

PAL20R8 Family

24-Pin TTL Programmable Array Logic

DISTINCTIVE CHARACTERISTICS

- 5-ns propagation delay
- Popular 24-pin architectures: 20L8, 20R8, 20R6, 20R4
- Programmable replacement for high-speed TTL logic
- Power-up reset for initialization
- Extensive third-party software and programmer support through FusionPLD partners
- 24-pin SKINNYDIP® and 28-pin PLCC packages save space

GENERAL DESCRIPTION

The PAL20R8 Family (PAL20L8, PAL20R8, PAL20R6, PAL20R4) includes the PAL20R8-5 Series which is ideal for high-performance applications. The PAL20R8 Family is provided in the standard 24-pin DIP and 28-pin PLCC pinouts.

The devices provide user programmable logic for replacing conventional SSI/LSI gates and flip-flops at a reduced chip cost.

The family allows the systems engineer to implement the design on-chip, by opening fuse links to configure AND and OR gates within the device, according to the desired logic function. Complex interconnections between gates, which previously required time-consuming layout, are lifted from the PC board and placed on silicon, where they can be easily modified during prototyping or production.

The PAL device implements the familiar Boolean logic transfer function, the sum of products. The PAL device is a programmable AND array driving a fixed OR array. The AND array is programmed to create custom product terms, while the OR array sums selected terms at the outputs.

In addition, the PAL device provides the following options:

- Variable input/output pin ratio
- Programmable three-state outputs
- Registers with feedback

Product terms with all connections opened assume the logical HIGH state; product terms connected to both true and complement of any single input assume the logical LOW state. Registers consist of D-type flip-flops that are loaded on the LOW-to-HIGH transition of the clock. Unused input pins should be tied to V_{CC} or GND.

AMD's FusionPLD program allows PAL20R8 Family designs to be implemented using a wide variety of popular industry-standard design tools. By working closely with the FusionPLD partners, AMD certifies that the tools provide accurate, quality support. By ensuring that third-party tools are available, costs are lowered because a designer does not have to buy a complete set of new tools for each device. The FusionPLD program also greatly reduces design time since a designer can use a tool that is already installed and familiar. Please refer to the PLD Software Reference Guide for certified development systems and the Programmer Reference Guide for approved programmers.

FUNCTIONAL DESCRIPTION

Standard 24-Pin PAL Family

The standard 24-pin PAL family is comprised of four different devices, including both registered and combinatorial devices. All parts are produced with a fuse link at each input to the AND gate array, and connections may be selectively removed by applying appropriate voltages to the circuit. Using any of a number of development packages, these products can be rapidly programmed to any customized pattern. Extra test words are pre-programmed during manufacturing to ensure extremely high field programming yields, and provide extra test paths to achieve excellent parametric correlation.

Variable Input/Output Pin Ratio

The registered devices have twelve dedicated input lines, and each combinatorial output is an I/O pin. The PAL20L8 has fourteen dedicated input lines, and only six of the eight combinatorial outputs are I/O pins. Buffers for device inputs have complementary outputs to provide user-programmable input signal polarity. Unused input pins should be tied to V_{CC} or GND.

Programmable Three-State Outputs

Each output has a three-state output buffer with three-state control. On combinatorial outputs, a product term controls the buffer, allowing enable and disable to be a function of any product of device inputs or output feedback. The combinatorial output provides a bidirectional I/O pin, and may be configured as a dedicated input if the buffer is always disabled. On registered outputs, an input pin controls the enabling of the three-state outputs.

Registers with Feedback

Registered outputs are provided for data storage and synchronization. Registers are composed of D-type flip-flops that are loaded on the LOW-to-HIGH transition of the clock input.

Power-Up Reset

All flip-flops power-up to a logic LOW for predictable system initialization. Outputs of the PAL20R8 Family will be HIGH due to the active-low outputs. The V_{CC} rise must be monotonic and the reset delay time is 1000 ns maximum.

Register Preload

The register on the AMD marked 20R8, 20R6, and 20R4 devices can be preloaded from the output pins to facilitate functional testing of complex state machine designs. This feature allows direct loading of arbitrary states, making it unnecessary to cycle through long test vector sequences to reach a desired state. In addition, transitions from illegal states can be verified by loading illegal states and observing proper recovery.

Security Fuse

After programming and verification, a PAL20R8 Family design can be secured by programming the security fuse. Once programmed, this fuse defeats readback of the internal programmed pattern by a device programmer, securing proprietary designs from competitors. When the security fuse is programmed, the array will read as if every fuse is intact.

Quality and Testability

The PAL20R8 Family offers a very high level of built-in quality. Extra programmable fuses provide a means of verifying performance of all AC and DC parameters. In addition, this verifies complete programmability and functionality of the device to provide the highest programming yields and post-programming functional yields in the industry.

Technology

The PAL20R8-5, -7 and 10/2 are fabricated with AMD's oxide isolated process. The array connections are formed with highly reliable PtSi fuses. The PAL20R8B, B-2, and A series are fabricated with AMD's trench-isolated bipolar process. The array connections are formed with proven TiW fuses. These processes reduce parasitic capacitances and minimum geometries to provide higher performance.

ABSOLUTE MAXIMUM RATINGS

Storage Temperature -65°C to $+150^{\circ}\text{C}$
 Ambient Temperature with
 Power Applied -55°C to $+125^{\circ}\text{C}$
 Supply Voltage with
 Respect to Ground -0.5 V to $+7.0\text{ V}$
 DC Input Voltage -1.5 V to $V_{\text{CC}} + 0.5\text{ V}$
 DC Output or I/O
 Pin Voltage -0.5 V to $V_{\text{CC}} + 0.5\text{ V}$

Stresses above those listed under Absolute Maximum Ratings may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to Absolute Maximum Ratings for extended periods may affect device reliability. Programming conditions may differ.

OPERATING RANGES

Commercial (C) Devices

Ambient Temperature (T_{A})
 Operating in Free Air 0°C to $+75^{\circ}\text{C}$
 Supply Voltage (V_{CC})
 with Respect to Ground $+4.75\text{ V}$ to $+5.25\text{ V}$

Operating ranges define those limits between which the functionality of the device is guaranteed.

Notes:

- All dimensions are in inches.
- A notch, tab, or pin one identification mark shall be located adjacent to the device pin one.
- Lead thickness increases by a maximum of 0.003 inch when a solder lead finish is applied.
- The minimum limit for the "b1" dimension is 0.030 inch in four corner leads for the PD 016, PD3024, PDW024, PD3028, and PDW028 package versions.
- Dimensions "D" and "E1" do not include mold flash or protrusion.
- Dimension "E" is measured from the outside of the leads and 0.015 inch below the plane of the package exit, as defined by the top of the lead.
- Dimension "Q" is measured from the seating plane to the base plane.
- Dimension "L" is measured from the seating plane (or from the lowest point of the lead shoulder width that measures 0.040 inch) to the lead tip.
- The difference between these two dimensions should not exceed seven degrees.
- When standoff has radii, the seating plane location is defined where the lead width equals 0.040 inch.
- PD is AMD's internal designator for a plastic dual-in-line package. PD3 and PDW designate PDIP packages with package widths that differ from the standard width for that pin-count size.

3. Dimensions "D1" and "E1" do not include corner mold flash. Allowable corner mold flash is 0.010 inch.
4. Dimensions "A, A1, D2, and E2" are measured from the points of contact to the base plane.
5. Lead spacing as measured from the center-line to the center-line shall be within ± 0.005 inch.
6. J-bend lead tips should be located inside the "pockets."
7. Lead coplanarity shall be within 0.004 inch as measured from the seating plane.
8. Lead tweeze shall be within 0.0045 inch on each side as measured from a vertical flat plane.
9. The lead pocket may be rectangular (as shown) or oval. If the corner lead pockets are connected, then 0.005-inch minimum lead spacing is required.
10. PL is AMD's internal abbreviation for a PLCC. PLH refers to one that has been thermally enhanced with an embedded heat spreader.

MIL-STD 1835 Case Outline ¹⁰	D-7		D-9		D-11		D-3		D-9		NL		D-10	

Notes:

1. All dimensions are in inches.
2. A notch, tab, or pin-one identification mark shall be located adjacent to pin one within the shaded area.
3. Dimensions "D" and "E" allow for off-center lid meniscus and glass overrun.
4. Dimensions "A" and "Q" are measured from the seating plane when the component is inserted into a 0.0415-inch minimum or 0.043-inch maximum gauge-hole socket. For the CD4 024-pin package, a 0.026-inch (minimum) to 0.028-inch (maximum) gauge should be used.
5. Dimension "L" is measured from the seating plane to the lead tips.
6. For dimension "e," each lead spacing shall be located within ± 0.010 inch of its true position.
7. This area may be a round, square, or rectangular shaped ultraviolet (UV) glass window in ceramic DIP packages for erasable memory products (designated as CDV).
8. Dimension "D" does not include units with bumper tape or clips.
9. CD is AMD's internal designator for a ceramic dual-in-line package. CD3 and CD4 indicate that the package width varies from the standard width for that pin-count. CDV means the package cap has a view window. CDE is a CD3 with a view window.
10. When "NL" is listed as the MIL-STD 1835 reference, the package is not listed in MIL-STD 1835.
