When any transfer is ended either due to an elapsed byte count or a UDPHS device initiated transfer end, this bit is automatically reset.
This bit is normally set or cleared by writing into the UDPHS_DMACONTROLx.CHANN_ENB bit either by software or descriptor loading.
If a channel request is currently serviced when the CHANN_ENB bit is cleared, the DMA FIFO buffer is drained until it is empty, then this status bit is cleared.

Value	Description
0	The DMA channel no longer transfers data, and may load the next descriptor if the UDPHS_DMACONTROLx.LDNXT_DSC bit is set.
1	The DMA channel is currently enabled and transfers data upon request.

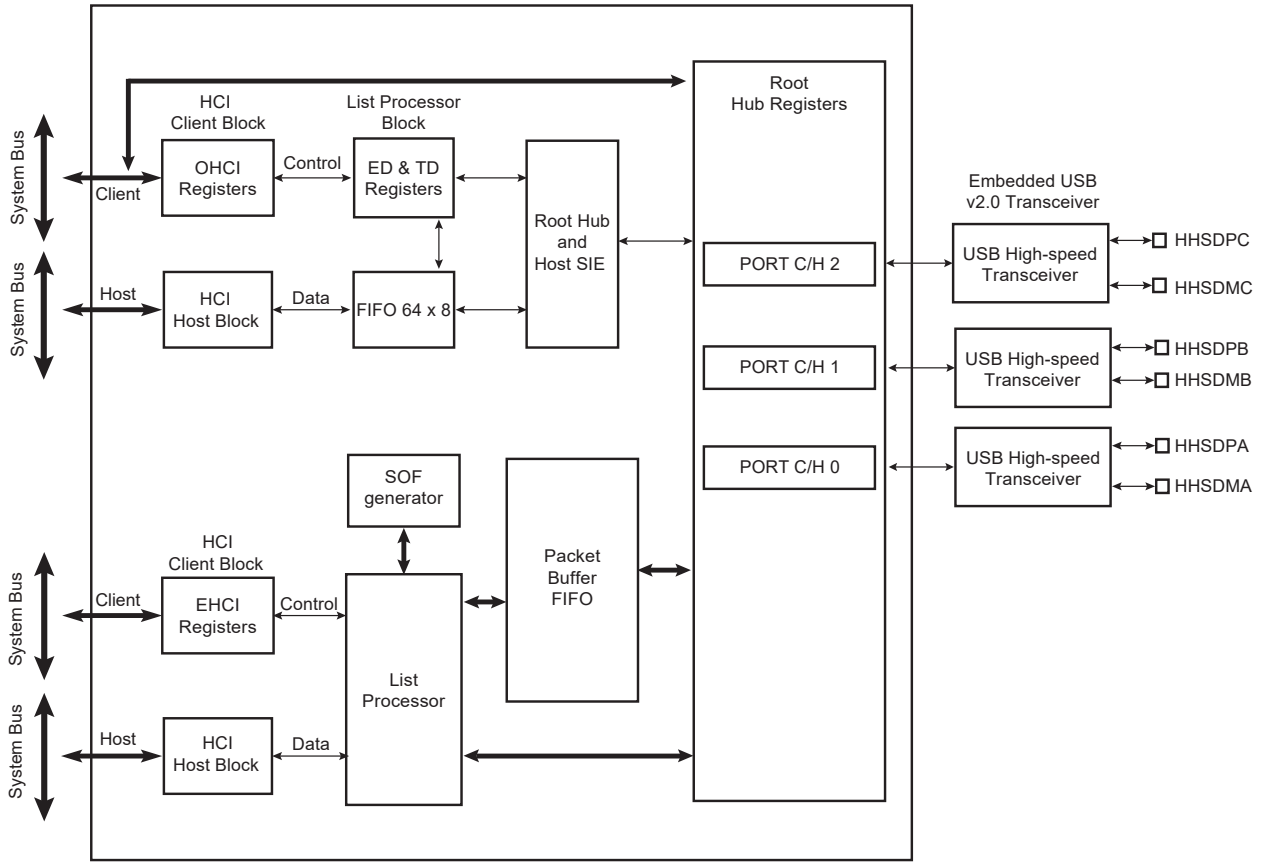
73. USB Host High Speed Port (UHPHS)

73.1. Description

The USB Host High Speed Port (UHPHS) interfaces the USB with the host application. It handles Open HCI protocol (Open Host Controller Interface) as well as Enhanced HCI protocol (Enhanced Host Controller Interface).



73.2. Embedded Characteristics

- Compliant with Enhanced HCI Rev 1.0 Specification
  - Compliant with USB V2.0 High-speed Specification
  - Supports high-speed 480 Mbps
- Compliant with Open HCI Rev 1.0 Specification
  - Compliant with USB V2.0 Full-speed and Low-speed Specification
  - Supports both low-speed 1.5 Mbps and full-speed 12 Mbps USB devices
- Root Hub Integrated with 2 Downstream USB HS Ports and 1 FS Port
- Embedded USB Transceivers
- Supports Power Management
- 3 Hosts (A, B, and C) High Speed (EHCI), Port A shared with UDPHS

© 2026 Microchip Technology Inc. and its subsidiaries

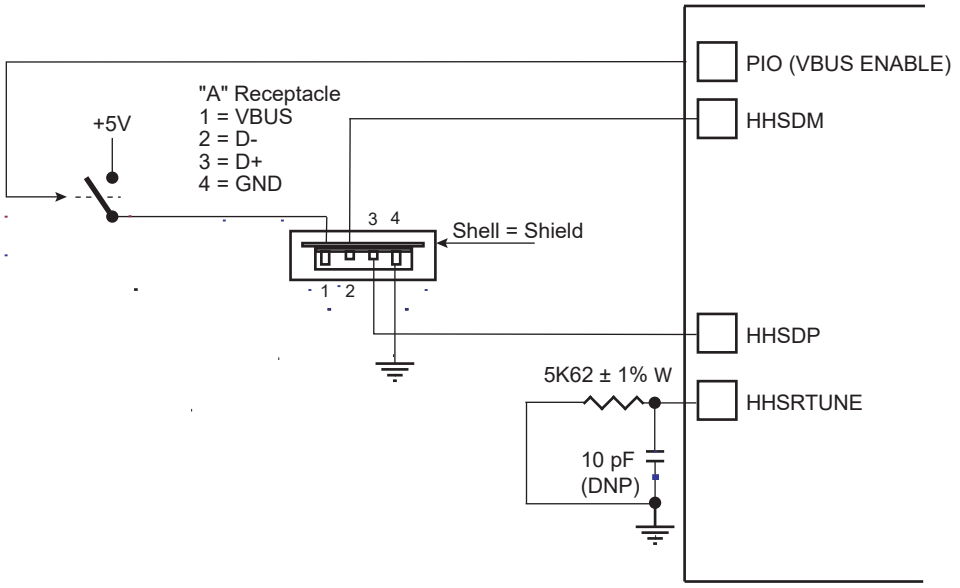
73.3. Block Diagram

Figure 73.1. UHPHS Block Diagram

Access to the USB host operational registers is achieved through the system bus client interface. The Open HCI host controller and Enhanced HCI host controller initialize host DMA transfers through the system bus host interface as follows:

- Fetches endpoint descriptors and transfer descriptors
- Accesses endpoint data from system memory
- Accesses HC communication area
- Writes status and retires transfer descriptor

Memory access errors (abort, misalignment) lead to an “Unrecoverable Error” indicated by the corresponding flag in the host controller operational registers.



The USB root hub is integrated in the USB host. Several USB downstream ports are available. The number of downstream ports can be determined by the software driver reading the root hub’s operational registers. Device connection is automatically detected by the USB host port logic.

USB physical transceivers are integrated in the product and driven by the root hub’s ports.

© 2026 Microchip Technology Inc. and its subsidiaries

73.4. Typical Connection

Figure 73.2. Board Schematic to Interface UHP High-speed Host Controller

73.5. Product Dependencies

73.5.1. I/O Lines

HHSDPs and HHSDMs are not controlled by any PIO controllers. The embedded USB High Speed physical transceivers are controlled by the USB host controller.

One transceiver is shared with the USB High Speed Device (port A). The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN_UDPHS) located in the UDPHS_CTRL register.

In the case the port A is driven by the USB High Speed Device, the output signals are DHSDP and DHSDM. The transceiver is automatically selected for Device operation once the USB High Speed Device is enabled.

In the case the port A is driven by the USB High Speed Host, the output signals are HHSDPA and HHSDMA.

73.5.2. Power Management

The system embeds three transceivers.

The USB Host High Speed requires a 480 MHz clock for the embedded High-speed transceivers. This clock (UPLLCK) is provided by the UTMI PLL.

In case power consumption is saved by stopping the UTMI PLL, high-speed operations are not possible. Nevertheless, OHCI Full-speed operations remain possible by selecting PLLACK as the input clock of OHCI.

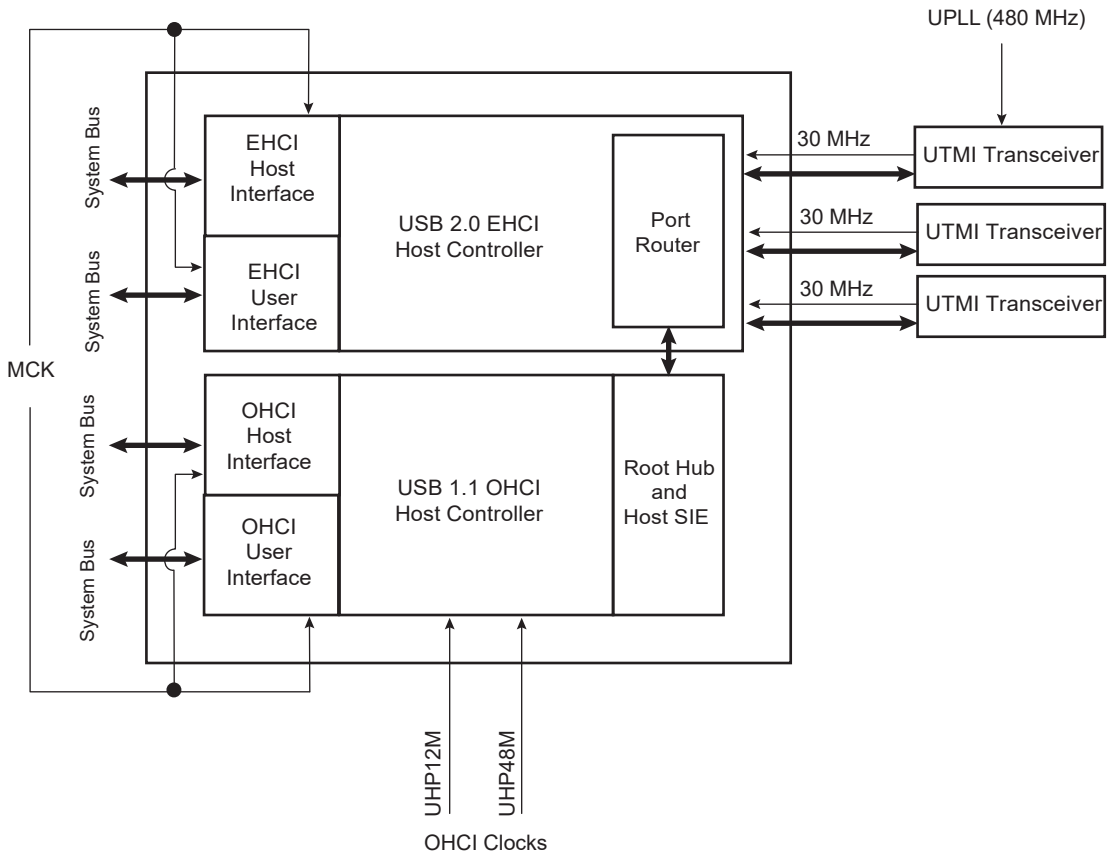
The High-speed transceiver returns a 30 MHz clock to the USB Host controller.

The USB Host controller requires 48 MHz and 12 MHz clocks for OHCI full-speed operations. These clocks must be generated by a PLL with a correct accuracy of +/-0.25% using the USBDIV field.

Thus the USB Host peripheral receives three clocks from the Power Management Controller (PMC): the Peripheral Clock (MCK domain), the UHP48M and the UHP12M (built-in UHP48M divided by four) used by the OHCI to interface with the bus USB signals (recovered 12 MHz domain) in Full-speed operations.

© 2026 Microchip Technology Inc. and its subsidiaries

Thus the USB Host peripheral receives three clocks from the Power Management Controller (PMC): the Peripheral Clock (MCK domain), the UHP48M and the UHP12M (built-in UHP48M divided by four) used by the OHCI to interface with the bus USB signals (recovered 12 MHz domain) in Full-speed operations.



For High-speed operations, the user has to perform the following:

- Enable UHPHS peripheral clock in the PMC.
- Start the UPLL with a 480 MHz output frequency following the recommendation provided in section "USB Clock Controller" in chapter "Power Management Controller (PMC)".
- Select UPLLCK as Input clock of OHCI part (USBS bit in PMC_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC_USB register. USBDIV must be 9 (division by 10) if UPLLCK is selected.
- Enable OHCI clocks with UHP bit in PMC_SCER.

For OHCI Full-speed operations only, the user can use the PLLA, and in this case has to perform the following:

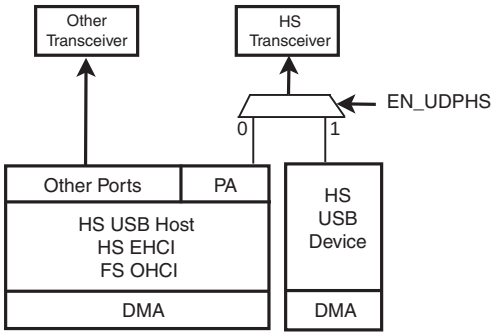
- Enable UHPHS peripheral clock in the PMC.
- Select PLLACK as Input clock of OHCI part (USBS bit in PMC_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC_USB register. USBDIV value is to be calculated according to the PLLACK value and USB Full-speed accuracy.
- Enable the OHCI clocks with UHP bit in PMC_SCER.

Figure 73.3. UHP Clock Trees

© 2026 Microchip Technology Inc. and its subsidiaries

73.5.3. Interrupt Sources

The USB host interface has an interrupt line connected to the interrupt controller.



Handling USB host interrupts requires programming the interrupt controller before configuring the UHPHS.

73.6. Functional Description

73.6.1. UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB device is controlled by the UDPHS enable bit (EN_UDPHS) located in the UDPHS_CTRL register.

Figure 73.4. USB Selection

73.6.2. EHCI

The USB Host Port controller is fully compliant with the Enhanced HCI specification. The USB Host Port User Interface (registers description) can be found in the Enhanced HCI Rev 1.0 Specification available on www.usb.org

73.6.3. OHCI

The USB Host Port integrates a root hub and transceivers on downstream ports. It provides several Full-speed half-duplex serial communication ports at a baud rate of 12 Mbps. Up to 127 USB devices (printer, camera, mouse, keyboard, disk, etc.) and the USB hub can be connected to the USB host in the USB “tiered star” topology.

The USB Host Port controller is fully compliant with the Open HCI specification. The USB Host Port User Interface (registers description) can be found in the Open HCI Rev 1.0 Specification available on www.usb.org.

All standard class devices are automatically detected and available to the user’s application. As an example, integrating an HID (Human Interface Device) class driver provides a plug & play feature for all USB keyboards and mouses.

73.7. Register Summary

The Enhanced USB Host Controller contains two sets of software-accessible hardware registers: memory-mapped Host Controller Registers and optional PCI configuration registers. Note that the PCI configuration registers are only needed for PCI devices that implement the Host Controller.

- Memory-mapped USB Host Controller Registers—This block of registers is memory-mapped into non-cacheable memory. This memory space must begin on a DWord (32-bit) boundary. This register space is divided into two sections: a set of read-only capability registers and a set of read/write operational registers. The table below describes each register space.

© 2026 Microchip Technology Inc. and its subsidiaries

Note: Host controllers are not required to support exclusive-access mechanisms (such as PCI LOCK) for accesses to the memory-mapped register space. Therefore, if software attempts exclusive-access mechanisms to the host controller memory-mapped register space, the results are undefined.

- PCI Configuration Registers (for PCI devices)—In addition to the normal PCI header, power management, and device-specific registers, two registers are needed in the PCI configuration space to support USB. The normal PCI header and device-specific registers are beyond the scope of this document (the UHPHS_CLASSC register is shown in this document). Note that HCD does not interact with the PCI configuration space. This space is used only by the PCI enumerator to identify the USB Host Controller, and assign the appropriate system resources.
  The table below summarizes the enhanced interface register sets.

Offset	Register Set	Explanation
0 to N-1	Capability Registers	The capability registers specify the limits, restrictions, and capabilities of a host controller implementation. These values are used as parameters to the host controller driver.
N to N+M-1	Operational Registers	The operational registers are used by system software to control and monitor the operational state of the host controller.

Note: Software must not modify reserved bits in Read/Write registers.

	CAPLENGTH[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	1	0	0	0	0

Bits 31:16 – HCIVERSION[15:0] Host Controller Interface Version Number
This is a two-byte field containing a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this field represents the major revision and the least significant byte the minor revision.

Bits 7:0 – CAPLENGTH[7:0] Capability Registers Length
This field is used as an offset to add to the register base to find the beginning of the Operational Register Space.

© 2026 Microchip Technology Inc. and its subsidiaries

73.7.2. UHPHS Host Controller Structural Parameters Register

Name: UHPHS_HCSPARAMS
Offset: 0x04
Reset: 0x00001303
Property: Read-only

These fields define structural parameters: number of downstream ports, etc.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	N_DP[3:0]							P_INDICATOR
Access	R	R	R	R				R
Reset	0	0	0	0				0

Bit	15	14	13	12	11	10	9	8
	N_CC[3:0]				N_PCC[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	1	0	0	1	1

Bit	7	6	5	4	3	2	1	0
				PPC	N_PORTS[3:0]			
Access				R	R	R	R	R
Reset				0	0	0	1	1

Bits 23:20 – N_DP[3:0] Debug Port Number
Optional. This register identifies which of the host controller ports is the debug port. The value is the port number (1-based) of the debug port. A non-zero value in this field indicates the presence of a debug port. The value in this register must not be greater than N_PORTS.

Bit 16 – P_INDICATOR Port Indicators
This bit indicates whether the ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. See UHPHS Port Status and Control Register for a definition of the port indicator control field.

Bits 15:12 – N_CC[3:0] Number of Companion Controllers
This field indicates the number of companion controllers associated with this USB 2.0 host controller.
A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports.
A value larger than zero in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports.

Bits 11:8 – N_PCC[3:0] Number of Ports per Companion Controller
This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software.
For example, if N_PORTS has a value of 6 and N_CC has a value of 2, then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller

© 2026 Microchip Technology Inc. and its subsidiaries

1, the next N_PCC ports to companion controller 2, etc. In the previous example, the N_PCC could have been 4, where the first four are routed to companion controller 1 and the last two are routed to companion controller 2.
The number in this field must be consistent with N_PORTS and N_CC.

Bit 4 – PPC Port Power Control
This field indicates whether the host controller implementation includes port power control. A one in this bit indicates the ports have port power switches. A zero in this bit indicates the ports do not have port power switches. The value of this field affects the functionality of the Port Power field in each port status and control register (see UHPHS Port Status and Control Register).

Bits 3:0 – N_PORTS[3:0] Number of Ports
This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1 to 15.
A zero in this field is undefined.

© 2026 Microchip Technology Inc. and its subsidiaries

73.7.3. UHPHS Host Controller Capability Parameters Register

Name: UHPHS_HCCPARAMS
Offset: 0x08
Reset: 0x00000026
Property: Read-only

These fields define capability parameters: Multiple Mode control (time-base bit functionality), addressing capability, etc.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	IST[3:0]					ASPC	PFLF	AC
Access	R	R	R	R		R	R	R
Reset	0	0	1	0		1	1	0

Bits 15:8 – EECP[7:0] EHCI Extended Capabilities Pointer
Indicates the existence of a capabilities list. A value of 0 indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in the PCI configuration space of the first EHCI extended capability. The pointer value must be 64 or greater if implemented to maintain the consistency of the PCI header defined for this class of device.

Bits 7:4 – IST[3:0] Isochronous Scheduling Threshold
Indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is 0, the value of the least significant three bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set to 1, the host software assumes the host controller may cache an isochronous data structure for an entire frame.

Bit 2 – ASPC Asynchronous Schedule Park Capability
The park capability can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the UHPHS_USBCMD register.

Value	Description
0	Host controller does not supports the park feature for high-speed queue.
1	Host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule.

Bit 1 – PFLF Programmable Frame List Flag

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
0	System software must use a frame list length of 1024 elements with this host controller. The UHPHS_USBCMD register Frame List Size field is a read-only register and must be set to 0.
1	System software can specify and use a smaller frame list and configure the host controller via the UHPHS_USBCMD register Frame List Size field. The frame list must always be aligned on a 4-Kbyte page boundary. This requirement ensures that the frame list is always physically contiguous.

Bit 0 – AC 64-bit Addressing Capability

This field documents the addressing range capability of this implementation. The value of this field determines whether software should use 32-bit or 64-bit data structures.
This information is not tightly coupled with the UHPHS_USBBASE address register mapping control. The 64-bit Addressing Capability bit indicates whether the host controller can generate 64-bit addresses as a host. The UHPHS_USBBASE register indicates the host controller only needs to decode 32-bit addresses as a client.

Value	Description
0	Data structures using 32-bit address memory pointers
1	Data structures using 64-bit address memory pointers

© 2026 Microchip Technology Inc. and its subsidiaries

73.7.4. UHPHS USB Command Register

Name: UHPHS_USBCMD
Offset: 0x10
Reset: 0x00080B00
Property: Read/Write

The Command Register indicates the command to be executed by the serial bus host controller. Writing to the register causes a command to be executed.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0

Bits 23:16 – ITC[7:0] Interrupt Threshold Control
This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined.

Value	Maximum Interrupt Interval
0	Reserved
1	1 microframe
2	2 microframes
4	4 microframes
8	8 microframes (1 ms)
16	16 microframes (2 ms)
32	32 microframes (4 ms)
64	64 microframes (8 ms)

Any other value in this register yields undefined results.
Software modifications to this field while HCHLT=0 results in undefined behavior.

Bit 11 – ASPME Asynchronous Schedule Park Mode Enable (optional)
If the Asynchronous Park Capability bit in the UHPHS_HCCPARAMS register is set to 1, then this bit is set to 1 and is Read/Write. Otherwise the bit must be 0 and is read-only.

Value	Description
0	Park mode is enabled.
1	Park mode is disabled.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 9:8 – ASPMC[1:0] Asynchronous Schedule Park Mode Count (optional)
If the Asynchronous Park Capability bit in the UHPHS_HCCPARAMS register is set to 1, then this field defaults to 3 and is read/write. Otherwise it defaults to 0 and is read-only. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1 to 3. Software must not write a 0 to this bit when Park Mode Enable is set to 1 as this will result in undefined behavior.

Bit 7 – LHCR Light Host Controller Reset (optional)
This control bit is not required. If implemented, it allows the driver to reset the EHCI controller without affecting the state of the ports or the relationship to the companion host controllers. For example, the UHPHS_PORTSC registers should not be reset to their default values and the CF bit setting should not go to 0 (retaining port ownership relationships).
A host software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for host software to re-initialize the host controller. A host software read of this bit as 1 indicates the Light Host Controller Reset has not yet completed.
If not implemented, a read of this field will always return a 0.

Bit 6 – IAAD Interrupt on Async Advance Doorbell
This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the UHPHS_USBSTS register. If the Interrupt on Async Advance Enable bit in the UHPHS_USBINTR register is set to 1, then the host controller will assert an interrupt at the next interrupt threshold.
The host controller sets this bit to 0 after it has set the Interrupt on Async Advance status bit in the UHPHS_USBSTS register to 1.
Software should not write a 1 to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.

Bit 5 – ASE Asynchronous Schedule Enable
This bit controls whether the host controller skips processing the Asynchronous Schedule.

Value	Description
0	Do not process the Asynchronous Schedule.
1	Use the UHPHS_ASYNCLISTADDR register to access the Asynchronous Schedule.

Bit 4 – PSE Periodic Schedule Enable
This bit controls whether the host controller skips processing the Periodic Schedule.

Value	Description
0	Do not process the Periodic Schedule.
1	Use the UHPHS_PERIODICLISTBASE register to access the Periodic Schedule.

Bits 3:2 – FLS[1:0] Frame List Size
This field is read-only with one exception: it is read/write if the Programmable Frame List flag, in the UHPHS_HCCPARAMS register, is set to 1. This field specifies the size of the frame list. The size of the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index.

Value	Description
0	1024 elements (4096 bytes).
1	512 elements (2048 bytes).
2	256 elements (1024 bytes), for resource-constrained environments.
3	Reserved.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 1 – HCRESET Host Controller Reset

This control bit is used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset.
When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports.
PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines, are set to their initial values. Port ownership reverts to the companion host controller(s) with side effects. Software must reinitialize the host controller in order to return the host controller to an operational state.
This bit is set to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this register.
Software must not set this bit to 1 when HCHLT in the UHPHS_USBSTS register is 0. Attempting to reset an actively running host controller results in undefined behavior.

Bit 0 – RS Run/Stop

The Host Controller must halt within 16 microframes after software clears the bit RS. The HCHLT bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software must not write 1 to this field unless the host controller is in the halted state (i.e., HCHLT in the UHPHS_USBSTS register is 1). Doing so yields undefined results.

Value	Description
0	Host Controller completes the current and any actively pipelined transactions on the USB and then halts.
1	Host Controller proceeds with execution of the schedule.

© 2026 Microchip Technology Inc. and its subsidiaries

73.7.5. UHPHS USB Status Register

Name: UHPHS_USBSTS
Offset: 0x14
Reset: 0x00001000
Property: Read/Write

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to 0 in this register by writing a 1 to it.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

			IAA	HSE	FLR	PCD	USBERRINT	USBINT
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 15 – ASS Asynchronous Schedule Status
The bit reports the current real status of the Asynchronous Schedule.
The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the UHPHS_USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled or disabled.

Value	Description
0	Asynchronous Schedule is disabled.
1	Asynchronous Schedule is enabled.

Bit 14 – PSS Periodic Schedule Status
The bit reports the current real status of the Periodic Schedule. If this bit is set to 0, then the status of the Periodic Schedule is disabled. If this bit is set to 1, then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the UHPHS_USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled or disabled.

Bit 13 – RCM Reclamation
This is a read-only status bit used to detect any empty asynchronous schedule.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 12 – HCHLT HCHalted
This bit is 0 whenever the Run/Stop bit is 1. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (following an internal error, for example).

Bit 5 – IAA Interrupt on Async Advance (Cleared on write)
System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing 1 to the Interrupt on the Async Advance Doorbell bit in the UHPHS_USBCMD register. This status bit indicates the assertion of that interrupt source.

Bit 4 – HSE Host System Error (Cleared on write)
The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Host Abort, and PCI Target Abort. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs.

Bit 3 – FLR Frame List Rollover (Cleared on write)
The Host Controller sets this bit to 1 when the Frame List Index (see UHPHS USB Frame Index Register) rolls over from its maximum value to 0. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the Frame List Size field of the UHPHS_USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX[13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to 1 every time FRINDEX[12] toggles.

Bit 2 – PCD Port Change Detect (Cleared on write)
The Host Controller sets this bit to 1 when any port for which the Port Owner bit is set to 0 (see UHPHS Port Status and Control Register) has a change bit transition from 0 to 1 or a Force Port Resume bit transition from 0 to 1 as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to 1 after system software has relinquished ownership of a connected port by writing 1 to a port's Port Owner bit.
This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force Port Resume, Overcurrent Change, Enable/Disable Change and Connect Status Change).

Bit 1 – USBERRINT USB Error Interrupt (Cleared on write)
The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (error counter underflow, for example). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and USBINT bit are set.

Bit 0 – USBINT USB Interrupt (Cleared on write)
The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set.
The Host Controller also sets this bit to 1 when a short packet is detected (the actual number of bytes received was less than the expected number of bytes).

© 2026 Microchip Technology Inc. and its subsidiaries

73.7.6. UHPHS USB Interrupt Enable Register

Name: UHPHS_USBINTR
Offset: 0x18
Reset: 0x00000000
Property: Read/Write

This register enables and disables reporting of the corresponding interrupt to the software. When a bit is set and the corresponding interrupt is active, an interrupt is generated to the host. Interrupt sources that are disabled in this register still appear in the UHPHS_USBSTS to allow the software to poll for events.

For all bits, 1=Enabled, 0=Disabled.

Bit 5 – IAAE Interrupt on Async Advance Enable
The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit UHPHS_USBSTS.

Bit 4 – HSEE Host System Error Enable
The interrupt is acknowledged by software clearing the Host System Error bit in UHPHS_USBSTS.

Bit 3 – FLRE Frame List Rollover Enable
The interrupt is acknowledged by software clearing the Frame List Rollover in UHPHS_USBSTS.

Bit 2 – PCIE Port Change Interrupt Enable
The interrupt is acknowledged by software clearing the Port Change Detect bit in UHPHS_USBSTS.

Bit 1 – USBEIE USB Error Interrupt Enable
The interrupt is acknowledged by software clearing the USBERRINT in UHPHS_USBSTS.

Bit 0 – USBIE USB Interrupt Enable
The interrupt is acknowledged by software clearing the USBINT in UHPHS_USBSTS.

© 2026 Microchip Technology Inc. and its subsidiaries

73.7.7. UHPHS USB Frame Index Register

Name: UHPHS_FRINDEX
Offset: 0x1C
Reset: 0x00000000
Property: Read/Write

This register is used by the host controller to index into the periodic frame list. The register updates every 125 µs (once each microframe). Bits [N:3] are used to select a particular entry in the Periodic Frame List during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by system software in the Frame List Size field in the UHPHS_USBCMD register).

This register must be written as a DWord. Byte writes produce undefined results. This register cannot be written unless the Host Controller is in the Halted state as indicated by the HCHLT bit (UHPHS_USBSTS register). A write to this register while the Run/Stop bit is set to 1 (UHPHS_USBCMD register) produces undefined results. Writes to this register also affect the SOF value.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	FI[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 13:0 – FI[13:0] Frame Index
The value in this register increments at the end of each time frame (microframe, for example). Bits [N:3] are used for the Frame List current index. This means that each location of the frame list is accessed eight times (frames or microframes) before moving to the next index. The following illustrates values of N based on the value of FLS (Frame List Size) in the UHPHS_USBCMD register.

UHPHS_USBCMD.FLS	Number Elements	N
0	1024	12
1	512	11
2	256	10
3	Reserved	–

The SOF frame number value for the bus SOF token is derived or alternatively managed from this register. The value of FRINDEX must be 125 µs (1 microframe) ahead of the SOF token value. The SOF value may be implemented as an 11-bit shadow register. For this discussion, this shadow register is 11 bits and is named SOFV. SOFV updates every eight microframes (1 millisecond). An

© 2026 Microchip Technology Inc. and its subsidiaries

example implementation to achieve this behavior is to increment SOFV each time the FRINDEX[2:0] increments from 0 to 1.
Software must use the value of FRINDEX to derive the current microframe number, both for high-speed isochronous scheduling purposes and to provide the “get microframe number” function required for client drivers. Therefore, the value of FRINDEX and the value of SOFV must be kept consistent if chip is reset or software writes to FRINDEX. Writes to FRINDEX must also write-through FRINDEX[13:3] to SOFV[10:0]. In order to keep the update as simple as possible, software should never write a FRINDEX value where the three least significant bits are 7 or 0.

© 2026 Microchip Technology Inc. and its subsidiaries

73.7.8. UHPHS Periodic Frame List Base Address Register

Name: UHPHS_PERIODICLISTBASE
Offset: 0x24
Reset: 0x00000000
Property: Read/Write

This 32-bit register contains the beginning address of the Periodic Frame List in the system memory. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (UHPHS_FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. This register must be written as a DWord. Byte writes produce undefined results.

73.7.9. UHPHS Asynchronous List Address Register

Name: UHPHS_ASYNCLISTADDR
Offset: 0x28
Reset: 0x00000000
Property: Read/Write

This 32-bit register contains the address of the next asynchronous queue head to be executed. Bits [4:0] of this register cannot be modified by system software and will always return a zero when read. The memory structure referenced by this physical memory pointer is assumed to be 32-byte (cache line) aligned. This register must be written as a DWord. Byte writes produce undefined results.

Bit	31	30	29	28	27	26	25	24
	LPL[26:19]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

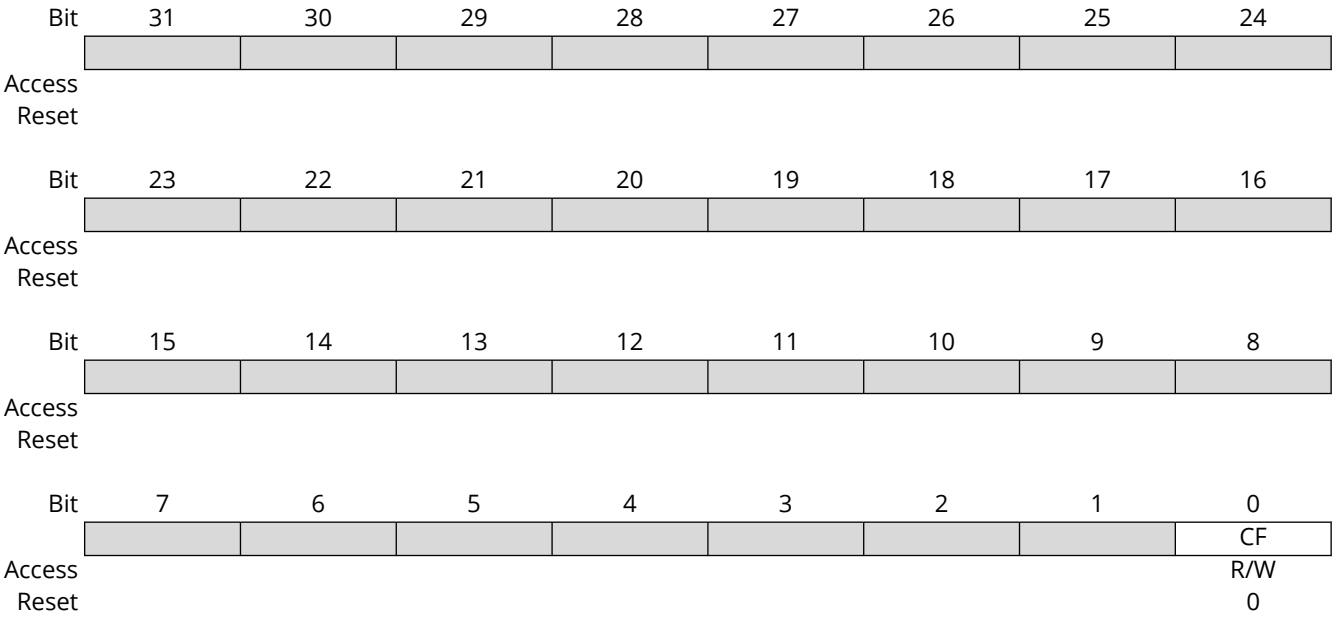
Bit	7	6	5	4	3	2	1	0
	LPL[2:0]							
Access	R/W	R/W	R/W					
Reset	0	0	0					



Bits 31:5 – LPL[26:0] Link Pointer Low
These bits correspond to memory address signals [31:5], respectively. This field may only reference a Queue Head (QH).

© 2026 Microchip Technology Inc. and its subsidiaries

73.7.10. UHPHS Configure Flag Register

Name: UHPHS_CONFIGFLAG
Offset: 0x50
Reset: 0x00000000
Property: Read/Write

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset.

Bit 0 – CF Configure Flag
Host software sets this bit as the last action in its process of configuring the Host Controller. This bit controls the default port-routing control logic. Bit values and side-effects are listed below.

Value	Description
0	Port routing control logic default-routes each port to an implementation-dependent classic host controller (default value).
1	Port routing control logic default-routes all ports to this host controller.

© 2026 Microchip Technology Inc. and its subsidiaries

73.7.11. UHPHS Port Status and Control Register

Name: UHPHS_PORTSCx
Offset: 0x54 + x*0x04 [x=0..2]
Reset: 0x00003000
Property: Read/Write

The number of port registers is documented in the UHPHS_HCSPARAMS register. Software uses this information as an input parameter to determine how many ports need to be serviced. All ports have the structure defined below.

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset. The initial conditions of a port are:

- No device connected
- Port disabled

If the port has port power control, software cannot change the state of the port until after it applies power to the port by setting port power to a 1. Software must not attempt to change the state of the port until after power is stable on the port. The host is required to have power stable to the port within 20 milliseconds of the 0 to 1 transition.

Notes:

1. When a device is attached, the port state transitions to the connected state and system software will process this as with any status change notification.
2. If a port is being used as the Debug Port, then the port may report device connected and enabled when the Configured Flag is set to 0.

Bit	31	30	29	28	27	26	25	24

Bit 22 – WKOC_E Wake on Overcurrent Enable
This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to overcurrent conditions as wake-up events.
1	Enables the port to be sensitive to overcurrent conditions as wake-up events.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 21 – WKDSCNNT_E Wake on Disconnect Enable
This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to device disconnects as wake-up events.
1	Enables the port to be sensitive to device disconnects as wake-up events.

Bit 20 – WKCNNT_E Wake on Connect Enable
This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to device connects as wake-up events.
1	Enables the port to be sensitive to device connects as wake-up events.

Bits 19:16 – PTC[3:0] Port Test Control
When this field is set to 0, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value.
Test mode bits are encoded as follows (6 to 15 are reserved):

Value	Test Mode
0	Test mode not enabled
1	Test J_STATE
2	Test K_STATE
3	Test SE0_NAK
4	Test Packet
5	Test FORCE_ENABLE

Refer to the USB Specification Revision 2.0, Chapter 7, for details on each test mode.

Bits 15:14 – PIC[1:0] Port Indicator Control
Writing to these bits has no effect if the P_INDICATOR bit in the UHPHS_HCSPARAMS register is set to 0. If the P_INDICATOR bit is set to 1, then the bits are encoded as follows:

Value	Meaning
0	Port indicators are off
1	Amber
2	Green
3	Undefined

Refer to the USB Specification Revision 2.0 for a description of how these bits are to be used.
This field is 0 if Port Power is 0.

Bit 13 – PO Port Owner
System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes 1 to this bit when the attached device is not a high-speed device. A 1 in this bit means that a companion host controller owns and controls the port.

Value	Description
0	This bit unconditionally goes to a 0 when the bit UHPHS_CONFIGFLAG.CF makes a 0 to 1 transition.
1	This bit unconditionally goes to 1 whenever the bit UHPHS_CONFIGFLAG.CF=0.

Bit 12 – PP Port Power
The function of this bit depends on the value of the Port Power Control (PPC) field in the UHPHS_HCSPARAMS register. When host controller has port power control switches (PPC=0), PP is in read-only mode:

© 2026 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Each port is hard-wired to power.

When host controller has port power control switches (PPC=1), PP is in read/write mode:

Value	Description
0	Host port power switch is off. When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc.
1	Host port power switch is on. When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc.

When an overcurrent condition is detected on a powered port and PPC is set to 1, the PP bit in each affected port may be transitioned by the host controller from 1 to 0 (removing power from the port).

Bits 11:10 – LS[1:0] Line Status

These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is 0 and the current connect status bit is set to 1.
This value of this field is undefined if Port Power is 0.

Value	Name	Description
0	SE0	Not a low-speed device, perform EHCI reset
1	K_STATE	Low-speed device, release ownership of port
2	J_STATE	Not a low-speed device, perform EHCI reset
3	Undefined	Not a low-speed device, perform EHCI reset

Bit 8 – PR Port Reset

When software writes a 1 to this bit (from 0), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a 0 to this bit to terminate the bus reset sequence. Software must keep this bit set to 1 long enough to ensure the reset sequence, as specified in the USB Specification Revision 2.0, completes.
Note: When software writes this bit to 1, it must also write 0 to the Port Enable bit.

When software writes a 0 to this bit, there may be a delay before the bit status changes to 0. The bit status will not read as 0 until after the reset has completed. If the port is in High-Speed mode after reset is complete, the host controller will automatically enable this port (set the Port Enable bit to 1, for example). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from 1 to 0. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2 ms of software writing this bit to 0.
The HCHLT bit in the UHPHS_USBSTS register should be set to 0 before software attempts to use this bit. The host controller may hold Port Reset asserted to 1 when the HCHLT bit is 1.
This field is 0 if Port Power is 0.

Value	Description
0	Port is not in Reset.
1	Port is in Reset.

Bit 7 – SUS Suspend

Value	Description
0	Port not in Suspend state.
1	Port in Suspend state.

© 2026 Microchip Technology Inc. and its subsidiaries

Note:
Port Enabled Bit and Suspend bit of this register define the port states as follows:

Bits [Port Enabled, Suspend]	Port State
0X	Disable
10	Enable
11	Suspend

When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB.

A write of 0 to this bit is ignored by the host controller. The host controller will unconditionally set this bit to 0 when:

- Software sets the Force Port Resume bit to 0 (from 1).
- Software sets the Port Reset bit to 1 (from 0).

If host software sets this bit to 1 when the port is not enabled (i.e., Port Enabled bit set to 0), the results are undefined.

This field is 0 if Port Power is set to 0.

Bit 6 – FPR Force Port Resume

This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are set to 1) and software transitions this bit to 1, then the effects on the bus are undefined.
Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to 1 because a J-to-K transition is detected, the Port Change Detect bit in the UHPHS_USBSTS register is also set to 1. If software sets this bit to 1, the host controller must not set the Port Change Detect bit.
Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains set to 1. Software must appropriately time the Resume and set this bit to 0 when the appropriate amount of time has elapsed. Writing a 0 (from 1) causes the port to return to High-Speed mode (forcing the bus below the port into a high-speed idle). This bit will remain set to 1 until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to 0.
This field is 0 if Port Power is 0.

Value	Description
0	No resume (K-state) detected/driven on port.
1	Resume detected/driven on port.

Bit 5 – OCC Overcurrent Change (Cleared on write)

Software clears this bit by writing 1.

Value	Description
0	No change to Overcurrent Active.
1	Changes to Overcurrent Active.

Bit 4 – OCA Overcurrent Active

This bit will automatically transition from 1 to 0 when the overcurrent condition is removed.

Value	Description
0	This port does not have an overcurrent condition.
1	This port currently has an overcurrent condition.

© 2026 Microchip Technology Inc. and its subsidiaries

Bit 3 – PEDC Port Enable/Disable Change (Cleared on write)

For the root hub, this bit gets set to 1 only when a port is disabled due to the appropriate conditions existing at the EOF2 point (refer to Chapter 11 of the USB Specification for the definition of a Port Error). Software clears this bit by writing a 1 to it.
This field is 0 if Port Power bit is 0.

Value	Description
0	No change in port enabled/disabled status.
1	Port enabled/disabled status has changed.

Bit 2 – PED Port Enabled/Disabled

Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this field. The host controller will only set this bit to 1 when the reset sequence determines that the attached device is a high-speed device.
Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events.
When the port is disabled (0b), downstream propagation of data is blocked on this port, except for reset.
This field is 0 if Port Power bit is 0.

Value	Description
0	Disable.
1	Enable.

Bit 1 – CSC Connect Status Change (Cleared on write)

Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be "setting" an already-set bit (i.e., the bit remains set). Software sets this bit to 0 by writing a 1 to it.
This field is 0 if Port Power bit is 0.

Value	Description
0	No change.
1	Change in Current Connect Status.

Bit 0 – CCS Current Connect Status

This value reflects the current state of the port, and may not correspond directly to the event that caused the CSC bit to be 1.
This bit is 0 if Port Power is 0.

Value	Description
0	No device is present.
1	Device is present on port.

Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	Nb_Burst[3:0]				Nb_Success_Burst[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 31 – AHB_ERR AHB Error
System bus error was encountered and erroneous burst characteristics are captured. To clear this field the application must write a 0.
EHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and an error occurs, 4 is written to INSNREG06[8:4].
- When INCR8 and an error occurs, 8 is written to INSNREG06[8:4].
- When INCR16 and an error occurs, 16 is written to INSNREG06[8:4].
- Other values except 4, 8, and 16 are not written to INSNREG06[8:4].

OHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and error occurs, 4 is written to INSNREG06[8:4].
- Other values except 4 are not written to INSNREG06[8:4].

Bits 11:9 – HBURST[2:0] Burst Value
Value of the control phase at which the AHB error occurred.
This field applies to enabled incremental bursts only.

Bits 8:4 – Nb_Burst[4:0] Number of Bursts
Number of beats expected in the burst at which the AHB error occurred. Valid values are 0 to 16.
This field applies to enabled incremental bursts only.

© 2026 Microchip Technology Inc. and its subsidiaries

Bits 3:0 – Nb_Success_Burst[3:0] Number of Successful Bursts
Number of successfully completed beats in the current burst before the AHB error occurred.
This field applies to enabled incremental bursts only.

Electrical and Mechanical Characteristics

74. Electrical Characteristics

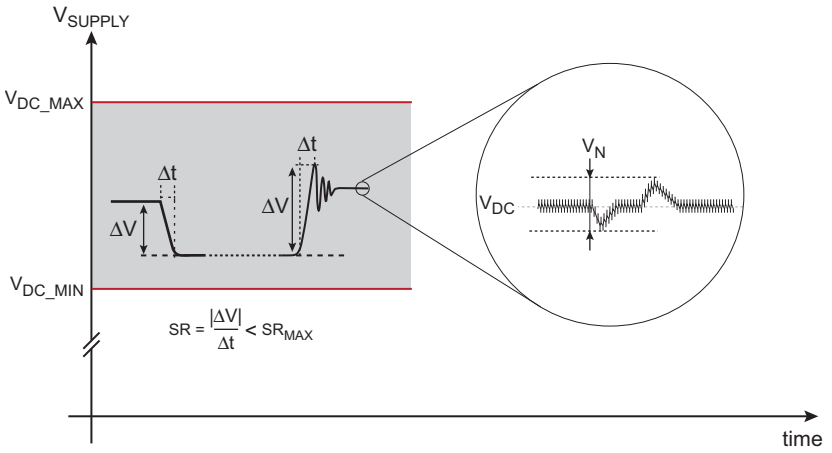
74.1. Electrical Parameters Usage

Tables in the following sections define the limiting values for several electrical parameters:

- I/O Characteristics
- Digital Peripheral Characteristics
- Analog Peripheral Characteristics
- Power Consumption in Active Mode
- Operation and Power Consumption in Low-Power Modes

- Unless otherwise noted, these values are valid over the junction temperature range T_J= [-40°C; +125°C].
- Parameters annotated as "simulation data" are not production-tested. Their limiting values come from simulations run in corner-case conditions and were verified by electrical characterization over a limited number of samples. Additionally, specifications in the section Digital Peripheral Characteristics are simulation data, even though they are not annotated as such.
- These limits may be affected by the board on which the device is mounted. Noisy supply and ground conditions must be avoided, and care must be taken to provide:
  - a PCB with a low-impedance ground plane. A single unbroken ground plane is a minimum requirement.
  - low-impedance decoupling of the device power supply inputs. A 10 nF to 220 nF Ceramic X7R (or X5R) capacitor placed very close to each power supply input is a minimum requirement. See specific recommendations regarding analog pins or functions in the corresponding sections. To reduce any potential electromagnetic compatibility (EMC) related issues, it is good practice to double this decoupling capacitor whenever possible with a high frequency one, for example one 100 pF (C0G or NP0) per power supply input.
  - low-impedance power supply decoupling of external components. This recommendation aims at avoiding large current spikes flowing into the PCB ground and power planes.
- In addition, although the device is specified with wide operating supply ranges on most of its supply inputs (for example 1.7V to 3.6V), large and fast supply variations may lead to unpredictable device behavior including, but not limited to, out-of-specification operation. Therefore, in addition to maintaining the power supply inputs within their specified ranges, it is mandatory to keep the power supply variations within the limits shown in the following table during the device operation.

Table 74.1. Maximum Power Supply Variations[1]



Power Input	Parameters	Conditions	Min	Max	Unit
V_N	Peak-to-peak ripple and noise voltage[2]	VDDCORE, VDDBU, VDDIOP0, VDDIOP1, VDDIOP2, VDDQSPI, VDDNF, VDDIOM	–	3	% V_{DC}
		VDDIN33, VDDANA, VDDLVDS[3]	–	1	% V_{DC}
SR	Slewrate of power supply variations[4][5]	$\Delta V < 5\% V_{DC_MIN}$	–	±50	V/ms
		$\Delta V < 10\% V_{DC_MIN}$	–	±10	V/ms
		$\Delta V \geq 10\% V_{DC_MIN}$	–	±1	V/ms

1. VDDMIPI is not mentioned in this table, as it must be connected to the VDDOUT25 regulator output that fulfills the electrical requirements of this power input.

© 2026 Microchip Technology Inc. and its subsidiaries

2. V_{DC} is the power supply DC value.
3. The peak-to-peak ripple and noise voltage for VDDLVDS can be relaxed to 3% V_{DC} when this segment is not used with the LVDS PHY.
4. V_{DC_MIN} is the minimum operating voltage of the supply input as described in Table 74.4.
5. ΔV is the variation amplitude. The slewrate specification applies when $\Delta V \geq V_{N.}$ The following examples and figure illustrate the above table.
   - When working with VDDIOP0 = 3.3V, a maximum power supply ripple and noise voltage of 99 mV peak-to-peak (3% of 3.3V) must be maintained.
   - When working with VDDIN33 = 3.3V, a maximum power supply ripple and noise voltage of 33 mV peak-to-peak (1% of 3.3V) must be maintained.

Figure 74.1. Maximum Power Supply Variation

© 2026 Microchip Technology Inc. and its subsidiaries

74.2. Absolute Maximum Ratings

Table 74.2. Absolute Maximum Ratings

Storage Temperature	-60°C to +150°C	**Note:** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
Voltage Difference between two ground pins (among GND and GNDANA)	±50 mV	
Voltage on Power Supply Inputs with respect to ground pins:		
VDDCORE	-0.3V to 1.4V	
VDDIOP0, VDDIOP1, VDDIOP2	-0.3V to 4.0V	
VDDIOM	-0.3V to 2.0V	
VDDANA, VDDIN33	-0.3V to 4.0V	
VDDNF, VDDQSPI, VDDBU	-0.3V to 4.0V	
VDDMIPI, VDDLVDS	-0.3V to 4.0V	
Voltage on Digital or Analog Input Pins with respect to ground	-0.3V to 4.0V	
Injected Current into any input pin	± 1 mA	
Total Injected Current in all input pins of a common power supply pair	± 10 mA	
Maximum DC Output Current:		
On all I/O lines into one power rail	100 mA	
Per output pin	25 mA	

Note: All I/O pins are internally clamped to their respective VDD and GND rails as defined in the Pin Description table. Ex: for PA2, this corresponds to VDDIOP0 and GND.

74.3. ESD Ratings

Table 74.3. Electrostatic Discharge (ESD) Ratings

Symbol	Description	Conditions	Value	Unit
Electrostatic Discharge, Human Body Model (HBM)				
ESD_HBM	AEC-Q100-002 Rev-E stress voltage level	All pins	±2	kV
Electrostatic Discharge, Charged-Device Model (CDM)				
ESD_CDM	AEC-Q100-011 Rev-D classification level	All pins	C2a	–
	Corresponding stress voltage level	All pins	±500	V
		Corner pins	±750	V

74.4. Recommended Operating Conditions

Table 74.4. Recommended Operating Conditions on Power Supply Inputs

Power Input	Parameters	Conditions	Min	Max	Unit
VDDIN33	VDDOUT25 regulator input, USB interface I/O lines and Main crystal oscillator power supply[1]	–	3.00	3.60	V
VDDANA	VDDANA I/O lines, A/D Converter and OTP memory power supply[1]	–	3.00	3.60	V

© 2026 Microchip Technology Inc. and its subsidiaries

Table 74.4. Recommended Operating Conditions on Power Supply Inputs (continued)

Power Input	Parameters	Conditions	Min	Max	Unit
VDDCORE	Core logic (processor, peripherals, memories, UTMI logic, etc.) power supply (2)	$f_{CPU} \leq 600$ MHz, $f_{MCK} \leq 200$ MHz	1.03	1.21	V
		$f_{CPU} \leq 800$ MHz, $f_{MCK} \leq 266$ MHz	1.12	1.21	V
		Device in ULP0 (f < 25 MHz)(3) or ULP1 mode	1.00	1.21	V
VDDIOM	SDRAM I/O lines power supply	DDR2-SDRAM	1.70	1.90	V
		DDR3-SDRAM	1.425	1.575	V
		DDR3L-SDRAM	1.283	1.450	V
VDDNF	NAND Flash I/O lines power supply(4)	–	1.70	3.60	V
VDDIOP0	VDDIOP0 I/O lines power supply(4)	–	1.70	3.60	V
VDDIOP1	VDDIOP1 I/O lines power supply(4)	–	1.70	3.60	V
VDDIOP2	VDDIOP2 I/O lines power supply(4)	–	1.70	3.60	V
VDDQSPI	VDDQSPI I/O lines power supply(4)	–	1.70	3.60	V
VDDLVDS	LVDS PHY and VDDLVDS I/O lines power supply(4)(5)	–	1.70	3.60	V
VDDMIPI	MIPI PHY and I/O lines power supply(6)	–	2.25	2.75	V
VDDBU	Backup domain power supply	–	1.6	3.60	V
t_{R_VDD}	Power supply slope at power-up	–	0.2	20	mV/µs
t_{F_VDD}	Power supply slope at power-down	–	–20	–1(7)	mV/µs

Notes:

1. VDDANA and VDDIN33 are powered from one single source: V(VDDANA,VDDIN33) ≤ ±50mV.
2. For device lifetime estimation as a function of VDDCORE and temperature, refer to the application note “SAM9X7 Series Product Lifetime Estimation” (AN5531), available on www.microchip.com.
3. In ULP0 mode, all PLLs are off. The maximum clock frequency in the system is 25 MHz: $f_{MAINCK} < 25$ MHz, $f_{CPU} < 25$ MHz, $f_{MCK} < 25$ MHz.
4. Supply range restrictions apply when using the digital peripheral timing characteristics. See I/O Characteristics.
5. When the LVDS PHY is used, VDDLVDS must be connected to VDDOUT25.
6. VDDMIPI must be connected to VDDOUT25.
7. For VDDBU, this value is 0 mV/µs.

Table 74.5. Recommended Operating Conditions on Input Pins(1)

Symbol	Parameters	Conditions	Min	Max	Unit
V_{IN}	Input line voltage range on inputs(2)(3)	–	-0.3	V_{DD}+0.3	V
I_{IN}	DC current injection on input (4)(5)	–	–	±0.2	mA
I_{TOT_INJ}	Total current injection per power rail or ground rail (6)	–	–	±2	mA

© 2026 Microchip Technology Inc. and its subsidiaries

Notes:

1. In this table, VDD refers to the voltage of the associated power rail of the I/O line, as defined in the Pin Description table. Ex: for PA2, VDD refers to VDDIOP0.
2. Input voltages $V_{IN} \leq 0V$ or $V_{IN} \geq VDD$ lead to negative or positive current injection on inputs.
3. For analog inputs (PA[31:24]), input voltages $V_{IN} \geq \min(V_{DDANA}, V_{ADVREFP})$ lead to saturated A/D conversion to 0xFFF.
4. Current injection on A/D converter analog inputs (PA[31:24]) can degrade the analog performance of the corresponding channel or the analog performance of other analog channels.
5. High frequency current injection must be limited to avoid propagating high frequency signals to internal sensitive analog circuits (oscillators, regulators, etc.). One common use case of high frequency current injection occurs when a digital input pin suffers overshoots and/or undershoots from a poorly adapted transmission line (PCB trace with signal reflections, for example). These cases should be cured by appropriate source series resistor termination. Special attention must be paid to high speed interfaces (Gigabit Ethernet MAC I/F, SD card or e.MMC I/F, QSPI I/F, etc.).
6. Corresponds to the sum of the positive currents into one power rail and, respectively, to the sum of the negative currents into one ground rail, as defined in the Pin Description table.

Table 74.6. Recommended Operating Conditions on Internal Clocks

Symbol	Parameters	Conditions	Min	Max	Unit
f_{CPU_CLK}	Processor clock (CPU_CLK) frequency	VDDCORE ≥ 1.12V	–	800	MHz
		VDDCORE ≥ 1.03V	–	600	MHz
f_{MCK}	Main system bus clock (MCK) frequency	VDDCORE ≥ 1.12V	–	266	MHz
		VDDCORE ≥ 1.03V	–	200	MHz

Table 74.7. Recommended Operating Conditions on SDRAM Interface

Symbol	Parameters	Conditions		Min	Max	Unit
f_{SDRAM_CLK}	SDRAM clock frequency	VDDCORE ≥ 1.12V	DDR2-SDRAM	125	266	MHz
			DDR3(L)-SDRAM (DLL ON)[1]	266	–	MHz
			DDR3(L)-SDRAM (DLL OFF)[2]	–	200	MHz
		VDDCORE ≥ 1.03V	DDR2-SDRAM	125	200	MHz
			DDR3(L)-SDRAM (DLL OFF)[2]	–	200	MHz

Notes:

1. According to the JEDEC specification, DDR3(L) “DLL On mode” is supported for clock frequencies of 300 MHz and above. Most memory suppliers accept operations down to 266 MHz. Contact the memory supplier for further details.
2. According to the JEDEC specification, DDR3(L) “DLL Off mode” is supported for clock frequencies up to 125 MHz. Most memory suppliers accept operations up to 200 MHz. Contact the memory supplier for further details.

Table 74.8. Recommended Thermal Operating Conditions

Symbol	Parameter	Conditions	Min	Max	Unit
T_A	Ambient temperature range	SAM9X7x-I devices	-40	85	°C
		SAM9X7x-V devices	-40	105	°C
T_J	Junction temperature range	–	-40	125	°C

Note: For lifetime estimation as a function of VDDCORE and temperature, refer to the application note "SAM9X7 Series Product Lifetime Estimation" (AN5531), available on www.microchip.com.

Table 74.9. Package Characteristics – SAM9X7x-I Devices

Symbol	Parameter	Conditions	Min	Max	Unit
R_{JA}	Junction-to-ambient thermal resistance	–		38	°C/W
R_{JC}	Junction-to-case thermal resistance	–		16	°C/W
R_{JB}	Junction-to-board thermal resistance	–		31	°C/W
$\Psi_{J\text{-}top}$	Junction-to-package top characterization parameter	–		0.57	°C/W

Note: The package characteristics in the above table are provided according to the JEDEC JESD51-2 standard with the 2s2p board and 0 m/s air flow. These values are not directly applicable to the final application. As per JEDEC standards, these parameters represent the device mounted on a specific PCB under controlled conditions. In real-world applications, the PCB design and construction, airflow, and other factors can significantly impact thermal characteristics.

Table 74.10. Package Characteristics – SAM9X7x-V Devices – BGA240

Symbol	Parameter	Conditions	Min	Max	Unit
R_{JA}	Junction-to-ambient thermal resistance	–		33	°C/W
R_{JC}	Junction-to-case thermal resistance	–		12	°C/W
R_{JB}	Junction-to-board thermal resistance	–		26	°C/W
$\Psi_{J\text{-}top}$	Junction-to-package top characterization parameter	–		0.45	°C/W

Note: The package characteristics in the above table are provided according to the JEDEC JESD51-2 standard with the 2s2p board and 0 m/s air flow. These values are not directly applicable to the final application. As per JEDEC standards, these parameters represent the device mounted on a specific PCB under controlled conditions. In real-world applications, the PCB design and construction, airflow, and other factors can significantly impact thermal characteristics.

Table 74.11. Package Characteristics – SAM9X7x-V Devices – BGA256

Symbol	Parameter	Conditions	Min	Max	Unit
R_{JA}	Junction-to-ambient thermal resistance	–		34	°C/W
R_{JC}	Junction-to-case thermal resistance	–		17	°C/W
R_{JB}	Junction-to-board thermal resistance	–		25	°C/W
$\Psi_{J\text{-}top}$	Junction-to-package top characterization parameter	–		0.4	°C/W

Note: The package characteristics in the above table are provided according to the JEDEC JESD51-2 standard with the 2s2p board and 0 m/s air flow. These values are not directly applicable to the final application. As per JEDEC standards, these parameters represent the device mounted on a specific PCB under controlled conditions. In real-world applications, the PCB design and construction, airflow, and other factors can significantly impact thermal characteristics.

74.5. Recommended Power Supply Sequencing

In the following sections, various recommended power sequences are described. Operating the device outside this scope may lead to unpredictable behavior.

74.5.1. Power-Up and Power-Down

At power-up, from a power supply sequencing perspective, the SAM9X7 Series power supply inputs are categorized into three independent groups:

- VDDCORE
- VDDIN33
- Periphery group containing all other power supply inputs except VDDBU

The figure below shows the recommended power-up sequence.

© 2026 Microchip Technology Inc. and its subsidiaries

Notes:

- VDDBU
  - When supplied from a pre-charged storage element (battery or supercapacitor), VDDBU is an always-on supply input and is therefore not part of the power supply sequencing.
  - When no storage element is used on VDDBU in the application, VDDBU must be tied to VDDIN33.
  - When a supercapacitor is used in the application to power VDDBU during Backup mode, this element must be isolated from VDDBU during its (slow) charge, so that VDDBU closely follows VDDIN33. In table Power-up Timing Requirements, the parameter t_0 limits the delay to establish VDDBU after VDDIN33.
- VDDOUT25 is the output of the internal 2.5V VDDOUT25 regulator, therefore, there is no power supply requirement on this pin. VDDOUT25 is automatically started at VDDIN33 rise when VDDIN33 is above its Power-On-Reset threshold.
- No board-level requirement on VDDMIPI as it is connected to VDDOUT25.
- VDDLVDS requirements do not apply when VDDLVDS is connected to VDDOUT25.

NRST must be asserted low during the whole power-up sequence.

Figure 74.2. Recommended Power Sequence at Power-Up

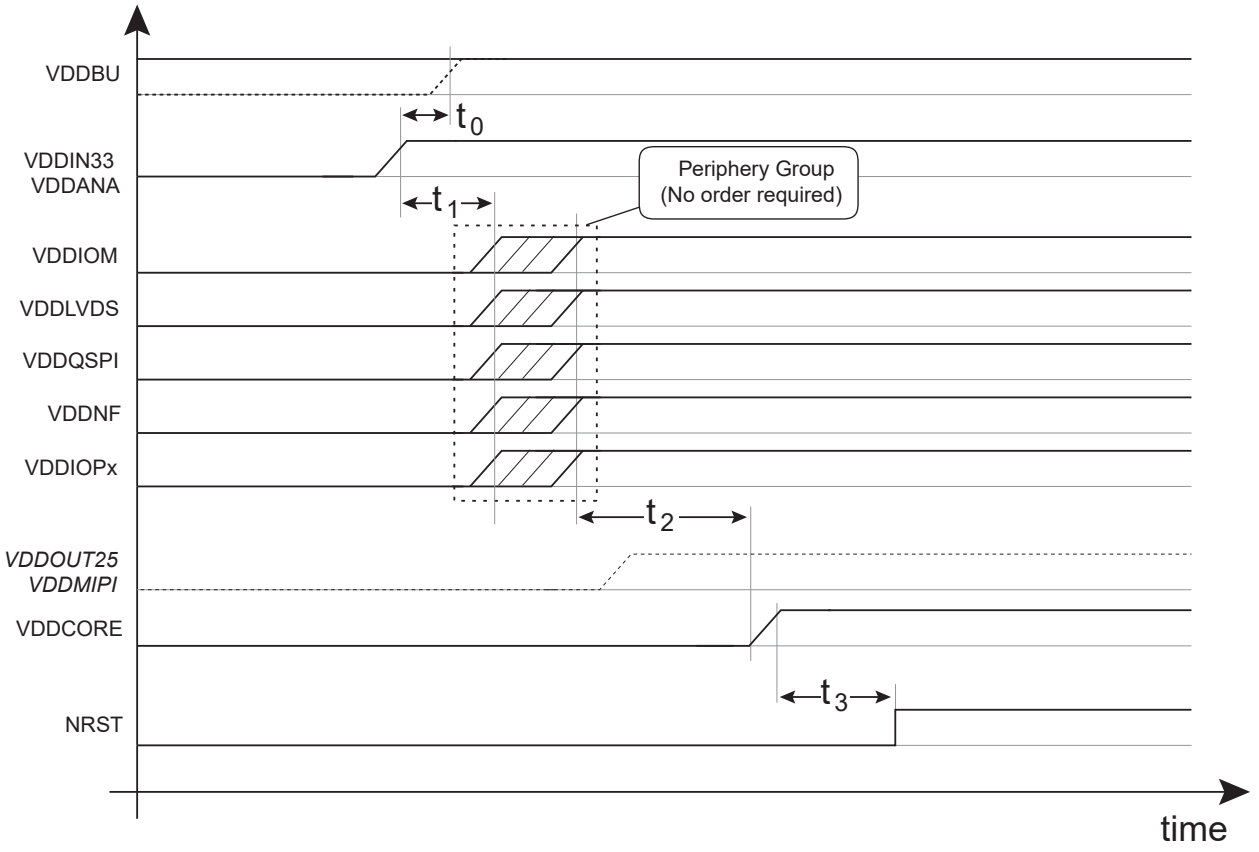

Table 74.12. Power-Up Timing Requirements[1]

Symbol	Parameters	Conditions	Min	Max	Unit
t_0	VDDBU delay	Delay from established VDDIN33 to established VDDBU	–	0.2	ms

© 2026 Microchip Technology Inc. and its subsidiaries

Table 74.12. Power-Up Timing Requirements[1] (continued)

Symbol	Parameters	Conditions	Min	Max	Unit
t_1	VDDIN33 to periphery group delay	Delay from established VDDIN33 to the first established Periphery Group supply	-0.1	–	ms
t_2	Periphery group to VDDCORE delay	Delay from the last established Periphery Group supply to VDDCORE supply turn-on	0	–	ms
t_3	Reset delay at power-up	From established VDDCORE to NRST high	8	–	ms

Note:

1. The term "established" refers to a power supply established to 90% of its final value.

The following figure shows the SAM9X7 Series power-down sequence that starts by asserting the NRST line to 0. Once NRST is asserted, the supply inputs can be immediately shut down without any specific timing or order. VDDBU may not be shut down if the application uses a backup storage element on this supply input. When VDDIN33 falls below the negative-going threshold of the VDDIN33 power-on reset, the VDDOUT25 regulator is automatically shut down and its output is pulled low by an internal discharge resistor.

Figure 74.3. Recommended Power Sequence at Power-Down

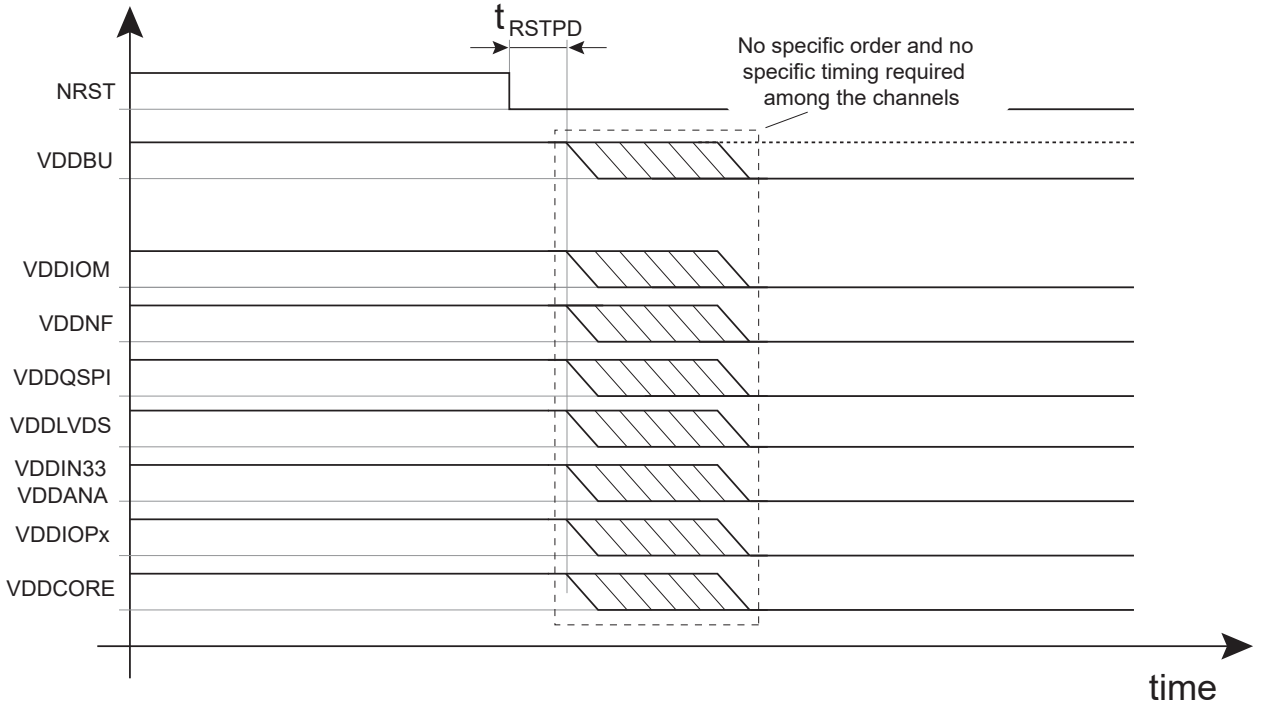

Table 74.13. Power-Down Timing Requirements

Symbol	Parameters	Conditions	Min	Max	Unit
t_{RSTPD}	NRST delay at power-down	Delay from NRST low to the first supply out of its operating range	0	–	ms

74.5.2. Backup Mode Entry and Wake-Up

The following figure shows the recommended power-down sequence to place the SAM9X7 Series device in Backup mode. The SHDN signal, output of Shutdown Controller (SHDWC), signals the shutdown request to the external power supply. This output is supplied by VDDBU that is present in

© 2026 Microchip Technology Inc. and its subsidiaries

Backup mode. In a similar way to the power-down sequence, the NRST signal must be asserted prior to turning the SAM9X7 Series power supplies off.

Figure 74.4. Recommended Power Sequence at Backup Mode Entry

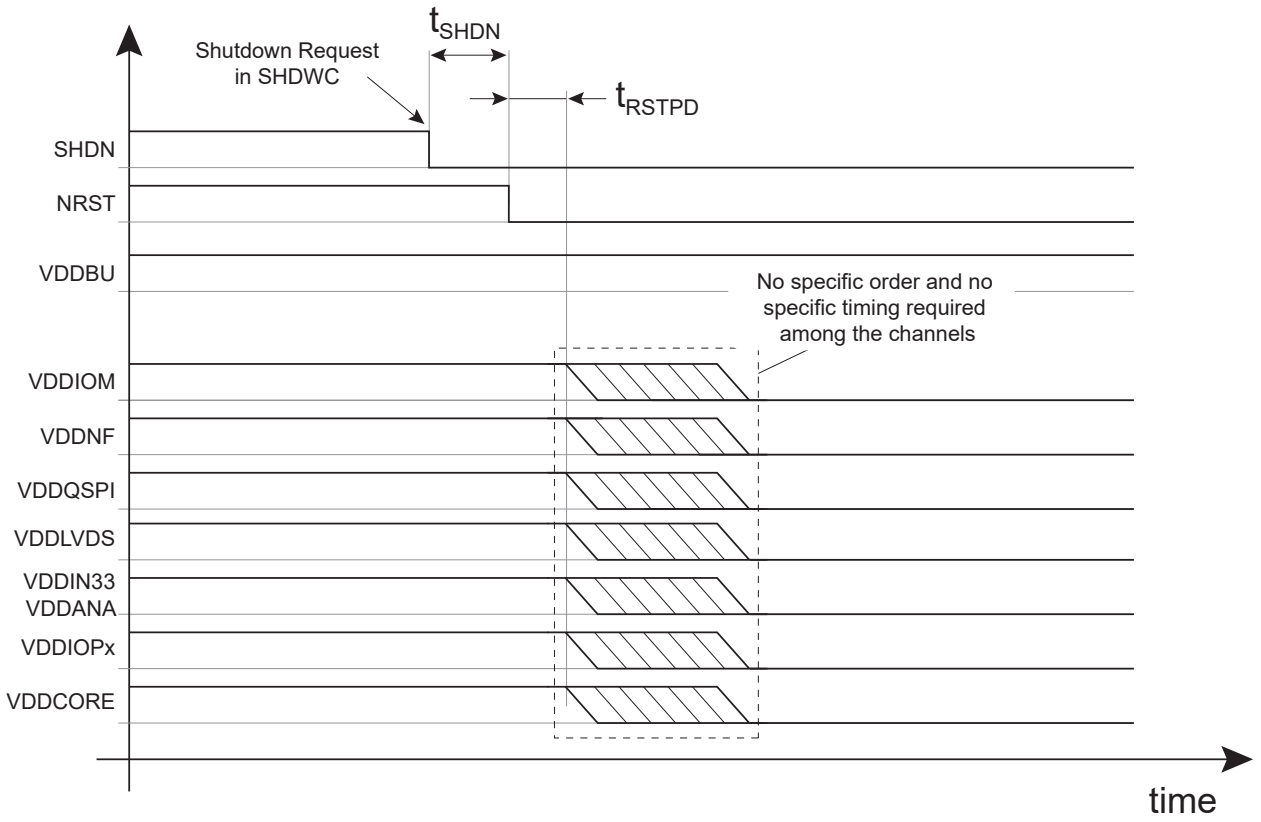

Table 74.14. Backup Mode Entry Timing Requirements

Symbol	Parameters	Conditions	Min	Max	Unit
t_{SHDN}	SHDN delay at Backup mode entry	Delay from SHDN low to NRST low	0	–	ms
t_{RSTPD}	NRST delay at power-down	Delay from NRST low to the first supply out of its operating range	0	–	ms

The following figure shows the recommended power-up sequence to wake up the SAM9X7 series device from Backup mode. Upon a wake-up event (WKUP pin, RTC alarm, etc.), the Shutdown Controller automatically toggles its SHDN output back to VDDBU to request the external power supply to restart. This power-up sequence is the same as the one shown in Figure 74.2. In particular, the supply groups definition is the same.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 74.5. Recommended Power Sequence at Wake-Up from Backup Mode

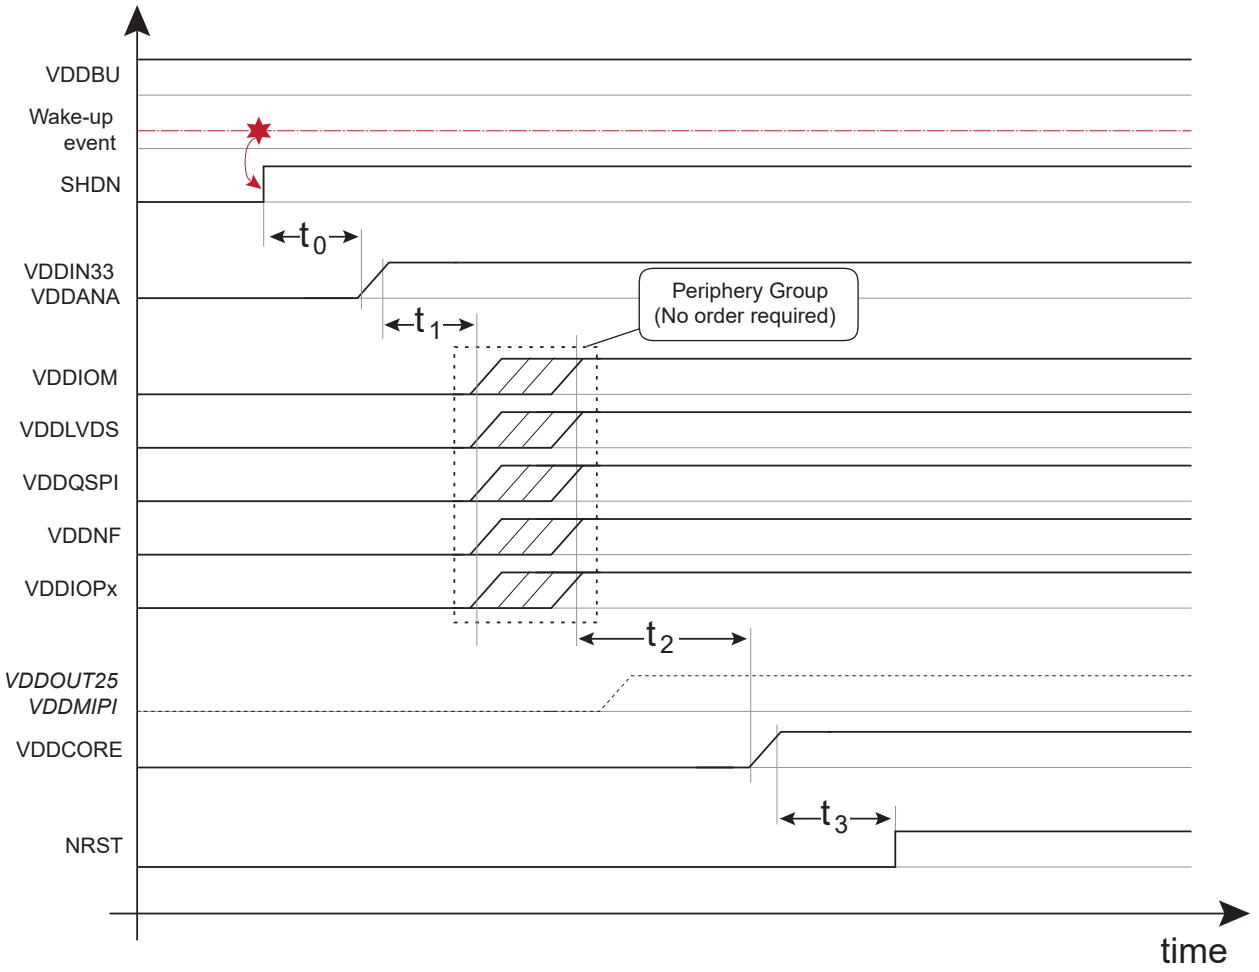

Table 74.15. Wake-Up from Backup Mode Timing Requirements[1]

Symbol	Parameters	Conditions	Min	Max	Unit
t_0	VDDIN33 delay	Delay from SHDN high to VDDIN33 turn-on	0	–	ms
t_1	VDDIN33 to periphery group delay	Delay from established VDDIN33 to the first established periphery group supply	-0.1	–	ms
t_2	Periphery group to VDDCORE delay	Delay from the last established periphery group supply to VDDCORE supply turn-on	0	–	ms
t_3	Reset delay at power-up	From established VDDCORE to NRST high	8	–	ms

Note:

1. The term "established" refers to a power supply established to 90% of its final value.

74.6. I/O Characteristics

The device features two types of Input/Output (I/O) circuits:

- GPIO
- DDRIO

Unless otherwise specified:

© 2026 Microchip Technology Inc. and its subsidiaries

- The following specifications apply to the GPIO type.
- V_{DD} refers to the voltage of the associated power rail of the I/O line, as defined in the Pin Description table. For example, for PA2, V_{DD} refers to the voltage applied on VDDIOP0.
- The GPIO type drive and slewrate controls are set in the PIO_DRIVE and PIO_SLEWR registers, respectively.

74.6.1. I/O DC Characteristics

Table 74.16. Input DC Characteristics

Symbol	Parameters	Conditions	Min	Max	Unit
V_{IL}	Low-level input voltage(1)	–	–	0.3 x V_{DD}	V
V_{IH}	High-level input voltage(1)	–	0.7 x V_{DD}	–	V
V_{OL}	Low-level output voltage	I_O max	–	0.2 x V_{DD}	V
V_{OH}	High-level output voltage	I_O max	0.8 x V_{DD}	–	V
I_{IH}	Input-high input leakage current(1)	Pull-down resistor disabled V_{IN} = V_{DD} = 3.6V	-150	150	nA
I_{IL}	Input-low input leakage current(1)	Pull-up resistor disabled V_{IN} = 0; V_{DD} = 3.6V	-150	150	nA
R_{PULL}	Programmable pull-up or pull-down resistor	Digital Input mode	60	140	kΩ
C_{IN}	Input capacitance(1)	Digital Input mode	–	4	pF
V_{hys}	Input hysteresis(1)	–	0.15	–	V

Note:

1. Simulation data

Table 74.17. Output DC Characteristics (1.7V < V_{DD} < 1.9V)

Symbol	Parameters	Conditions		Min	Max	Unit
I_{OH} or I_{OL}	High-level or low-level output current	Any	I_{OL}: V_{OL} = 0.2 x V_{DD} I_{OH}: V_{OH} = 0.8 x V_{DD}	–	–	–
		GPIO	Drive = 0, Slewrate = 0	–	3	mA
			Drive = 1, Slewrate = 0	–	4	mA
			Drive = 0, Slewrate = 1	–	1	mA
			Drive = 1, Slewrate = 1	–	2	mA

Table 74.18. Output DC Characteristics (3.0V < V_{DD} < 3.6V)

Symbol	Parameters	Conditions		Min	Max	Unit
I_{OH} or I_{OL}	High-level or low-level output current(1)	Any	I_{OL} : V_{OL} = 0.2 x V_{DD} I_{OH} : V_{OH} = 0.8 x V_{DD}	–	–	–
		GPIO	Drive = 0, Slewrate = 0	–	9	mA
			Drive = 1, Slewrate = 0	–	10	
			Drive = 0, Slewrate = 1	–	3	
			Drive = 1, Slewrate = 1	–	6	

Note:

© 2026 Microchip Technology Inc. and its subsidiaries

74.6.2. I/O AC Characteristics

74.6.2.1. Output Driver AC Characteristics

The following figure provides the timing definitions required to specify the maximum operating frequency of an output driver.

Figure 74.6. Timing Definitions of a Digital Output Signal

t_{SIG}: Period of the digital output signal

$f = 1 / t_{SIG}$: Frequency of the digital output signal

t_{HIGH}: Time during which the output waveform is greater than $V_{DD} / 2$

$t_{LOW} = t_{SIG} - t_{HIGH}$: Time during which the output waveform is less than $V_{DD} / 2$

$d = t_{HIGH} / t_{SIG}$: Output waveform duty cycle

V_O: Output waveform amplitude

In Table 74.20 and Table 74.21, the maximum operating frequency f_{MAX} guarantees that the driver's output waveform fulfills the following characteristics:

- $t_R < 0.75 / f_{MAX}$ and $t_F < 0.75 / f_{MAX}$
- d: the duty cycle of the output waveform is between 45% and 55%
- V_O: the output waveform amplitude is greater than 95% VDD

The f_{MAX} parameter indicates the speed limit of an output driver across various operating conditions: supply voltage range, load capacitance, drive strength and slewrate programming. The effective maximum output frequency of a specific output line may be limited by the peripheral that drives this line.

Table 74.20 and Table 74.21 provide the AC output characteristics of the output drivers in the following conditions:

- Output load: 10 pF capacitor to ground
- Two VDD ranges:
  - 1.7V < VDD < 3.6V
  - 3.0V < VDD < 3.6V
- Two Drive settings: 0 and 1
- Two Slewrate settings for the GPIO type: 0 and 1. The DDRIO drivers do not have slewrate settings and rather use an autocalibration setting.

For the GPIO drivers, the table below shows the recommended Drive and Slewrate settings depending on the output switching frequency and the two commonly used VDD ranges (1.8V and

© 2026 Microchip Technology Inc. and its subsidiaries

3.3V). Other settings are possible but they may lead to excessively fast rise and fall times (t_R, t_F), with a potentially negative impact on the electromagnetic emissions of the application.

Table 74.19. Recommended GPIO Drive and Slewrate Settings versus GPIO Use Case

VDD Range	Low-Speed (f_{GPIO} < 50 MHz)(1)	High-Speed (f_{GPIO} ≥ 50 MHz)
1.7V – 1.9V	Drive = 1, Slewrate = 1	Drive = 1, Slewrate = 0
3.0V – 3.6V	Drive = 0, Slewrate = 1	Drive =0, Slewrate = 0

Note:

1. Indicative value. See Table 74.20 and Table 74.21 for accurate maximum frequency specifications.

Table 74.20. Output Driver AC Characteristics (1.7V < V_{DD} < 1.9V, C_L = 10 pF)

Symbol	Parameters	Conditions		Min	Max	Unit
t_R / t_F	Rise or fall time(1)(2)	GPIO	Drive = 0, Slewrate = 0	1.5	5.1	ns
			Drive = 1, Slewrate = 0	1.4	4.8	ns
			Drive = 0, Slewrate = 1	4.1	10.3	ns
			Drive = 1, Slewrate = 1	2.1	7.0	ns
f_{MAX}	Maximum frequency(2)(3)(4)	GPIO	Drive = 0, Slewrate = 0	95	–	MHz
			Drive = 1, Slewrate = 0	135	–	MHz
			Drive = 0, Slewrate = 1	25	–	MHz
			Drive = 1, Slewrate = 1	50	–	MHz

Notes:

1. Measured between V_O = 10% V_{DD} and V_O = 90% V_{DD}
2. Simulation data
3. f_{MAX} = 0.75 / (t_R+t_F). Frequency numbers are rounded for legibility.
4. f_{MAX} may be limited by the peripheral that drives the I/O line.

Table 74.21. Output Driver AC Characteristics (3.0V < V_{DD} < 3.6V, C_L = 10 pF)

Symbol	Parameter	Conditions		Min	Max	Unit
t_R or t_F	Rise or fall time(1)(2)	GPIO	Drive = 0, Slewrate = 0	1.5	2.9	ns
			Drive = 1, Slewrate = 0	1.4	2.7	ns
			Drive = 0, Slewrate = 1	4.0	7.0	ns
			Drive = 1, Slewrate = 1	2.2	4.0	ns
f_{MAX}	Maximum frequency(2)(3)(4)		Drive = 0, Slewrate = 0	90	–	MHz
			Drive = 1, Slewrate = 0	130	–	MHz
			Drive = 0, Slewrate = 1	25	–	MHz
			Drive = 1, Slewrate = 1	50	–	MHz

Notes:

1. Measured between V_O = 10% V_{DD} and V_O = 90% V_{DD}
2. Simulation data
3. f_{MAX} = 0.75 / (t_R+t_F). Frequency numbers are rounded for legibility.
4. f_{MAX} may be limited by the peripheral that drives the I/O line.

74.6.2.2. Input AC Characteristics

The following table provides the input requirements of the signals connected to I/O lines when they are configured as digital inputs. In particular, these values apply when the XIN input is used as a clock input of the device (main crystal oscillator set in Bypass mode). They do not apply for the

© 2026 Microchip Technology Inc. and its subsidiaries

XIN32 input which is designed for slow signals with frequencies up to 50 kHz. Parameters V_{IL} and V_{IH} defined in Table 74.16 apply.

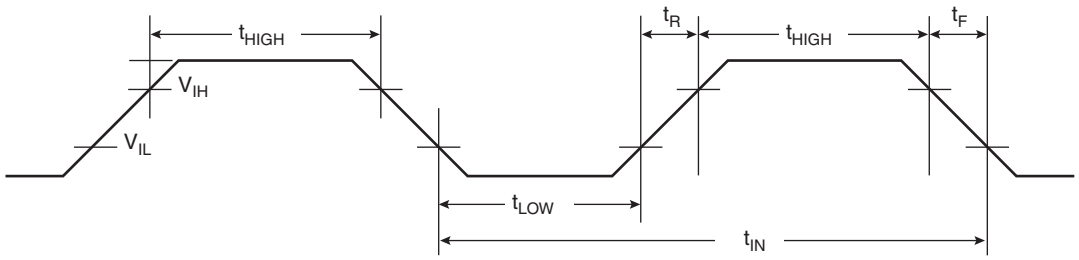

Table 74.22. Input AC Characteristics

Symbol	Parameters	Conditions	Min	Max	Unit
f_{IN}	Input frequency(1)	–	–	50	MHz
t_{IN}	Input period	–	20	–	ns
t_{HIGH}	Time at high level	–	8	–	ns
t_{LOW}	Time at low level	–	8	–	ns
t_R	Rise time	–	–	2.2	ns
t_F	Fall time	–	–	2.2	ms

Note:

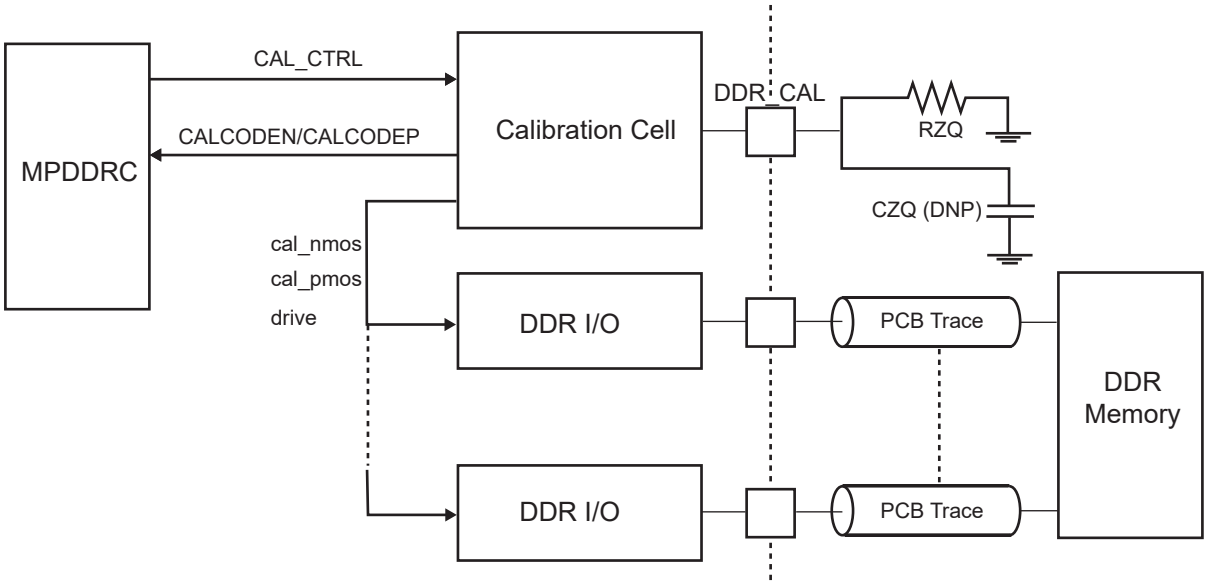
1. The maximum input frequency may be limited by the peripheral receiving this signal.

Figure 74.7. Digital Input AC Characteristics

74.6.3. DDR I/O Calibration and DDR Voltage Reference

74.6.3.1. DDR I/O Calibration

The DDR I/Os embed an automatic impedance matching control to avoid overshoots and reach the best performance levels depending on the bus load and external memories. A serial termination connection scheme, where the driver has an output impedance matched to the characteristic impedance of the line, is used to improve signal quality and reduce EMI.



One specific analog input, DDR_CAL, is used to calibrate all DDR I/Os.

The MPDDRC supports the ZQ calibration procedure used to calibrate the SAM9X7 Series DDR I/O drive strength and the commands to set up the external memory device drive strength (refer to DDR-SDRAM Controller (MPDDRC)).

Note: All DDRC pads are calibrated to 50 ohms.

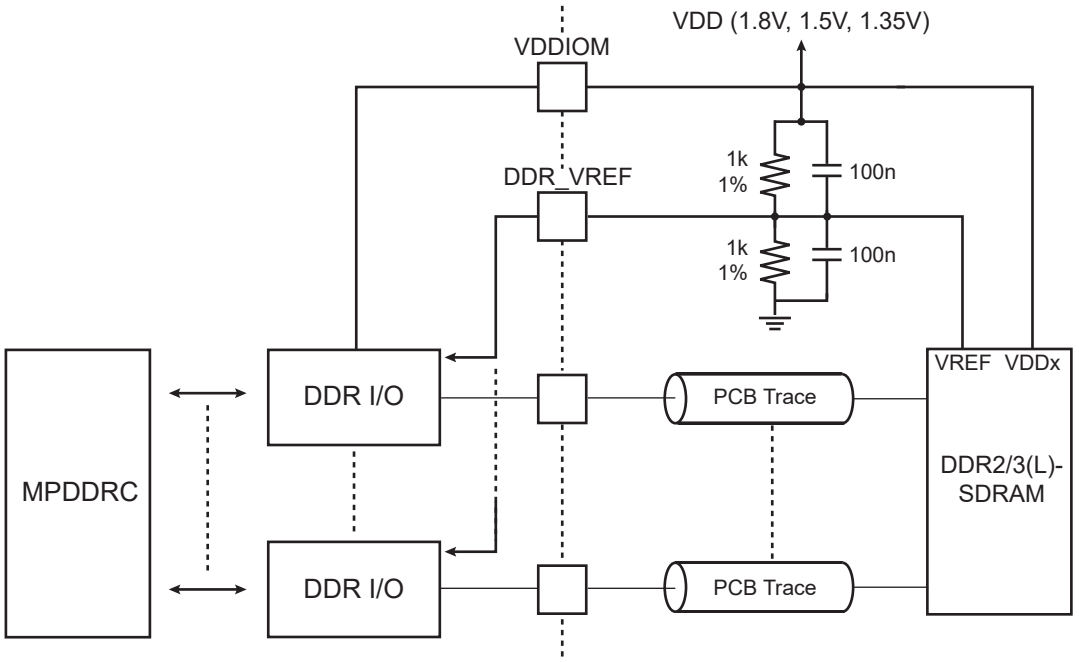
© 2026 Microchip Technology Inc. and its subsidiaries

Figure 74.8. DDR Calibration Cell

The calibration cell provides an input pin, DDR_CAL, loaded with the following resistor RZQ value:

- 20 KΩ ±1% for DDR2 and DDR3L

The CZQ capacitor must not be mounted.



DDR I/Os calibration must be done before initializing the DDR-SDRAM. The calibration is performed by software, via the SFR_CAL1 register. Refer to DDR-SDRAM Controller (MPDDRC) for further details.

74.6.3.2. DDR Voltage Reference

The DDR_VREF pin serves as a voltage reference input for the DDR I/Os when DDR2, DDR3 or DDR3L external SDRAM memories are used.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 74.9. DDR_VREF Recommended Schematic with DDR2/3(L)-SDRAM

74.7. Digital Peripheral Characteristics

74.7.1. DDR-SDRAM Controller (MPDDRC)

The MPDDRC complies with the following JEDEC standards:

- DDR3-SDRAM: JESD79-3C with operating frequencies up to 266 MHz
- DDR3L-SDRAM: JESD79-3-1A with operating frequencies up to 266 MHz
- DDR2-SDRAM: JESD79-2F with operating frequencies up to 266 MHz

The physical interface (PCB layout) between the processor and its memory has a major impact on the signal integrity. Microchip provides IBIS models of the SAM9X7 Series device and strongly recommends verifying this processor-memory interface on a PCB simulation tool. For design guidance, refer to the Microchip application note “SAM9X75 Hardware Design Considerations” (AN4962), available on www.microchip.com.

The following table provides the recommended settings on the MPDDRC_RD_DATA_PATH.SHIFT_SAMPLING field depending on the memory type and on its operating frequency.

Table 74.23. SHIFT_SAMPLING Settings

SDRAM Type	SDRAM Clock Frequency (MHz)	SHIFT_SAMPLING
DDR2-SDRAM	$125 \le f_{SDRAM_CLK} \le 266$	1
DDR3(L)-SDRAM (DLL on)	$f_{SDRAM_CLK} = 266$	3
DDR3(L)-SDRAM (DLL off)	$f_{SDRAM_CLK} \le 200$	3

74.7.2. Secure Digital MultiMedia Card Controller (SDMMC)

The SDMMC complies with the following specifications:

- SD Host Controller Standard Specification Version 3.00

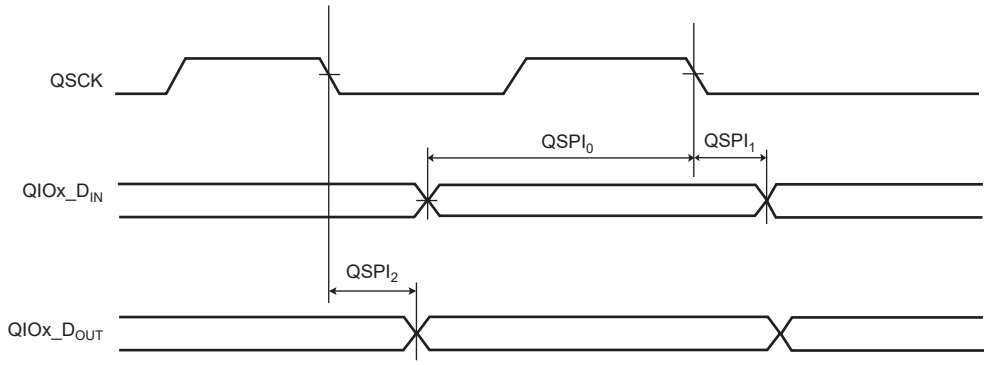
© 2026 Microchip Technology Inc. and its subsidiaries

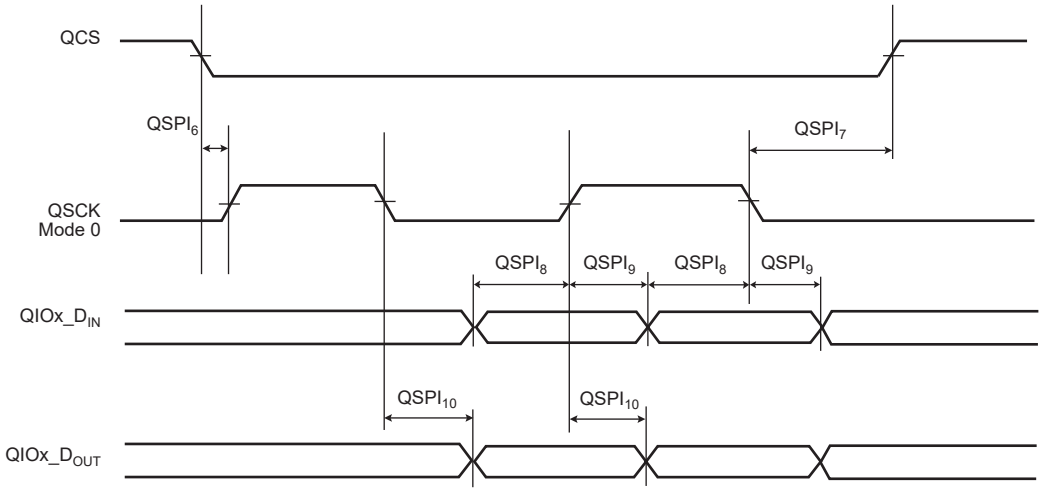
- Embedded MultiMedia Card Specification (e.MMC) Version 4.51
  - e.MMC default speed (maximum SDCLK frequency = 26 MHz)
  - e.MMC high speed (maximum SDCLK frequency = 52 MHz)
  - e.MMC high speed DDR (maximum SDCLK frequency = 52 MHz)
- SD Memory Card Specification Version 3.00
- SDIO Specification Version 3.00
  - SD/SDIO default speed (maximum SDCLK frequency = 25 MHz)
  - SD/SDIO high speed (maximum SDCLK frequency = 50 MHz)

74.7.3. Quad Serial Peripheral Interface (QSPI)

The following timings are provided for the Serial Memory mode (QSPI_MR.SMM=1). In this mode, only SPI mode 0 is supported. Refer to Quad Serial Peripheral Interface (QSPI) for more details.

Figure 74.10. QSPI Host Mode 0 in Single Data Rate





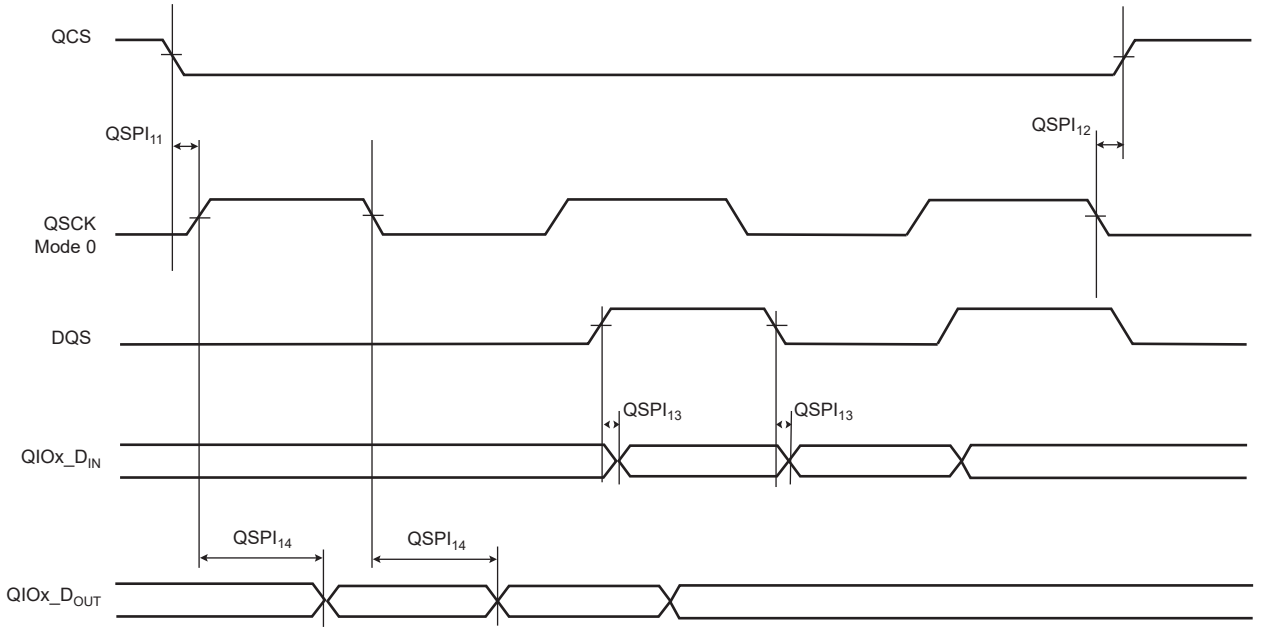


Figure 74.11. QSPI Host Mode in Double Data Rate Mode

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 74.12. QSPI Host Mode in Double Data Rate Mode with DQS

74.7.3.1. Maximum QSPI Frequency

The QSPI GCLK frequency must be set to the target frequency f_{QSCK}. The following formulas provide the achievable QSPI frequency in Host Read and Host Write modes. When the result of these formulas exceeds the f_{QSCK_MAX} parameter provided in the tables in QSPI Timings, f_{QSCK_MAX} applies.

- **Host Write in Single Data Rate Mode**

  $$f_{QSCK} = \frac{1}{(QSPI_2 + t_{SU_CLIENT})}$$

  Where t_{SU_CLIENT} is the input setup time of the client device.

- **Host Read in Single Data Rate Mode**

  $$f_{QSCK} = \frac{1}{QSPI_0 + t_{VALID}}$$

  Where t_{VALID} is the client time response to output data after detecting a QSCK edge.
  - For a QSPI client device with t_{VALID} (or t_V) = 12 ns, with $QSPI_0$ = 1.0 ns, f_{QSCK} max = 77 MHz.
  - For a QSPI Flash memory device with t_{VALID} (or t_V) = 6 ns, and $QSPI_0$ = 1.0 ns, the formula returns a value of 143 MHz, therefore f_{QSCK} = 100 MHz applies in this case.

- **Host Write in Dual Data Rate Mode**

  $$f_{QSCK} = \frac{0.5}{(QSPI_8 + t_{SU_CLIENT})}$$

  Where t_{SU_CLIENT} is the input setup time of the client device.

- **Host Read in Dual Data Rate Mode**

  $$f_{QSCK} = \frac{1}{2x(QSPI_{10} + t_{VALID})}$$

  Where t_{VALID} is the client time response to output data after detecting a QSCK edge.
  - For a QSPI Flash memory device with t_{VALID} (or t_V) = 6 ns, and $QSPI_{10}$ = 0.7 ns, the formula returns a value of 74 MHz, therefore f_{QSCK} = 57.7 MHz applies in this case.

© 2026 Microchip Technology Inc. and its subsidiaries

74.7.3.2.QSPI Timings

For the QSPI0 instance, the timings shown in the tables below are provided in the following domains:

- 1.8V domain: VDDQSPI from 1.7V to 1.9V, maximum external capacitor: 10 pF, Drive = 1, Slewrate = 0
- 3.3V domain: VDDQSPI from 3.0V to 3.6V, maximum external capacitor: 10 pF, Drive = 0, Slewrate = 0

Table 74.24. QSPI Timings in Single Data Rate Mode (STR)

Symbol	Parameter	Conditions	Min	Max	Unit
f_{QSCK}	QSCK maximum frequency	–	–	100	MHz
$QSPI_0$	QIOx data in to QSCK falling edge (input setup time)	–	1	–	ns
$QSPI_1$	QIOx data in to QSCK falling edge (input hold time)	–	1	–	ns
$QSPI_2$	QSCK falling edge to QIOx delay	–	0	1	ns

Table 74.25. QSPI Timings in Double Data Rate Mode (DTR)

Symbol	Parameter	Conditions	Min	Max	Unit
f_{QSPI}	QSCK operating frequency	–	–	57.7	MHz
t_{QSCK_MIN}	Minimum SPCK period	–	17.3	–	ns
$QSPI_6$	CS low before QSCK edge (rising or falling) (1)	–	1.1	–	ns
$QSPI_7$	QSCK edge (rising or falling) to CS high(2)	–	0.2	1	ns
$QSPI_8$	QIOx input data setup to QSCK edge (rising or falling)	–	1.4	–	ns
$QSPI_9$	QIOx input data hold after QSCK edge (rising or falling)	–	0.9	–	ns
$QSPI_{10}$	QSCK edge (rising or falling) to QIOx delay	–	0	0.7	ns

Notes:

1. Refer to DLYCS and DLYBS descriptions in Quad Serial Peripheral Interface (QSPI) for more configuration details.
2. Refer to DLYBCT description in Quad Serial Peripheral Interface (QSPI) for more configuration details.

Table 74.26. QSPI Timings in DTR Mode with Data Strobe (DQS)

Symbol	Parameter	Conditions	Min	Max	Unit
f_{QSPI}	QSCK operating frequency	–	–	100	MHz
t_{QSCK_MIN}	Minimum SPCK period	–	10	–	ns
$QSPI_{11}$	CS low before QSCK edge (rising or falling) (1)	–	1.1	–	ns
$QSPI_{12}$	QSCK edge (rising or falling) to CS high(2)	–	0.2	1	ns
$QSPI_{13}$	QIOx input skew to DQS edge (rising or falling)	–	0	2.2	ns
$QSPI_{14}$	QSCK edge (rising or falling) to QIOx delay	–	0	$t_{QSCK}/4 + 0.7$	ns

Notes:

1. Refer to DLYCS and DLYBS descriptions in Quad Serial Peripheral Interface (QSPI) for more configuration details.
2. Refer to DLYBCT description in Quad Serial Peripheral Interface (QSPI) for more configuration details.

74.7.4. Flexible Serial Communication Controller (FLEXCOM) - SPI

In Figure 74.14 and Figure 74.15, the MOSI line shifting edge is represented with a 0 hold time. However, it is important to note that for this device, the MISO line is sampled prior to the MOSI line shifting edge. As shown in Figure 74.13, the device sampling point extends the propagation delay (t_p) for device and routing delays to more than half the SPI clock period, whereas the common sampling point allows only less than half the SPI clock period.

As an example, an SPI device working in mode 0 can be safely driven if the SPI host is configured in mode 0.

Figure 74.18. FLEXCOM in SPI Client - NPCS Timings

74.7.4.1. FLEXCOM SPI Timings

Timings are provided in the following conditions:

- 1.8V domain: VDDIO from 1.7V to 1.9V, maximum external capacitor = 10 pF, DRV = 1, SR = 0
- 3.3V domain: VDDIO from 3.0V to 3.6V, maximum external capacitor = 10 pF, DRV = 0, SR = 0

Table 74.27. FLEXCOM SPI Timings

Symbol	Parameter	Conditions	Min	Max	Unit
Host Mode					
f_{SPCK}	SPCK operating frequency		–	44	MHz
t_{SPCK}	SPCK period	–	22.5	–	ns
SPI_0	MISO setup time before SPCK rises/falls	–	16.5	–	ns
SPI_1	MISO hold time after SPCK rises/falls	–	0.0	–	ns
SPI_2	SPCK rising to MOSI delay	–	-4.5	4.5	ns
SPI_3	MISO setup time before SPCK rises/falls	–	16.5	–	ns
SPI_4	MISO hold time after SPCK rises/falls	–	0.0	–	ns
SPI_5	SPCK falling to MOSI delay	–	-4.5	4.5	ns
Client Mode					
f_{SPCK}	SPCK operating frequency		–	25	MHz
t_{SPCK}	SPCK period	–	40.0	–	ns
SPI_6	SPCK falling to MISO delay	–	4.0	16.0	ns
SPI_7	MOSI setup time before SPCK rises/falls	–	2.0	–	ns
SPI_8	MOSI hold time after SPCK rises/falls	–	2.0	–	ns
SPI_9	SPCK rising to MISO delay	–	4.0	16.0	ns
SPI_{10}	MOSI setup time before SPCK rises/falls	–	2.0	–	ns
SPI_{11}	MOSI hold time after SPCK rises/falls	–	2.0	–	ns
SPI_{12}	NPCS setup to SPCK rising	–	42.0	–	ns
SPI_{13}	NPCS hold after SPCK rises/falls	–	42.0	–	ns
SPI_{14}	NPCS setup to SPCK falling	–	42.0	–	ns
SPI_{15}	NPCS hold after SPCK rises/falls	–	42.0	–	ns
SPI_{16}	NPCS falling to MISO valid	–	42.0	–	ns

74.7.5. Flexible Serial Communication Controller (FLEXCOM) - USART

Table 74.28. FLEXCOM USART Timings

Symbol	Parameter	Conditions	Min	Max	Unit
f_{SCK}	SCK frequency in Synchronous mode (FLEX_US_MR.SYNC = 1)	Host or client	–	25	MHz
BR	Baud rate in Asynchronous mode[1] (FLEX_US_MR.SYNC = 0)	FLEX_US_MR.OVER = 1	–	max (f_{MCK}/8, 25)	Mbps
		FLEX_US_MR.OVER = 0	–	f_{MCK}/16	

Note:

1. With f_{MCK} = 266 MHz, the maximum baud rate is BR = 25 Mbps (OVER = 1) or BR = 266/16 = 16.6 Mbps (OVER = 0).

74.7.6. Flexible Serial Communication Controller (FLEXCOM) - TWI

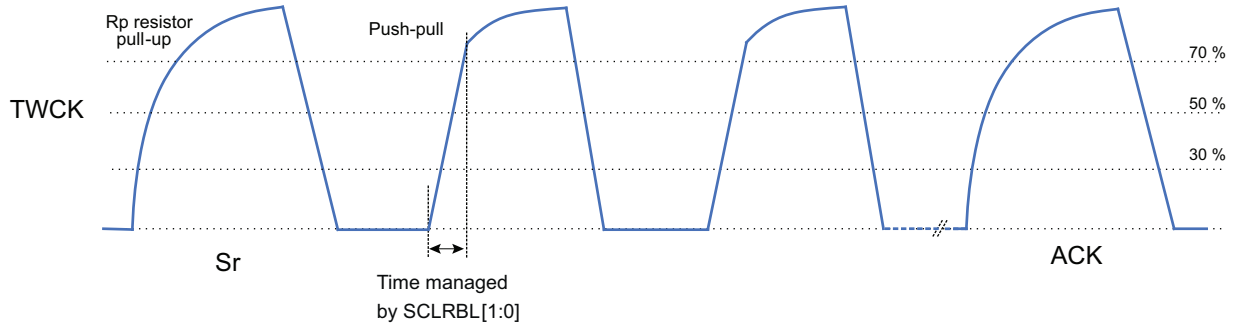
The TWI communicates in Standard, Fast, Fast Mode Plus and High-Speed (HS) modes subject to the following:

- When the registers FLEX_TWI_CWGR, FLEX_TWI_HSCWGR and FLEX_TWI_MMR are programmed in the TWI Controller
- When pull-ups (Rp) are computed to achieve the required rise time according to the total Cbus capacitance.

Possible limitations are shown in the table and figures below.

Table 74.29. Two-Wire Interface I/O Characteristics

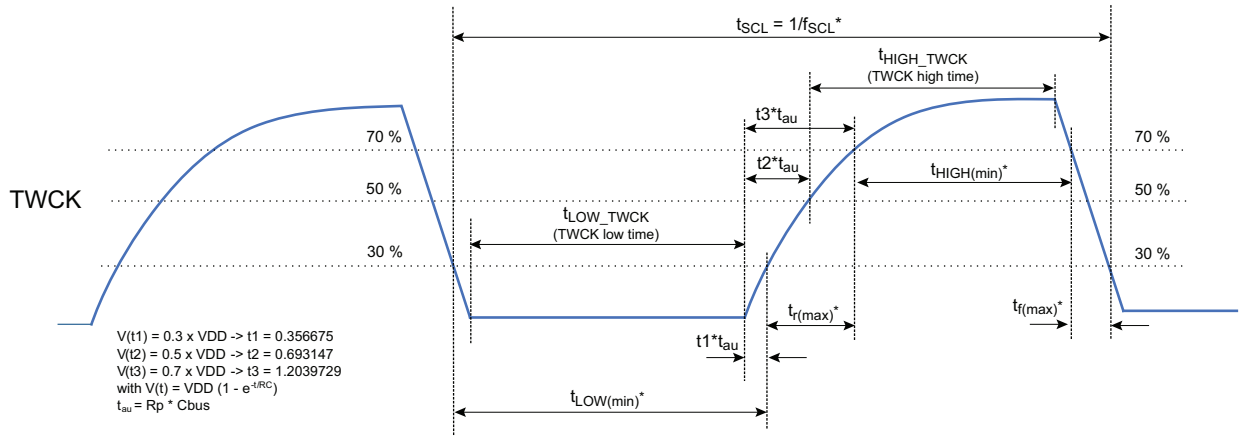
Symbol	Parameter	Conditions	Min	Max	Unit
V_{IL}, V_{IH}	Low-level/High-level Input Voltage	All modes	See note [1]		V
V_{OL}, V_{OH}	Low-level/High-level Output Voltage	All modes	See note [2]		V
I_{OL}	Low-level Output Current	Standard Fast Fast-Mode Plus	See notes [2, 3]		mA
		High-speed Mode	See note [2]		
t_f	Output fall time of both TWD and TWCK signals V_{IHmin} to V_{ILmax}	Standard Fast Fast-Mode Plus	See note [4]		ns
t_{fTWCK}, t_{fTWD}	Fall time of both TWD and TWCK signals	High-speed Mode			
t_{rTWCK}	Rise time of TWCK, rise boost mode (push-pull mode)	SCLRBL > 0	See note [5]		ns



Notes:

1. See the table Input DC Characteristics.
2. See the tables Output DC Characteristics (1.7V < VDD < 1.9V) and Output DC Characteristics (3.0V < VDD < 3.6V). If $R_{p(min)}$ as specified in the I2C specification must be overridden (stronger) to meet the timing specification, the IBIS model of the product can be used to extract $V_{OL(max)}$ vs I_{OL}.
3. 20 mA is not supported for Fast Mode Plus.
4. Fall time of FLEXCOM I/O buffers are not I2C-compliant. Fall time can be increased by adding series resistors (see series protection resistors in the I2C specification). Rs < 1 KΩ depending on Cbus and Rp to respect V_{OL}, V_{IL} on the bus. Use Drive disabled (set to 0) and Slew rate enabled (set to 1) on the corresponding I/O. In the I/O AC Characteristics section, see falling times provided for a 10 pF load. IBIS models of the product can be used to choose an adequate Rs value by simulating different drive/slew rate combinations with respect to the Cbus load.

© 2026 Microchip Technology Inc. and its subsidiaries



5. When in High-speed mode, the TWI Clock signal (TWCK) rise can be boosted to meet a very fast rise time of the parameter t_{rCL} of the I2C specification when the Rp value on TWCK is lower than $R_{p(min)}$.
   Bits in FLEX_TWI_MMR.SCLRBL must be programmed according to t_{MCKx} to meet these timing requirements. This defines the number of peripheral clock periods during which the SCL rise is boosted, that is, driven in Push-pull mode. Note that the Cbus value and the drive and slew rate settings still influence the rise time. Rise boost usage is more suited with high Cbus values.
   Note: MCKx refers to the MCK associated with the FLEXCOM. Refer to the Domain Clock column in the table “Peripheral Identifiers”.

Figure 74.19. TWCK High-Speed Mode with Rise Boost Enabled

The figure below shows programmable register fields (CLDIV/HSCLDIV, CHDIV/HSCHDIV and optional CKDIV/HSCKDIV) in relation to t_{LOW}, t_{HIGH} , t_r, t_f, f_{SCL}, t_{rCL}, t_{rCL1}, t_{fCL} from the I2C specification.

Figure 74.20. TWCK Timings Characteristics

Note: Symbols with an asterisk (*) are I2C specification symbols: t_{LOW}, t_{HIGH}, t_r , t_f.

Note: For High-speed mode, $t_r = t_{rCL}$ or t_{rCL1} and $t_f = t_{fCL}$ from the I2C specification.

Important: $t_{SCL} \cong t_{LOW(min)} + t_{r(max)} + t_{HIGH(min)} + t_{f(max)}$

74.7.6.1.FLEXCOM TWI Timings

Table 74.30. TWI Interface Host Mode Timings

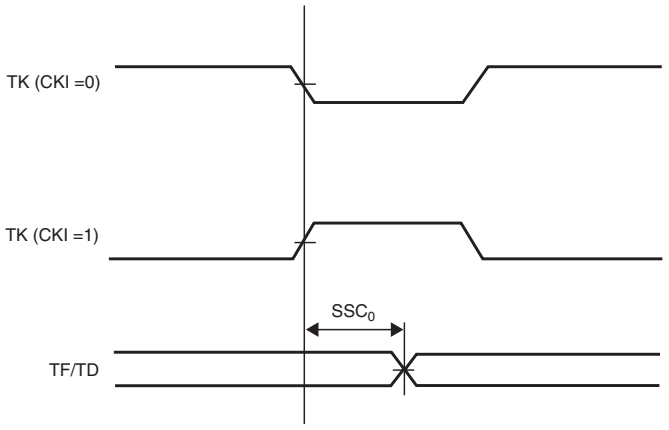
Symbol	Parameter	Conditions	Min	Max	Unit
t_{LOW_TWCK}	TWCK low time	–	See notes (1, 3, 4)	–	µs
t_{HIGH_TWCK}	TWCK high time	–	See notes (2, 3, 4)	–	µs
f_{TWCK}	TWCK frequency(5)	Standard Fast Fast-Mode Plus High-speed Mode	0	0.1 0.4 1 3.4	MHz
$t_{HD(STA)}$	Hold time (repeated) START condition	Standard Fast Fast-Mode Plus	t_{HIGH_TWCK}	–	ns
		High-speed Mode	FLEX_TWI_CWGR.BRSRCCLK = 1: t_{LOW_TWCK}(6) FLEX_TWI_CWGR.BRSRCCLK = 0: 2 x t_{HIGH_TWCK}	–	ns
$t_{SU(STA)}$	Setup time for a repeated START condition	Standard Fast Fast-Mode Plus	t_{LOW_TWCK}	–	ns
		High-speed Mode	FLEX_TWI_CWGR.BRSRCCLK = 1: t_{LOW_TWCK} FLEX_TWI_CWGR.BRSRCCLK = 0: 2 x t_{LOW_TWCK} (6)	–	ns
$t_{HD(DAT)}$	Data hold time	Standard Fast Fast-Mode Plus	2 x t_{MCKx}	(HOLD + 3) × t_{MCKx}	ns
		High-speed Mode	0	150 @ f_{TWCK} max = 1.7 MHz 70 @ f_{TWCK} max = 3.4 MHz	ns
$t_{SU(DAT)}$	Data setup time	Standard Fast Fast-Mode Plus	t_{LOW} – (HOLD + 3) × t_{MCKx}	–	ns
		High-speed Mode	t_{LOW_TWCK}	–	ns
$t_{SU(STO)}$	Setup time for STOP condition	Standard Fast Fast-Mode Plus	FLEX_TWI_CWGR.BRSRCCLK = 1: t_{LOW_TWCK} FLEX_TWI_CWGR.BRSRCCLK = 0: t_{HIGH_TWCK}	–	ns
		High-speed Mode	FLEX_TWI_CWGR.BRSRCCLK = 1: t_{HIGH+1} FLEX_TWI_CWGR.BRSRCCLK = 0: t_{HIGH_TWCK}	–	ns
t_{BUF}	Bus free time between a STOP and a START condition	Standard Fast Fast-Mode Plus	t_{LOW_TWCK}	–	ns

© 2026 Microchip Technology Inc. and its subsidiaries

Notes:

1. TWCK low time (t_{LOW_TWCK}) ≥ t_{LOWmin} - t1*t_{au} → HSCLDIV/CLDIV = ((t_{LOW_TWCK} / t_{PERIPH})-3) / $2^{CKDIV\ or\ HSCKDIV}$)
2. TWCK high time (t_{HIGH_TWCK}) ≥ $t_{HIGHmin}$ + (t3-t2)*t_{au} → HSCHDIV/CHDIV = ((t_{HIGH_TWCK} / t_{PERIPH})-3) / $2^{CKDIV\ or\ HSCKDIV}$)
3. t_{TWCK} = (t_{LOW_TWCK} + t1*t_{au}) + $t_{r(max}$ + (t_{HIGH_TWCK} + (t3-t2)*t_{au}) + $t_{f(max)}$
4. The TWCK low/high time formulae in notes 1 and 2 are for Bit Rate Source Clock (BRSRCCLK) = 0 for all modes and RX Digital Filter (FILT) = 0 for Standard, Fast and FM+ Modes only. See FLEX_TWI_CWGR, FLEX_TWI_HSCWGR and FLEX_TWI_FILTR registers for more details.
5. 1.7 MHz (Cbus 400 pF max), 3.4 MHz (Cbus 100 pF max). Timings in the above table involving t_{LOW_TWCK} and/or t_{HIGH_TWCK} may limit the TWCK maximum frequency when interfacing with an I2C client requiring strict I2C timings.
6. If computing HSCLDIV and/or HSCHDIV results in 0, $t_{SU(STA)}$ and/or $t_{HD(STA)}$ is equal to 6x t_{LOW_TWCK} and/or 6x t_{HIGH_TWCK}, respectively.
7. MCKx refers to the MCK associated with the FLEXCOM. Refer to column Domain Clock in the table “Peripheral Identifiers”.

Table 74.31. Two-Wire Interface Client High-Speed Mode Timings



Symbol	Parameter	Conditions	Min	Max	Unit
f_{TWCK}	TWCK clock frequency	–	–	3.4	MHz
$t_{HD(DAT)}$	Data hold time	f_{TWCK} = 1.7 MHz	0	70	ns
		f_{TWCK} = 3.4 MHz	0	150	
$t_{SU(DAT)}$	Data setup time	f_{TWCK} = 1.7 MHz f_{TWCK} = 3.4 MHz	10	–	ns

74.7.7. Synchronous Serial Controller (SSC)

Timings are provided in the following conditions:

- 1.8V domain: VDDIO from 1.7V to 1.9V, maximum external capacitor = 10 pF, DRV = 1, SR = 1
- 3.3V domain: VDDIO from 3.0V to 3.6V, maximum external capacitor = 10 pF, DRV = 0, SR = 1

C_{OUT}	Stable output capacitor range(5)	Capacitance	1	2.7	µF
		ESR	0.01	0.3	Ω
R_{DIS}	Output discharge resistance(1)	Regulator off	100	300	Ω

© 2026 Microchip Technology Inc. and its subsidiaries

Notes:

1. Simulation data
2. This regulator is designed to supply the device internal circuits (PLLs, MIPI PHY, USB PHYs, oscillators, etc.). To supply external components, only DC current is permissible (for example, a resistive divider).
3. Input current when charging the external output capacitor C_{OUT}.
4. A X5R or X7R ceramic capacitor connected between VDDIN33 and the device's closest GND pin is a minimum requirement to reduce the inrush current and maximize the regulator's performances.
5. To ensure stability, an external X5R or X7R ceramic output capacitor, C_{OUT}, must be connected between the VDDOUT25 and the device's closest GND pin.

74.8.2. Power-On Reset (POR) Cells

Table 74.40. VDDCORE POR Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDCORE}	Supply voltage range (VDDCORE)	–	0.5	1.21	V
V_{IT-}	Negative-going input threshold voltage (VDDCORE)(1)	Measured with a -10V/s ramp rate	0.68	0.92	V
V_{IT+}	Positive-going input threshold voltage (VDDCORE)(1)	Measured with a +10V/s ramp rate	0.70	0.99	V
V_{hys}	Hysteresis voltage(1)(2)	–	20	60	mV
t_{RES}	Reset time(1)	–	1	5	ms
t_{DET-}	V_{IT-} detection propagation time	100 mV threshold overdrive	–	10	µs

Notes:

1. Simulation data
2. Vhys = VIT+ - VIT-

Table 74.41. VDDIN33 POR Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)	–	–	3.60	V
V_{IT-}	Negative-going input threshold voltage (VDDIN33) (1)	Measured with a -10V/s ramp rate	2.40	2.60	V
V_{IT+}	Positive-going input threshold voltage (VDDIN33) (1)	Measured with a +10V/s ramp rate	2.44	2.65	V
V_{hys}	Hysteresis voltage (1)(2)	–	40	60	mV

Table 74.46. Recommended 32.768 kHz Crystal Characteristics (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
R_S	Equivalent series resistor	–	–	90	kΩ
C_M	Motional capacitance	–	0.6	3	fF
C_{SHUNT}	Shunt capacitance	–	0.6	2	pF
P_{ON}	Drive level	–	0.2	–	µW

74.8.6. Main Crystal Oscillator

Table 74.47. Main Crystal Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.0	3.60	V
I_{DDIN33}	Current consumption (VDDIN33)(2)	–	–	3.0	mA
t_{START}	Start-up time(2)	–	–	10	ms
f_{OSC}	Operating frequency range	–	20	50	MHz
Duty	Duty cycle(2)	–	40	60	%
C_{PARA}	Internal parasitic capacitance(2)	Between XIN and XOUT	1		pF

Notes:

1. This oscillator is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data

The Main crystal oscillator supports a Bypass mode. See Input AC Characteristics.

Two sets of crystal characteristics are supported with this oscillator, corresponding to two operating frequency ranges:

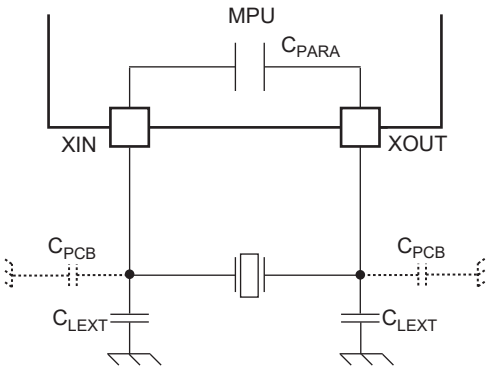
- Set 1: Crystal frequency is between 20 and 30 MHz. See Table 74.48.
- Set 2: Crystal frequency is between 30 and 50 MHz. See Table 74.49.

When choosing a crystal, one and only one of these sets of characteristics must be completely satisfied.

Table 74.48. Recommended Crystal Characteristics (Set 1)

Symbol	Parameters	Conditions	Min	Max	Unit
f_0	Fundamental frequency	–	20	30	MHz
$C_{CRYSTAL}$	Crystal load capacitance	–	6	12.5	pF
R_S	Equivalent series resistor	–	–	100	Ω
C_M	Motional capacitance	–	1.3	3	fF
C_{SHUNT}	Shunt capacitance	–	–	3	pF
P_{ON}	Drive level	–	300	–	µW

Table 74.49. Recommended Crystal Characteristics (Set 2)



Symbol	Parameters	Conditions	Min	Max	Unit
f_0	Fundamental frequency	–	30	50	MHz
$C_{CRYSTAL}$	Crystal load capacitance	–	6	10	pF
C_{SHUNT}	Shunt capacitance	With R_{S_MAX} = 60Ω	–	3	pF
		With R_{S_MAX} = 80Ω	–	1	pF
R_S	Equivalent series resistor	With C_{SHUNT_MAX} = 1pF	–	80	Ω
		With C_{SHUNT_MAX} = 3pF	–	60	Ω

Table 74.49. Recommended Crystal Characteristics (Set 2) (continued)

Symbol	Parameters	Conditions	Min	Max	Unit
C_M	Motional capacitance	–	1.3	3.2	fF
P_{ON}	Drive level	–	400	–	µW

Figure 74.38. Main Crystal Oscillator Schematic

$C_{LEXT} = 2 \times (C_{CRYSTAL} - C_{PARA} - C_{PCB} / 2)$.

where C_{PCB} is the single-ended (ground-referenced) parasitic capacitance of the printed circuit board (PCB) on XIN and XOUT tracks. As an example, if the crystal is specified for a 12.5 pF load, with C_{PCB}=1 pF (on XIN and on XOUT), $C_{LEXT} = 2 \times (12.5 - 1 - 0.5) = 22$ pF.

74.8.7. Crystal Oscillator Design Considerations

When choosing a crystal for the 32.768 kHz crystal oscillator or for the Main crystal oscillator, several parameters must be taken into account. Important parameters are as follows:

- Crystal Load Capacitance: the total capacitance loading the crystal, including the oscillator's internal parasitics and the PCB parasitics, must match the load capacitance for which the crystal's frequency is specified. Any mismatch in the load capacitance with respect to the crystal's specification leads to inaccurate oscillation frequency.
- Crystal Drive Level: use only crystals with specified drive levels greater than the minimum recommended value. Applications that do not respect this criterion may damage the crystal.
- Crystal Equivalent Series Resistance (ESR): use only crystals with a specified ESR lower than the maximum specified value. In applications where this criterion is not respected, the crystal oscillator may not start.
- Crystal Shunt Capacitance: use only crystals with a specified shunt capacitance lower than the maximum specified value. In applications where this criterion is not respected, the crystal oscillator may not start.
- PCB Layout Considerations: to minimize inductive and capacitive parasitics associated with XIN, XOUT, XIN32, XOUT32 traces, it is recommended to minimize as much as possible their routing length. These traces must be kept away from noisy switching signals (clock, data, PWM, etc.). A good practice is to shield them with a quiet ground to avoid coupling to neighboring signals.

74.8.8. PLL Characteristics

Table 74.50. PLLA Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.0	3.60	V

Notes:

1. This PLL is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data.
3. For optimal settings of LVDS PLL, set the PMC_PLL_ACR as follows:
   PMC_PLL_ACR=0x12023010 for f_{IN}=[20 MHz, 32 MHz]
   PMC_PLL_ACR=0x1B023010 for f_{IN}=[32 MHz, 50 MHz]
4. This is the pixel clock feeding the LCD Controller when using the LVDS Controller.

Table 74.53. AUDIO PLL Characteristics

Symbol	Parameters	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33) (1)	–	3.0	3.60	V
V_{DDCORE}	Supply voltage range (VDDCORE)	–	1.03	1.21	V
I_{DDIN33}	Current consumption (VDDIN33)(2)	–	–	2.8	mA
I_{DDCORE}	Current consumption (VDDCORE)(2)	–	–	3.45	mA
t_{START}	Start-up time(2)	–	–	100	µs
f_{IN}	Input frequency range(3)	–	20	50	MHz
$f_{COREPLLCK}$	COREPLLCK frequency range	–	600	1200	MHz
$f_{AUDIOPLLCK}$	AUDIOPLLCK frequency range	–	–	300	MHz
$f_{AUDIOCLK}$	AUDIOCLK Output frequency range(4)	–	–	50	MHz

Notes:

1. This PLL is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data
3. For optimal settings of AUDIO PLL, set PMC_PLL_ACR as follows:
   PMC_PLL_ACR=0x12023010 for f_{IN} = [20 MHz, 32 MHz]
   PMC_PLL_ACR=0x1B023010 for f_{IN} = [32 MHz, 50 MHz]
4. AUDIOCLK corresponds to the AUDIOCLK pin.

74.8.9. 12-bit ADC Characteristics

Table 74.54. ADC Power Supply and Voltage Reference Input Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDANA}	Supply voltage range (VDDANA)	–	3.0	3.60	V
I_{DDANA}	Current consumption (VDDANA)(1)	Low speed – $f_S \le 500$ kS/s ADC_ACR.IBCTL = $(00)_2$	–	1.0	mA
		Full speed – $f_S \le 1$ MS/s ADC_ACR.IBCTL = $(01)_2$	–	1.8	mA
$V_{ADVREFP}$	ADVREFP input voltage range(2)	–	2.4	V_{DDANA}	V
$R_{ADVREFP}$	ADVREFP input resistance to ground(1)	ADC on	7.2	12	kΩ
		ADC off	1	–	MΩ
$C_{ADVREFP}$	Required bypass capacitor on ADVREFP	–	1	–	µF

1. Simulation data
2. The ADVREFN pin must be connected to the PCB ground plane.

© 2026 Microchip Technology Inc. and its subsidiaries

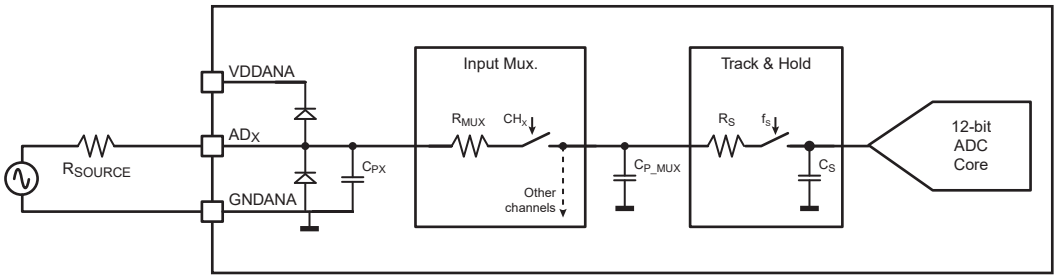
Table 74.55. ADC Timing Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
f_{CKADC}	ADC clock frequency(1)	Low speed – $f_S \le 500$ kS/s ADC_ACR.IBCTL = $(00)_2$	0.1	10	MHz
		Full speed – $f_S \le 1$ MS/s ADC_ACR.IBCTL = $(01)_2$	0.2	20	MHz
t_{CONV}	ADC conversion time(2)	–	20	–	t_{CKADC}
f_S	Sampling rate(1)(3)	Low speed – $f_S \le 500$ kS/s ADC_ACR.IBCTL = $(00)_2$	–	0.5	MS/s
		Full speed – $f_S \le 1$ MS/s ADC_ACR.IBCTL = $(01)_2$	–	1	MS/s
t_{START}	Start-up time(4)	–	–	5	µs
t_{TRACK}	Track and hold time(4)(5)	–	300	–	ns

Notes:

1. ADC_ACR.IBCTL defaults to $(00)_2$ at reset, therefore f_{CKADC} and f_S are limited to 10 MHz and 500 kS/s, respectively, at reset. Program ADC_ACR.IBCTL to $(01)_2$ to use the ADC at up to 20 MHz and 1 MS/s.
2. $t_{CONV} = t_{CH} + t_{TRACK} + 14 \times t_{CKADC}$ with $t_{CKADC} = 1 / f_{CKADC}$.
   $t_{CH} = 0$ when the ADC operates in the same input mode (Single-ended, Pseudo-differential or Differential) for the current conversion than for the previous one.
   $t_{CH} = 2$ when the ADC input mode is changed to perform the current conversion.
3. $f_S = 1 / t_{CONV}$
4. Simulation data
5. See Track and Hold Time versus Source Impedance – Sampling Rate.

Table 74.56. ADC Analog Input Characteristics



Symbol	Parameter	Conditions	Min	Max	Unit
V_{FS}	Analog input full scale range (1)	ADC_CCR.DIFFx = 0	0	$V_{ADVREFP}$	V
		ADC_CCR.DIFFx = 1	$-V_{ADVREFP}$	$V_{ADVREFP}$	V
V_{INCM}	Common mode input range in Differential mode(2)	ADC_CCR.DIFFx = 1	0.4 x V_{DDANA}	0.6 x * V_{DDANA}	V
C_S	ADC sampling capacitance(3)	–	–	3	pF
C_{P_ADx}	ADx input parasitic capacitance(3)(4)	ADx pin configured as analog input	–	7	pF
R_{ON}	Internal series resistor(3)(4)	–	–	2	kΩ
Z_{IN}	Common mode input impedance(3)(5)	On ADx pin	1 / (f_S.C_S)	–	Ω

Notes:

1. $V_{FS} = (V_{ADx} - V_{GNDANA})$ in Single-ended mode, $V_{FS} = (V_{ADx} - V_{AD11})$ in Pseudo-differential mode, and $V_{FS} = (V_{ADx} - V_{ADx+1})$ in Differential mode.
2. $V_{INCM} = (V_{ADx} + V_{ADx+1}) / 2$
3. Simulation data
4. With respect to the equivalent model of Figure 74.40
5. Assuming conversion on one single channel

© 2026 Microchip Technology Inc. and its subsidiaries

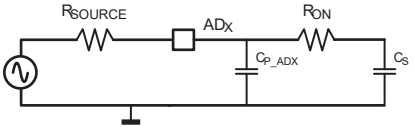


Figure 74.39. Acquisition Path Block Diagram

For tracking time calculation, during the sampling phase of the converter, this acquisition path can be reduced to the equivalent model provided in the following figure, where:

- $R_{ON} = R_{MUX} + R_S$
- $C_{P_ADX} = C_{PX} + C_{P_MUX}$

Figure 74.40. Equivalent Model of the Acquisition Path

See Track and Hold Time versus Source Impedance – Sampling Rate for further details on how to use this model.

In the following table, unless otherwise specified, the specifications are provided for two speed operating ranges.

- Source resistance = 50 Ω
- ADC_EMR.OSR<2:0> = $(000)_2$
- Low-speed
  - f_{CKADC} = 10 MHz, f_S = 500 kS/s
  - ADC_ACR.IBCTL = $(00)_2$
- High-speed
  - f_{CKADC} = 20 MHz, f_S = 1 MS/s
  - ADC_ACR.IBCTL = $(01)_2$

Table 74.57. Static Performance Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
RES_{ADC}	Native ADC resolution	–	12		Bit
INL	Integral non-linearity	–	-3	3	LSB
DNL	Differential non-linearity	–	-2	2	LSB
OE	Offset error	–	-4	4	LSB
GE	Gain error	–	-4	4	LSB

Notes:

1. In this table, errors are expressed in LSB where:
   - LSB = $V_{ADVREF} / 2^{12}$ in Single-ended mode (ADC_CCR.DIFFx = 0 and ADC_PDR.PDIFFx = 0)
   - LSB = $V_{ADVREF} / 2^{11}$ in Differential or Pseudo-differential mode (ADC_CCR.DIFFx = 1)
2. Error with respect to the best fit line method

74.8.9.1. Track and Hold Time versus Source Impedance – Sampling Rate

Referring to Figure 74.40, during its tracking phase, the 12-bit ADC charges its sampling capacitor C_S through various serial resistors modeled as R_{SOURCE} (source output resistor) and R_{ON} (multiplexer series resistor and sampling switch series resistor). In case of high output source resistance (with a low-power resistive divider, for example), the tracking time must be increased to ensure full settling of the sampling capacitor voltage. Of course, programming a long tracking time may impact the sampling frequency (f_S). The following formula calculates the minimum tracking time to ensure a 12-bit accurate settling:

- $t_{TRACK} \geq 8 \times (R_{SOURCE} + R_{ON}) \times C_S$

The ADC Controller (ADCC) counts the tracking time in ADC clock cycles (t_{CKADC}). This time can be adjusted between 6 and 54 cycles using the ADC_MR.TRACKTIM and ADC_EMR.TRACKX4 fields. At maximum ADC clock frequency (20 MHz), the maximum tracking time that can be programmed is 2.7 µs. This limits 12-bit accurate sampling to sources having R_{SOURCE} in the 100 kΩ range. To overcome this limitation, the ADC clock frequency can be decreased.

The following examples show typical use cases of tracking time and sampling frequency calculation.

Example 1: Calculated tracking time is lower than the default (minimum) tracking time.

- Assuming f_{CKADC} = 8 MHz (t_{CKADC} = 125 ns), R_{SOURCE} = 10 kΩ
- The minimum required track time is $t_{TRACK} = 8 \times (10\ k\Omega + 2\ k\Omega) \times 3pF = 288$ ns
- t_{TRACK} is less than the minimum tracking time (6 x t_{CKADC} = 750 ns): set TRACKTIM = 0 and TRACKX4 = 0
- The real tracking time is 6 x t_{CKADC} (750 ns) and the conversion time is: $t_{CONV} = t_{TRACK} + 14 \times t_{CKADC} = 20 \times t_{CKADC}$
- The sampling rate is f_S = 8 MHz / 20 = 400 kS/s
- The maximum allowable source resistance is $R_{SOURCE_MAX} = (6 \times t_{CKADC}) / (3\ pF \times 8) - 2\ k\Omega = 29.25\ k\Omega$

Example 2: Calculated tracking time is greater than the default (minimum) tracking time.

- Assuming f_{CKADC} = 20 MHz (t_{CKADC} = 50 ns), R_{SOURCE} = 20 kΩ
- The minimum required track time is $t_{TRACK} = 8 \times (20\ k\Omega + 2\ k\Omega) \times 3\ pF = 528$ ns
- t_{TRACK} is greater than the minimum tracking time (6 x t_{CKADC} = 300 ns): set TRACKTIM=5 and TRACKX4=1
- The real tracking time is (4 x (5 + 1) - 10) = 14 x t_{CK_ADC} = 700 ns
- The conversion time is $t_{CONV} = t_{TRACK} + 14 \times t_{CKADC} = 28 \times t_{CKADC}$
- The sampling rate is f_S = 20 MHz / 28 = 714.3 kS/s
- The maximum allowable source resistance is $R_{SOURCE_MAX} = (14 \times t_{CKADC}) / (3\ pF \times 8) - 2\ k\Omega = 27.2\ k\Omega$

Example 3: Maximum sampling rate operation.

- Assuming f_{CKADC} = 20 MHz (t_{CKADC} = 50 ns), R_{SOURCE} = 10 kΩ
- The minimum required track time is $t_{TRACK} = 8 \times (10\ k\Omega + 2\ k\Omega) \times 3\ pF = 288$ ns
- t_{TRACK} is less than the minimum tracking time (6 x t_{CKADC} = 300 ns): set TRACKTIM=0 and TRACKX4=0
- The real tracking time is 6 x t_{CK_ADC} (300 ns) and the conversion time is: $t_{CONV} = t_{TRACK} + 14 \times t_{CKADC} = 20 \times t_{CKADC}$
- The sampling rate is f_S = 20 MHz / 20 = 1 MS/s
- The maximum allowable source resistance is $R_{SOURCE_MAX} = (6 \times t_{CKADC}) / (3\ pF \times 8) - 2\ k\Omega = 10.5\ k\Omega$

74.8.10. HS USB Transceiver Characteristics

The device complies with all voltage, power, and timing characteristics and specifications set forth in the USB 2.0 Specification. Refer to the USB 2.0 Specification for more information.

Table 74.58. USB 2.0 Transceiver Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range	–	3.0	3.6	V
I_{DDIN33}	HS transceiver current consumption(1)(2)	Bias circuits enabled only	–	15	mA
		HS(3)	–	20	mA
		LS/FS – 0m cable(3)	–	5	mA
		LS/FS – 5m cable(3)	–	30	mA

1. Simulation data
2. Including 1 mA due to pull-up/pull-down current
3. Additional current consumption for each port enabled

74.8.11. LVDS PHY Characteristics

The SAM9X7 Series complies with the LVDS standard TIA/EIA-644 for protocol and electrical specifications.

Table 74.59. LVDS PHY Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.0	3.60	V
I_{DDIN33}	Current consumption (VDDIN33)(2)(3)	Pre-emphasis disabled	–	30.0	mA
		Pre-emphasis enabled	–	50.0	mA
t_{START}	Start-up time(2)	–	–	50	µs
V_{OD}	Output differential voltage(2)	–	+/-250	+/-450	mV
V_{CM}	Output common mode voltage	–	1.06	1.44	V
V_{OHS}	Single-ended output level high(2)	–	1.21	1.64	V
V_{OLS}	Single-ended output level low	–	0.91	1.24	V
f_{LVDSCK}	LVDS_CLK1x output frequency(2)	–	57	79	MHz
BR_{LANE}	Bit rate per lane(4)	–	175	550	Mbps

Notes:

1. This LVDS PHY must be powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data
3. Four-lane data stream, 0.4 Mbps/lane, 100 Ohms load
4. Maximum LVDS PHY operating data rate. From a system point of view, the display resolution is limited to 1280x720.

74.8.12. MIPI D-PHY Characteristics

The SAM9X7 Series complies with the protocol and electrical specifications of the following standards:

- MIPI Alliance Specification for Display Serial Interface (DSI) Version 1.2
- MIPI Alliance Specification for Camera Serial Interface 2 (CSI-2), Version 1.2
- MIPI Alliance Specification for D-PHY, Version 1.2

© 2026 Microchip Technology Inc. and its subsidiaries

Table 74.60. MIPI PHY DSI Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.0	3.60	V
I_{DDIN33}	Current consumption (VDDIN33)(2)	HS mode, 4 lanes	–	30.0	mA
t_{START}	Start-up time(3)	–	–	60	µs
High-Speed Characteristics					
V_{CMTXDC}	Output common mode voltage(2)	–	150	250	mV
V_{OD}	Output differential voltage(2)	–	140	270	mV
V_{OHHS}	Output high voltage(2)	–	–	360	mV
Z_{OS}	Output impedance(3)	–	40	62.5	Ω
DZ_{OS}	Output impedance mismatch(3)	–	–	10	%
f_{DSICK}	MIPI_CLKx output frequency(3)	–	40	500	MHz
BR_{LANE}	Bit rate per lane(3)	–	80	1000	Mbps
Low-Power Characteristics					
V_{OH}	High-level output(3)	–	1.10	1.30	V
V_{OL}	Low-level output(3)	–	-50	50	mV
Z_{OLP}	Output impedance(3)	–	110	–	Ω
t_{RLP} / t_{FLP}	15% to 85% rise time and fall time(3)	C_L < 70 pF	–	25	ns

Notes:

1. This MIPI D-PHY must be powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Lane load impedance is 80 to 125 Ω.
3. Simulation data

Table 74.61. MIPI PHY CSI Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.0	3.60	V

74.9. Power Consumption in Active Mode

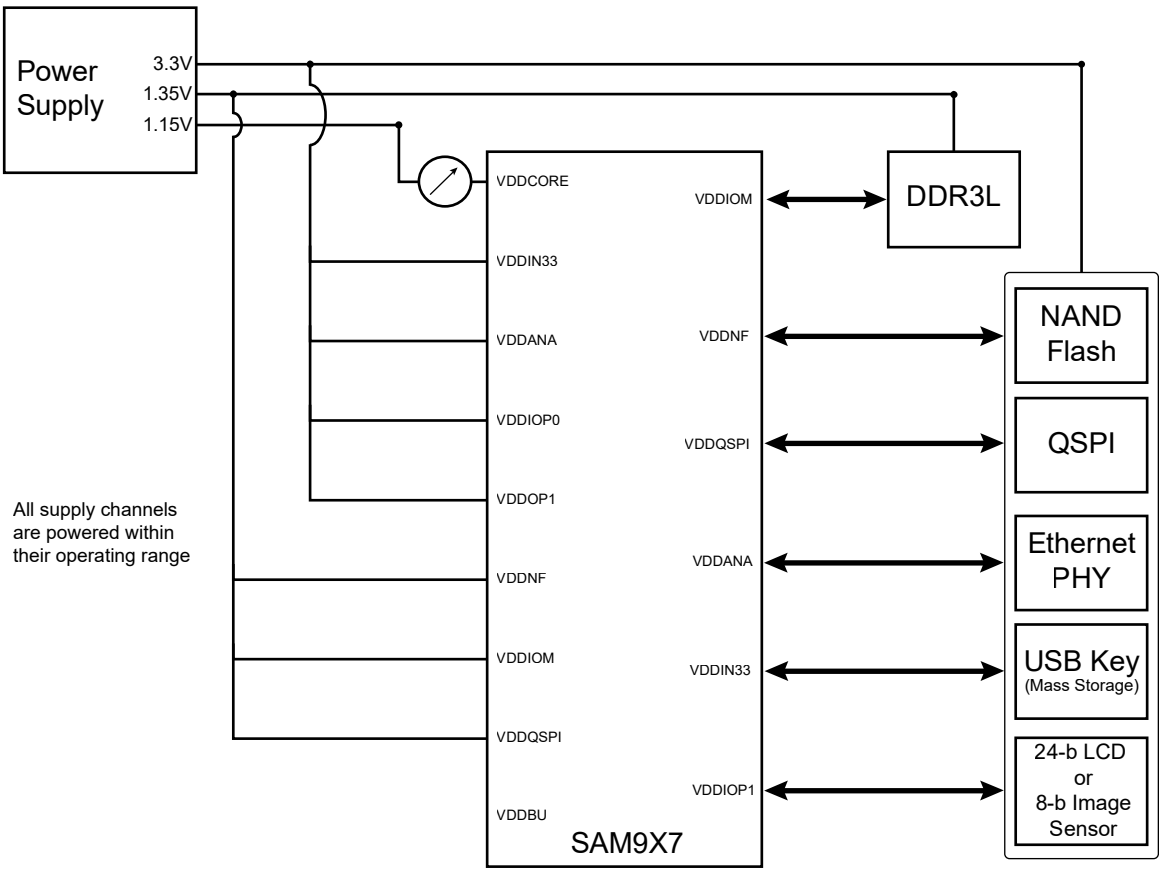

Table 74.62 and Table 74.64 report active power consumption data measured on a few typical samples of SAM9X7 Series. These data do not provide maximum power consumption specifications.

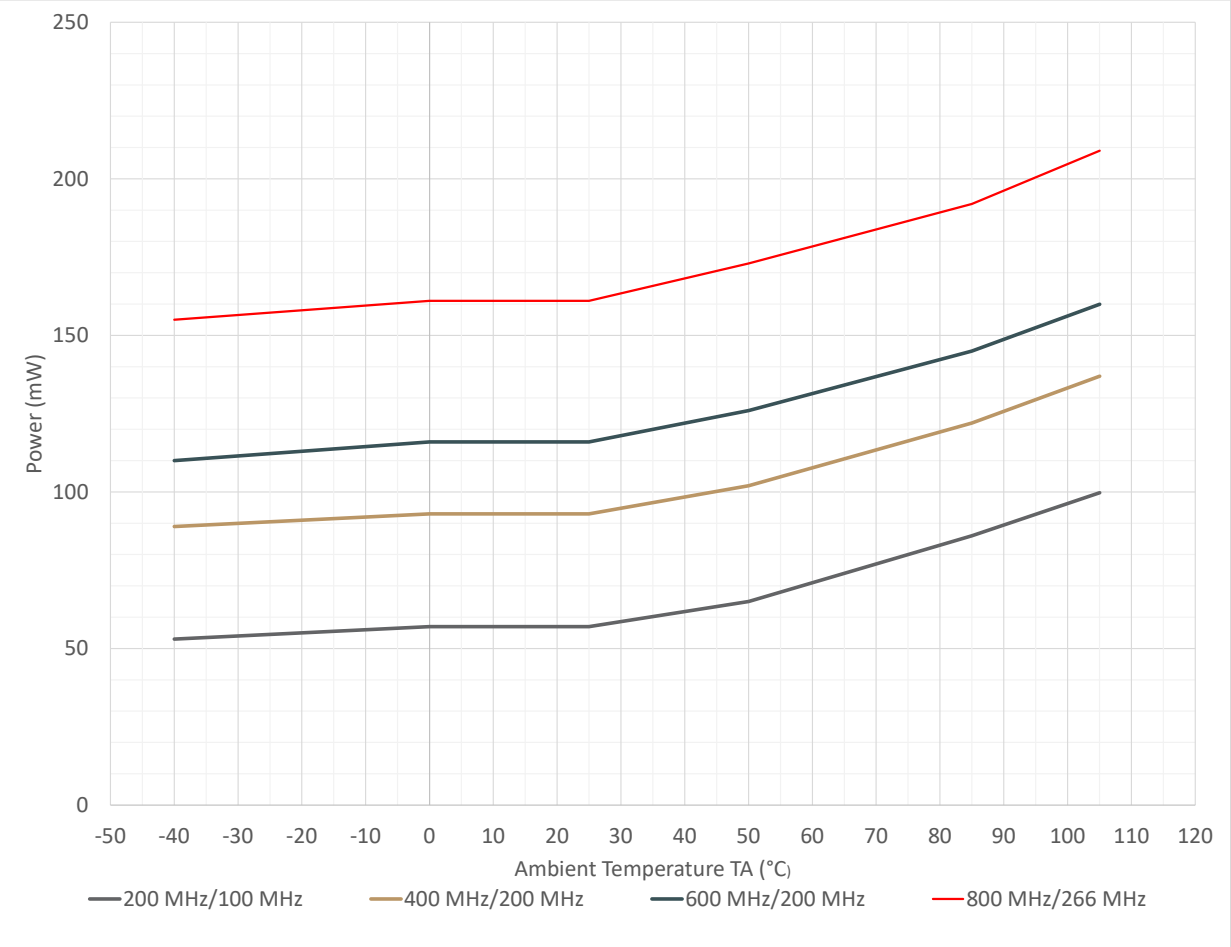
74.9.1. Processor Power Consumption in Active Mode

Table 74.62 provides the processor power consumption in the following conditions:

- f_{CPU_CLK} = from 200 MHz to 800 MHz
- f_{MCK} = 100 MHz to 266 MHz
- L1 caches enabled
- The Arm926EJ-S core executes a Coremark benchmark from the (internal) SRAM0
- Code compiled with speed optimization
- Peripheral clocks disabled
- Current measured as per the following figure

Figure 74.41. Current Measurement on VDDCORE



© 2026 Microchip Technology Inc. and its subsidiaries

Table 74.62. Processor Power Consumption Running a Coremark Benchmark from SRAM0

f_{CPU_CLK}/f_{MCK}	Power (mW) vs T_A					
	-40°C	0°C	25°C	50°C	85°C	105°C
200 MHz/100 MHz	53	57	57	65	86	99.75
400 MHz/200 MHz	89	93	93	102	122	137
600 MHz/200 MHz	110	116	116	126	145	160
800 MHz/266 MHz	155	161	161	173	192	209

Figure 74.42. Processor Power Consumption Running a Coremark Benchmark from SRAM0

74.9.2. System Power Consumption in Applicative Use Cases

Table 74.64 provides the processor power consumption in the following conditions:

- f_{CPU_CLK} = 800 MHz
- f_{MCK} = 266 MHz
- I & D caches enabled
- External SDRAM memory: DDR3L operating at 266 MHz
- Use cases are run on Linux
- Current consumptions are measured according to Figure 74.43. Note that external component current consumptions are not counted. Either the 24-bit display or the 8-bit image sensor is connected to the SAM9X7 Series device, but not both.

© 2026 Microchip Technology Inc. and its subsidiaries

Table 74.63. Use Case Definition

Use Case	Description
1	After Linux boot root prompt
2	Running 2D graphics benchmark with EGT monitor (800x480 DSI panel @ 46 fps) - 22% CPU usage
3	SAM9X70 running as iPerf server
4	Run Bonnie++ on USB mass storage
5	Image sensor video recording with QVGA resolution - 10 fps

Figure 74.43. Current Measurement for Applicative Use Cases

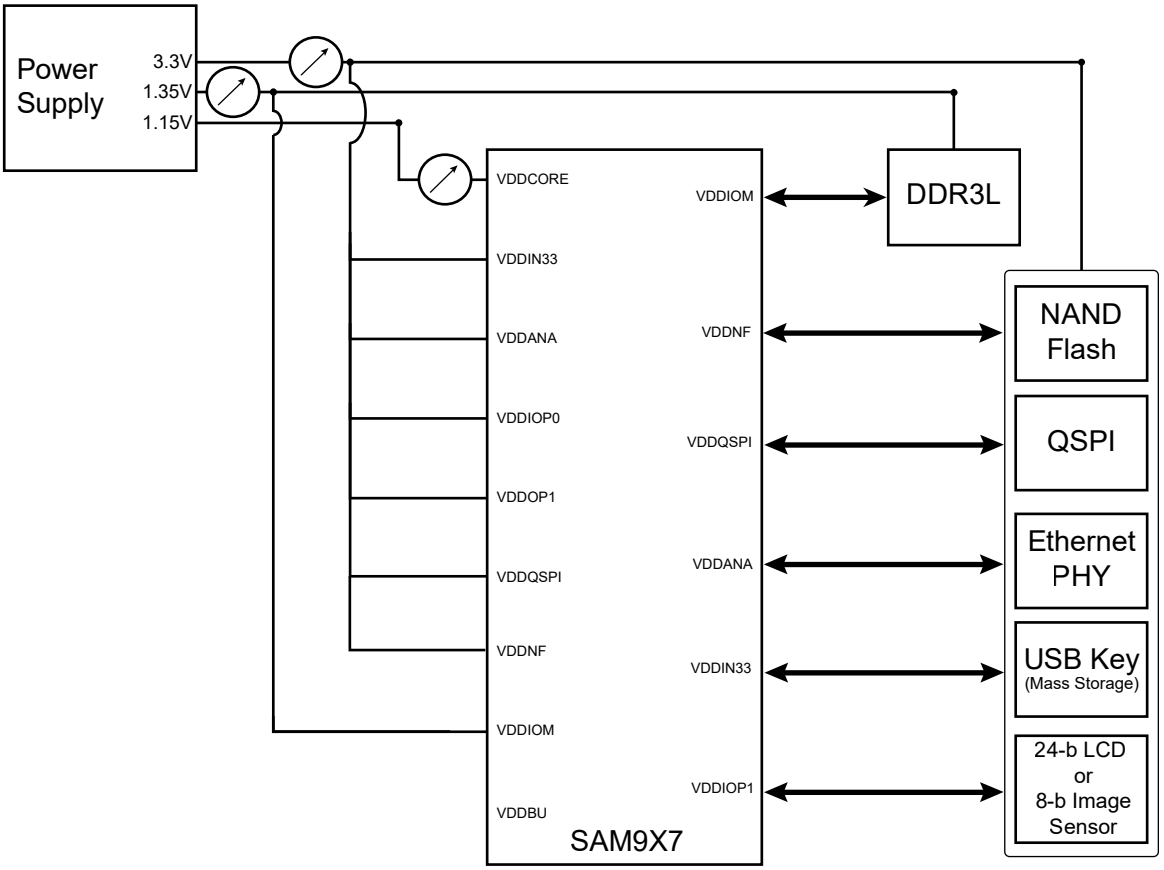


Table 74.64. Power Consumption in Applicative Use Cases at T_A = 25°C

Power Input	Voltage Level (V)	Power Consumption vs Use Case (mW)				
		#1	#2	#3	#4	#5
VDD_3V3	3.3	165	125	165	116	330
VDDCORE	1.15	132	132	167	207	196
VDDIOM	1.35	27	43	95	41	53

74.10. Operation and Power Consumption in Low-Power Modes

The SAM9X7 Series features four low-power modes summarized in Table 74.65. A detailed description of each mode is provided in the following sections.

© 2026 Microchip Technology Inc. and its subsidiaries

Table 74.65. Low-Power Modes Summary

		Backup Mode	ULP1	ULP0	Idle
VDDBU power		✓	✓	✓	✓
Other power supply inputs		✗	✓	✓	✓
DDR self-refresh		–	✓	✓	✗
Main crystal oscillator		–	✓	✓	✓
Main RC oscillator		–	✓	✓	✓
MAINCK (main clock)	Source	–	Main RC osc.	User-defined	User-defined
	Status	–	✗	User-defined	✓
MCK (main system bus clock)	Source	–	MAINCK	User-defined (MD_SLCK, MAINCK, etc.)	User-defined
	Status	–	✗	✓	✓
HCLK (CPU clock)		–	✗	✓	✓
CPU state		–	Clocks stopped	WFI	WFI
Mode entry		Use SHDWC to shutdown all power rails except VDDBU	DDR-saved context DDR self-refreshed ULP1 bit	DDR-saved context DDR self-refreshed WFI	WFI
Wake-up	Sources	RTC alarm WKUP0 pin	RTC/RTT alarm USB resume Wake-On-LAN WKUP[13:0]	Any non-masked interrupt	Any non-masked interrupt
	Event or interrupt sampling clock	MD_SLCK	Asynchronous	User-defined (MCK, periph_clk, etc.)	User-defined
MCK at wake-up		MAINCK (defaults to Main RC osc.)	MAINCK (Main RC osc.)	User-defined	User-defined

Note:

1. ✓/✗ means either powered/unpowered for a power source, on/off for an oscillator, active/inactive for a clock signal, or in/out of Self-refresh mode for the external SDRAM.

74.10.1. Backup Mode

74.10.1.1.Operation

The Backup mode is designed to serve prolonged power-down periods of the processor. In this mode, only the backup area of the device powered by VDDBU is maintained (RTC, GPBR, SHDWC, BSCR). This mode is entered by shutting down all the power rails of the device except VDDBU. It is good practice to use the SHDN output of the Shutdown Controller (SHDWC) for this purpose.

The SAM9X7 Series exits Backup mode when an active wake-up event is triggered by the Shutdown Controller (SHDWC). Upon this wake-up event, the SHDWC automatically toggles its SHDN output back to VDDBU and this signal typically helps to restart all the power supply channels at board level.

The wake-up events to exit Backup mode are:

- WKUP0 pin (level transition, configurable debouncing)
- RTC alarm

74.10.1.2.Power Consumption

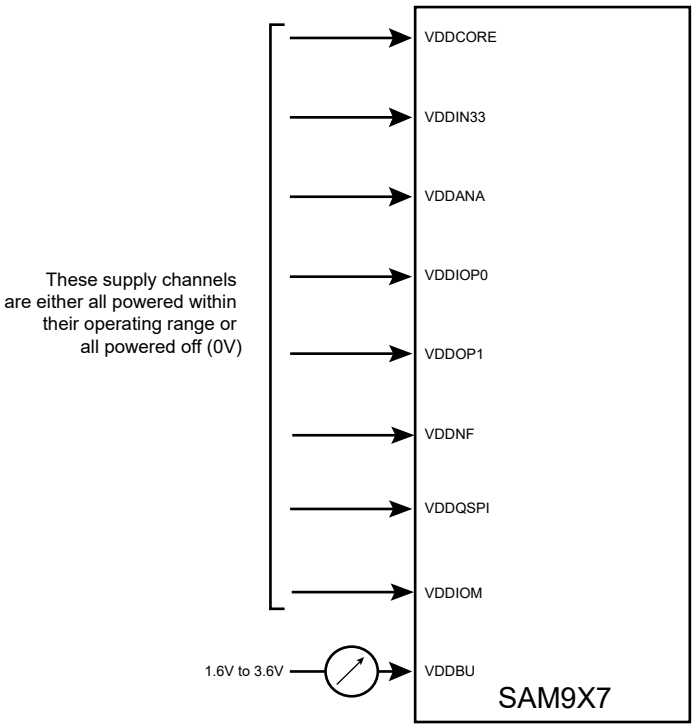
Backup mode configuration and measurements are defined as follows:

- POR backup on VDDBU enabled

© 2026 Microchip Technology Inc. and its subsidiaries

- RTC running
- Force wake-up (FWUP) enabled
- Current measurement as per the following figure

Figure 74.44. Measurement on VDDBU



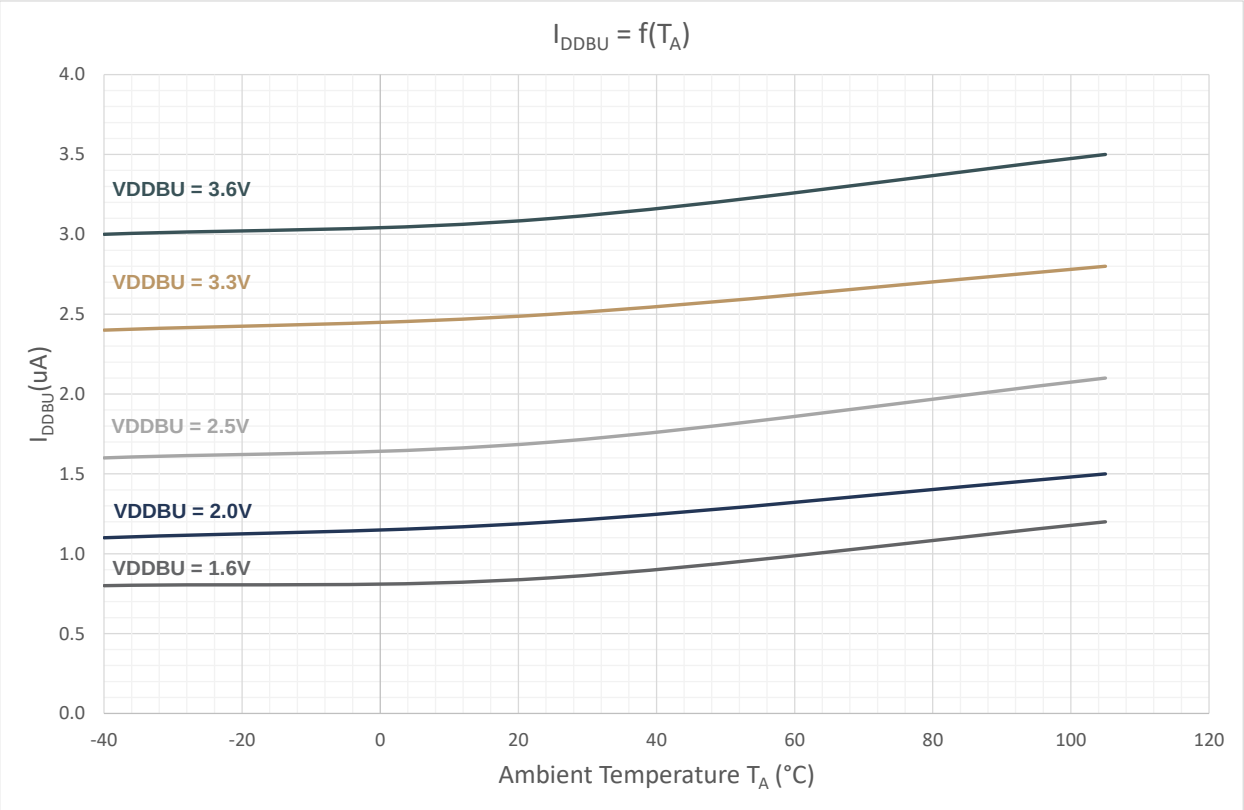


Table 74.66. Current Consumption in Backup Mode at T_A = 105°C

Symbol	Parameter	Conditions	Min	Max	Unit
I_{VDDBU}	Current consumption in Backup mode (VDDBU)	VDDBU = 3.3V	–	5	µA

The following figure shows the average Backup mode current consumption measured on a few typical devices.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 74.45. Typical Current Consumption in Backup Mode

74.10.2. ULP0, ULP1 and Idle Modes

In these three low-power modes, the SAM9X7 Series power supplies are all applied within their operating range. The power reduction is achieved by reducing the frequency or even stopping the clock signals of the processor and/or its peripherals.

- In Idle mode, only the processor clock is affected when in ULP0 and ULP1 modes; the clocks feeding both the processor and its peripherals are slowed down.
- In ULP0 or ULP1 mode, the SAM9X7 Series is placed in Retention mode and is able to resume on wake- up events (any interrupt or hardware event). This mode is a combination of the Wait for Interrupt mode of the Arm core and the system clocks frequency reduction or shut-off.

A detailed description of each mode is provided in the following sections and is followed by a power consumption section dedicated to those modes.

ULP0 Operation

The ULP0 mode maintains very low frequency clocks (MCK, CPU_CLK) in the system to wake up on any interrupt. The selection of the clock frequency depends on the current consumption target versus the required wake-up time. The higher the frequency, the higher the power consumption and the faster the wake-up time.

The sequence to enter ULP0 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM0.

1. Set the DDR to Self-refresh mode.
2. Set the interrupts to wake up the system.
3. Disable all peripheral clocks.
4. Set the I/Os to an appropriate state and disable the USB transceivers.

© 2026 Microchip Technology Inc. and its subsidiaries

5. Switch the system clock to Slow Clock.
6. Set the SRAM memories to Light Sleep mode in SFR_LS, except LS6 (internal SRAM).
7. Disable the PLLs, the main oscillator and the 12 MHz RC oscillator.
8. Enter the Wait for Interrupt mode and disable the CPU_CLK clock in PMC_SCDR.

Wake-up from ULP0 mode is triggered by any enabled interrupt. When resuming, the software reconfigures the system (oscillator, PLL, etc.) in the same state as before WFI. Disable Light Sleep mode for SRAM memories in the SFR_LS register prior to returning to full speed operation.

ULP1 Operation

Unlike the ULP0 mode, all the clocks are off in the ULP1 mode, and the number of wake-up sources is limited to the list below:

- WKUP[13:0] pins (level transition, configurable debouncing)
- RTC/RTT alarm
- USB Resume from Suspend mode
- Wake-On-LAN events from EMAC peripherals

The sequence to enter ULP1 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM0.

1. Set the DDR to Self-refresh mode.
2. Set the events to enable a system wake-up.
3. Disable all peripheral clocks.
4. Set the I/Os to an appropriate state and disable the USB transceivers.
5. Switch the system clock to the 12 MHz RC oscillator.
6. Set the SRAM memories to Light Sleep mode in SFR_LS, except LS6 (internal SRAM).
7. Disable the PLLs and the main oscillator.
8. Enter ULP1 mode by setting the ULP1 bit in CKGR_MOR and wait for the PMC_SR.MCKRDY bit to be set.

When resuming, the software reconfigures the system (oscillator, PLL, etc.) in the same state as before entering ULP1. In particular, the SRAM memories Light Sleep mode must be disabled as soon as possible in the wake-up process.

Idle Mode Operation

The purpose of Idle mode is to optimize power consumption of the device versus response time. In this mode, only the processor clock is stopped. The peripheral clocks, including the DDR controller clock, can be enabled. The current consumption in this mode is application-dependent.

This mode is entered via the Wait for Interrupt (WFI) instruction.

The processor can be awakened from an interrupt. The system resumes where it was before entering WFI mode.

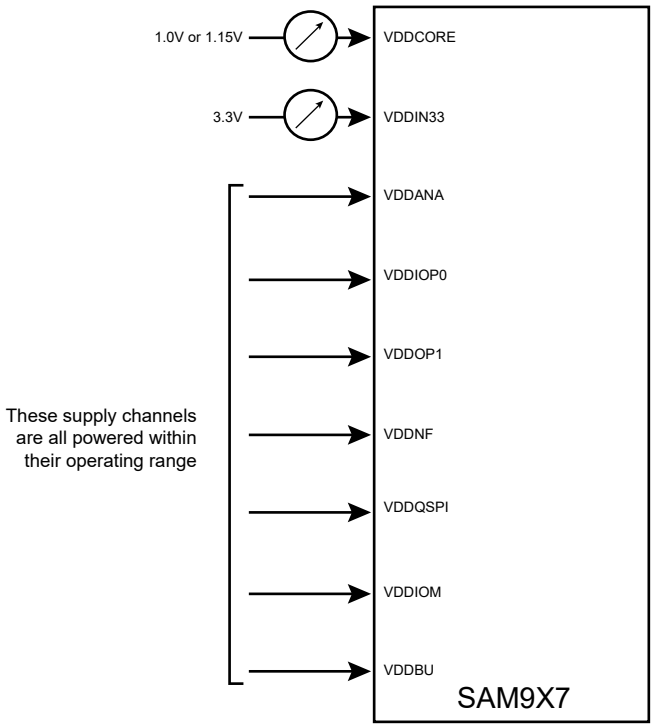
74.10.3. Power Consumption in ULP0, ULP1 and Idle Modes

- Figure 74.47, Figure 74.48, Table 74.67 and Table 74.68 report the SAM9X7 Series average power consumption in Idle, ULP0 and ULP1 modes versus temperature measured on a few typical devices. They do not provide maximum power consumption specifications.
- All power supply inputs are powered within their operating range and in particular VDDCORE = 1.15V.

© 2026 Microchip Technology Inc. and its subsidiaries

- There is no consumption on the device I/Os. To reach the best possible power consumption figures, it is of prime importance to set each I/O of the device to an appropriate state (Pull-Up/ Pull-Down, etc.) with respect to the external components connected to these I/Os.
- USB transceivers are disabled.
- All peripheral clocks are disabled.
- Current measurement as per the following figure.

Figure 74.46. Current Measurement in ULP0, ULP1 and Idle Modes



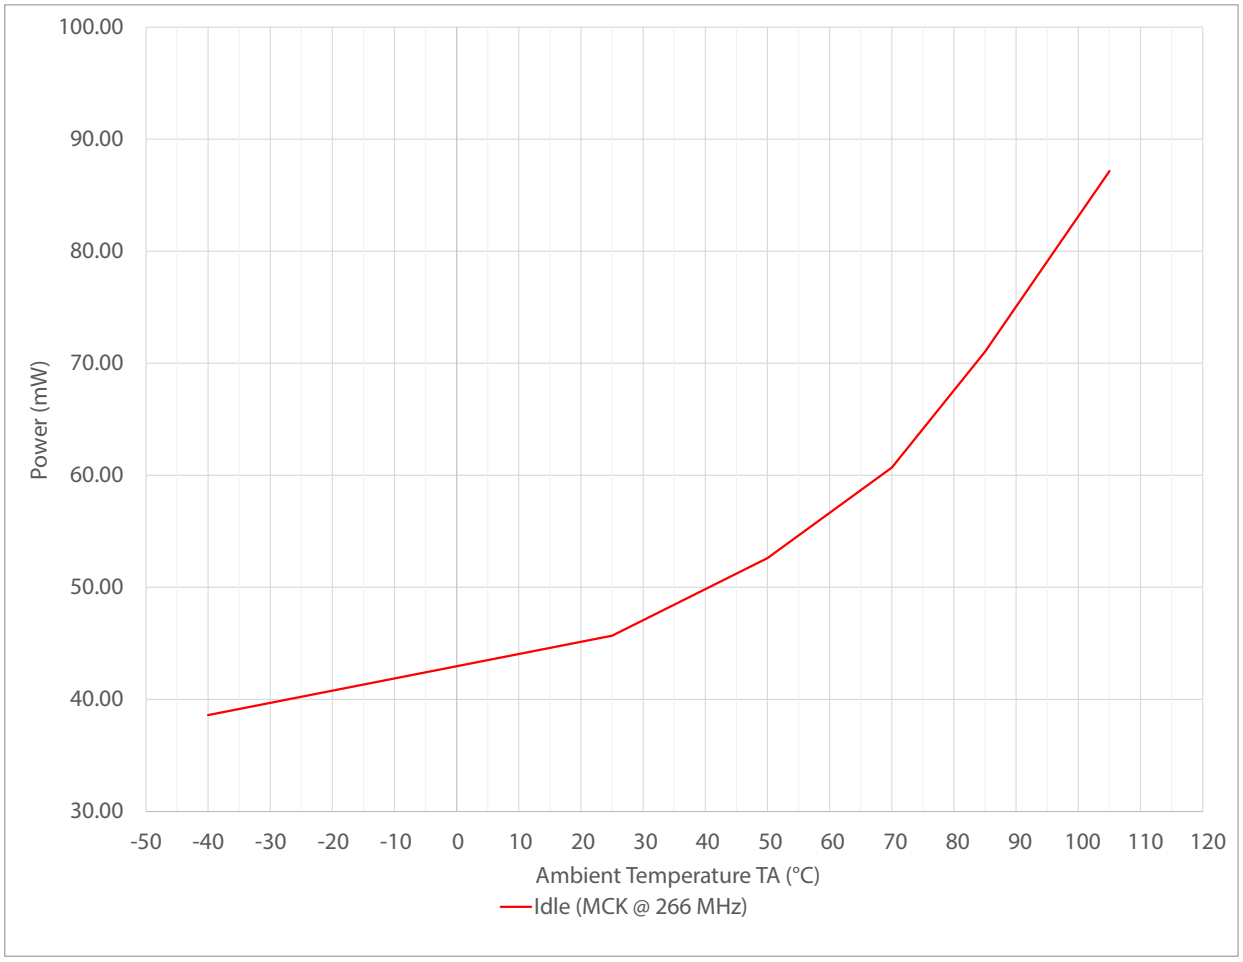


Table 74.67. Typical Power Consumption in ULP0, ULP1 and Idle Modes

Low-Power Mode (mW)	P_{VDD3v3}	$P_{VDDCORE}$	P_{VDD3v3}	$P_{VDDCORE}$	P_{VDD3v3}	$P_{VDDCORE}$	P_{VDD3v3}	$P_{VDDCORE}$	P_{VDD3v3}	$P_{VDDCORE}$	P_{VDD3v3}	$P_{VDDCORE}$	Wake-up Time (µs)
T_A (°C)	-40		25		50		70		85		105		
Idle (MCK @ 266 MHz)	0.66	37.95	0.83	44.85	0.86	51.75	0.89	59.80	0.89	70.15	0.92	86.25	10x t_{CPU_CLK}
ULP1	0.66	1.58	0.83	4.73	0.86	8.93	0.89	15.75	0.89	23.10	0.92	33.60	15
ULP1 @ 1.0V	0.66	1.00	0.83	3.00	0.86	6.00	0.89	10.00	0.89	14.50	0.92	23.00	
ULP0 @ 32 kHz	0.66	1.26	0.83	7.04	0.86	12.50	0.89	19.11	0.89	25.73	0.92	36.96	5625
ULP0 @ 187.5 kHz	0.99	1.37	1.12	7.09	1.16	12.60	1.19	19.22	1.19	25.73	1.22	36.96	960
ULP0 @ 750 kHz	0.99	1.47	1.12	7.14	1.16	12.71	1.19	19.22	1.19	25.73	1.22	36.96	240
ULP0 @ 12 MHz	0.99	2.52	1.12	8.19	1.16	14.18	1.19	20.16	1.19	26.67	1.22	37.70	15

The following figures plot the power consumption of the SAM9X7 Series in ULP0, ULP1 and Idle modes. These figures account for the power consumption in VDDCORE and VDDIN33: Power (mW) = I_{DDIN33} x 3.3V + I_{DDCORE} x 1.15V, with I_{DDIN33} and + I_{DDCORE} as measured in the above table.

Revision History

76. Revision History

76.1. DS60001813E - 08/2026

Section	Changes
Product Identification System	Updated example
Microchip Recommended Power Management Solutions	Updated Figure 9.1 and Figure 9.2
Memory Mapping	Figure 11.1: corrected SYSCWP offset
Peripheral Identifiers	Table 12.1: restored GMAC (ID 67) row; updated PMECC (ID 48) row
Memories	Updated Clocks
Static Memory Controller (SMC)	Updated Figure 20.1 SMC_OCMS: corrected field name to CSxSE
Programmable Multibit ECC Error Location Controller (PMERRLOC)	PMERRLOC_SIGMA0: renamed field from SIGMA0 to SIGMA PMERRLOC_SIGMAx: renamed field from SIGMAx to SIGMA
Real-Time Clock (RTC)	Updated UTC Mode Updated RTC_TSTRx, RTC_TSDRx, RTC_TSSRx register descriptions RTC_MR: updated UTC and HRMODE descriptions RTC_TIMALR (DEFAULT_MODE): updated AMPM description
Debug Unit (DBGU)	Updated Chip Identifier and DBGU_CIDR
Special Function Registers (SFR)	SFR_TSU_CFG: updated WIDTH description
Power Management Controller (PMC)	Updated Spread Spectrum
Parallel Input/Output Controller (PIO)	PIO_ABCDSR1 and PIO_ABCDSR2 renamed PIO_ABCDSR0 and PIO_ABCDSR1 PIO_DRIVER1 renamed PIO_DRIVER
Analog-to-Digital Controller (ADC)	Added ADC Input Sampling Capacitor Charging Time (Tracking Time), Maximum Sampling Frequency Analog-to-Digital Conversion: updated tracking time information ADC_MR: updated TRACKTIM description ADC_ACR: corrected reset value; updated IBCTL description ADC_EMR: updated TRACKX4 description
LCD Controller (LCDC)	Split the LCDC_LCDCFG5 register into LCDC_LCDCFG5 (DEFAULT_MODE) and LCDC_LCDCFG5 (DPI-COMPLIANT_MODE)
2D Graphics Engine (GFX2D)	BLEND_WD5: updated SPRE and DPRE descriptions
Display Serial Interface (DSI)	High-Speed Frequency Range Control Operation: updated Table 49.3 D-PHY PLL Control Operation: updated Table 49.4

DS60001813E - 08/2026 (continued)	
Section	**Changes**
Camera Serial Interface (CSI)	Added Data ID Monitors Added the following registers: • CSI_DATA_IDS_1 • CSI_DATA_IDS_VC_1 • CSI_DATA_IDS_VC_2 • CSI_VC_EXTENSION • CSI_INT_ST_LINE • CSI_INT_MSK_LINE • CSI_INT_FORCE_LINE • CSI_INT_ST_BNDRY_FRAME_FATAL • CSI_INT_MSK_BNDRY_FRAME_FATAL • CSI_INT_FORCE_BNDRY_FRAME_FATAL • CSI_INT_ST_SEQ_FRAME_FATAL • CSI_INT_MSK_SEQ_FRAME_FATAL • CSI_INT_FORCE_SEQ_FRAME_FATAL • CSI_INT_ST_CRC_FRAME_FATAL • CSI_INT_MSK_CRC_FRAME_FATAL • CSI_INT_FORCE_CRC_FRAME_FATAL • CSI_INT_ST_PLD_CRC_FATAL • CSI_INT_MSK_PLD_CRC_FATAL • CSI_INT_FORCE_PLD_CRC_FATAL • CSI_INT_ST_DATA_ID • CSI_INT_MSK_DATA_ID • CSI_INT_FORCE_DATA_ID • CSI_INT_ST_ECC_CORRECT • CSI_INT_MSK_ECC_CORRECT • CSI_INT_FORCE_ECC_CORRECT Updated CSI_INT_ST_MAIN CSI_SCRAMBLING_SEED3: corrected reset value
Image Sensor Controller (ISC)	Embedded Characteristics: updated Parallel Interface characteristic
Inter-IC Sound Multi-Channel Controller (I2SMCC)	Updated Monitors and Reports DMA Controller Operation: added Table 55.4 and Table 55.5 I2SMCC_MRB: updated DMACHUNK description I2SMCC_IERA, I2SMCC_IDRA, I2SMCC_IMRA, I2SMCC_ISRA: removed bits with indexes greater than 0
Advanced Encryption Standard (AES)	Updated Start Modes, Encrypted Tweak Generation, Data Processing XEX-based Tweaked-codebook Mode (XTS): updated auto-padding information
Secure Hash Algorithm (SHA)	Updated Description, SHA Algorithm, Protocol Layers Improved Performances SHA_WPMR: updated ACTION description SHA_CR: updated SWRST description SHA_MR: corrected ALGO description SHA_ISR: corrected URAT description
Triple Data Encryption Standard (TDES)	Updated Security and Safety Analysis and Reports TDES_MR: modified PKRS description

© 2026 Microchip Technology Inc. and its subsidiaries

DS60001813E - 08/2026 (continued)	
Section	**Changes**
Ethernet MAC (GMAC)	Updated 1588 Timestamp Unit Table 64.2: updated field 12:0 GMAC_MAN: updated OP description GMAC_TSCTL: corrected field name from TXSQ0 to TXSQ
Flexible Serial Communication Controller (FLEXCOM)	Modified content regarding multiple data reading in SPI Multiple Data Access, FLEX_SPI_RDR (FIFO_MULTI_DATA_8), FLEX_SPI_RDR (FIFO_MULTI_DATA_16) Updated Table 65.2 FLEX_SPI_RDR (FIFO_MULTI_DATA_8), FLEX_SPI_RDR (FIFO_MULTI_DATA_16), FLEX_SPI_TDR (FIFO_MULTI_DATA): "FIFO" removed from register name (but kept in register acronym)
Quad Serial Peripheral Interface (QSPI)	Updated Scrambling/Unscrambling Function, Data Strobe Delay Management
Secure Digital MultiMedia Card Controller (SDMMC)	Split the SDMMC SDMA System Address/Argument 2 Register into SDMMC_SSAR (DEFAULT_MODE) and SDMMC_SSAR (CMD23)
USB Device High Speed Port (UDPHS)	Updated Power Management Added Detach Procedure (Software Disconnect) Transfer Without DMA: updated "Important" note Register Summary: corrected format of registers suffixed with "(DEFAULT_MODE)" UDPHS_CTRL: updated DETACH description UDPHS_TST: updated SPEED_CFG description
USB Host High Speed Port (UHPHS)	Updated Figure 73.2
Electrical Characteristics	12-bit ADC Characteristics: added table footnote (1) Updated Table 74.50, Table 74.67, Flexible Serial Communication Controller (FLEXCOM) - USART

76.2. DS60001813D - 03/2025

Section	Changes
General	Added content related to: • SAM9X75(T)-V/4PB(-SLx)VAO Automotive grade device • SAM9X72 and SAM9X70 fine pitch package devices
Features	Added Qualification feature
Ordering Information	Updated ordering codes
Product Identification System	Updated ordering code description
Security and Cryptography Subsystem	Updated Cryptography Subsystem Keybus
Flexible Serial Communication Controller (FLEXCOM)	FLEX_US_FIDI (LON_MODE), FLEX_US_LONB1TX, FLEX_US_LONB1RX, FLEX_US_IDTTX, FLEX_US_IDTRX: added note in field description
Quad Serial Peripheral Interface (QSPI)	Added End of Frame Procedure
Secure Digital MultiMedia Card Controller (SDMMC)	SDMMC_PVRx: corrected the number of register instances from 4 to 3
USB Device High Speed Port (UDPHS)	Updated Transfer Without DMA
Electrical Characteristics	Added ESD Ratings section, Figure 74.46 Updated Table 74.4, Table 74.6, Table 74.7, Table 74.50, Table 74.51, Table 74.52, Table 74.53, , Table 74.62, Table 74.64, Table 74.68 Updated Figure 74.13, Figure 74.42, Figure 74.44, Figure 74.47, Figure 74.48

© 2026 Microchip Technology Inc. and its subsidiaries

76.3. DS60001813C - 12/2024

Section	Changes
General	• Added content related to SAM9X7 Series fine pitch package devices (SAM9X75(T)-V/6GW) • Added content related to Software License Level (SLx) • Data sheet format reworked
Ordering Information	Updated ordering codes
Product Identification System	Updated ordering codes
Boot Strategies	Added Software Considerations Updated Hardware Considerations
Debug Unit (DBGU)	Chip Identifier: updated reset value information
LCD Controller (LCDC)	Updated Embedded Characteristics, Vertical Scaler, Active Mode Output Pin Assignment
Low Voltage Differential Signaling Controller (LVDSC)	LVDSC_WPSR: corrected WPVSRC field size
CSI-2 Demultiplexer Controller (CSI2DC)	YUV 420 8-bit Legacy Mode: updated Figure 51.6; added Note YUV 420 8-bit Mode: updated Table 51.12 and Table 51.13
Image Sensor Controller (ISC)	Updated Defective Pixel Correction (DPC), Green Disparity Correction (GDC), White Balance (WB) Module Black Level Correction (BLC) Rounding, Limiting and Packing (RLP) Module: updated DATY10 table row ISC_INTEN, ISC_INTDIS, ISC_INTMASK, ISC_INTSR: removed WPE
Inter-IC Sound Multi-Channel Controller (I2SMCC)	Updated Figure 55.7
Flexible Serial Communication Controller (FLEXCOM)	Updated Baud Rate Generator, Baud Rate in Synchronous Mode, FIFO Overflow/Underflow Error, FIFO Overflow/Underflow Error, FIFO Overflow/Underflow Error Updated TXFPTEF and RXFPTEF definitions in FLEX_US_FESR, FLEX_SPI_SR, FLEX_TWI_FSR FLEX_TWI_SMBTR: added detail on WPEN FLEX_SPI_MR: added LSBHALF
Quad Serial Peripheral Interface (QSPI)	Embedded Characteristics: added supported standards Memory Registers/Commands Access: added note about the RBSYERR flag Added Peripheral Bus Access Errors Updated HyperFlash Mode, Twin-Quad Mode Instruction Frame Transmission Examples: corrected address range used in examples QSPI_IFR: updated PROTTYP description Updated Initialization Procedure, Figure 66.23. Added Figure 66.14, Figure 66.16, Figure 66.18, Figure 66.20, Figure 66.22
Analog-to-Digital Controller (ADC)	Updated Table 44.4
Electrical Characteristics	Updated Table 74.4 Added Power Consumption in Active Mode Table 74.9, Table 74.10: updated Note

76.4. DS60001813B - 02/2024

Section	Changes
Reference Document	New section
Configuration Summary	Updated Table 5.1
Block Diagram	Updated Figure 6.1
Package and Pinout	Updated Table 8.1
DMA Controller (XDMAC)	Updated Figure 16.5
Overview	Updated Power Supplies

© 2026 Microchip Technology Inc. and its subsidiaries

DS60001813B - 02/2024 (continued)	
Section	**Changes**
Real-Time Clock (RTC)	All occurrences of Persian mode deleted Updated Waveform Generation, Figure 33.8, RTC Accurate Clock Calibration RTC_MR: index 1 now 'reserved'; UTC description updated RTC_SR: updated reset value
Power Management Controller (PMC)	Throughout: changed "FSTP" to "WIP" Updated Main Crystal Oscillator Failure Detection
External Bus Interface (EBI)	Added whole chapter
DDR-SDRAM Controller (MPDDRC)	DDR3-SDRAM/DDR3L-SDRAM Initialization: corrected DDR3(L)-SDRAM value
OTP Memory Controller (OTPC)	Updated Power Management
LCD Controller (LCDC)	Updated Embedded Characteristics, Functional Description LCDC_LCDISR: updated WP description
Display Serial Interface (DSI)	Offsets 0x000000E0–0x000000E8 and 0x000000F8 now 'reserved' DSI_INT_FORCE0, DSI_INT_FORCE1: access now Write-only
CSI-2 Demultiplexer Controller (CSI2DC)	CSI2DC_SSPISR, CSI2DC_GSPISR, CSI2DC_GLPISR, CSI2DC_IDSISR, CSI2DC_DPISR, CSI2DC_VPISR: updated bit descriptions
Image Sensor Controller (ISC)	Added section Scaler Function ISC_INTEN, ISC_INTDIS, ISC_INTMASK, ISC_INTSR: added WPE
Inter-IC Sound Multi-Channel Controller (I2SMCC)	Updated Common Registers TDM Reception and Transmission Sequence: added note I2SMCC_MRA: updated TDMFS description I2SMCC_MRB: updated I2SLINESIZE description I2SMCC_ISRA: updated RXLRDYx and TXRRDYx descriptions
Synchronous Serial Controller (SSC)	Updated Embedded Characteristics
Ethernet MAC (GMAC)	Updated Embedded Characteristics, GMAC Connections to PHY in Different Modes, Media Access Controller, Jumbo Frames, PHY Interface GMAC_EMAC_SCR2_RATE_LIMIT1: added register at offset 0x1B44 GMAC_EMAC_DCFGR: FBLDO now at index [4:0] GMAC_RJFML: updated reset value GMAC_ISR, GMAC_IER, GMAC_IDR, GMAC_IMR: corrected offsets of TXLCK and RXLCK GMAC_DCFGR: corrected offset of CRCERRREP GMAC_RX_WATERMARK, GMAC_EMAC_RX_WATERMARK, GMAC_TQSA, GMAC_EMAC_TQSA, GMAC_SCR2_RATE_STATUS, GMAC_EMAC_TSCTL, GMAC_EMAC_TQBWRL, GMAC_EMAC_ENST_CR, GMAC_EMAC_SCR2_RATE_STATUS, GMAC_NCFGR, GMAC_EMAC_NCFGR: updated bit descriptions GMAC_FRER_STAT_Bx, GMAC_EMAC_FRER_STAT1_B, GMAC_EMAC_FRER_STAT2_B: bits 25:24 now 'reserved' GMAC_SCR2_RATE_LIMITx, GMAC_EMAC_ENST_ON, GMAC_EMAC_ENST_START, GMAC_EMAC_ENST_OFF, GMAC_FRER_CTRL_Ax, GMAC_FRER_CTRL_Bx, GMAC_FRER_STAT_Ax, GMAC_FRER_STAT_Bx: modified index range of registers
Flexible Serial Communication Controller (FLEXCOM)	Updated I/O Lines Description, Baud Rate in Synchronous Mode FLEX_TWI_SR (DEFAULT_MODE), FLEX_TWI_SR (FIFO_ENABLED): index 17 now 'reserved'
Timer Counter (TC)	Updated Block Diagram TC_BMR: updated TCxXCxS descriptions
Electrical Characteristics	Updated Table 74.34, Table 74.16, Digital Peripheral Characteristics System Power Consumption in Applicative Use Cases: updated Table 74.64 Operation and Power Consumption in Low-Power Modes: updated Table 74.65
Ordering Information	Updated ordering codes

Microchip Information

Trademarks

The “Microchip” name and logo, the “M” logo, and other names, logos, and brands are registered and unregistered trademarks of Microchip Technology Incorporated or its affiliates and/or subsidiaries in the United States and/or other countries (“Microchip Trademarks”). Information regarding Microchip Trademarks can be found at https://www.microchip.com/en-us/about/legal-information/microchip-trademarks.

Legal Notice

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at www.microchip.com/en-us/support/design-help/client-support-services.

THIS INFORMATION IS PROVIDED BY MICROCHIP “AS IS”. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP’S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip products are strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
